Herbs, apparently ascending, presumably perennial, often turning yellow when dry; stems glabrous. Petiole 3–4.5 cm, glabrous; leaf blade drying papery, adaxially leaden gray, obovate or elliptic-obovate, 5–8 × 3–4 cm, both surfaces glabrous, base obtuse then decurrent, apex obtuse to acute; secondary veins 6

or 7 pairs; stipules persistent, triangular to lanceolate, ca. 4 mm, glabrous, obtuse to acute. Inflorescences and flowers not seen. Infructescence paniculate, glabrous, branched dichasially to several orders; peduncle ca. 10 cm; branched portion ca. 4 cm; bracts narrowly triangular, 2–5 mm. Capsules subsessile, linear-oblong to oblanceoloid, ca. 2 × 0.5–0.6 mm, glabrous or puberulent, valves 4, becoming twisted. Fr. Jul.

- Shady places on limestone hills; ca. 100 m. Guangxi (Daxin).

The name *Spiradiclis "microcarpa"* was not validly published by H. S. Lo (loc. cit.) because what should have been the indication of type merely cited "Guangxi: Daxin, circ. 100 m alt[.], non collelector [sic!] s. n." without using the word "holotype" or "type" or an equivalent and without specifying the herbarium in which the type was conserved (*Vienna Code*, Art. 37.6 and 37.7). It has not been possible to locate a specimen from the gathering cited by Lo.

**24. *Spiradiclis microphylla*** H. S. Lo, Acta Bot. Austro Sin. 1: 34. 1983.

小叶螺序草 xiao ye luo xu cao

Herbs, ascending, presumably perennial; stems pubescent. Petiole 0.4–1 cm, pubescent; leaf blade drying thinly papery, brown, ovate, 1–3 × 0.5–1.4 cm, glabrous or pilose on both surfaces, base obtuse then decurrent, apex obtuse to acute; secondary veins 4–7 pairs; stipules subulate-lanceolate, acuminate or caudate-acuminate. Inflorescences cymose, several flowered, with axes scorpioid; peduncles 2–5 cm; bracts lanceolate or subulate-lanceolate, 1–2 mm. Calyx pilose to puberulent; hypanthium portion ca. 0.8 mm; limb deeply lobed; lobes ca. 0.7 mm. Corolla white, shortly tubular, ca. 2.5 mm; lobes ovate-triangular, carinate on dorsal surface. Capsules subglobose, valves 4. Fl. Sep–Oct.

- Sparse forests. Jiangxi (Longnan).

This species was keyed by H. S. Lo (in FRPS 71(1): 88. 1999) based on its glabrous stems and inflorescences, but the description (loc. cit.: 101) reported it as pubescent. The key here is adjusted accordingly.

**25. *Spiradiclis napoensis*** D. Fang & Z. M. Xie, Acta Phytotax. Sin. 40: 154. 2002.

那坡螺序草 na po luo xu cao

Herbs, ca. 65 cm tall, presumably perennial, procumbent at base, ascending above; stems moderately to densely curved pubescent. Leaves somewhat anisophyllous and clustered near top of stem; petiole 0.7–2 cm, densely curved pubescent; blade drying thinly papery to submembranous, adaxially dark green, abaxially pale, narrowly ovate to broadly ovate, 4–7 × 1.5–3.5 cm, adaxially pilosulous to glabrescent, abaxially glabrescent or curved pubescent along principal veins, base rounded to obtuse then decurrent, apex acuminate; secondary veins 8–10 pairs; stipules linear-subulate, 2–8 mm, glabrous, 2-lobed, lobes ca. 1 mm. Inflorescences cymose, 8–10-flowered, densely curved pubescent; peduncles 0.3–0.5 cm; axes 1–4 mm, puberulent; bracteoles linear, 6–10 mm, glabrous. Flowers distylous. Calyx puberulent to glabrescent; hypanthium portion ellipsoid, ca. 2 mm; limb deeply lobed; lobes narrowly triangular, ca. 2.5 mm, with a gland in each sinus. Corolla in bud white tinged with pink, subtubular, glabrous outside; tube ca. 12 mm, inside villous in throat; lobes subovate, ca. 5 mm, acute. Capsules unknown. Fl. Apr–May.

• Forests in valleys of limestone hills; ca. 1000 m. Guangxi (Napo).

Details of the long-styled and short-styled flowers are given in the protologue.

**26. *Spiradiclis oblanceolata*** W. L. Sha & X. X. Chen, Acta Bot. Austro Sin. 1: 35. 1983.

长叶螺序草 chang ye luo xu cao

Herbs, erect, unbranched, 13–25 cm tall, presumably perennial; stems glabrous. Petiole 3–5 cm, glabrous; leaf blade drying papery, oblanceolate or narrowly elliptic-oblong, 7–17 × 2–4 cm, glabrous on both surfaces, base cuneate, apex acute; secondary veins 9–12 pairs; stipules long triangular, ca. 8 mm, glabrous, 2-lobed, lobes ca. 3 mm. Inflorescences paniculate, many flowered, ca. 20 cm, glabrous; peduncles 9–11 cm; bracts linear, ca. 3 mm. Calyx with hypanthium portion ovoid, ca. 2 mm. Corolla white, outside glabrous; tube ca. 5 mm, bearded in throat. Capsules ovoid, ca. 2 mm, glabrous. Fl. and fr. Apr–Jun.

• Rocks in forests. Guangxi.

**27. *Spiradiclis petrophila*** H. S. Lo, Acta Bot. Austro Sin. 1: 33. 1983.

石生螺序草 shi sheng luo xu cao

Herbs, to 30 cm tall, apparently perennial, often procumbent at base, ascending above; stems densely pilosulous to tomentulose. Petiole 0.5–1.5 cm, densely pilosulous to tomentulose; leaf blade drying papery, ovate-elliptic to elliptic, 3–5 × 1.5–3 cm, densely tomentulose to pilosulous on both surfaces, base cuneate then decurrent, usually slightly inequilateral, apex acute; secondary veins ca. 9 pairs; stipules caducous, triangular, 1.5–2 mm, puberulent to glabrescent, acute and sometimes erose. Inflorescences paniculate, many flowered, densely pilosulous to tomentulose; peduncles slender, 3.5–6.5 cm; axes distally scorpoid, 1–1.5 cm; bracts narrowly triangular, 0.3–0.8 mm. Flowers sessile or subsessile, distylous. Calyx densely puberulent to hispidulous; hypanthium portion ellipsoid to obconic, ca. 0.8 mm; lobes triangular, ca. 0.3 mm. Corolla white, tubular, outside puberulent to glabrescent; tube ca. 2 mm; lobes triangular, ca. 1 mm, dorsally keeled, apically rostrate-inflexed. Capsules subglobose to obovoid, ca. 2 mm, somewhat flattened laterally, valves 2 then tardily splitting into 4. Fl. Sep, fr. Dec.

• On limestone rocks and dripping cliffs. Guangdong (Yangchun).

**28. *Spiradiclis purpureocerulea*** H. S. Lo, Bull. Bot. Res., Harbin 6(4): 39. 1986.

紫花螺序草 zi hua luo xu cao

Herbs, presumably perennial; stems densely brown pubescent. Leaves subsessile; blade drying papery, adaxially black, abaxially pale, ovate, 3–6.5 × 1.5–3 cm, adaxially densely strigose-hispidulous, abaxially densely pubescent, base rounded or obtuse, apex obtuse; secondary veins 7–10 pairs; stipules subulate, 2–3 mm, pubescent, caudate-acuminate. Inflorescence congested-cymose, 1.5–3 cm, densely pubescent; peduncles short. Calyx pubescent; hypanthium portion obconic-globose, ca. 2 mm; lobes narrowly lanceolate, 4–4.5 mm, acuminate. Corolla bluish purple, slenderly salverform; tube 19–21 mm; lobes sub-

ovate, ca. 6 mm, obtuse. Capsules subglobose, 4–4.5 mm in diam., pubescent, valves 4. Fl. Aug.

• On rocks at roadsides. Guangxi (Longzhou).

**29. *Spiradiclis rubescens*** H. S. Lo, Guihaia 11: 101. 1991.

红叶螺序草 hong ye luo xu cao

Herbs, apparently ascending, low, ca. 6 cm tall, perhaps annual; stems subglabrous, drying purplish black. Leaf blade drying papery, purplish red, elliptic-oblong or oblong-ovate, 4–6 × 2–2.3 cm, glabrous on both surfaces, base obtuse, margins ciliate, apex acute to obtuse; secondary veins 9–11 pairs; stipules triangular to broadly ovate, 4–5 mm, caudate-acuminate. Inflorescence cymose, 3–5-flowered; bracteoles linear, 4–6 mm, sparsely ciliate; pedicels short. Calyx glabrous; hypanthium portion obovoid, ca. 2 mm; lobes narrowly lanceolate, unequal, larger 4–4.5 mm, smaller ca. 3.5 mm, acuminate, ciliate, with gland in each sinus. Corolla red, slenderly salverform-funnel-form, outside glabrous, strongly 5-ribbed; tube ca. 21 mm; lobes ovate, ca. 3.5 mm. Capsules unknown. Fl. Jun.

• On rocks in shady places. Guangxi (Tiandong).

This species is noted for its reddened color when dry.

**30. *Spiradiclis scabrida*** D. Fang & D. H. Qin, Bull. Bot. Res., Harbin 13: 333. 1993.

糙边螺序草 cao bian luo xu cao

Herbs, perhaps perennial, 40–50 cm tall, rooting near base, apices apparently ascending; stems pubescent to glabrescent. Leaves often slightly anisophyllous; petiole 0.2–0.5 cm, glabrous or usually pubescent; blade drying papery, adaxially olive-green, abaxially yellowish green, ovate, narrowly ovate, or lanceolate, 2–9 × 1–3.3 cm, glabrous or occasionally sparsely strigillose or scabridulous at least on principal veins, base obtuse, apex acuminate; secondary veins 6–9 pairs; stipules caducous to persistent, subtriangular, 0.7–1 mm, subglabrous, acute. Inflorescence corymbose-cymose, 3–24-flowered, pubescent, puberulent, or glabrescent; peduncle 0.6–2.7 cm; bracteoles linear, 2–5 mm; pedicels to 2 mm. Flowers sessile to pedicellate. Calyx puberulent; hypanthium portion obovate, 1–1.5 mm; limb deeply lobed; lobes ovate-lanceolate, 1–1.5 mm, slightly unequal, with gland in each sinus. Corolla white sometimes flushed with pink or purple, slenderly salverform-funnelform, glabrous inside and outside; tube 25–26 mm; lobes ovate, ca. 3.5 mm. Capsules subglobose, 3–4 mm in diam., glabrescent, valves 4. Fl. Dec, fr. Mar–Apr.

• On rocks in forests; 800–1200 m. Guangxi (Napo).

**31. *Spiradiclis spatulata*** X. X. Chen & C. C. Huang, Guihaia 13: 3. 1993.

匙叶螺序草 chi ye luo xu cao

Herbs, low, erect, perhaps perennial, usually reduced or acaulescent with leaves clustered at base. Petiole 5–8 mm; leaf blade drying papery, adaxially olive-green, abaxially pale, spatulate or obovate-oblanceolate, 8–13 × 2–4.5 cm, adaxially sparsely pubescent, abaxially densely pubescent at least along principal veins, base acute to cuneate and usually decurrent,

apex obtuse to rounded; secondary veins 15–25 pairs; stipules lanceolate-linear or linear, 7–9 mm, densely villosulous. Inflorescences cymose, 10- to many flowered, pubescent; peduncle 7–12 cm; bracteoles linear-lanceolate, 3–4 mm; pedicels 2–3 mm. Calyx pubescent; hypanthium obconic, 1.5–2 mm; limb deeply lobed; lobes narrowly lanceolate, 1–1.3 mm. Corolla purplish red, slenderly salverform, puberulent outside; tube 15–25 mm, inside with villous ring at middle; lobes subovate, 4–6 mm. Capsules unknown. Fl. May.

- On rocks in shady places. Guangxi (Ningming).

**32. *Spiradiclis tomentosa*** D. Fang & D. H. Qin, Bull. Bot. Res., Harbin 13: 330. 1993.

粘毛螺序草 nian mao luo xu cao

Herbs, erect, 3–23 cm tall, presumably perennial, acaulescent with leaves clustered at base; stems densely gray-viscid multicellular tomentose. Leaves slightly anisophyllous; petiole 0.5–4.5 cm, densely tomentose; blade drying thinly papery, oblanceolate, obovate, or rarely elliptic, 3.5–14 × 1.5–5 cm, both surfaces densely tomentose, base acute, apex cuspidate to rounded; secondary veins 7–10 pairs; stipules persistent, triangular, 8–22 mm, tomentose, narrowed to subulate acuminate apex. Inflorescences paniculiform, 8- to many flowered, tomentose; peduncles 4.5–18 cm; bracts linear, 3–7 mm; pedicels 1–5 mm. Calyx tomentose; hypanthium portion turbinate, ca. 1 mm; lobes linear, 1.5–2 mm. Corolla white, subfunneliform, outside sparsely pubescent; tube 6–8 mm, glabrous inside; lobes ovate, 2–3 mm. Capsules subglobose, ca. 2 mm in diam., valves 4, persistent calyx lobes 3.5–4 mm. Fl. Apr, fr. Jun.

- Limestone caverns; ca. 500 m. Guangxi (Fengshan).

H. S. Lo (in FRPS 71(1): 99. 1999) described the leaves as cuspidate at apex, but the corresponding figure (p. 103, t. 23, f. 7) showed the leaves to be apically rounded.

**33. *Spiradiclis umbelliformis*** H. S. Lo, Bull. Bot. Res., Harbin 6(4): 36. 1986.

伞花螺序草 san hua luo xu cao

Herbs, perhaps perennial, creeping or with upper parts perhaps ascending; stems densely reddish brown multicellular villosulous. Petiole 1–3 cm, reddish brown villosulous; leaf blade drying papery, adaxially olive-green, abaxially pale, ovate-orbicular, 1.5–4 × 1–3 cm, adaxially glabrescent, abaxially pilosulous to pilose at least along principal veins, base cordulate to truncate and usually decurrent, apex obtuse to rounded; secondary veins 4–6 pairs; stipules persistent, pilosulous to glabrescent, deeply 2-parted, lobes linear, to 10 mm. Inflorescences cymose, umbelliform to subcapitate, 4–10-flowered, puberulent, pilosulous, or villosulous; peduncles 2–7 cm; bracts narrowly triangular. Flowers subsessile, distylous. Calyx subgla-

brous; hypanthium portion turbinate to subglobose, ca. 1.5 mm; lobes ovate-triangular, ca. 0.6 mm, usually with gland in sinus. Corolla white to pale purplish red, funneliform to tubular-funneliform, glabrous outside; tube 17–18 mm, with villous ring above base inside; lobes ovate, ca. 6 mm. Capsules subglobose, 3–3.5 mm in diam., glabrescent, valves 4, flat. Fl. Apr.

- Rock crevices in forests, on limestone. Guangdong (Ruyuan), Guangxi.

**34. *Spiradiclis villosa*** X. X. Chen & W. L. Sha, Bull. Bot. Res., Harbin 11(3): 17. 1991.

毛螺序草 mao luo xu cao

Herbs, 30–50 cm tall, perennial, procumbent and rooting below, perhaps upper parts ascending; stems densely dark brown villous. Petiole 3.5–7 cm, densely villous; leaf blade drying membranous, oblong-elliptic or obovate-elliptic, 10–25 × 3–8 cm, adaxially dark brown pubescent, abaxially densely brown villous, base cuneate or acute, apex acute or shortly acuminate; secondary veins 14–16 pairs; stipules 2-lobed, densely dark brown villous, lobes lacinate, 15–30 mm. Inflorescences and flowers not seen. Infructescences cymose-paniculate, many flowered, densely dark brown villous; peduncles to 27 cm. Young capsules ovoid, ca. 2 mm, villous, with calyx lobes ca. 4 mm, dehiscence unknown. Young fr. Jul.

- On rocks in forests. Guangxi (Longzhou).

H. S. Lo (in FRPS 71(1): 101. 1999) described the stipules as to 30 mm, a relatively large size.

**35. *Spiradiclis xizangensis*** H. S. Lo, Bull. Bot. Res., Harbin 6(4): 43. 1986.

西藏螺序草 xi zang luo xu cao

Herbs, perhaps perennial, procumbent near base, ascending in upper parts; stems densely pubescent, drying purplish brown. Petiole 1–2 cm, densely pubescent; leaf blade drying thinly papery, leaden gray with veins dark purple abaxially, ovate, 3.5–6 × 1.5–3.2 cm, adaxially glabrescent except pubescent along midrib, abaxially pubescent along principal veins, base obtuse or subrounded, apex acute or slightly obtuse; secondary veins ca. 7 pairs; stipules sublanceolate, 2–2.5 mm, subglabrous, often reflexed. Inflorescence cymose, 4–6-flowered; peduncle ca. 1 cm; bracteoles linear-lanceolate, ca. 7 mm; pedicels 2–5 mm. Calyx densely pubescent; hypanthium portion subellipsoid, ca. 1.8 mm; lobes narrowly lanceolate, unequal, larger one ca. 2 mm, smaller ones ca. 1.6 mm. Corolla slenderly salverform-subfunneliform, outside pubescent; tube ca. 17 mm, glabrescent inside; lobes triangular, ca. 3 mm. Capsules unknown. Fl. May.

- Dense forests; 1800–2100 m. Xizang (Mêdog).

## 89. TARENNA Gaertner, Fruct. Sem. Pl. 1: 139. 1788.

乌口树属 wu kou shu shu

Chen Tao (陈涛); Charlotte M. Taylor

*Chomelia* Linnaeus (1758), not Jacquin (1760, nom. cons.); *Cupi* Adanson; *Webera* Schreber.

Shrubs or trees, unarmed, often drying blackened. Raphides absent. Leaves opposite, sometimes with domatia; stipules persis-

tent or occasionally tardily deciduous, interpetiolar or united around stem, triangular, often aristate. Inflorescences terminal, sometimes displaced to pseudoaxillary by subsequent growth, cymose to corymbiform, few to many flowered, sessile or pedunculate, bracteate or bracts reduced. Flowers pedicellate or sessile, bisexual, monomorphic, often fragrant. Calyx limb 5-lobed. Corolla white, pale green, or yellow, funnelform or salverform, inside glabrous or pubescent in throat; lobes 5, convolute in bud, usually strongly reflexed at anthesis. Stamens 5, inserted in corolla throat, exserted; filaments short or reduced; anthers dorsifixed. Ovary 2-celled, ovules 1 to numerous in each cell on axile placentas; stigma fusiform or linear, sulcate or striate, shortly 2-lobed at apex, exserted. Fruit baccate, leathery or thinly fleshy, globose to ellipsoid, black or perhaps sometimes white, with calyx limb deciduous; seeds several, medium-sized, plano-convex or concavo-concave, testa membranous, leathery, or crustaceous; endosperm fleshy or corneous; embryo small; cotyledon small, leaflike.

About 370 species: tropical and subtropical Africa, Asia, Madagascar, and Pacific islands; 18 species (12 endemic) in China.

The name *Chomelia* Linnaeus (1758) was applied to these plants for many years; however, the later homonym *Chomelia* Jacquin (1760), which applies to a wholly neotropical genus, is now conserved against the Linnaean name, so the Old World plants formerly known under *Chomelia* are now correctly known under *Tarenna*.

Most of the characters that distinguish species of *Tarenna* are found in the corollas and calyx limb, thus specimens of *Tarenna* are often difficult to identify when they only have fruit from which the calyx limb has fallen. The genus was not well known in China until the work of W. C. Chen (Acta Phytotax. Sin. 22: 139–174. 1984). *Tarenna* apparently has secondary pollen presentation. W. C. Chen (in FRPS 71(1): 370. 1999) described the stipules as caducous, but the specimens seen all have persistent or tardily deciduous stipules. The key here closely follows that of W. C. Chen in FRPS (loc. cit. 1999: 370–372), with its emphasis on pubescence characters and number of ovules per locule, for reference. Chen (loc. cit. 1999: 370–384) considered the form (i.e., raised vs. flat vs. impressed) of the leaf midrib adaxially to be consistent within a species, but specimens studied show variation within species and overlapping among most species.

- 1a. Flowers with pedicels 18–30 mm ..... 14. *T. sinica*
- 1b. Flowers subsessile or with pedicels to 13 mm.
  - 2a. Calyx lobes subulate, 3–5 mm ..... 7. *T. lanceolata*

              - 8b. Ovary with ovules ca. 17 per cell; calyx with hypanthium portion glabrous, lobes 0.5–0.8 mm; leaf blade drying leathery, with secondary veins 7–9 pairs ..... 12. *T. polysperma*
  - 4b. Corolla tube as long as or shorter than corolla lobes.
    - 9a. Leaf blade glabrous on both surfaces.
      - 10a. Branches becoming yellowish white or grayish white with age, sometimes resinous at apex; stipules deciduous usually through fragmentation ..... 4. *T. depauperata*
      - 10b. Branches green to brown or ashy gray, not evidently resinous at apex; stipules persistent or deciduous through fragmentation.
        - 11a. Leaf secondary veins 3–10 pairs; petioles 0.8–2 cm; inflorescences 4–9 × 4–9 cm; leaf blade 4.5–15 × 1.5–6 cm.
          - 12a. Corolla tube 2–2.5 mm ..... 2. *T. attenuata*
          - 12b. Corolla tube 5–7 mm ..... 8. *T. lancilimba*
        - 11b. Leaf secondary veins 7–13 pairs; petioles 1–3.5 cm; inflorescences 4–15 × 6–20 cm; leaf blade 13–25 × 5–12 cm.
          - 13a. Leaf secondary veins 8–13 pairs; calyx mealy puberulent; inflorescences subglabrous or puberulent, ca. 15 × 20 cm; ovary with 4 ovules per cell ..... 9. *T. laticorymbosa*
          - 13b. Leaf secondary veins 7 or 8 pairs [or 6 in Japan]; calyx glabrous; inflorescences glabrous, 4–10 × 6–15 cm; ovary with 2 ovules per cell ..... 18. *T. zeylanica*
    - 9b. Leaves abaxially strigillose, hirtellous, hispidulous, pilosulous, or villosulous.

- 14a. Leaves pubescent adaxially, at least on midrib.  
 15a. Corolla glabrous outside; fruit with seeds 1–6 ..... 13. *T. pubinervis*  
 15b. Corolla strigillose or hirtellous outside; fruit with seeds ca. 30.  
 16a. Corolla tube 5–7 mm, lobes 11–12 mm, much longer than tube; leaf  
 secondary veins widely spaced, 6–8 pairs ..... 10. *T. laui*  
 16b. Corolla tube 3–4 mm, lobes 4–5 mm, slightly longer than or nearly as  
 long as tube; leaf secondary veins well spaced to closely set, 5–12 pairs ..... 11. *T. mollissima*  
 14b. Leaves glabrous or glabrescent adaxially.  
 17a. Corolla tube pubescent outside; leaf blade lanceolate or lanceolate-oblong,  
 12–29 × 4.5–10.5 cm, abaxially pubescent along principal veins ..... 16. *T. wangii*  
 17b. Corolla tube glabrous outside; leaf blade narrowly elliptic, obovate, lanceolate,  
 or oblong-obovate, 6–16 × 1.5–7 cm, abaxially subglabrous to scabrous,  
 puberulent, or strigillose on blade and veins.  
 18a. Ovary with ovules 5 or 6 per cell; pedicels rather slender, 5–10 mm; fruit  
 ellipsoid; leaf blade abaxially sparsely strigillose ..... 6. *T. gracilipes*  
 18b. Ovary with ovules 2 per cell; pedicels rather thick, 4–7 mm; fruit subglobose;  
 leaf blade scattered subpapillose-pubescent, scabrous, or subglabrous ..... 15. *T. tsangii*

**1. *Tarenna acutisepala*** F. C. How ex W. C. Chen, Acta Phytotax. Sin. 24: 477. 1986.

尖萼乌口树 *jian e wu kou shu*

Shrubs, 1–2.5 m tall; branches hispidulous or hirtellous becoming glabrescent, gray to reddish brown. Petiole 5–22 mm, hispidulous; leaf blade drying papery or subleathery, elliptic-oblong, lanceolate, oblong-ovate, or subovate, 4–19.5 × 1.5–5.6 cm, adaxially glabrous or sometimes sparsely puberulent along midrib or sparsely strigillose throughout, abaxially strigillose to hirtellous or sometimes glabrous, base cuneate, obtuse, or acute, apex acuminate or acute; secondary veins 5–7 pairs; stipules persistent, shortly united around stem, triangular, narrowly triangular, or lanceolate, 4–7 mm, hispidulous to glabrescent, acute. Inflorescence corymbiform to congested-cymose, 2.5–3 × 3–4 cm, several to many flowered, strigillose, pedunculate; peduncle 0.5–1 cm; bracts lanceolate to triangular, 1.5–2 mm; pedicels 0.5–3 mm. Flowers subsessile to pedicellate. Calyx strigillose; hypanthium portion ellipsoid to ovoid, 1–1.5 mm; limb 1.5–2 mm, deeply lobed; lobes triangular-lanceolate, apex acute. Corolla pale yellow, glabrous outside; tube ca. 10 mm, villosulous inside upper part and throat; lobes narrowly elliptic, ca. 4 mm. Ovules 16–20 per cell. Berries subglobose, 5–7 mm in diam., strigillose or glabrous; seeds 9–31. Fl. Apr–Sep, fr. May–Nov.

• Forests or thickets at streamsides in valleys or on mountain slopes; 500–1600 m. Fujian, Guangdong, Guangxi, Hubei, Hunan, Jiangsu, Jiangxi, Sichuan.

**2. *Tarenna attenuata*** (J. D. Hooker) Hutchinson in Sargent, Pl. Wilson. 3: 411. 1916.

假桂乌口树 *jia gui wu kou shu*

*Webera attenuata* J. D. Hooker, Fl. Brit. India 3: 104. 1880;  
*Ixora attenuata* (J. D. Hooker) Kuntze; *Tarenna sylvestris* Hutchinson.

Shrubs or trees, 1–8 m tall; branches glabrous, flattened, becoming ash gray to brown with age. Petiole 0.5–1.5 cm, glabrous; leaf blade drying papery or thinly leathery, blackish brown, and somewhat shiny adaxially, oblong-lanceolate, ob-

long-obovate, lanceolate, or obovate, 4.5–15 × 1.5–6 cm, both surfaces glabrous, base cuneate or acute, margins sometimes thinly revolute, apex acuminate or abruptly shortly acuminate; secondary veins 5–10 pairs, sometimes with pilosulous domatia; stipules persistent, shortly united around stem, narrowly triangular, 4–9 mm, glabrous, acuminate to cuspidate. Inflorescences congested-cymose, pyramidal to corymbiform, 2.5–5 × 4–6 cm, many flowered, puberulent to glabrescent, pedunculate; peduncle 0.3–1 cm; bracts narrowly triangular to subulate, 1–5 mm, acute; pedicels 0.5–5 mm. Flowers subsessile to pedicellate in dichotomous cymules. Calyx glabrous; hypanthium portion subglobose to ellipsoid, 1.5–2 mm; limb 1–2 mm, lobed for 1/4–1/2; lobes triangular, acute. Corolla white or pale yellow, outside glabrous; tube 2–2.5 mm, villosulous at throat; lobes narrowly oblong to spatulate, 5–8 mm, acute to obtuse. Ovules 1 per cell. Berries subglobose, 5–7 mm in diam., glabrous; seeds 2. Fl. Apr–Nov, fr. May–Jan.

Forests or thickets at streamsides, on hills or mountains, or in fields; near sea level to 1200 m. Guangdong, Guangxi, Hainan, Yunnan [Cambodia, India, Thailand, Vietnam].

**3. *Tarenna austrosinensis*** Chun & F. C. How ex W. C. Chen, Acta Phytotax. Sin. 22: 145. 1984.

华南乌口树 *hua nan wu kou shu*

Shrubs, ca. 2 m tall; branches terete to flattened, glabrous, becoming pale gray. Petiole 5–15 mm, glabrous; leaf blade drying papery or membranous, blackish brown, elliptic-oblong or oblong-lanceolate, 5–15 × 2–4.5 cm, glabrous on both surfaces or puberulent to strigillose abaxially, base cuneate to acute, apex acuminate; secondary veins 6 or 7 pairs, without domatia; stipules generally deciduous leaving truncate persistent base, ovate to triangular, 3–5 mm, glabrous, acuminate. Inflorescences corymbiform to cymose, ca. 3 cm, few flowered, strigillose; peduncle 4–5 mm; bracts linear to triangular, 1–3 mm, acute; pedicels 3–7 mm. Flowers pedicellate. Calyx with hypanthium portion cupular to ellipsoid, 1–1.5 mm, sparsely puberulent to hispidulous; limb 2–3 mm, glabrous, lobed for ca. 1/2; lobes triangular, apex acute. Corolla pale green, outside glabrous; tube ca. 7 mm, villosulous inside and at throat; lobes

ovate, 3–4 mm, apex acute. Ovules 6–9 per cell. Berries globose, 5–6 mm in diam.; seeds 6–14. Fl. Apr–May, fr. Aug–Sep.

• Forests on mountains; 800–1300 m. Guangdong (Xinyi), Guangxi (Jinxu), Hunan (Yizhang).

**4. *Tarenna depauperata*** Hutchinson in Sargent, Pl. Wilson. 3: 411. 1916.

白皮乌口树 bai pi wu kou shu

Shrubs or small trees, 1–6 m tall; branches glabrous, blackened becoming yellowish white or grayish white with age. Petiole 4–18 mm, glabrous; leaf blade drying papery or leathery, dark brown or sometimes yellowish brown abaxially, and somewhat shiny adaxially, elliptic-obovate, elliptic, or subovate, 4–15 × 2–6.5 cm, both surfaces glabrous, base cuneate or acute, apex shortly acuminate often abruptly acuminate with tip often slightly obtuse; secondary veins 5–11 pairs, without domatia; stipules deciduous usually through fragmentation, shortly united around stem, triangular-ovate, 1.5–3 mm, glabrous, resinous, acute. Inflorescences corymbiform to pyramidal, 2.5–3 × 3–5 cm, few to many flowered, puberulent, hirtellous, or glabrescent, subsessile to pedunculate; peduncle to 1 cm; bracts triangular, 0.3–1.5 mm; pedicels 0–3 mm. Flowers mixed sessile and pedicellate (or perhaps borne on expanded axes) in dichotomous cymes. Calyx glabrous, puberulent, or pilosulous; hypanthium portion cupuliform to ellipsoid, ca. 1 mm; limb ca. 1 mm, lobed for 1/2–3/4; lobes ovate or triangular, ciliolate, acute to rounded. Corolla white, outside glabrous; tube 3–4 mm, villous inside and at throat; lobes narrowly oblong to spatulate, ca. 5 mm, acute to obtuse. Ovules 1–3 per cell. Berries globose, 6–8 mm in diam., shiny, glabrescent; seeds 1 or 2. Fl. Apr–Nov, fr. Apr–Jan.

Forests or thickets at streamsides, on hills, or on mountain slopes; 200–1700 m. Guangdong, Guangxi, Guizhou, Jiangsu, Yunnan [Vietnam].

**5. *Tarenna foonchewii*** (W. C. Ko) Tao Chen, *comb. nov.*

宽昭龙船花 kuan zhao long chuan hua

Basionym: *Ixora foonchewii* W. C. Ko, *Guihaia* 19: 102. 1999.

Small trees, to 3 m tall; branches glabrous. Petiole 12–17 mm, glabrous; leaf blade drying papery and olive-brown, elliptic, 15–18 × 5–9 cm, glabrous, base obtuse, apex cuspidate or shortly acuminate; secondary veins 12 or 13 pairs; stipules persistent, broadly triangular, 12–14 mm, glabrous, long acuminate to aristate. Inflorescence cymose, ca. 7 × 5.5 cm, many flowered; peduncle ca. 3 cm, sometimes subtended by or bearing reduced leaves or leaflike bracts; bracts linear, 3–4 mm; pedicels ca. 1 mm. Flowers pedicellate. Calyx glabrous; hypanthium cupuliform, ca. 2 mm; limb deeply lobed; lobes triangular, ca. 1 mm. Corolla outside glabrous; tube ca. 13 mm; lobes narrowly ligulate to narrowly elliptic, ca. 5 × 3 mm, obtuse. Fruit unknown. Fl. Apr.

• Roadsides. Yunnan.

Based on the description of this species as having 5 corolla lobes, fully exerted anthers, and subcapitate stigmas, as well as its general aspect, this species seems better placed in *Tarenna* than *Ixora*. The proto-

logue did not describe the number of ovules per ovary locule, which is not a significant character in *Ixora* and probably thus was not checked.

**6. *Tarenna gracilipes*** (Hayata) Ohwi, *Repert. Spec. Nov. Regni Veg.* 36: 57. 1934.

薄叶玉心花 bao ye yu xin hua

*Chomelia gracilipes* Hayata, *Icon. Pl. Formosan.* 9: 57. 1920; *C. lancifolia* Hayata; *Tarenna hayataiana* Kanehira; *T. lancifolia* (Hayata) Kanehira & Sasaki.

Shrubs, to 3 m tall; branches slender, strigillose becoming glabrescent and brown with age. Petiole 0.5–1.5 cm, strigillose; leaf blade drying papery, obovate, lanceolate, or narrowly elliptic, 6.5–15 × 2–4.5 cm, glabrous adaxially, sparsely strigillose abaxially at least along veins, base cuneate to acute, apex acute to acuminate; secondary veins 6 or 7 pairs, without domatia; stipules persistent, shortly united around stem, triangular, 1.5–3 mm, strigillose to glabrescent, acute to cuspidate. Inflorescences corymbose, 3–6 × 3–10 cm, trichotomous, strigillose, subsessile to pedunculate; peduncle to 1 cm; bracts narrowly triangular, 0.2–2 mm, acute; pedicels slender, 5–10 mm. Flowers pedicellate. Calyx glabrous to strigillose; hypanthium portion ellipsoid, 1–1.5 mm; limb 1–1.5 mm, lobed for 1/4–1/2; lobes broadly triangular, acute. Corolla white, glabrous outside; tube 4–6 mm, villous at throat; lobes narrowly spatulate-oblong, 9–10 mm, obtuse. Ovules 5 or 6 per cell. Berries ellipsoid, 5–8 mm in diam., glabrous. Fl. May, Jul, fr. Dec.

Forests on mountains; 100–500 m. Taiwan [Japan].

The specimens studied are from the elevations given; W. C. Chen (in *FRPS* 71(1): 378. 1999) gave the elevational range of this species as up to 2500 m.

**7. *Tarenna lanceolata*** Chun & F. C. How ex W. C. Chen, *Acta Phytotax. Sin.* 22: 139. 1984.

广西乌口树 guang xi wu kou shu

Shrubs, 0.5–3 m tall; branches densely strigillose becoming glabrescent, often brownish red. Petiole 0.3–1.8 cm, densely strigillose; leaf blade drying papery, lanceolate to oblanceolate, 5–32.5 × 1–5 cm, adaxially sparsely scabrous or strigillose on lamina and densely strigillose on principal veins, abaxially strigillose to pilosulous with pubescence denser on principal veins, base acute or cuneate, apex long acuminate; secondary veins 7–10 pairs, apparently without domatia; stipules generally persistent becoming brown and hardened, partially fused around stem, lanceolate to triangular or ovate, 3–4 mm, strigillose or glabrescent on margins, acute to cuspidate. Inflorescences corymbiform and often nodding, ca. 2 × 3 cm, several to many flowered, densely strigillose, sessile or pedunculate; peduncle to 5 mm; bracts linear to narrowly lanceolate, 2–10 mm; pedicels 1–3 mm. Flowers pedicellate. Calyx in bud with hypanthium portion ellipsoid to ovoid, 1.5–2 mm, densely pilosulous to puberulent; limb lobed nearly to base, densely strigillose; lobes linear to narrowly lanceolate, 3–5 mm, sometimes unequal on an individual flower. Corolla in bud densely strigillose outside. Berries subglobose, 3–6 mm in diam., puberulent, strigillose, or glabrescent; seeds 8–32. Fl. buds Oct, fr. May–Nov.

● Forests or thickets in valleys; 700–1600 m. Guangxi, Guizhou, Hunan (Dongkou).

W. C. Chen (in FRPS 71(1): 372. 1999) described the stipules as 6–10 mm, but the specimens studied (including several paratypes) all have stipules 3–4 mm.

**8. *Tarenna lancilimba*** W. C. Chen, Acta Phytotax. Sin. 22: 141. 1984.

披针叶乌口树 *pi zhen ye wu kou shu*

*Tarenna attenuata* (Voigt) Hutchinson var. *puberula* Chun & F. C. How ex W. C. Ko, Fl. Hainan. 3: 584. 1974.

Shrubs or trees, 2–10(–15) m tall; branches slightly compressed, glabrous or mealy pubescent, becoming brown with age. Petiole 0.8–2 cm, glabrous; leaf blade drying thinly leathery, dark brown or yellowish abaxially, lanceolate, elliptic, or obovate-oblong, 5–15 × 1.5–5 cm, both surfaces glabrous, base cuneate then shortly decurrent, apex shortly acuminate; secondary veins 3–5 pairs, without domatia; stipules generally persistent, shortly united around stem, triangular, 1.5–3 mm, glabrous, acute to cuspidate. Inflorescence corymbose, trichotomous, 4–9 × 4–9 cm, many flowered, subglabrous or mealy pubescent, subsessile; bracts triangular, 0.5–1.5 mm, ciliate; pedicels 3–6 mm. Flowers pedicellate. Calyx glabrous or puberulent; hypanthium portion cupuliform, 1–1.5 mm; limb 1–1.5 mm, lobed for ca. 1/2; lobes triangular to spatulate, ciliate. Corolla white, outside glabrous, sparsely to densely villous at throat and onto lobes; tube 5–7 mm; lobes ligulate-linear, 5–6 mm, obtuse. Ovules 2 per cell. Berry globose, 5–6 mm in diam., glabrescent; seeds 2–4. Fl. Apr–Jun, fr. Jun–Jan.

Forests or thickets on hills; 100–1000 m. Guangxi (Shangsi), Hainan [Vietnam].

**9. *Tarenna laticorymbosa*** Chun & F. C. How ex W. C. Chen, Acta Phytotax. Sin. 22: 141. 1984.

宽序乌口树 *kuan xu wu kou shu*

Shrubs, height not noted; branches glabrous. Petiole 2.5–3.5 cm, glabrous; leaf blade drying membranous or papery and grayish black, elliptic-oblong or obovate-oblong, 18.5–25 × 6–10 cm, glabrous on both surfaces, base cuneate, apex acuminate or obtuse then mucronate; secondary veins 8–13 pairs; stipules ovate-triangular, glabrous. Inflorescence corymbose with axes spreading, ca. 15 × 20 cm, subglabrous or puberulent; pedicels 3–8 mm. Flowers pedicellate. Calyx mealy puberulent; hypanthium portion obconical; limb denticulate. Corolla glabrous outside, pilosulous in throat and onto bases of lobes; tube ca. 6.5 mm; lobes narrowly linear-oblong, ca. 7 mm, rounded. Ovules 4 per cell. Fruit unknown. Fl. May.

● Yunnan (Hekou).

**10. *Tarenna laui*** Merrill, Lingnan Sci. J. 14: 59. 1935.

崖州乌口树 *ya zhou wu kou shu*

Shrubs, 2–3 m tall; branches densely grayish yellow hispidulous or strigillose becoming glabrescent with age. Petiole 6–23 mm, densely strigillose; leaf blade drying papery and dark yellowish brown or blackish brown, oblong-elliptic or oblong-

lanceolate, 5–15 × 1.5–6 cm, sparsely hispidulous to strigillose adaxially, sparsely to densely hispidulous or strigillose abaxially, base cuneate or acute, apex acuminate; secondary veins 6–8 pairs; stipules generally persistent, shortly united around stem, broadly triangular, 1.5–3, densely strigillose, acute. Inflorescences cymose to corymbose and somewhat lax, 6–10 cm, densely grayish yellow strigillose, pedunculate; peduncle ca. 1 cm; bracts triangular, 1–3 mm; pedicels 2–13 mm. Flowers pedicellate. Calyx densely strigillose; hypanthium portion cylindrical, ellipsoid, or urceolate, 2–2.5 mm; limb 1–2 mm, lobed for ca. 1/2; lobes ovate-triangular to triangular, apex acute. Corolla white, outside densely strigillose; tube 5–7 mm, villous in throat; lobes narrowly lanceolate to spatulate, 11–12 mm, acute to obtuse. Ovules ca. 15 per cell. Berry subglobose, 5–6 mm in diam., strigillose. Fl. May–Jul, fr. Jul–Feb.

● Forests on mountains; ca. 700 m. Hainan (Sanya).

**11. *Tarenna mollissima*** (Hooker & Arnott) B. L. Robinson, Proc. Amer. Acad. Arts 45: 405. 1910.

白花苦灯笼 *bai hua ku deng long*

*Cupia mollissima* Hooker & Arnott, Bot. Beechey Voy. 192. 1833; *Mussaenda kuliangensis* F. P. Metcalf; *Stylocoryna mollissima* (Hooker & Arnott) Walpers; *Tarenna incana* Diels.

Shrubs or small trees, 1–6 m tall; branches densely gray or brown pilosulous or tomentulose, becoming glabrescent when old. Petiole 0.4–2.5 cm, densely pilosulous or tomentulose; leaf blade drying papery and blackish brown, lanceolate, oblong-lanceolate, or ovate-elliptic, 4.5–22.5 × 1–10 cm, adaxially moderately to densely hispidulous to pilosulous, abaxially densely pilosulous, tomentulose, or villosulous, base cuneate, acute, or obtuse, apex acuminate or long acuminate; secondary veins 5–12 pairs, apparently without domatia; stipules generally persistent, interpetiolar or shortly united around stem, ovate to triangular, 5–8 mm, densely strigillose to pilosulous, acute to cuspidate. Inflorescences corymbose, 4–8 cm, many flowered, densely pilosulous to tomentulose, sessile and subtended by a pair of somewhat reduced leaves; bracts linear, 1–3 mm; pedicels 3–6 mm. Flowers pedicellate. Calyx densely tomentulose to pilosulous; hypanthium portion ellipsoid to subglobose, 1.5–2 mm; limb 1–1.8 mm, lobed shallowly to deeply; lobes triangular to spatulate, rounded to acute. Corolla white, outside densely strigillose to hirtellous; tube 3–4 mm, densely villous at throat; lobes narrowly oblong, 4–5 mm, obtuse to rounded. Ovules ca. 15 per cell. Berry subglobose, 5–7 mm in diam., pilosulous, villosulous, or sometimes glabrescent; seeds 7–30. Fl. May–Jul, fr. May–Jan.

Forests or thickets at streamsides, on hills, or on mountains; 200–1100 m. Fujian, Guangdong, Guangxi, Guizhou, Hainan, Hunan, Jiangxi, Yunnan, Zhejiang [Vietnam].

W. C. Chen (in FRPS 71(1): 377. 1999) described the corollas as ca. 1.2 cm, but this length has not been seen on the numerous specimens studied.

**12. *Tarenna polysperma*** Chun & F. C. How ex W. C. Chen, Acta Phytotax. Sin. 22: 144. 1984.

多籽乌口树 *duo zi wu kou shu*

Shrubs or trees, 1.5–14 m tall; branches slightly compressed, glabrous, becoming brown when old. Petiole 5–15 mm, glabrous; leaf blade drying leathery and olive-greenish brown, oblong-lanceolate or elliptic, 5–10.5 × 1.5–3.8 cm, glabrous on both surfaces, base cuneate, apex shortly acuminate or abruptly acute; secondary veins 7–9 pairs, without domatia; stipules deciduous usually through fragmentation often leaving a persistent truncate base, interpetiolar, triangular to narrowly triangular, 3–4 mm, glabrous, acute. Inflorescences corymbose and trichotomous, 3–5 × 4–6 cm, 6–10-flowered, puberulent to glabrescent, subsessile to pedunculate; peduncle to 1 cm; bracts filiform, 1–2 mm, ciliate; pedicel 3.5–6.5 mm. Flowers pedicellate. Calyx glabrous; hypanthium portion turbinate, ca. 1 mm; limb 1–1.5 mm, lobed for ca. 1/2; lobes broadly triangular. Corolla white, glabrous outside; tube ca. 8 mm, villous at throat; lobes ovate to elliptic, ca. 4.5 mm, obtuse. Ovules ca. 17 per cell. Berry globose, ca. 7 mm in diam., glabrous; seeds 14–27. Fl. Mar–Apr, fr. May–Oct.

• Forests on mountains; 900–1000 m. Guangdong.

The protologue and W. C. Chen in FRPS (71(1): 382. 1999) described the secondary leaf veins as 7–9 pairs, but the paratypes seen all have 5 or 6 pairs, which has complicated herbarium identifications of this species.

**13. *Tarenna pubinervis*** Hutchinson in Sargent, Pl. Wilson. 3: 411. 1916.

滇南乌口树 dian nan wu kou shu

Shrubs or small trees, 0.5–6 m tall; branches puberulent to pilosulous, becoming gray with age. Petiole 5–25 mm, strigillose to hirtellous; leaf blade drying papery or membranous, blackish brown, oblong-elliptic, oblong-lanceolate, lanceolate, or oblanceolate, 6–22 × 2–7.8 cm, strigillose to hirtellous on both surfaces with pubescence denser on principal veins, base acute to attenuate, apex caudate-acuminate or acuminate; secondary veins 7–10 pairs, apparently without domatia; stipules generally persistent and becoming yellowed and hardened, interpetiolar or shortly united around stem, triangular to ovate, 3–9 mm, pilosulous to strigillose becoming glabrescent, long acuminate to aristate or cuspidate. Inflorescences cymose, ca. 3 × 3.5 cm, few flowered, densely strigillose, subsessile; bracts linear, 1.5–2 mm; pedicels 1–2.5 mm. Flowers pedicellate. Calyx glabrous or sparsely pubescent; hypanthium portion obconic, 1–1.5 mm; limb lobed for ca. 1/2; lobes lanceolate, 1–1.75 mm, ciliate. Corolla pale green, glabrous outside; tube 4–5 mm, villosulous inside; lobes narrowly oblong, 5–6 mm, obtuse. Ovules ca. 3 per cell. Berry subglobose to ellipsoid, 5–10 mm in diam., puberulent to glabrescent; seeds 1–6. Fl. Mar–May, fr. Jun–Jan.

• Forests in valleys; 700–2700 m. Guangxi, Sichuan, Yunnan.

**14. *Tarenna sinica*** W. C. Chen, Acta Phytotax. Sin. 22: 146. 1984.

长梗乌口树 chang geng wu kou shu

Shrubs, ca. 1.5 m tall; branches hispid. Petiole 0.5–1.5 cm, hispid; leaf blade drying papery and blackish brown, narrowly elliptic or elliptic-lanceolate, 6–12 × 2–4 cm, both surfaces

sparsely strigose except densely hispid-hirsute along principal lateral veins, base cuneate, apex acuminate; secondary veins 6–8 pairs; stipules persistent becoming hardened and straw-yellow, subtriangular, ca. 2 mm, hispidulous, acute. Inflorescences corymbiform, ca. 5 cm, few flowered, hispidulous, pedunculate; peduncle 0.5–0.7 cm; bracts lanceolate, ca. 2 mm; pedicels 18–30 mm. Flowers pedicellate. Calyx hispidulous; hypanthium portion ellipsoid, ca. 1.5 mm; limb lobed for ca. 1/2; lobes triangular, ca. 0.7 mm, acute. Corolla white, ca. 12 mm, hispidulous outside; tube densely villosulous inside and at throat; lobes linear-lanceolate, longer than corolla tube. Ovules 1 per cell. Berry unknown. Fl. Jun.

• Forests on mountain slopes. Guangxi (Jingxi).

**15. *Tarenna tsangii*** Merrill, Lingnan Sci. J. 11: 59. 1932.

海南乌口树 hai nan wu kou shu

*Tarenna tsangii* f. *elliptica* Chun & F. C. How ex W. C. Ko.

Shrubs or trees, 1–6 m tall; branches flattened, shortly pilosulous, becoming brown or grayish brown with age. Petiole 5–15 mm, pilosulous; leaf blade drying papery and blackish brown, oblong-obovate or lanceolate, 5–26 × 1.5–7 cm, adaxially glabrous, abaxially scabrous and sparsely puberulent to subglabrous with pubescence denser along principal veins, base cuneate, apex acuminate or shortly acuminate; secondary veins 4–7 pairs; stipules triangular, 4–5 mm, acuminate or apiculate. Inflorescence corymbose, 4–7 × ca. 6 cm, many flowered, gray strigillose, pedunculate; pedicels 4–7 mm. Flowers pedicellate. Calyx pilosulous; hypanthium portion cylindrical-urceolate, ca. 1.5 mm; limb ca. 1.5 mm, lobed for up to 1/3. Corolla white, glabrous outside; tube 8–9 mm, pilosulous inside; lobes narrowly oblong, ca. 10 mm. Ovary with 2 ovules per cell. Berry subglobose, 5–7 mm in diam., glabrous; seeds 4. Fl. May–Jul, fr. Jul–Jan.

• Forests on hills; 100–800 m. Guangdong (Maoming), S Guangxi, Hainan.

Plants from Hainan (Lingshui) with leaf blade elliptic or ovate-elliptic and 5–8 × 3–6 cm that fruit in Dec were described as *Tarenna tsangii* f. *elliptica*. These features, however, do not clearly distinguish the two groups of plants in Hainan, so this name is here synonymized.

**16. *Tarenna wangii*** Chun & F. C. How ex W. C. Chen, Acta Phytotax. Sin. 22: 143. 1984.

长叶乌口树 chang ye wu kou shu

Shrubs, 2–5 m tall; branches gray, glabrous. Petiole 1–3 cm, subglabrous or puberulent; leaf blade drying papery or membranous and brownish black, lanceolate or lanceolate-oblong, 12–29 × 4.5–10.5 cm, glabrous on both surfaces or abaxially strigillose along principal veins, base attenuate, apex acuminate or shortly acuminate; secondary veins 9–11 pairs; stipules ovate-triangular, 3–4 mm. Inflorescences corymbose, ca. 5 × 5 cm, strigillose; pedicels 3–4 mm. Flowers pedicellate. Calyx pilosulous; hypanthium portion obconical; limb subtruncate or denticulate. Corolla white, villous inside and onto lobes; tube ca. 5 mm; lobes linear-oblong. Ovules 4 per cell. Berry subglobose, 8–10 mm in diam.; seeds 2 or 3. Fl. Jun, fr. Aug–Nov.

- Forests on hills; 900–1000 m. Yunnan.

**17. *Tarenna yunnanensis*** F. C. How ex W. C. Chen, *Acta Phytotax. Sin.* 22: 142. 1984.

云南乌口树 *yun nan wu kou shu*

Shrubs or trees, to 3 m tall; branches densely yellowish brown villosulous to tomentulose. Petiole 0.5–2.3 cm, densely villosulous to tomentulose; leaf blade drying papery, elliptic, obovate, elliptic-oblong, or oblanceolate-oblong, 11–32 × 3.5–12 cm, adaxially subglabrous or sparsely hispidulous with pubescence denser along principal veins, abaxially densely villosulous to pilosulous, base cuneate, obtuse, or acute, apex abruptly shortly acuminate; secondary veins 8–12 pairs, apparently without domatia; stipules generally persistent, shortly united around stem, broadly triangular, 2.5–4 mm, densely villosulous, acute to cuspidate. Inflorescences cymose to corymbiform, 4–9 × 4–7 cm, many flowered, densely pilosulous, pedunculate; peduncle 1–3.5 cm; bracts linear to narrowly triangular, 1–4 mm; pedicels 2–9 mm. Flowers pedicellate. Calyx densely pilosulous; hypanthium portion cupulate, ca. 1 mm; limb 1–1.5 mm, lobed shallowly or for up to 1/2; lobes triangular. Corolla outside moderately to densely yellowish brown villosulous to pilosulous; tube 5–6.5 mm, sparsely pilosulous at throat; lobes narrowly oblong to spatulate, 4–4.5 mm, obtuse. Ovules 3–5 per cell. Berry subglobose, ca. 5 mm in diam., yellowish brown villous. Fl. Apr–Jun, fr. Jun.

- Forests or thickets in valleys or at streamsides; 100–200 m. Yunnan.

**18. *Tarenna zeylanica*** Gaertner, *Fruct. Sem. Pl.* 1: 139. 1788.

锡兰玉心花 *xi lan yu xin hua*

*Chomelia kotoensis* Hayata; *Tarenna kotoensis* (Hayata) Masamune.

Shrubs, evergreen, to 2.5 m tall; branches glabrous, compressed to subquadrangular, green sometimes turning brown. Petiole 1–2.5 cm, glabrous; leaf blade drying papery, oblong-ovate to oblong-obovate, elliptic, or elliptic-oblong, 13–22 × 5–12 cm, glabrous on both surfaces, base cuneate to obtuse, apex shortly cuspidate or acute; secondary veins 7 or 8 pairs, with pilosulous domatia; stipules generally deciduous through fragmentation often leaving persistent base, shortly united around stem, triangular, 3–11 mm, glabrous, acute to acuminate. Inflorescences corymbiform to broadly pyramidal, 4–10 × 6–15 cm, many flowered, glabrous, subsessile to pedunculate; peduncle to 1 cm; bracts linear to narrowly triangular, 1–3 mm, acute; pedicels 3–8 mm. Flowers pedicellate. Calyx glabrous; hypanthium portion ellipsoid to cupular, 1–1.5 mm; limb 1–1.5 mm, lobed for ca. 1/2; lobes triangular. Corolla white, glabrous outside; tube ca. 5 mm, villous in throat; lobes narrowly oblong to spatulate, 7–12 mm, obtuse. Ovules 2 per cell. Berry globose, ca. 10 mm in diam., glabrous; seeds 2–4. Fl. Feb, Apr, fr. Sep, Dec.

Forests; below 100–600 m. Taiwan [Japan, Sri Lanka].

W. C. Chen (in FRPS 71(1): 373. 1999) described the petioles as up to 5 cm, but no petioles at all similar to this have been seen on specimens studied.

## 90. TARENNOIDEA Tirvengadam & Sastre, *Mauritius Inst. Bull.* 8(4): 90. 1979.

岭罗脉属 *ling luo mai shu*

Chen Tao (陈涛); Charlotte M. Taylor

Trees, unarmed. Raphides absent. Leaves opposite, usually with domatia; stipules caducous, interpetiolar or shortly united around stem, triangular to ovate. Inflorescences terminal or sometimes pseudoaxillary or appearing leaf-opposed due to anisophyly with 1 leaf caducous at subtending node, compound-cymose, several to many flowered, pedunculate or sessile and tripartite, bracteate. Flowers pedicellate, bisexual, monomorphic. Calyx limb campanulate, truncate to 5-dentate. Corolla yellow to white, salverform, inside villosulous in throat; lobes 5, convolute in bud, reflexed at anthesis. Stamens 5, inserted in corolla throat, exserted; filaments short; anthers dorsifixed. Ovary 2-celled, ovules 1 or usually 2–6 in each cell on axile placentas; stigma fusiform to cylindrical, exserted. Fruit black, baccate, subglobose, leathery or fleshy, with calyx limb deciduous; seeds 2–8, medium-sized, ellipsoid to subglobose.

Two species: S and SE Asia; one species in China.

**1. *Tarennoidea wallichii*** (J. D. Hooker) Tirvengadam & Sastre, *Mauritius Inst. Bull.* 8(4): 90. 1979.

岭罗麦 *ling luo mai*

*Randia wallichii* J. D. Hooker, *Fl. Brit. India* 3: 113. 1880; *Aidia wallichii* (J. D. Hooker) T. Yamazaki; *Tarenna incerta* Koorders & Valetton; *T. pallida* (Franchet ex Brandis) Hutchinson; *Webera cavaleriei* H. Léveillé; *W. pallida* Franchet ex Brandis.

Trees, 3–20 m tall; branches rather stout, compressed to angled, glabrous, with thin epidermis wrinkled and cracked, coppery brown to reddish purple-brown, deciduous leaving

stems wrinkled to smooth. Petiole 1–3 cm, glabrous; leaf blade drying leathery and often paler below, elliptic-oblong, oblanceolate-oblong, or elliptic-lanceolate, 7–30 × 2.9–9 cm, adaxially shiny and glabrous, abaxially puberulent to glabrous, base cuneate to acute, margins often thinly revolute, apex obtuse to acuminate with tip often ultimately obtuse; secondary veins 5–13 pairs, in abaxial axils with foveolate and/or pilosulous domatia; stipules 4–10 mm, glabrous, acute to acuminate. Inflorescences 4–12 × 8–13 cm, densely hirtellous or pilosulous to tomentulose; bracts lanceolate to spatulate, 1–3 mm, acute to rounded; pedicels 1–5 mm. Calyx with ovary portion obconic, ca. 1 mm, densely puberulent to tomentulose; limb 1–2.5 mm, puberulent or tomentulose to glabrescent, with lobes linear to

narrowly triangular, 0.5–0.7 mm, acute. Corolla yellow or white, outside glabrous [to sericeous], inside pilosulous in throat with pubescence sometimes extending onto lobes; tube 3–4 × ca. 1.5 mm; lobes spatulate-oblong, 3–4 mm, obtuse to rounded. Fruiting pedicels to 10 mm. Berry ovoid to subglobose, 7–18 mm in diam., glabrous; seeds ca. 5 mm. Fl. Mar–Jun, fr. Jul–Feb.

Forests or thickets at streamsides in valleys or on hills or mountains; 400–2200 m. Guangdong, Guangxi, Guizhou, Hainan, Yunnan

[Bangladesh, Bhutan, Cambodia, India, Indonesia, Malaysia, Myanmar, Nepal, Philippines, Thailand, Vietnam].

Puff et al. (Rubiaceae of Thailand, 70. 2005) noted that the growth form or architecture of this species is strongly sympodial: “approached a Terminalian branching pattern.” The flowers on our specimens appear to be strongly dichogamous, with the anthers fully developed and apparently dehiscent while the stigmas are still enclosed in the corolla tube; then after the anthers have released all their pollen the styles apparently elongate and the stigmas become fully exerted from the corolla.

## 91. *THELIGONUM* Linnaeus, Sp. Pl. 2: 993. 1753.

假繁缕属 *jia fan lü shu*

Chen Jiarui (陈家瑞 *Chen Chia-jui*); A. Michele Funston

*Cynocrambe* Gagnebin.

Herbs, annual or perennial, monoecious. Stems somewhat succulent. Raphides present. Leaves petiolate, somewhat succulent, lower ones opposite, upper ones apparently alternate due to anisophylly, entire; stipules interpetiolar, membranous, united at base to petioles. Flowers unisexual, rarely bisexual, axillary in upper nodes, small 1–3 flowered cymes, bracts reduced. Staminate flowers sessile; calyx limb reduced; perianth (equivalent to corolla) deeply lobed, lobes 2–5, valvate, spreading or reflexed at anthesis, 3–5 parallel nerves; stamens (2–)6–30, sometimes united basally in groups, anthers linear, dorsifixed at anthesis, free slender filaments, pistillode reduced. Pistillate flowers subsessile; calyx limb reduced; perianth (equivalent to corolla) tubular, oblique, upper part an elongate constricted mouth, 2–4 denticulate-lobed; staminodes reduced; ovary 1-celled; style simple, exerted; ovule solitary, basal. Fruit a nutlike drupe, compressed; seed U-shaped; endosperm fleshy.

Four species: E Asia, Atlantic Ocean islands, Mediterranean region; three species (two endemic) in China.

Traditionally, Theligonaceae have been treated as a monogeneric family of controversial relationship: Rubiales (Cronquist), Myrtales (Engler), Caryophyllales (Dalla Torre & Harms). However, recent reliable molecular data place it within a highly derived group of Rubiaceae (along with *Galium*, *Hedyotis*, and *Rubia*; Pl. Syst. Evol. 225: 43–75. 2000).

台湾假繁缕 *tai wan jia fan lü*

*Cynocrambe formosana* Ohwi, Acta Phytotax. Geobot. 2: 157. 1933.

Herbs, perennial, small, becoming black when dry. Stem erect, 10–15 cm, branched from base, creeping below, somewhat hairy. Leaf blade broadly ovate, 1.2–2 × 1–1.5 cm, pilose adaxially, puberulent on veins abaxially, base subcordate, subtruncate, or rounded, decurrent to petiole, apex acute; petiole 0.5–1.2 cm; stipules membranous, connate, deltoid-ovate, 2–3 mm, ciliate. Flowers white, unisexual. Staminate flowers: perianth membranous, 3-parted, lobes oblanceolate, 2.5–3 mm, obtuse, reflexed, 3–5-veined; stamens 5–7. Pistillate flowers smaller; perianth 2-lobed, lobes obtuse. Fruit obliquely obovoid, ca. 4 mm, hairy. Fl. Mar–Jul, fr. Jun–Aug.

• Wet places in forests and along mountain trails; ca. 2700 m. Taiwan (Pingdong).

**2. *Theligonum japonicum*** Ôkubo & Makino, Bot. Mag. (Tokyo) 3: 5 [5]. 1889.

日本假繁缕 *ri ben jia fan lü*

*Cynocrambe japonica* (Ôkubo & Makino) Makino.

Herbs, perennial, fetid. Stem erect or ascending, 15–36 cm, branched often from base, creeping below, pubescent above. Leaf blade ovate or elliptic, 0.7–3 × 1–1.5 cm, pubescent on both surfaces, base rounded or broadly cuneate, apex acute, lateral veins 3 each side; petiole 0.3–1.5 cm; stipules membranous, connate, ovate or deltoid-ovate, 2–3 mm, ciliate. Flowers unisexual. Staminate flowers: perianth membranous, 3-parted, lobes oblanceolate, 2.5–3 mm, obtuse, reflexed, 3–5-veined; stamens 20–25 or 16–20, pendulous. Pistillate flowers: minute; perianth 3- or 4-toothed. Fruit obliquely ovoid, ca. 5 mm, hairy. Fl. Mar–Jun, fr. Jun–Aug.

Wet places in valleys, by streams; 900–1200 m. Anhui, Shaanxi, Zhejiang [Japan].

**3. *Theligonum macranthum*** Franchet, Nouv. Arch. Mus. Hist. Nat., sér. 2, 10: 71. 1887.

假繁缕 *jia fan lü*

*Cynocrambe macrantha* (Franchet) Poulsen.

Herbs, annual, fetid. Stem erect, 30–50 cm, ferruginous pubescent. Leaves herbaceous; leaf blade broadly ovate, ovate-lanceolate, or suboblong, 2–5 × 1–3 cm, sparsely pubescent on both surfaces, glabrescent, base subcuneate or subrounded, somewhat decurrent to petiole, apex acuminate; petiole 0.5–

1.8 cm; stipules membranous, connate, ovate or deltoid-ovate, 4–6 mm, ciliate. Flowers unisexual. Staminate flowers: perianth membranous, 2-lobed, tube ca. 2 mm, lobes 3–5 mm, lanceolate, apex obtuse, reflexed, 5–7-veined; stamens more than 20.

Pistillate flowers: smaller; perianth 2-lobed, apex obtuse. Fruit ovoid, ca. 5 mm. Fl. Apr–Jul, fr. Jun–Aug.

• Wet places in forests; 1800–2400 m. W Hubei, Sichuan, Zhejiang.

## 92. TIMONIUS Candolle, Prodr. 4: 461. 1830, nom. cons.

海茜树属 *hai qian shu*

Chen Tao (陈涛); Charlotte M. Taylor

Trees or shrubs, dioecious [or sometimes polygamo-dioecious], unarmed, terrestrial [or sometimes epiphytic]. Raphides absent. Leaves opposite or verticillate, usually with domatia, notably leathery [to papery or succulent]; tertiary venation finely lineolate [or sometimes not visible]; stipules caducous, interpetiolar [or calyptate], triangular. Inflorescences axillary, cymose with axes dichotomous to scorpioid, few to several flowered with pistillate usually fewer flowered than staminate, pedunculate, bracteate or bracts reduced; bracteoles sometimes fused in pairs. Flowers sessile, unisexual. Calyx limb cupular, truncate to 4- or 5-lobed. Corolla white to pale yellow, funnelform or tubular-funnelform with pistillate frequently shorter and broader in diam. than staminate, outside densely strigose to sericeous, inside glabrous, leathery; lobes 4(–10), thinly imbricate in bud (i.e., “subimbricate” of Darwin 1993, with margins thinly overlapping; see comment below). Stamens 4(–10), inserted in corolla throat, exserted; filaments short; anthers dorsifixed, at base 2-lobed. Ovary many celled, ovules 1 in each cell, pendulous from apical placentas; disk hirsute; style 4–12-parted with segments linear, often unequal; stigmas 4–12 (i.e., 1 on each style arm), papillose, included or exserted. Fruit red or black, drupaceous, thinly fleshy, ovoid, subglobose, or oblate (i.e., depressed globose), often 4- or 5-ridged when dry, with calyx limb persistent; pyrenes several to numerous [to 350 or more], 1-celled with 1 seed, narrowly oblong to cylindrical, bony; seeds cylindrical, straight or curved; testa membranous; endosperm scanty or absent; embryo straight or curved; cotyledons minute, flattened; radicle elongate, terete, ascending.

About 150–180 species: tropical SE Asia and the Pacific islands; one species in China.

Darwin (Allertonia 7(1): 1–39. 1993) noted that although the corolla lobes have been commonly described as valvate in *Timonius*, in fact, they are “subimbricate” with the margins only thinly overlapping; this arrangement is here called “thinly imbricate.” A notable characteristic of *Timonius* within the Rubiaceae is the multiplication of ovules, or often entire files of ovules, as well as the number of cells in the ovary, from the 2 cells that are typical of most Rubiaceae, to far past the 5–9 cells found in *Guettarda*. Darwin (loc. cit.; Syst. Bot. Monogr. 42: 1–86. 1994) has monographed part but far from all of this large genus.

### 1. *Timonius arboreus* Elmer, Leafl. Philipp. Bot. 1: 72. 1906 [“*arborea*”].

海茜树 *hai qian shu*

Trees 5–12 m tall; branches angled or flattened, rather stout, glabrous or glabrescent, often markedly sylleptic from nodes below leaves with markedly elongated lowermost internode, with scars of petioles often enlarged. Leaves opposite or usually whorls of 3; petiole stout, 1–5 mm, glabrous; blade drying stiffly papery, elliptic, elliptic-oblong, or broadly elliptic, 8.4–17 × 3–7.5 cm, adaxially glabrous, abaxially moderately to sparsely strigillose, base cuneate to acute and often tapered, apex acuminate; secondary veins 5–7 pairs, usually with densely pilosulous domatia; stipules caducous often leaving a ring of persistent trichomes 0.5–1 mm, triangular to lanceolate, 5–7 mm, abaxially moderately strigose, adaxially densely sericeous, acute to acuminate. Inflorescences strigose to glabrous, staminate 3–7-flowered, pistillate 1-flowered; peduncles 0.5–3 cm; bracts lanceolate to triangular, 0.5–2 mm, usually fused in pairs. Flowers subtended at immediate base by 2 to several persistent bracteoles 0.5–1 mm, these sometimes shortly fused in pairs. Calyx sparsely strigillose to glabrous; ovary portion subglobose, 2.5–3.5 mm in diam.; limb tubular, 1–2 mm, truncate or undulate to 5- or 6-denticulate. Corolla outside densely velutinous-strigillose to sericeous; tube 4–7 mm, glabrous inside; lobes 6–8, narrowly triangular, 4–7 mm, acute. Drupes subglobose to oblate, 8–10 × 10–14 mm, glabrescent, color not noted; pyrenes 50 or more, subcylindrical, 6–7 × 2–2.5 mm. Fl. Apr, Nov, fr. Apr–Jun.

Nate 3–7-flowered, pistillate 1-flowered; peduncles 0.5–3 cm; bracts lanceolate to triangular, 0.5–2 mm, usually fused in pairs. Flowers subtended at immediate base by 2 to several persistent bracteoles 0.5–1 mm, these sometimes shortly fused in pairs. Calyx sparsely strigillose to glabrous; ovary portion subglobose, 2.5–3.5 mm in diam.; limb tubular, 1–2 mm, truncate or undulate to 5- or 6-denticulate. Corolla outside densely velutinous-strigillose to sericeous; tube 4–7 mm, glabrous inside; lobes 6–8, narrowly triangular, 4–7 mm, acute. Drupes subglobose to oblate, 8–10 × 10–14 mm, glabrescent, color not noted; pyrenes 50 or more, subcylindrical, 6–7 × 2–2.5 mm. Fl. Apr, Nov, fr. Apr–Jun.

Near sea level to 400 m. Taiwan [Philippines].

The pubescence of the lower leaf surface is nearly colorless and arranged along the higher order veins; thus, it is often difficult to see, even with good magnification, and has been overlooked by some authors.

## 93. TRAILLIAEDOX W. W. Smith & Forrest, Notes Roy. Bot. Gard. Edinburgh 10: 74. 1917.

丁茜属 *ding qian shu*

Chen Tao (陈涛); Charlotte M. Taylor

Shrubs, low, erect, unarmed or with spinescent branches; branches at base with a pair of reduced, usually deciduous leaves and a persistent stipule. Raphides apparently absent. Leaves opposite, sometimes fasciculate on unexpanded axillary stems and appearing whorled, subsessile, without domatia; stipules deciduous, interpetiolar or fused to petiole bases, 2-lobed, lobes gland-tipped. Inflorescences terminal, pseudoaxillary, or terminal on paired lateral short shoots and appearing axillary, congested-cymose to umbelliform or fasciculate, few to many flowered, often nodding, sessile to pedunculate; bracts reduced or occasionally leaflike. Flowers pedi-

cellate, bisexual, apparently monomorphic. Calyx limb 5-lobed essentially to base. Corolla white, pink, or pale yellow, salverform to funnellform, glabrous inside; lobes 5, convolute in bud. Stamens 5, inserted in corolla throat, exserted; filaments short; anthers dorsifixed near base. Ovary 2-celled, ovules 1 in each cell, pendulous from apex; style curved; stigma clavate to ellipsoid and 2-lobed for a third to half its length, exserted. Fruit schizocarpous, dry, oblanceoloid, with calyx limb persistent; mericarps 2, indehiscent, each with 1 seed, ellipsoid, crustaceous; seeds medium-sized, ellipsoid; testa leathery; endosperm absent; embryo linear-oblanceolate.

- One species: China.

The presence or absence of raphides has not been specifically noted anywhere we have seen; their absence is presumed here based on observations of specimens and the classification by Robbrecht (Opera Bot. Belg. 1: 1–271. 1988) of this genus in Antirrhoideae. W. C. Ko (in FRPS 71(2): 1. 1999) described the anthers as partially exserted, but these are fully exserted at anthesis on the specimens studied. On the few specimens studied (*T. T. Yü 1348*, *C. Schneider 2194*, *Forrest 10713*, all A; *Boufford et al. 35041*, MO), the flowers appear to be protandrous, with the stamens apparently dehiscing while the stigmas are enclosed in the corolla; on these plants subsequently the style elongates, the stigma is exserted by several millimeters, and then the two lobes separate and presumably become receptive.

**1. *Trailliaedoxa gracilis*** W. W. Smith & Forrest, Notes Roy. Bot. Gard. Edinburgh 10: 75. 1917.

丁茜 ding qian

Subshrubs, erect, 20–45(–60) cm tall, multibranched; branchlets weakly angled to terete, densely strigillose to pilosulous becoming glabrescent. Leaf blade drying papery to stiffly papery, obovate, elliptic, or oblanceolate, 0.5–1 × 0.3–0.4 cm, adaxially glabrous or sparsely pilosulous to strigillose, abaxially paler and glabrous or villosulous to strigillose or hispidulous at least along midrib, base acute or very shortly and abruptly truncate, apex rounded or obtuse; secondary veins indistinct; stip-

ules 0.6–1 mm, pilosulous to glabrescent. Inflorescences 0.5–1 × 0.8–1 cm, 6–12-flowered, pilosulous to villosulous, sessile or with peduncle to 5 mm; pedicels 1–2 mm. Calyx with ovary portion cylindrical-lanceoloid, ca. 1 mm, densely pilosulous; lobes narrowly elliptic or oblanceolate to linear, 0.8–1.5 mm, glabrescent, acute. Corolla outside sparsely villosulous to glabrescent; tube 1.8–2.5 mm; lobes elliptic-spatulate, 1–1.5 mm, obtuse to rounded. Schizocarps ca. 1.5 × 1 mm, densely villosulous. Fl. Jul–Aug, fr. Aug.

- On rocks or in thickets on mountain slopes in dry and warm valleys; 1400–3000 m. Sichuan, Yunnan.

## 94. *UNCARIA* Schreber, Gen. Pl. 125. 1789, nom. cons.

钩藤属 gou teng shu

Chen Tao (陈涛); Charlotte M. Taylor

*Aglyophora* Necker ex Rafinesque; *Ourouparia* Aublet.

Woody vines or lianas, climbing by recurved, usually paired spines generally 1–2 cm. Raphides absent. Leaves opposite, usually with domatia; stipules persistent or caducous, interpetiolar, generally ovate to ligulate in outline, entire to 2-lobed, usually reflexed. Inflorescences axillary and sometimes also terminal, capitate with heads globose and 1 to several in cymes or fascicles, pedunculate, bracteate; peduncles usually articulate in middle or upper portion, often with stipuliform bracts at articulation; bracts enclosing heads sometimes caducous, involucrel, stipuliform. Flowers sessile and bracteolate or pedicellate and bracteolate or ebracteolate, bisexual, monomorphic. Calyx limb 5-lobed. Corolla white to yellow, salverform or funnellform, inside glabrous or pubescent; lobes 5, imbricate in bud. Stamens 5, inserted in corolla tube near throat, exserted; filaments short; anthers dorsifixed. Ovary 2-celled, ovules numerous in each cell on axile placentas attached in upper third of septum; stigma globose or clavate, exserted. Fruiting heads globose, with fruiting pedicels when present often elongating notably. Fruit capsular, fusiform to obovoid, loculicidally dehiscent into 2 valves that usually remain attached at both ends, thinly to thickly papery or cartilaginous, with calyx limb persistent; seeds numerous, small to medium-sized, fusiform, flattened, winged with wing deeply bifid.

About 34 species: 29 in tropical Asia through Australia, three in Africa and Madagascar, two in tropical America; 12 species (five endemic) in China.

Ridsdale (Blumea 24: 43–46. 1978) presented an extensive consideration of the morphology, branching, and architecture of *Uncaria*. The characteristic hooked spines have been interpreted variously as modified plagiotropic shoots (Ridsdale, loc. cit.), peduncles that are modified into spines (e.g., Steyermark in Lasser, Fl. Venezuela 9: 32. 1974), and short shoots modified into thorns (Robbrecht, Opera Bot. Belg. 1: 1–271. 1988). By any name, these structures function to support the plants as they climb and sometimes bear a terminal inflorescence. Ridsdale (loc. cit.: 69) described the corolla lobe aestivation as valvate or thinly imbricate at their apices; other authors described them as imbricate. *Uncaria* was reviewed in detail for China by How (Sunyatsenia 6: 231–262. 1946), who emended the circumscriptions of several species, and then by Hsue and Wu (J. S. China Agric. Coll. 2(8): 21–32. 1981), who recognized ten species. The arrangement of the flowers and fruit, whether sessile or pedicellate, is taxonomically important; however, the pedicels usually elongate shortly before the flowers open and then continue to elongate as the fruit develop, often markedly, so the pedicel length at anthesis may be difficult to discern from inflorescences in bud.

*Uncaria* is considered medicinally useful, with uses ranging from general tonics to supposedly curing HIV-AIDS (e.g., K. C. Hsia & X. M. Liu, Acta Phytotax. Sin. 20: 319–320. 1982). Various parts of the plants are apparently used, with the materials generally wild-collected. *Uncaria gambir* (W. Hunter) Roxburgh, found from the Malay Peninsula through Borneo, is apparently both cultivated and wild-harvested as the source of gambir or gambier (Ridsdale, loc. cit.: 82; Mabberley, Mabberley's Pl.-Book, ed. 3, 885–886. 2008), a yellowish dry resin chewed together with the betel nut and sometimes used in tanning. How (loc. cit.) noted that the Chinese drug Kou-T'eng is derived from the "hardened sterile peduncle with attached portions of the stem" of a species that is probably *U. rhynchophylla*.

- 1a. Flowers subsessile to pedicellate, fruit pedicellate.
- 2a. Stipules suborbicular, 14–16 mm, entire ..... 12. *U. yunnanensis*
- 2b. Stipules ovate, 6–12 mm, shallowly to deeply 2-lobed.
- 3a. Leaves drying papery, 2–8 cm wide; flowers subsessile; fruit 1–3 mm wide ..... 5. *U. lanosa*
- 3b. Leaves drying thinly leathery, 6–12 cm wide; flowers with well-developed pedicels; fruit 4–5 mm wide ..... 6. *U. macrophylla*
- 1b. Flowers and fruit sessile to subsessile.
- 4a. Leaf blade abaxially strigillose, strigose, puberulent, and/or hirsute on lamina (but sometimes with different pubescence on veins); stems strigillose, tomentulose, strigose, hirtellous, hirsute, or pilosulous; stipules 2-lobed.
- 5a. Flowering heads 18–25 mm in diam. across calyces; stipule lobes ovate to lanceolate; calyx limb with tube 2–4 mm, lobes 2–3 mm ..... 1. *U. hirsuta*
- 5b. Flowering heads 9–12 mm in diam. across calyces; stipule lobes narrowly triangular, lanceolate, or ovate; calyx limb deeply lobed, lobes 0.75–2 mm.

- 6b. Corolla lobes ca. 2 mm; leaves 3–5.5 cm wide ..... 9. *U. scandens*
- 4b. Leaf blade abaxially glabrous to puberulent on lamina; stems glabrous, puberulent, sparsely hirsute, or sparsely hirtellous; stipules entire or 2-lobed.
- 7a. Stipules entire or shallowly emarginate, broadly triangular, ovate, or suborbicular ..... 11. *U. sinensis*
- 7b. Stipules 2-lobed, elliptic-oblong, ligulate, lanceolate, or ovate, with lobes narrowly triangular, linear, ovate, lanceolate, or triangular-ovate.
- 8a. Leaf blade drying thinly leathery; calyx lobes 0.1–0.3 mm.
- 9a. Leaf blade not glaucous abaxially, with tertiary venation mostly reticulate and not strongly scalariform on adaxial surface; peduncles simple; corolla lobes externally glabrous; fruit 6–8 mm ..... 3. *U. laevigata*
- 9b. Leaf blade often glaucous abaxially, with tertiary venation rather evidently scalariform at least on adaxial surface; peduncles simple or often branched; corolla lobes externally sericeous; fruit 10–14 mm ..... 10. *U. sessilifructus*
- 8b. Leaf blade drying thickly papery to thinly papery; calyx lobes 0.5–2 mm.
- 10a. Corollas 7–9 mm; leaf blade often drying reddish brown or dark red, often glaucous abaxially; calyx limb ca. 1 mm ..... 7. *U. rhynchophylla*
- 10b. Corollas 10.5–14.5 mm; leaf blade drying brown, grayish brown, or green, not glaucous abaxially; calyx limb 1.5–4 mm.
- 11a. Calyx limb ca. 1.5 mm ..... 8. *U. rhynchophylloides*
- 11b. Calyx limb 2–4 mm.
- 12a. Flowering heads 13–15 mm across calyces; leaves glabrous ..... 4. *U. lancifolia*
- 12b. Flowering heads 18–20 mm across calyces; leaves glabrous or usually puberulent at least on veins abaxially ..... 5. *U. lanosa*

**1. *Uncaria hirsuta* Haviland, J. Linn. Soc., Bot. 33: 88. 1897.**

毛钩藤 mao gou teng

*Nauclea formosana* Matsumura; *Ourouparia hirsuta* (Haviland) Yamamoto; *Uncaria formosana* (Matsumura) Hayata; *U. kawakamii* Hayata; *U. uraiensis* Hayata.

Lianas, height unknown. Young stems slender, terete or weakly 4-angled, sparsely to densely strigillose, strigose, or hirsute. Petiole 3–6 mm, strigose to strigillose; leaf blade drying thickly papery to thinly leathery, ovate, lanceolate-oblong, or elliptic, 8–12 × 3.5–7 cm, adaxially glabrous and smooth to sparsely puberulent-scabrous on lamina and puberulent on veins, abaxially sparsely to densely strigose with trichomes generally produced regularly along and at 90° to tertiary veins, apex acuminate; secondary veins 7–11 pairs, usually with hirtellous domatia; stipules generally deciduous, broadly ovate, 7–10 mm, 2-lobed for at least 2/3, strigillose, puberulent, or glabrescent, lobes ovate to lanceolate, ciliate, acute to acuminate. Inflorescences axillary or frequently paired and terminal on stems (apparently due to terminal bud not developing further), pilose

to pilosulous; peduncle 2.5–5 cm, simple; bracts 5–10 mm; flowering heads 18–25 mm in diam. across calyces, 30–40 mm in diam. across corollas; bracteoles linear or spatulate, ca. 2 mm. Flowers subsessile. Calyx with hypanthium portion obconic, ca. 2 mm, densely pilose to strigose; limb densely strigillose, with tube 2–4 mm; lobes linear-oblong, 2–3 mm. Corolla pale yellow or pale red, salverform, outside sparsely to densely strigillose; tube 7–10.5 mm; lobes oblong to elliptic, 2–2.5 mm, obtuse to rounded. Fruiting heads 30–35 mm in diam. Fruit subsessile, obovoid, 5–9 mm (not including persistent calyx limb), densely strigose; seeds ca. 1.5 mm. Fl. and fr. Jan–Dec.

• Thickets or forests at streamsides in valleys; below 100–500 m. Fujian, Guangdong, Guangxi, Guizhou, Taiwan.

H. H. Hsue and H. Wu (in FRPS 71(1): 257. 1999) listed “*Ourouparia setiloba* Sakai” as a synonym of this species, but that name is correctly “*Ourouparia setiloba* (Benth.) Sakai,” which is a combination based on *Uncaria setiloba*, here treated as a synonym of *U. lanosa* var. *appendiculata*. Hsue and Wu described the corolla tubes as 7–10 mm, but these are 8–10.5 mm on all the specimens studied and in descriptions of other authors.

## 2. *Uncaria homomalla* Miquel, Fl. Ned. Ind. 2: 343. 1857.

北越钩藤 bei yue gou teng

*Uncaria tonkinensis* Haviland.

Lianas, climbing to 25 m tall. Young stems quadrate, sparsely to densely, usually ferruginous tomentulose or -hirtellous. Petiole 3–6 mm, hirtellous to strigose; leaf blade drying papery, elliptic, lanceolate, elliptic-lanceolate, or ovate-lanceolate, 6–10 × 2.5–4 cm, adaxially rather sparsely but evenly puberulent to strigillose on lamina and densely tomentulose on costa, abaxially moderately to densely hirsute or strigose with trichomes produced mostly along veins, base rounded, apex acuminate or caudate; secondary veins 6–8 pairs, usually with well-developed pilosulous domatia; stipules generally deciduous, deeply 2-lobed, lobes narrowly triangular, 4–5 mm, acute. Inflorescences axillary and sometimes also terminal, densely hirtellous to strigose; peduncles simple, 2.5–3 cm, at articulation with narrowly triangular bracts 2–3 mm; flowering heads 7–10 mm in diam. across calyces, 25–30 mm in diam. across corollas; bracteoles apparently absent. Flowers sessile. Calyx with hypanthium portion obconic, ca. 1.2 mm; limb deeply lobed; lobes linear to narrowly triangular, 0.75–1 mm, densely pilosulous, acute. Corolla yellow [to pale green], outside densely strigose to strigillose; tube 5–8.5 mm; lobes ligulate to elliptic-oblong, ca. 1.25 mm, obtuse to rounded. Fruiting heads 12–20 mm in diam. Fruit sessile, obovoid, ca. 4 × 2 mm, strigose to pilosulous; seeds 2–3 mm. Fl. Apr, May.

Evergreen to seasonal forests; 200–600 m. Guangxi, Yunnan [Bangladesh, Cambodia, India, Indonesia, Laos, Malaysia, Myanmar, Thailand, Vietnam].

H. H. Hsue and H. Wu (in FRPS 71(1): 258. 1999) described the leaves as up to 5.5 cm wide, but this has not been seen on specimens studied nor reported by other authors. Ridsdale (Blumea 24: 95. 1978) reported this species from Guangdong and Hainan but without vouchers. The separation here of *Uncaria homomalla* and *U. scandens* follows previous Chinese authors, but the separation of these species (or possibly the application of these names to the Chinese plants) needs further study. Ridsdale (loc. cit.) separated *U. homomalla* from *U. scandens* based on the size of the flowering heads and leaves; however, Chinese specimens included previously in *U. scandens* (e.g., *Henry 11868*, MO!) have flowering heads and leaves similar in size to those of *U. homomalla*.

## 3. *Uncaria laevigata* Wallich ex G. Don, Gen. Hist. 3: 470. 1834.

平滑钩藤 ping hua gou teng

*Nauclea laevigata* (Wallich ex G. Don) Walpers.

Lianas, height unknown. Young stems slender, quadrangular, glabrous [to puberulent]. Petiole 7–11 mm, glabrous; leaf blade drying thinly leathery, elliptic, lanceolate, or elliptic-oblong, 8.5–12 × 3–6 cm, glabrous on both surfaces or puberulent on veins abaxially, base rounded to cuneate, apex acute or acuminate; secondary veins 4–7 pairs, usually with hirtellous domatia; stipules caducous, elliptic-oblong to ovate, 4–6 mm, 1-lobed for 1/2 or more, glabrous or sparsely puberulent, lobes narrowly triangular, acute. Inflorescences axillary and sometimes in terminal groupings, glabrous; peduncles 2.5–6 cm,

simple; bracts 2–4 mm; flowering heads 8–10 mm in diam. across calyces, 25–35 mm in diam. across corollas; bracteoles linear or subspatulate, 2–3 mm. Flowers sessile. Calyx with hypanthium portion obconic, 1–1.5 mm, densely sericeous or strigose; limb densely puberulent to strigillose, with tube 1–1.5 mm; lobes ligulate, 0.1–0.3 mm, obtuse. Corolla color unknown, salverform, glabrous outside; tube 7–10 mm; lobes oblong, ca. 2 mm, obtuse to rounded. Fruiting head 25–30 mm in diam. Fruit sessile, fusiform, 6–8 mm, strigose to strigillose; seeds not seen. Fl. and fr. May–Nov.

Forests; 600–1300 m. Guangxi, Taiwan, Yunnan [Bangladesh, India, Laos, Myanmar, Thailand, Vietnam].

## 4. *Uncaria lancifolia* Hutchinson in Sargent, Pl. Wilson. 3: 407. 1916.

倒挂金钩 dao gua jin gou

Large lianas, height unknown. Young stems quadrangular, glabrous. Petiole 3–5 mm, glabrous; leaf blade drying papery, oblong-lanceolate or ovate-lanceolate, 9–12 × 3–6 cm, glabrous on both surfaces, base rounded to truncate or subcordate, apex acute or acuminate; secondary veins 5–10 pairs, without domatia; stipules often persistent, ovate, 5–8 mm, 2-lobed for 1/3–1/2, glabrous, lobes lanceolate, acute. Inflorescences axillary and terminal, glabrous; peduncles 4–7 cm, simple; bracts caducous, ca. 5 mm; flowering heads ca. 15 mm in diam. across calyces, ca. 45 mm in diam. across corollas; bracteoles linear or linear-spatulate, 3–4.5 mm. Flowers sessile. Calyx with hypanthium portion obconic, ca. 3 mm, densely sericeous to pilose; limb densely puberulent to strigillose, with tube 1–2 mm; lobes spatulate, ca. 2 mm, obtuse to rounded. Corolla greenish white, salverform, glabrous; tube 9–12 mm; lobes oblong, 1.5–2.5 mm, obtuse to rounded. Fruiting head 25–35 mm in diam. Fruit sessile, obovoid, 9–12 mm, sericeous to strigose; seeds 2.5–3 mm. Fl. and fr. Jun–Dec.

Subtropical evergreen broad-leaved forests; 1500–1900 m. Yunnan [Vietnam].

How (Sunyatsenia 6: 252. 1946) first described the flowers of this species. H. H. Hsue and H. Wu (in FRPS 71(1): 253. 1999) described the leaves as having domatia; but the type specimen and several additional specimens studied lack these, and How did not mention them.

## 5. *Uncaria lanosa* Wallich var. *appendiculata* (Benth) Ridsdale, Blumea 24: 88. 1978.

恒春钩藤 heng chun gou teng

*Uncaria appendiculata* Benth, London J. Bot. 2: 222. 1843; *Ouroparia setiloba* (Benth) Sakai; *U. lanosa* f. *setiloba* (Benth) Ridsdale; *U. philippinensis* Elmer; *U. setiloba* Benth.

Woody vines, height not noted. Young stems quadrangular, sparsely hirsute to glabrescent. Petiole 4–10 mm, sparsely hirsute to glabrescent; leaf blade drying papery, ovate, lanceolate, or lanceolate-oblong, 7–11 × 3.5–8 cm, adaxially shiny and glabrous except sparsely hirsute along veins, abaxially glabrescent except sparsely hirsute along veins, base rounded, truncate, or cordulate, apex acute to acuminate; secondary veins 6–9 pairs, usually with domatia in axils of secondary and often also ter-

tiary veins; stipules persistent or caducous, ovate, 6–10 × 8–10 mm, 2-lobed for 1/3–1/2, lobes narrowly triangular, acute to acuminate. Inflorescences axillary and frequently also terminal, strigose to hirsute or glabrescent; peduncle 2.5–4.5 cm; bracts ca. 10 mm; flowering heads solitary (or 2), 18–20 mm in diam. across calyces, 30–37 mm in diam. across corollas; bracteoles apparently absent. Flowers sessile or subsessile. Calyx densely strigillose; hypanthium portion fusiform, ca. 2 mm; limb deeply lobed; lobes linear, ca. 2 mm, obtuse. Corolla color unknown, salverform, externally sparsely sericeous to glabrescent; tube ca. 12 mm; lobes oblong, ca. 2.5 mm, obtuse. Fruiting heads 30–40 mm in diam.; pedicels 5–9 mm. Fruit pedicellate, fusiform, 9–27 × 1–3 mm, strigose; seeds 2.5–3 mm. Fl. Feb, perhaps Oct, fr. Feb.

Forests; ca. 300 m. S Taiwan [Indonesia (Sulawesi), Philippines].

Ridsdale (loc. cit.: 70) keyed *Uncaria lanosa* based on its stipules that are subentire, but in our plants as well as the type of *U. philippinensis*, treated by him as a synonym of *U. lanosa* (NY, Web!), they are markedly 2-lobed.

*Uncaria lanosa* var. *lanosa* occurs in Australia, Borneo, Indonesia, Malaysia, Myanmar, New Guinea, Pacific islands (Caroline Islands, Palau, Solomon Islands), Philippines, and Thailand.

**6. *Uncaria macrophylla*** Wallich in Roxburgh, Fl. Ind. 2: 132. 1824.

大叶钩藤 da ye gou teng

Large lianas, height not noted. Young stems weakly to markedly quadrangular, pilosulous, tomentulose, or glabrescent. Petiole 3–25 mm, glabrous to densely tomentulose; leaf blade drying thinly leathery and yellowish brown adaxially, ovate or broadly elliptic, 10–16 × 6–12 cm, adaxially glabrous except strigillose along veins, abaxially sparsely to densely hirsutulous with pubescence denser along veins, base rounded, subcordate, or cordate, apex acute or shortly acuminate; secondary veins 6–9 pairs, usually with pubescent domatia; stipules caducous, ovate, 6–12 × 6–15 mm, 2-lobed for 1/2 or 2/3, lobes triangular to ovate. Inflorescences axillary, tomentulose to glabrescent; peduncle 3–7 cm; bracts triangular, 6–8 mm; flowering heads solitary, 15–20 mm in diam. across calyces, 40–50 mm in diam. across corollas; bracteoles absent; pedicels 2–5 mm. Flowers pedicellate. Calyx densely strigillose; hypanthium portion obconic, 2–2.5 mm; limb deeply lobed; lobes linear-oblong, 3–4 mm, obtuse to rounded. Corolla pale green to white, salverform, outside strigillose to tomentulose; tube 9–10 mm; lobes oblong to ligulate, ca. 2 mm, obtuse to rounded. Fruiting head 8–10 cm in diam.; pedicels 6–18 mm. Fruit pedicellate, fusiform, 14–20 × 4–5 mm, densely strigillose; seeds 6–8 mm. Fl. Jul, Sep, Dec, fr. Mar–Apr, Sep–Nov.

On canopy crowns in secondary forests; 300–900 m. Guangdong, Guangxi, Hainan, Yunnan [Bangladesh, Bhutan, India, Laos, Myanmar, N Thailand, Vietnam].

**7. *Uncaria rhynchophylla*** (Miquel) Miquel ex Haviland, J. Linn. Soc., Bot. 33: 890. 1897.

钩藤 gou teng

*Nauclea rhynchophylla* Miquel, Ann. Mus. Bot. Lugduno-

Batavi 3: 108. 1867; *Orouparia rhynchophylla* (Miquel) Matsumura; *Uncaria rhynchophylla* var. *koutong* Yamazaki.

Lianas, height unknown. Young stems slender, weakly to markedly quadrangular, glabrous, sometimes glaucous. Petiole 5–15 mm, glabrous; leaf blade drying papery and often red-brown or dark red, elliptic, lanceolate, or elliptic-oblong, 5–12 × 3–7 cm, glabrous on both surfaces, often glaucous abaxially, base cuneate, obtuse, or rounded, apex acute to usually acuminate; secondary veins 4–8 pairs, sometimes with pilosulous domatia; stipules often deciduous, lanceolate to ovate, 4–15 mm, 2-lobed for up to 4/5, glabrous, lobes linear to triangular-lanceolate or ovate, acute to acuminate. Inflorescences axillary and terminal, solitary or usually in terminal groups of 7–11, glabrous; peduncles 1.5–5 cm, simple; bracts 1–4 mm; flowering heads 4–8 mm in diam. across calyces, 12–15 mm in diam. across corollas; bracteoles linear or linear-spatulate, ca. 2 mm. Flowers sessile or subsessile. Calyx with hypanthium portion obconic, ca. 1 mm, densely strigillose to strigose; limb densely strigillose, ca. 1 mm, lobed for 1/2 or more; lobes triangular to spatulate, acute to obtuse. Corolla color unknown, salverform, outside puberulent to glabrous; tube 5.5–6 mm; lobes ovate, 1.5–2 mm, rounded to obtuse. Fruiting head 10–20 mm in diam. Fruit sessile or subsessile, obovoid to fusiform, 5–7 mm, strigillose to strigose; seeds 2–3 mm. Fl. and fr. May–Dec.

Sparse forests or thickets at streamsides in valleys; near sea level to 1000 m. Fujian, Guangdong, Guangxi, Guizhou, Hubei, Hunan, Jiangxi, Yunnan, Zhejiang [Japan].

Ridsdale (Blumea 24: 93. 1978) included *Uncaria rhynchophylloides* as a synonym of *U. rhynchophylla*; however, these do appear to be distinct.

**8. *Uncaria rhynchophylloides*** F. C. How, Sunyatsenia 6: 257. 1946.

侯钩藤 hou gou teng

Lianas, to 13 m tall. Young stems quadrangular, puberulent to glabrescent. Petiole 5–7 mm, puberulent to glabrous; leaf blade drying thickly papery and dark brown to grayish brown, ovate, lanceolate, or elliptic-ovate, 5–9 × 2.5–4.5 cm, both surfaces puberulent to glabrescent, base cuneate to obtuse, rounded, or cordulate, apex acuminate; secondary veins 5–7 pairs, usually with pilosulous domatia; stipules generally persistent, ovate, deeply 2-lobed, glabrous to puberulent, lobes triangular to ovate, 3–4 mm, acute to acuminate. Inflorescences axillary and often in terminal groups of 3–5, puberulent to glabrescent; peduncles 3.5–6 cm, simple but sometimes with 2 articulations; bracts 3–4 mm; flowering heads 9–11 mm in diam. across calyces, 25–30 mm in diam. across corollas; bracteoles linear or linear-spatulate, 2.5–3.5 mm. Flowers sessile. Calyx with hypanthium portion obconic, ca. 1.5 mm, densely sericeous or strigose; limb deeply lobed, densely strigillose; lobes oblong to spatulate, ca. 1.5 mm, obtuse to rounded. Corolla color unknown, salverform, outside puberulent; tube ca. 12 mm; lobes obovate or oblong-obovate, 2–2.5 mm, rounded. Fruiting head 16–20 mm in diam. Fruit sessile, obovoid-ellipsoid, 8–10 × 3–3.5 mm, sericeous to strigillose; seeds not seen. Fl. and fr. May–Dec.

• Forests, forest margins; 500–800 m. Guangdong, Guangxi.

This species was illustrated by How (loc. cit.: 257, f. 31). Ridsdale (Blumea 24: 93. 1978) included *Uncaria rhynchophylloides* as a synonym of *U. rhynchophylla*; however, these do appear to be distinct.

**9. *Uncaria scandens*** (Smith) Hutchinson in Sargent, Pl. Wilson. 3: 406. 1916.

攀茎钩藤 *pan jing gou teng*

*Nauclea scandens* Smith in Rees, Cycl. 24: *Nauclea* no. 9. 1813; *Cephalanthus cavaleriei* H. Léveillé; *Uncaria wangii* F. C. How.

Large lianas, height not noted. Young stems slender, weakly to markedly quadrangular, densely hirtellous or pilosulous. Petiole 3–6 mm, hirtellous to pilosulous; leaf blade drying papery, ovate, ovate-oblong, lanceolate, elliptic, or elliptic-oblong, 10–15 × 3–5.5 cm, adaxially sparsely to moderately strigillose or scabrous-puberulent on lamina and densely puberulent to strigillose on veins, abaxially moderately to densely pilosulous, hirtellous, and/or strigillose usually with at least some pubescence spreading, base rounded to truncate, subcordate, or cordulate, apex acute or usually acuminate; secondary veins 7–10 pairs, usually with pilosulous domatia; stipules deciduous, ovate, 6–10 mm, deeply 2-lobed, strigillose, puberulent, or glabrescent, lobes lanceolate, ovate, or narrowly triangular, acute. Inflorescences axillary and often in terminal groups of 5–7 heads, densely pilosulous to tomentulose; peduncles 3–7 cm, simple; bracts 4–9 mm; flowering heads 9–12 mm in diam. across calyces, 25–30 mm in diam. across corollas; bracteoles linear or linear-spatulate, 1–3 mm, sparsely pubescent. Flowers sessile. Calyx with hypanthium portion obconic, 1–1.5 mm, densely strigose or pilose; limb 2–3 mm, lobed for up to 2/3, densely grayish white strigillose; lobes linear or linear-spatulate, 1.5–2 mm, obtuse. Corolla pale yellow sometimes flushed with pink, salverform, outside sparsely to densely hirtellous; tube 8–10 mm; lobes obovate to elliptic, ca. 2 mm, rounded. Fruiting head 20–25 mm in diam. Fruit sessile, obovoid to ob-lanceoloid, 6–9 mm, hirtellous; seeds orange-yellow, ca. 2 mm. Fl. Feb, Apr, fr. Jul, Nov.

• Sparse forests, broad-leaved forests; 100–1500 m. Guangdong, Guangxi, Hainan, Sichuan, Xizang, Yunnan.

This species was illustrated by How (Sunyatsenia 6: t. 42. 1946, as *Uncaria wangii*). See comments about the separation of this species under *U. homomalla*.

**10. *Uncaria sessilifructus*** Roxburgh, Fl. Ind. 2: 130. 1824.

白钩藤 *bai gou teng*

*Nauclea sessilifructus* (Roxburgh) D. Dietrich.

Large lianas, height unknown. Young stems slender, quadrangular, sparsely puberulent or hirtellous to glabrous. Petiole 5–10 mm, glabrous; leaf blade drying thinly leathery, ovate, elliptic, or elliptic-oblong, 8–12 × 4–6.5 cm, glabrous on both surfaces or abaxially puberulent on principal veins, often glaucous abaxially, base cuneate to rounded, apex acute or acuminate; secondary veins 4–7 pairs, usually with pilosulous domatia; stipules deciduous, ligulate to lanceolate, 7–10 mm, 2-lobed for 2/3 or more, glabrous to densely puberulent, lobes narrowly triangular, acute. Inflorescences axillary or terminal, heads solitary or in groups of 5–15, strigillose to glabrescent; peduncles

3–5.5 cm, simple or often branched to 1 order; flowering heads 5–10 mm in diam. across calyces, 25–35 mm in diam. across corollas; bracteoles linear or subspatulate, 2–3 mm. Flowers sessile. Calyx with hypanthium portion obconic, 1.5–2 mm, densely strigose to sericeous; limb densely strigillose to pilosulous, with tube 1–2 mm; lobes oblong to triangular, 0.25–1 mm, obtuse to acute. Corolla yellowish white, salverform; tube 6–10 mm, outside glabrous, pilosulous, or sericeous; lobes oblong, ca. 2 mm, outside sericeous or hirtellous, rounded to obtuse. Fruiting head 25–35 mm in diam. Fruit sessile, fusiform, 10–14 mm, sericeous; seeds not seen. Fl. and fr. Mar–Dec.

Dense forests or thickets in valleys; 300–1500 m. Guangxi, Yunnan [Bangladesh, Bhutan, India, Laos, Myanmar, Nepal, Vietnam].

This species was illustrated by Ridsdale (Blumea 24: 91, f. 11. 1978).

**11. *Uncaria sinensis*** (Oliver) Haviland, J. Linn. Soc., Bot. 33: 89. 1897.

华钩藤 *hua gou teng*

*Nauclea sinensis* Oliver, Hooker's Icon. Pl. 20: t. 1956. 1891; *Uncaria membranifolia* F. C. How.

Lianas, height unknown. Young stems slender, quadrangular, glabrous. Petiole 6–10 mm, glabrous; leaf blade drying thinly papery, elliptic to ovate, 9–14 × 5–8.5 cm, both surfaces sparsely puberulent to glabrous, base obtuse to rounded, apex acuminate; secondary veins 6–8 pairs, without domatia; stipules often persistent, broadly triangular, ovate, or orbicular, 3–10 mm, glabrous, rounded to truncate or sometimes shallowly emarginate. Inflorescences axillary, heads solitary or sometimes in terminal groups of 3–5, glabrous; peduncles 3–7 cm, rather slender; bracts 2–3 mm; flowering heads 10–15 mm in diam. across calyces, ca. 30 mm in diam. across corollas; bracteoles linear or subspatulate, 2–3 mm. Flowers subsessile. Calyx with hypanthium portion ca. 2 mm, densely strigose to strigillose; limb deeply lobed, densely strigillose; lobes linear-oblong, 1–1.5 mm, obtuse to rounded. Corolla color unknown, salverform; tube 7–8 mm, outside glabrous; lobes ligulate to triangular, ca. 2 mm, outside puberulent, acute to obtuse. Fruiting head 20–30 mm in diam. Fruit sessile, ellipsoid, 8–10 mm, strigillose to strigose; seeds not seen. Fl. and fr. Jun–Oct.

• Sparse forests or wet secondary forests at middle elevations; 900–1100 m. Gansu, Guangxi, Guizhou, Hubei, Hunan, Shaanxi, Sichuan, Yunnan.

This species was illustrated by How (Sunyatsenia 6: 254, f. 30. 1946, as *Uncaria membranifolia*).

**12. *Uncaria yunnanensis*** K. C. Hsia, Acta Phytotax. Sin. 20: 319. 1982.

云南钩藤 *yun nan gou teng*

Woody vines or lianas, to 15–25 m tall. Young branches weakly quadrangular, ferruginous villous. Petiole glabrous or ferruginous hirtellous; leaf blade drying leathery, ovate, elliptic, or elliptic-oblong, 9–18 × 5–8 cm, both surfaces glabrous, base obtuse, apex shortly acuminate; secondary veins ca. 4 pairs; stipules caducous, suborbicular, 14–16 mm, rounded. Inflorescences axillary and sometimes terminal, with heads solitary,

brown hirtellous; peduncle 30–35 mm; flowering heads 15–20 mm in diam. in bud. Flowers not seen. Fruiting head ca. 40 mm in diam.; pedicels 6–8 mm. Fruit pedicellate, fusiform, ca. 10 mm, brown hirtellous. Fl. Jul, fr. Jan.

- Forest margins, thickets. Yunnan (Xishuangbanna).

H. H. Hsue and H. Wu (in FRPS 71(1): 249. 1999) described the

petioles as ferruginous pubescent, but the protologue description of this species says "*petioli glabri nitiduli*," though these "*petioli*" are described as structures belonging to "*pedunculus communis*" and may be pedicels rather than petioles.

The possibility cannot be completely excluded based on the information available that this name will be found synonymous with *Uncaria gambir*.

## 95. UROPHYLLUM Wallich in Roxburgh, Fl. Ind. 2: 184. 1824.

尖叶木属 *jian ye mu shu*

Chen Tao (陈涛); Charlotte M. Taylor

Trees or shrubs, sometimes dioecious, unarmed. Raphides present. Leaves opposite, often distichous on horizontal branches, apparently without domatia, with tertiary venation often regularly rectangular-areolate or clathrate and quaternary venation not visible; stipules persistent or caducous, interpetiolar, narrowly triangular to linear [or sometimes reduced], acute. Inflorescences axillary, capitate to cymose or often umbelliform, few to several flowered, pedunculate or sessile, bracteate or bracts reduced. Flowers pedicellate and ebracteate, bisexual and apparently monomorphic or sometimes unisexual. Calyx limb cupular, (4 or)5(–7)-toothed. Corolla white to yellow, rotate, shortly tubular, or funnellform, inside villous in throat, leathery; lobes (4 or)5(–7), valvate in bud. Stamens (4 or)5(–7), inserted in corolla throat, included or exserted; filaments short; anthers apparently dorsifixed. Ovary (4 or)5(–7)-celled, ovules numerous in each cell on axile placentas attached at inner corner of cell; style often swollen at base; stigmas 3–8-lobed, exserted. Fruit white, orange, yellow, or red, baccate, fleshy, ellipsoid to subglobose, with calyx limb persistent; seeds numerous, small, subglobose; testa crustaceous, areolate; embryo clavate.

About 150 species: widespread in tropical Asia; three species (two endemic) in China.

Although this genus is sometimes said to range into Africa, more recently the African species formerly included in *Urophyllum* have all been moved to other genera (Lebrun & Stork, Énum. Pl. Fleurs Afr. Trop. 1–249. 1997). This genus does not seem well known, apart from a consideration of its delimitation in the Philippines by Bremekamp (J. Arnold Arbor. 21: 32–41. 1940). Puff et al. (Rubiaceae of Thailand, 134. 2005) found *Urophyllum* to be wholly dioecious in Thailand and noted that the staminate plants sometimes bear what they call "sterile pseudo-fruit consisting of [a] fleshy cuplike calyx and enlarged, empty ovaries [sic]." The reproductive biology of the Chinese species was not noted by H. S. Lo (in FRPS 71(1): 326–329. 1999).

- 1a. Leaves at apex rounded then abruptly caudate with tips narrowly triangular to linear, 15–20 mm; corolla ca. 2 mm ..... 2. *U. parviflorum*  
 1b. Leaves at apex acute or tapered to an acuminate apex, with tips narrowly triangular, 3–15 mm; corolla 3–4 mm.  
 2a. Stems flattened; stipules 10–19 mm; corolla lobed for ca. 1/2 ..... 1. *U. chinense*  
 2b. Stems subterete; stipules 7–10 mm; corolla lobed for ca. 1/3 ..... 3. *U. tsaiantum*

**1. *Urophyllum chinense*** Merrill & Chun, Sunyatsenia 2: 19. 1934.

尖叶木 *jian ye mu*

Shrubs or small trees, 1.5–4 m tall; branches compressed, longitudinally sulcate on each interpetiolar side, ascending strigose to sericeous, sometimes becoming glabrescent. Petiole 7–15 mm, strigillose to glabrescent; leaf blade drying papery, olive-green, oblong-elliptic, lanceolate, oblong-lanceolate, or rarely subovate, 8–20 × 2.5–6.5 cm, adaxially glabrous, abaxially sparsely to moderately strigillose with pubescence denser on veins, base obtuse to acute, apex acute to acuminate, tip 3–20 mm; secondary veins 7–9 pairs, tertiary venation subclathrate; stipules persisting on 1–3 apical nodes, narrowly lanceolate or narrowly oblong, 10–19 mm, densely strigose to sericeous, obtuse or acute. Inflorescences cymose, umbelliform, or corymbiform, several to many flowered, strigose to strigillose; peduncle 2–12 mm; bracts lanceolate, 2–3 mm, acute; pedicels 3–11 mm. Calyx strigillose or puberulent to glabrescent; hypanthium portion in staminate flowers obconic, ca. 0.5 mm, in pistillate flowers cupuliform, 1.5–2 mm; limb dentate, ca. 1 mm; lobes triangular. Corolla white, 3–4 mm, outside glabrous, vil-

lous in throat, 5-parted for ca. 1/2; lobes ovate to subtriangular. Berries red or orange-yellow, subglobose, ca. 8 mm in diam. Fl. Jun–Aug, fr. Aug–Oct.

Thickets on mountains; 400–900 m. Guangdong, Guangxi, Yunnan [N Vietnam].

**2. *Urophyllum parviflorum*** F. C. How ex H. S. Lo, Bull. Bot. Res., Harbin 18: 278. 1998.

小花尖叶木 *xiao hua jian ye mu*

Shrubs or small trees; branches laterally compressed, often longitudinally sulcate along interpetiolar sides, glabrous except sparsely hispidulous on nodes. Petiole 5–8 mm, hispidulous in lines; leaf blade drying papery, adaxially greenish gray, abaxially pale brown, elliptic-oblong, oblanceolate, or oblong-lanceolate, 13–16 × 3–5.5 cm, adaxially glabrous, abaxially hispidulous along principal veins and strigillose to glabrescent on higher order venation and blade, base acute to rounded, apex rounded then abruptly caudate, tips narrowly triangular to linear, 15–20 mm; secondary veins 7–10 pairs, tertiary veins generally parallel; stipules caducous or persisting on apical 1 or 2 nodes, narrowly lanceolate to narrowly ligulate, 7–13 mm,

densely sericeous, acute to obtuse. Inflorescences corymbose to umbelliform, several flowered, strigillose to hispid; peduncle 3–5 mm; bracts lanceolate-linear, ca. 2 mm; pedicels 3–9 mm. Calyx strigillose; hypanthium portion in pistillate flowers cupulate, ca. 1.5 mm; limb ca. 1 mm, shallowly 4- or 5-lobed; lobes triangular. Corolla ca. 2 mm, lobed for ca. 1/2; lobes 4 or 5, triangular. Berries ellipsoid to subglobose, ca. 4 × 5.5 mm. Fl. May, fr. Aug.

- About 700 m. Yunnan (Jinping).

**3. *Urophyllum tsaianum*** F. C. How ex H. S. Lo, Bull. Bot. Res., Harbin 18: 279. 1998.

滇南尖叶木 *dian nan jian ye mu*

Shrubs or small trees, 2–6 m tall; branches subterete,

hispidulous. Petiole 5–8 mm, hispidulous; leaf blade drying papery, pale brown or greenish gray, narrowly lanceolate, narrowly elliptic-oblong, elliptic-oblong, or lanceolate, slightly inequilateral, 6–13.5 × 2–4 cm, adaxially glabrous, abaxially strigillose, base obtuse or acute, apex acuminate; secondary veins 6–9 pairs; stipules linear-lanceolate, 7–10 mm, densely adpressed sericeous or -villous, acuminate. Inflorescences corymbiform to umbelliform, few to several flowered, hispidulous; peduncle 5–10 mm; bracts subulate, ca. 2 mm; pedicels 3–6 mm, unequal. Calyx hispidulous to glabrous; hypanthium portion cupulate, ca. 2 mm; limb deeply lobed; lobes broadly triangular, ca. 0.6 mm. Corolla yellow or white, tubular, ca. 3 mm, glabrous outside, lobed for ca. 1/3; lobes triangular. Berries red, globose, ca. 5 mm in diam. Fl. Jul, fr. Jan–Feb.

- Dense forests on mountains; 1000–1500 m. S Yunnan.

## 96. *WENDLANDIA* Bartling ex Candolle, Prodr. 4: 411. 1830, nom. cons., not Willdenow (1799).

水锦树属 *shui jin shu shu*

Chen Tao (陈涛); Charlotte M. Taylor

Shrubs or trees, unarmed; branches sometimes flattened. Raphides absent. Leaves opposite or occasionally in whorls of 3, without or rarely with domatia, with margins rarely denticulate (apparently where scabrous projections form triangular thickenings), infrequently with venation not visible abaxially; stipules persistent or caducous as a whole or by fragmentation, interpetiolar, triangular to pandurate or leaflike (i.e., generally ovate and narrowed to a stipitate base), entire or rarely bilobed, erect and flat to longitudinally folded and/or spreading to reflexed. Inflorescences terminal, cymose, thyrsoid, or paniculiform, many flowered, sessile to pedunculate, bracteate. Flowers sessile or pedicellate, bisexual, monomorphic, often fragrant. Calyx limb 5-lobed. Corolla white, purple, or red, tubular, salverform, or funnelform, glabrous or pubescent inside, with top portion of tube often reflexed at anthesis; lobes (4 or)5, imbricate in bud, strongly reflexed to revolute at anthesis. Stamens (4 or)5, inserted in corolla tube near throat, partially to fully exserted; filaments short to developed; anthers dorsifixed, sometimes with connective prolonged in short apical and/or basal appendages. Ovary 2(or 3)-celled, ovules numerous in each cell on peltate axile placentas; stigma bifid or rarely clavate and shortly emarginate at apex (*Wendlandia pendula*), exserted. Fruit capsular, subglobose, loculicidally dehiscent across apical portion into 2 valves with valves later sometimes splitting septically, papery to woody, with calyx limb persistent; seeds numerous, small, compressed, sometimes narrowly winged; testa membranous, reticulate-striate; endosperm fleshy.

At least 90 species: mainly in tropical and subtropical Asia and a few in the Pacific region; 31 species (21 endemic) in China.

The flowers seem to open generally all at once on an individual plant and perhaps in the population. They are reported in several species to be strongly fragrant. W. C. Chen (in FRPS 71(1): 191. 1999) described the fruit as rarely septicidal, but this has not been reported by other authors and has not been seen on the specimens studied.

*Wendlandia* has been studied by several authors, notably in a comprehensive monograph by Cowan (Notes Roy. Bot. Gard. Edinburgh 16: 233–313, t. 232–235. 1932, with supplemental notes shortly afterward; Notes Roy. Bot. Gard. Edinburgh 18: 183–188. 1934) and then in treatments of the Chinese species by F. C. How (Sunyatsenia 7(1–2): 32–62. 1948) and later W. C. Chen (Acta Phytotax. Sin. 21: 277–284, 386–403. 1983).

Many *Wendlandia* species seem to be morphologically variable with much of the variation difficult to partition into distinct clusters, as discussed by Cowan (loc. cit. 1932). Cowan also evaluated characters used by various authors to distinguish species and concluded that many were variable and/or incorrectly interpreted, although he used several of these to distinguish infraspecific taxa. With more species known now, there also seems to be variation within species in some of the characters that Cowan considered reliable to distinguish species. W. C. Chen (loc. cit. 1983) used Cowan's characters to delimit some of his new species, but circumscribed other species to include a relatively wide range of variation in some of the same features (e.g., *W. pingpiensis*).

Cowan recognized four series and four subseries, distinguished by stigmas, anther, and stipule morphology as well as habit. These taxa were accepted by W. C. Chen in FRPS (loc. cit. 1999: 195, 196, 200, 202, 208, 218, 221); however, the classification following Cowan's treatment of several Chinese *Wendlandia* species described by recent authors is problematic because flowers are needed but are unknown for these. The key published by W. C. Chen (loc. cit. 1999: 192–195) closely follows that of Cowan except some leads were numbered incorrectly while others appear to be missing, and the updated information on morphological variation and geographic distribution was not added to the key so could be problematic to use. The key to *Wendlandia* species here follows that of W. C. Chen, to outline for reference the species distinctions in that treatment; however, it has been augmented with the new morphological and distributional information.

In addition to the species treated here, F. C. How (loc. cit.: 43) reported *Wendlandia ternifolia* Cowan provisionally from China based on *Tsang* 21937, *Liang* 67941, and *Zoo* 69290. However, W. C. Chen in FRPS (loc. cit. 1999: 192) commented that study of *Tsang* 21937 showed the calyx to have stiff pubescence, which is inconsistent with the protologue description of *W. ternifolia*, while the other two specimens cited have no flowers in

adequate condition for identification. Therefore, *W. ternifolia* was excluded from the Chinese flora; no new or alternative identification was given by Chen for these specimens.

- 1a. Most or all flowers with well-developed pedicels 2–6 mm; stipules triangular to broadly triangular, acute, cuspidate, or narrowly spatulate.
  - 2a. Shrubs or trees; petioles 0.5–1.5 cm; corolla lobes 1–2.5 mm; anthers 0.8–2 mm, subsessile or with filaments less than 1 mm.
    - 3a. Corolla with lobes ca. 1 mm, less than half as long as tube; anthers ca. 1 mm ..... 12. *W. laxa*
    - 3b. Corolla with lobes 1.5–2.5 mm, half as long as tube to  $\pm$  equal to tube; anthers 1.2–2 mm.
      - 4a. Leaves abaxially with secondary and higher order venation well marked; corolla white to yellow, with tube 1.5–4 mm ..... 8. *W. formosana*
      - 4b. Leaves abaxially with secondary and higher order venation hardly visible; corolla purplish red, with tube 2.3–3 mm ..... 16. *W. longipedicellata*
  - 2b. Low shrubs or sometimes trees up to 12 m tall; petioles 0.1–0.6 cm; corolla lobes 3.5–8 mm; anthers 2–3.5 mm, exserted on filaments 4–6 mm (*W. ser. Montigenae* Cowan).
    - 5a. Shrubs or trees 1–12 m tall; leaves elliptic-oblong, oblong-lanceolate, oblanceolate, or elliptic, 3–14.5 cm, glabrous on both surfaces; stipules spatulate to lanceolate or leaflike (i.e., ovate and stipitate); Hainan ..... 18. *W. merrilliana*
    - 5b. Leaves elliptic-lanceolate, lanceolate, narrowly lanceolate, ovate, or suborbicular, 0.8–3 cm, pubescent on one or both surfaces; stipules triangular, lanceolate-triangular, or ovate; mainland.
      - 6a. Leaves acute, shortly acuminate, or obtuse at apex, with secondary veins ca. 3 pairs, visible abaxially; calyx lobes linear-oblong, spatulate, or oblanceolate ..... 15. *W. longidens*
      - 6b. Leaves obtuse at apex, veins not visible abaxially; calyx lobes triangular or lanceolate ..... 28. *W. subalpina*
- 1b. Flowers sessile to shortly pedicellate, with pedicels up to 2 mm; stipules variously shaped, generally triangular, spatulate, ovate, suborbicular, leaflike, or pandurate.
  - 7a. Stipules triangular, ovate, broadly triangular, or leaflike, at apex acute, cuspidate, ligulate, or aristate, erect or slightly spreading with age.
    - 8a. Leaves subsessile or shortly petiolate, petioles up to 3 mm.
      - 9a. Leaves opposite or ternate, ovate to ovate-lanceolate, 1.8–4 cm wide, drying papery, margins not thickened nor edged with a vein; stigma clavate ..... 22. *W. pendula*
      - 9b. Leaves opposite, narrowly elliptic to narrowly lanceolate, 0.4–1.2 cm wide, drying thinly leathery, marginally edged with a thickened vein; stigma deeply bilobed ..... 25. *W. salicifolia*
    - 8b. Leaves petiolate, petioles 3–25 mm.
      - 10a. Stipule apex prolonged, ligulate, 5–7 mm ..... 9. *W. grandis*
      - 10b. Stipule apex acute, cuspidate, or shortly acicular, 0.5–2 mm.
        - 11a. Calyx lobes narrowly triangular to linear, 1–1.2 mm, equal or unequal on an individual flower with at least one of lobes longer than 1 mm.
          - 12a. Petioles 0.8–1.2 cm; stipules ca. 5 mm; corolla lobes ca. 1 mm ..... 6. *W. cavaleriei*
          - 12b. Petioles 0.8–1.5 cm; stipules 2–3 mm; corolla lobes 1.5–2.2 mm ..... 13. *W. ligustrina*
        - 11b. Calyx lobes lanceolate, triangular, or spatulate, 0.3–1.2 mm, equal or subequal.
          - 13a. Leaves strigillose to puberulent on both surfaces; corolla tube 8.5–11 mm ..... 1. *W. aberrans*
          - 13b. Leaves strigillose, puberulent, tomentulose, villous, or glabrescent on both surfaces; corolla tube 1.5–4 mm.
            - 14a. Calyx lobes 0.3–0.5 mm ..... 8. *W. formosana*
            - 14b. Calyx lobes 0.8–1 mm.
              - 15a. Inflorescences smaller, 5–6  $\times$  3–6 cm; calyx glabrous or sparsely villosulous; leaves sparsely pubescent to glabrous abaxially ..... 4. *W. brevipaniculata*
              - 15b. Inflorescences larger, 9–17  $\times$  6–22 cm; calyx glabrous to densely pilosulous, hirtellous, or villosulous; leaves glabrous to strigillose, tomentose, or villous abaxially.
                - 16a. Inflorescences 9–17  $\times$  9–22 cm; corolla outside with tubes and lobes variously glabrous, strigillose, and/or villosulous (including glabrous on tube and densely villosulous on lobes in subsp. *affinis*) ..... 29. *W. tinctoria*
                - 16b. Inflorescences 9–12  $\times$  6–11 cm; corolla outside glabrous on tube and densely villosulous or hirtellous on lobes ..... 31. *W. villosa*
        - 7b. Stipules triangular, ovate, suborbicular, leaflike, or pandurate, with apex obtuse, rounded, shortly acuminate, 2-lobed, or ligulate and usually spreading to reflexed.
          - 17a. Anthers linear-lanceolate, 1.3–2 mm, exserted from corolla on developed filaments; corolla 7–9.4 mm; capsule 2.5–3 mm in diam. (*W. ser. Euexsertae* Cowan p.p., *W. subser. Orbiculares* Cowan) ..... 27. *W. speciosa*

- 17b. Anthers lanceolate or elliptic, 0.5–1.7 mm, partially included, sessile or with filaments less than 1 mm; corolla 2–13.5 mm; capsule 1–2.5 mm in diam. (fruit unknown in *W. augustinii*, *W. erythroxyton*, *W. myriantha*, *W. parviflora*, *W. pubigera*) (*W. ser. Wendlandia* p.p., *W. subser. Paniculatae* Cowan).
- 18a. Leaves abaxially densely strigose or sericeous along midrib; inflorescences smaller, 4–10.5 × 3–10 cm; corolla 11.5–13.5 mm, red or purple; capsule 2–2.5 mm in diam. .... 3. *W. bouvardioides*
- 18b. Leaves abaxially glabrous, glabrescent, or sparsely to densely strigillose, puberulent, pilosulous, tomentose, hispidulous, or hirtellous; inflorescences often larger, 4–30 × 4–25 cm; corolla 2–6 mm, white, pale green, pale yellow, or yellowish green; capsule 1–2 mm in diam. (unknown in *W. augustinii*, *W. erythroxyton*, *W. myriantha*, *W. parviflora*, *W. pubigera*).
- 19a. Corolla tube 1–1.5 mm, with lobes equal to, longer than, or sometimes slightly shorter than tube; leaves 5–17 × 2–8.5 cm.
- 20a. Leaves glabrescent or sparsely strigillose to pilosulous abaxially; Guangdong, Guangxi ..... 5. *W. breviflora*
- 20b. Leaves densely ferruginous pubescent abaxially; Yunnan ..... 21. *W. parviflora*
- 19b. Corolla tube 2–5 mm, with lobes clearly shorter than tube; leaves 3–26 × 1.5–14 cm.
- 21a. Leaves drying leathery, abaxially with secondary veins plane and tertiary venation hardly or not visible.
- 22a. Calyx densely hirtellous ..... 14. *W. litseifolia*
- 22b. Calyx glabrous to sparsely strigillose ..... 20. *W. oligantha*
- 21b. Leaves drying papery to leathery, abaxially with secondary veins raised and tertiary venation easily visible and usually also raised (i.e., most common condition).
- 23a. Calyx glabrous to sparsely puberulent, with lobes 1.2–2 mm, entire to ciliate.
- 24a. Calyx lobes 1.2–2 mm; corolla tube 2–3.5 mm; Guangdong, Hainan ..... 10. *W. guangdongensis*
- 24b. Calyx lobes 1.2–1.5 mm; corolla tube 2.5–4 mm; Guangxi, Taiwan.
- 25a. Leaves entire or scabrous to denticulate marginally; stipules entire; Taiwan ..... 7. *W. erythroxyton*
- 25b. Leaves entire, smooth or ciliate marginally; stipules entire or 2-lobed; Guangxi ..... 19. *W. myriantha*
- 23b. Calyx with hypanthium portion and limb glabrous, glabrescent, or pilosulous, puberulent, tomentose, hirtellous, pilose, strigose, or strigillose, with lobes 0.3–1 mm.
- 26a. Leaves abaxially moderately to densely hirtellous, strigillose, pilosulous, pilose, or strigose with pubescence on lamina spreading and/or partly obscuring its surface.
- 27a. Leaves scaberulous on lamina adaxially; stipules usually equal to or only slightly wider than stem; corolla inside with short trichomes confined to lower to upper part of tube; Yunnan ..... 26. *W. scabra*
- 27b. Leaves sparsely hirtellous, hispidulous or scaberulous adaxially; stipules usually twice or more as wide as stem; corolla hirsute inside upper part of tube and throat ..... 30. *W. uvariifolia*
- 26b. Leaves abaxially glabrous to sparsely strigillose or hispidulous on lamina and strigillose to moderately hispidulous or hirtellous on principal veins.
- 28a. Leaves abaxially glabrous on lamina and sparsely strigillose and/or hirtellous on principal veins; Taiwan ..... 17. *W. luzoniensis*
- 28b. Leaves abaxially glabrous to hispidulous or strigillose; mainland.
- 29a. Stipules with apex ligulate, obtuse, often longitudinally folded ..... 9. *W. grandis*
- 29b. Stipules with apex oblanceolate to suborbicular, folded to usually flat.
- 30a. Corolla tube 4–5 mm; Yunnan.
- 31a. Stipules with apical portion 3–4 mm wide; leaves with secondary veins 7–9 pairs ..... 2. *W. augustinii*
- 31b. Stipules with apical part broad, ca. 10 mm wide; leaves with secondary veins 7–13 pairs ..... 23. *W. pingpienensis*
- 30b. Corolla tube 2–3 mm.
- 32a. Leaves smaller, 7–10.5 × 2–4 cm, abaxially glabrous on lamina and sparsely pubescent only on veins; secondary veins 7 or 8 pairs; Yunnan ..... 11. *W. jingdongensis*
- 32b. Leaves larger, 14.5–18 × 6–7 cm, abaxially glabrous to sparsely pubescent on lamina with pubescence denser along veins; secondary veins 10 or 11 pairs; Guangxi .... 24. *W. pubigera*

1. *Wendlandia aberrans* F. C. How, Sunyatsenia 7(1–2): 44. 1948.

广西水锦树 *guang xi shui jin shu*

Shrubs, 1–3 m tall; branches terete, yellowish brown, densely adpressed ferruginous hirsute. Leaves opposite; petiole 3–10 mm, appressed yellowish brown pubescent; blade drying papery and reddish yellow, oblong-elliptic or ovate-elliptic, 5–

16 × 2–5.8 cm, adaxially adpressed puberulent with pubescence denser along midrib, abaxially sparsely puberulent with pubescence denser along principal veins, base cuneate or acute, apex shortly caudate-acuminate or acute; secondary veins 6–12 pairs; stipules late deciduous to persistent, triangular, 3–5 mm, yellowish brown pubescent becoming glabrescent, cuspidate. Inflorescences congested-paniculate, narrowly pyramidal in outline, 5–10 × 3–8 cm, appressed ferruginous pubescent, tripartite

and sessile or pedunculate; bracts leaflike or filiform. Flowers subsessile to shortly pedicellate. Calyx grayish white pilosulous or hirtellous; hypanthium portion subglobose, 0.8–1.2 mm; limb lobed nearly to base; lobes lanceolate to triangular, 0.7–1.2 mm. Corolla reddish white, slenderly funnelform, glabrous outside; tube 8.5–11 mm, sparsely white villous at middle inside; lobes oblong-ovate, 1.5–2 mm. Anthers linear-oblong, 1–1.7 mm, subsessile, partially exserted. Stigma 2-lobed, ca. 0.8 mm. Capsules not seen. Fl. Apr–Dec.

- Forests on hill slopes; 900–1200 m. Guangxi (Napo).

W. C. Chen's key (in FRPS 71(1): 192. 1999) described the leaves of this species as hispidulous on both surfaces, but this conflicts with the protologue and Chen's species description.

**2. *Wendlandia augustinii*** Cowan, Notes Roy. Bot. Gard. Edinburgh 16: 298. 1932.

思茅水锦树 *si mao shui jin shu*

Shrubs, 2–3 m tall; branches terete, densely tomentulose to hirtellous becoming glabrescent. Leaves opposite; petiole 5–15 mm, densely tomentulose; blade drying papery, elliptic or elliptic-ovate, 9–15.5 × 2–6 cm, adaxially sparsely hispidulous to glabrous on lamina and sparsely to densely puberulent on principal veins, abaxially sparsely strigillose to hispidulous, base cuneate to acute, apex acute to acuminate; secondary veins 7–9 pairs; stipules generally persistent, pandurate, 5–7 × 3–4 mm, densely hirtellous, pilosulous, or strigillose, apically spreading, obtuse to rounded. Inflorescences paniculate, pyramidal in outline, 11–12 × 11–14 cm, branched to 2 or 3 orders, densely pilosulous to strigillose, pedunculate; peduncle 0.8–1.5 cm; bracts linear to narrowly lanceolate, 1–1.5 mm. Flowers sessile or subsessile. Calyx densely pilosulous to puberulent; hypanthium portion ellipsoid to turbinate, 0.8–1.2 mm; limb deeply lobed; lobes triangular, ca. 0.3 mm. Corolla white, funnelform, outside glabrous; tube 4–5 mm, inside glabrous or puberulent in throat; lobes ovate, 0.6–1 mm. Anthers elliptic, subsessile, ca. 0.8 mm, partially exserted. Stigma bilobed, ca. 0.4 mm. Capsules not seen.

- Forests on mountains; ca. 1300 m. Yunnan (Simao).

**3. *Wendlandia bouvardioides*** Hutchinson in Sargent, Pl. Wilson. 3: 393. 1916.

薄叶水锦树 *bao ye shui jin shu*

Shrubs or small trees, 1–5 m tall; branches terete, densely strigose to hirsute. Leaves opposite; petiole 0.4–1.2 cm, strigose to strigillose; blade drying thinly papery, elliptic, narrowly elliptic, or lanceolate, 5–20 × 1.2–5.5 cm, adaxially strigillose on principal veins and glabrescent on lamina, abaxially glabrescent on lamina, strigose to sericeous on principal veins, and strigillose on higher order veins, base acute to attenuate, apex long acuminate; secondary veins 5–8 pairs; stipules deciduous, suborbicular, ovate, or leaflike, 3–5 × 3.5–5 mm, strigose to glabrescent, base shortly stipitate, apex spreading to reflexed, obtuse to shortly acuminate. Inflorescences congested-cymose or thyrsoid, cylindrical in outline, branched to 1 or 2 orders, 4–10.5 × 3–10 cm, densely strigose, hirsute, or strigillose, subsessile to pedunculate; peduncle to 1 cm; bracts subulate, linear,

narrowly triangular, or lanceolate, 1–5 mm; pedicels to 1 mm. Flowers subsessile to pedicellate. Calyx densely strigillose; hypanthium portion turbinate, ca. 1 mm; limb deeply lobed; lobes lanceolate to narrowly triangular, 0.3–1.5 mm, unequal on an individual flower (this entire size range found on one flower). Corolla red or purple, salverform or tubular, outside glabrous; tube 10–11 mm; lobes oblong to lanceolate, 1.5–2.5 mm, obtuse to rounded. Anthers lanceolate, 1–1.7 mm, partially exserted, subsessile. Stigma 2-lobed, 0.3–0.5 mm. Capsules globose, 2–2.5 mm in diam., strigillose. Fl. Feb–Dec, fr. May–Dec.

- Thickets or forests in valleys, on mountain slopes, or at stream-sides; 1200–1800 m. Yunnan.

This species seems to have been grouped together with *Wendlandia* species with relatively long, fully exserted anthers by W. C. Chen (in FRPS 71(1): 192–193. 1999), but it actually has relatively short fat anthers that are not exserted, as noted in the protologue.

**4. *Wendlandia brevipaniculata*** W. C. Chen, Acta Phytotax. Sin. 21: 386. 1983.

吹树 *chui shu*

Trees; branches subterete, yellowish brown velutinous or mealy pubescent. Leaves opposite; petiole 0.8–1.2 cm, puberulent; blade drying leathery, elliptic or ovate-elliptic, 4.5–10.5 × 2.5–4.5 cm, sparsely pubescent to glabrescent on both surfaces with pubescence denser along principal veins, base cuneate to obtuse, apex abruptly shortly acuminate or acute; secondary veins 8–10 pairs; stipules generally persistent, triangular to ovate, ca. 4 mm, puberulent to strigillose, apex cuspidate, erect. Inflorescence paniculate, subglobose, 5–6 × 3–6 cm, densely tomentose or strigillose to glabrescent, sessile and tripartite or pedunculate; peduncle 0.8–1.8 cm; bracts lanceolate to linear, 1–5 mm. Flowers subsessile. Calyx glabrous or sparsely villosulous; hypanthium subglobose, ca. 0.8 mm; limb lobed nearly to base; lobes lanceolate, ca. 0.8 mm. Corolla tubular-salverform, outside glabrous or villosulous on lobes; tube 2–3 mm, white hirsute inside; lobes elliptic, ca. 1 mm. Filaments ca. 0.8 mm; anthers elliptic, ca. 0.8 mm, partially exserted. Stigma 2-lobed, ca. 0.2 mm. Capsules globose, ca. 2 mm in diam., puberulent, villosulous, or subglabrous. Fl. and fr. Sep.

- Forests; 200–300 m. Yunnan (Jingdong).

**5. *Wendlandia brevitiba*** Chun & F. C. How ex W. C. Chen, Acta Phytotax. Sin. 21: 397. 1983.

短筒水锦树 *duan tong shui jin shu*

Shrubs, 0.5–3 m tall; branches flattened to terete, densely hirtellous, pilosulous, or strigillose. Leaves opposite; petiole 0.3–1.5 cm, densely hirtellous or pilosulous; blade drying papery, elliptic-oblong, elliptic-ovate, or elliptic, 5–15 × 2–6.3 cm, adaxially glabrous or sparsely strigillose on lamina and densely strigillose on principal veins, abaxially sparsely strigillose to glabrous on lamina and densely strigillose to pilosulous on principal veins, base cuneate, apex acuminate to shortly acuminate; secondary veins 4–8 pairs; stipules deciduous, suborbicular, elliptic, or pandurate, 2–6 × 1.5–4 mm, moderately to densely strigillose, spreading at apex to fully reflexed, apex obtuse to rounded. Inflorescences rather laxly paniculate, pyra-

midal in outline, branched to 1 or 2 orders, 4–7 × 4–11 cm, densely pilosulous to hirtellous, sessile and tripartite or pedunculate; peduncle 0.3–3.5 cm; bracts linear to triangular, 0.3–1 mm. Flowers subsessile. Calyx densely strigillose to pilosulous; hypanthium portion subglobose, ca. 0.8 mm; limb deeply lobed; lobes lanceolate to triangular, 0.5–1 mm. Corolla white, tubular or salverform, sparsely pilosulous or glabrous outside; tube 1–1.5 mm, sparsely pubescent or glabrescent inside; lobes oblong-ovate or subovate, 1–1.5 mm, rounded to obtuse. Anthers elliptic, ca. 0.8 mm, subsessile, partially exserted. Stigma bifid, ca. 1 mm. Capsules subglobose, 1–1.5 mm in diam., pilosulous. Fl. Apr–May, fr. Jun–Dec.

• Forests in valleys; 100–900 m. Guangdong, Guangxi.

**6. *Wendlandia cavaleriei*** H. Léveillé, Repert. Spec. Nov. Regni Veg. 10: 434. 1912.

贵州水锦树 *gui zhou shui jin shu*

*Wendlandia feddei* H. Léveillé.

Shrubs or small trees, 1.5–3 m tall; branches brown, subterete, strigillose to glabrescent. Leaves opposite; petiole 0.8–1.2 cm, strigillose; blade drying subleathery, ovate, elliptic, or oblanceolate-elliptic, 4.5–13.5 × 2–6 cm, adaxially glabrous to sparsely strigillose on lamina and sparsely pubescent along midrib, abaxially sparsely hirsute with pubescence denser along veins, base obtuse to acute, apex acute or acuminate; secondary veins 7–10 pairs; stipules generally persistent, broadly triangular, ca. 5 mm, strigillose, apex erect, cuspidate. Inflorescence paniculate, pyramidal to ovate in outline, 7–21 × 6–15 cm, densely many flowered, branched to 2 or 3 orders, densely yellowish brown pilosulous, sessile and tripartite or pedunculate; peduncle 1–6 cm; bracts triangular, 1–3 mm. Flowers sessile. Calyx densely hirtellous to pilosulous; hypanthium portion subglobose, ca. 1 mm; limb deeply lobed; lobes narrowly triangular, 1–1.2 mm. Corolla white or purple, tubular-funnelform, glabrous to pilosulous; tube ca. 3.5 mm, inside white villosulous; lobes ovate to elliptic, ca. 1 mm. Anthers elliptic, ca. 0.8 mm, subsessile, partially exserted. Stigma 2-lobed, ca. 0.7 mm. Capsules globose, ca. 1.5 mm in diam., pilosulous. Fl. Mar–Apr, fr. Apr.

• Forests or thickets on hill slopes; 200–700 m. Guangxi (Tianyang), Guizhou.

W. C. Chen (in FRPS 71(1): 203. 1999) described the corollas as glabrous outside, but Cowan (Notes Roy. Bot. Gard. Edinburgh 16: 263–264. 1932) specifically noted that the corollas of *Wendlandia cavaleriei* vary from glabrous to pubescent in China, as described here.

**7. *Wendlandia erythroxylon*** Cowan, Notes Roy. Bot. Gard. Edinburgh 16: 299. 1932.

红木水锦树 *hong mu shui jin shu*

Trees, ca. 7 m tall; wood firm, red; branches quadrate, brownish gray, moderately to densely mixed pubescent, hirsute and pilosulous, sometimes becoming glabrescent. Leaves opposite; petiole 0.5–1 cm, moderately to densely strigillose to hirtellous; blade drying leathery or papery, elliptic-ovate, obovate, or ovate, 5–12 × 3–5.5 cm, adaxially sparsely strigillose or hirtellous to glabrescent, abaxially sparsely to moderately hirtel-

lous with pubescence denser along principal veins, base obtuse to acute, margins scaberrulous to denticulate, apex acute to acuminate; secondary veins 6 or 7 pairs; stipules generally persistent, suborbicular to pandurate, 5–8 × 4–5.5 mm, sparsely to densely strigillose or strigose basally and glabrescent above, apex usually spreading to reflexed, obtuse to rounded. Inflorescence rather laxly paniculate, 5–13 × 3–12.5 cm, sparsely to densely hirtellous to hirsute, tripartite and sessile or pedunculate; peduncle 1–6 cm; bracts ligulate to lanceolate or narrowly elliptic, 1.2–5 mm, often glabrescent. Flowers sessile or subsessile. Calyx glabrous or sparsely pilose; hypanthium portion subglobose to ellipsoid, ca. 0.8 mm; limb lobed nearly to base; lobes ovate-oblong to ligulate, ca. 1.2 mm, ciliate. Corolla tubular to salverform, glabrous outside; tube 2.5–3 mm, in throat white hirsute; lobes ovate, 1–1.2 mm. Anthers elliptic, ca. 0.8 mm, subsessile, partially exserted. Stigma ca. 0.5 mm, 2-lobed. Capsules unknown. Fl. Apr–Oct.

• Forests on hills of low elevations. Taiwan.

The leaf margins of the specimens seen are denticulate, with the teeth apparently scabrosities rather than dentate mesophyll tissue.

**8. *Wendlandia formosana*** Cowan, Notes Roy. Bot. Gard. Edinburgh 16: 247. 1932.

水金京 *shui jin jing*

Shrubs or trees, 2–8 m tall; branches flattened to terete, densely puberulent to glabrescent, reddish brown to gray. Leaves opposite; petiole 0.7–2.5 cm, thinly puberulent or glabrous; blade drying papery, elliptic or elliptic-lanceolate, 6–14 × 2–6.5 cm, both surfaces glabrescent or sparsely to densely puberulent or strigillose at least on principal veins, base acute to obtuse, apex acute to acuminate; secondary veins 5–10 pairs; stipules generally persistent, broadly triangular, 2–3.5 mm, densely strigillose to puberulent, apex erect, acute, cuspidate, or sometimes narrowly spatulate. Inflorescences paniculate, pyramidal in outline, 12–20 × 10–20 cm, branched to 2 or 3 orders, densely puberulent to strigillose, sessile and tripartite or pedunculate; peduncle 2–4 cm; bracts linear, spatulate, or narrowly elliptic, 1–6 mm; pedicels 0.5–4 mm. Flowers subsessile to pedicellate. Calyx glabrous; hypanthium portion subglobose, ca. 0.8 mm; limb lobed nearly to base; lobes triangular, 0.3–0.5 mm, sometimes ciliolate. Corolla white to yellow, funnelform, glabrous outside; tube 1.5–4 mm, villosulous in throat; lobes spatulate, 1.5–2.5 mm. Filaments ca. 0.8 mm; anthers linear-lanceolate, ca. 2 mm, partially exserted. Stigma 2-lobed, ca. 0.8 mm. Capsules globose, 1.8–2 × 2–2.2 mm, glabrous. Fl. Apr–Jun, fr. May–Dec.

Thickets or forests at low elevations or on hills or mountains; 200–1600 m. Guangdong, Guangxi, Taiwan, Yunnan [Japan (Ryukyu Islands), Vietnam].

- 1a. Leaf secondary veins 7–10 pairs, closely set, usually prominent abaxially; corolla 3–5 mm, with tube slightly longer than lobes ..... 8a. subsp. *breviflora*
- 1b. Leaf secondary veins 5–9 pairs, rather well spaced, prominulous abaxially; corolla 5–6.5 mm, with tube markedly longer than lobes ..... 8b. subsp. *formosana*

**8a. *Wendlandia formosana* subsp. *breviflora*** F. C. How, Sunyatsenia 7(1–2): 38. 1948.

短花水金京 duan hua shui jin jing

Leaf secondary veins 7–10 pairs, closely set, usually prominent abaxially. Corolla tube 1.5–3 mm, lobes 1.5–2 mm. Fl. Apr–Jun, fr. May–Dec.

Thickets or forests on hills or mountains; 200–1600 m. Guangdong, Guangxi, Yunnan [Vietnam].

**8b. *Wendlandia formosana* subsp. *formosana***

水金京(原亚种) shui jin jing (yuan ya zhong)

Secondary veins 5–7 pairs in leaves of flowering branches, 5–9 pairs in leaves of vegetative branches (*Tsang 23991*, MO), rather well spaced, prominulous abaxially. Corolla tube 3–4 mm, lobes 2–2.5 mm. Fl. Apr–Jun, fr. Jun–Aug.

Forests on hills at low elevations; 200–500 m. Taiwan [Japan (Ryukyu Islands)].

**9. *Wendlandia grandis*** (J. D. Hooker) Cowan, Notes Roy. Bot. Gard. Edinburgh 16: 261. 1932.

西藏水锦树 xi zang shui jin shu

*Wendlandia tinctoria* (Roxburgh) Candolle var. *grandis* J. D. Hooker, Fl. Brit. India 3: 38. 1880.

Trees, 3–4 m tall; branches brown, fissured, strigillose to glabrescent. Leaves opposite; petiole 0.5–1.5 cm, strigillose; blade drying leathery or thickly papery, elliptic, elliptic-oblong, or obovate-oblong, 5–17 × 2.5–7 cm, adaxially glabrous or sparsely strigillose, abaxially glabrous or sparsely pubescent on lamina, sparsely hispidulous along veins, and with pubescence denser along midrib, base cuneate or acute, apex acute or shortly acuminate; secondary veins 8–12 pairs; stipules generally persistent, triangular to ovate, 9–12 mm, strigillose, apex erect to spreading, ligulate, 5–7 mm, often longitudinally folded. Inflorescences paniculate, ovoid, 9–17 × 5–15 cm, densely brown hirsute; bracts lanceolate, ca. 5 mm. Flowers sessile. Calyx densely brown hirtellous; hypanthium portion ca. 1 mm; limb deeply lobed; lobes lanceolate, 0.5–1 mm. Corolla white, funelform, glabrous outside; tube ca. 4 mm, white hirsute inside; lobes triangular, 1–1.2 mm. Anthers elliptic, ca. 0.8 mm, subsessile, partially exserted. Stigma 2-lobed. Capsules subglobose, ca. 2 mm in diam., pubescent. Fl. and fr. Aug.

Evergreen forests, secondary forests; 700–1300 m. Xizang (Mêdog) [Bangladesh, Bhutan, India, Myanmar, Nepal].

Springate et al. (Fl. Bhutan 2(2): 754. 1999) described the leaf size of plants from Bhutan as 10–24 × 5–11 cm and the corolla tubes there as 2.5–5 mm; these measurements might be found in Chinese plants.

**10. *Wendlandia guangdongensis*** W. C. Chen, Acta Phytotax. Sin. 21: 393. 1983.

广东水锦树 guang dong shui jin shu

Shrubs or trees, 4–6 m tall; branches terete, moderately to densely hirsute. Leaves opposite; petiole 0.3–1.2 cm, moderately to densely hirtellous; blade drying thickly papery, lanceolate-oblong or ovate-elliptic, 7–16 × 3–8.5 cm, adaxially

sparsely strigillose or puberulent to glabrescent on lamina and moderately to densely strigillose or hirtellous on principal veins, abaxially sparsely to moderately hirtellous throughout, base rounded to obtuse, apex obtuse, shortly acuminate, or acute; secondary veins 7–11 pairs; stipules generally persistent, pandurate, 5–6 × 4–6 mm, glabrescent, with upper part spreading to reflexed, apex rounded to obtuse. Inflorescences paniculate, branched to 2 or 3 orders, 13–17 × 10–20 cm, densely hirtellous to hirsute, pedunculate; peduncle 1–2 cm; bracts narrowly elliptic to oblanceolate, 1.5–3 mm. Flowers sessile in glomerules. Calyx glabrous; hypanthium portion subglobose, ca. 0.8 mm; limb divided nearly to base; lobes lanceolate or narrowly oblong, 1.2–2 mm, sparsely to densely ciliate. Corolla white or greenish yellow, tubular to salverform, glabrous outside; tube 2–3.5 mm, in throat white hirsute; lobes suborbicular, ca. 1 mm. Anthers elliptic, ca. 0.7 mm, subsessile, partially exserted. Stigma 2-lobed, ca. 0.3 mm. Capsules subglobose, ca. 1.5 mm in diam., glabrous. Fl. Mar–Apr, fr. May.

• Thickets or forests in ravines or on hill slopes; 100–800 m. Guangdong, Hainan.

The ciliate filaments on the margins of the calyx lobes give the appearance of pilose pubescence on all of the calyx at first glance, but when teased apart the individual hypanthia on the material seen are completely glabrous.

**11. *Wendlandia jingdongensis*** W. C. Chen, Acta Phytotax. Sin. 21: 396. 1983.

景东水锦树 jing dong shui jin shu

Shrubs, ca. 3 m tall; branches pubescent. Petiole 0.7–1 cm, pubescent; leaf blade drying leathery, lanceolate-elliptic, 7–10.5 × 2–4 cm, adaxially glabrous or sparsely puberulent along veins, abaxially sparsely pubescent along veins and glabrous on lamina, base cuneate or acute, apex acuminate; secondary veins 7 or 8 pairs; stipules pandurate, as wide as or wider than branchlets, apex erect, rounded. Inflorescences 9–15 × 10–15 cm, densely brown hirsute. Flowers sessile. Calyx pubescent; lobes lanceolate. Corolla pale yellow, glabrous outside; tube 2.5–3 mm, white hirsute inside; lobes ca. 0.5 mm. Anthers elliptic, ca. 0.6 mm, subsessile, partially exserted. Stigma bifid. Capsules subglobose, ca. 1.5 mm in diam., densely pubescent. Fl. and fr. May.

• Forests on mountains; ca. 1700 m. Yunnan (Jingdong).

**12. *Wendlandia laxa*** S. K. Wu ex W. C. Chen, Acta Phytotax. Sin. 21: 390. 1983.

疏花水锦树 shu hua shui jin shu

Small trees, 5–8 m tall; branches mealy puberulent. Petiole 0.7–1.5 cm, glabrescent; leaf blade drying papery to thinly leathery, lanceolate-elliptic to elliptic, 4.5–13 × 2–5 cm, both surfaces glabrous throughout or puberulent on principal veins, base acute to obtuse, apex acute to shortly acuminate; secondary veins 6 or 7 pairs; stipules persistent, broadly triangular, 2.4–4.5 mm, glabrescent, apex erect, cuspidate. Inflorescences paniculate, pyramidal, 13–22 × 12–18 cm, densely puberulent; pedicels 2–4.5 mm. Flowers pedicellate. Calyx puberulent to glabrous; hypanthium portion turbinate; limb lobed nearly to

base; lobes ovate. Corolla white, tubular-salverform, outside puberulent to glabrous; tube 3.5–4 mm, sparsely puberulent inside; lobes subrounded, ca. 1 mm. Anthers elliptic, ca. 0.8 mm, partially exserted. Stigma 2-lobed. Capsules subglobose, glabrescent. Fl. Nov, fr. Jul, Dec.

- Mixed forests; 500–1000 m. Yunnan (Jingdong).

**13. *Wendlandia ligustrina*** Wallich ex G. Don, Gen. Hist. 3: 518. 1834.

小叶水锦树 xiao ye shui jin shu

Shrubs, 1.5–3 m tall; branches flattened to quadrangular, strigillose to glabrescent. Leaves opposite; petiole 0.8–1.5 cm, strigillose to glabrescent; blade drying leathery, dark brown adaxially, reddish brown abaxially, elliptic or elliptic-ovate, 3–12 × 1.5–6 cm, adaxially glabrous, abaxially glabrescent to sparsely strigillose or puberulent at least along principal veins, base cuneate and sometimes shortly decurrent, apex acute or obtuse; secondary veins 6–8 pairs; stipules generally persistent, broadly triangular, 2–3 mm, strigillose to glabrescent, apex erect, cuspidate. Inflorescences paniculate, pyramidal, 15–17 × 12–20 cm, branched to 2 or 3 orders, densely hirtellous to strigillose, sessile and tripartite or pedunculate; peduncle 2–3 cm; bracts 1.5–6 mm; pedicels to 1 mm. Flowers sessile to shortly pedicellate. Calyx moderately to sparsely strigillose; hypanthium portion ellipsoid, ca. 1 mm; limb lobed nearly to base; lobes narrowly triangular to linear, 1–1.5 mm, generally unequal on an individual flower. Corolla yellow or pale yellowish green, salverform to tubular-funnelform, glabrous outside; tube 3.5–5 mm, pilose in throat; lobes narrowly oblong to spatulate, 1.5–2.2 mm. Filaments ca. 1 mm; anthers linear-lanceolate, 1.2–1.5 mm, partially exserted. Stigma 2-lobed, ca. 1 mm. Capsules subglobose, ca. 2 mm, strigillose. Fl. Jun–Feb of following year.

Forests in valleys; 1500–1600 m. Guizhou (Qinglong), Yunnan [Myanmar].

**14. *Wendlandia litseifolia*** F. C. How, Sunyatsenia 7(1–2): 46. 1948.

木姜子叶水锦树 mu jiang zi ye shui jin shu

Trees, ca. 10 m tall; branches terete to subquadrangular, densely brown hirtellous to glabrescent. Leaves opposite; petiole 0.5–1.2 cm, densely hirtellous to strigillose; blade drying subleathery, obovate, obovate-elliptic, or rarely elliptic, 6.4–11.5 × 3–6.5 cm, adaxially sparsely hispidulous to puberulent with pubescence denser along midrib, abaxially sparsely to moderately strigillose or hirtellous with pubescence denser along veins, base obtuse, apex acute to abruptly and shortly acuminate; secondary veins 6–8 pairs, plane to hardly visible abaxially; stipules generally persistent, pandurate, 3–5 × 1.5–2 mm, densely strigillose, apex suberect to spreading, subrounded. Inflorescences paniculate, 7–10 × 4–5 cm, branched to 2 or 3 orders, dark yellow- to reddish brown tomentose to hirtellous, pedunculate; peduncle 0.5–0.8 cm; bracts linear to narrowly elliptic, 1–3 mm. Flowers sessile, densely grouped. Calyx densely hirtellous; hypanthium portion subglobose, ca. 0.8 mm; limb lobed nearly to base; lobes triangular to ovate, ca. 0.5 mm. Corolla pale yellow, tubular-funnelform, glabrous outside; tube 2.5–3 mm, sparsely pilose in throat; lobes ovate, ca. 1 mm.

Anthers elliptic, ca. 0.7 mm, subsessile, partially exserted. Stigma 2-lobed, ca. 0.2 mm. Capsules subglobose to ovoid, ca. 2 × 2 mm, hirtellous. Fl. and fr. Jun.

- Forests on mountains or hills; ca. 800 m. Guangxi (Tianlin).

This species was included by How (loc. cit.) and W. C. Chen (Acta Phytotax. Sin. 21: 391. 1983) in the group of *Wendlandia* species with erect, triangular, acute stipules; but examination of an isotype (MO!) and careful study of the protologue (including the figure) shows that the stipules are oblanceolate to pandurate, with the apex narrow but mostly not spreading from the stem on most nodes.

**15. *Wendlandia longidens*** (Hance) Hutchinson in Sargent, Pl. Wilson. 3: 392. 1916.

水晶榉子 shui jing ke zi

*Hedyotis longidens* Hance, J. Bot. 20: 289. 1882; *Wendlandia henryi* Oliver.

Subshrubs, much branched, 0.2–1.5 m tall; branches terete, densely strigillose, hirtellous, or hispidulous. Leaves opposite; petiole 0.5–2 mm, strigillose to hirtellous; blade drying papery, elliptic-lanceolate, lanceolate, narrowly lanceolate, or ovate, 0.8–3 × 0.3–1 cm, adaxially densely hispidulous to glabrous, abaxially densely to sparsely hispidulous or strigillose or glabrous, base acute and usually decurrent, apex acute to shortly acuminate or rarely obtuse; secondary veins ca. 3 pairs, occasionally with foveolate pilosulous domatia; stipules lanceolate, triangular, or ovate-triangular, 2.5–4.5 mm, densely strigillose to hispidulous, apex erect to spreading, acute to cuspidate. Inflorescence paniculate to cymose, corymbiform to subglobose, 2–4 × 2–4 cm, densely strigillose, hirtellous, or strigose, sessile and tripartite or pedunculate; peduncle 3–6 mm; bracts linear to narrowly triangular, 0.5–5 mm; pedicels 2–3 mm. Flowers pedicellate. Calyx densely strigillose to glabrescent; hypanthium portion turbinate to ellipsoid, 1–2 mm; limb lobed nearly to base; lobes linear-oblong to spatulate or oblanceolate, 2–3 mm. Corolla white, tubular-salverform, glabrous outside; tube 7–8 mm; lobes linear-oblong, 7–8 mm. Filaments 5–6 mm; anthers linear-lanceolate, 3–3.2 mm, exserted. Stigma 2-lobed, ca. 2 mm. Capsule subglobose, 2–2.5 mm in diam., densely strigillose to glabrescent, with calyx lobes elongating, up to 4 mm. Fl. May–Jul, fr. Jul–Nov.

- Thickets at riversides or on mountain slopes; near sea level to 1800 m. Guizhou (Chishui), Hubei (Yichang), Sichuan, Yunnan.

**16. *Wendlandia longipedicellata*** F. C. How, Sunyatsenia 7(1–2): 39. 1948.

长梗水锦树 chang geng shui jin shu

Shrubs, ca. 1.5 m tall; branchlets ferruginous pubescent. Leaves opposite; petiole 0.5–1 cm, glabrous or sparsely pubescent; blade drying leathery, elliptic or lanceolate-elliptic, 4–8 × 0.8–2 cm, adaxially glabrous, abaxially sparsely pubescent along midrib, base acute and usually decurrent, apex acute; secondary veins not easily visible; stipules generally persistent, broadly triangular, 1.5–3 mm, apex erect, acute. Inflorescence paniculate, lax, pyramidal, 6–10.5 × 4.5–10.5 cm, ferruginous pilosulous, sessile and tripartite or pedunculate; peduncle 1.8–3.6 cm; pedicels 3–6 mm. Flowers pedicellate. Calyx sparsely

pilosulous or glabrous; hypanthium portion subglobose, ca. 1.75 mm; limb lobed nearly to base; lobes triangular, ca. 0.75 mm. Corolla purplish red, tubular-salverform, glabrous outside; tube 2.3–3 mm, sparsely strigillose inside; lobes narrowly oblong to spatulate, 1.7–2 mm. Anthers linear-lanceolate, ca. 1.2 mm, subsessile, partially exserted. Stigma 2-lobed, ca. 0.5 mm. Capsules not seen. Fl. Feb.

• Forests on mountains; ca. 1600 m. Yunnan (Luxi).

**17. *Wendlandia luzoniensis*** Candolle, Prodr. 4: 412. 1830.

吕宋水锦树 lǚ song shuǐ jīn shù

*Wendlandia luzoniensis* var. *membranifolia* (Elmer) Cowan; *W. membranifolia* Elmer.

Shrubs or small trees; branches flattened-quadrate, glabrous to sparsely strigillose. Leaves opposite; petiole 0.8–1.2 cm, glabrous to sparsely strigillose; blade drying papery, ovate-oblong or elliptic, 10–20 × 4.5–7 cm, glabrous on both surfaces or sparsely strigillose on principal veins abaxially, base cuneate to acute, apex acute to shortly acuminate; secondary veins 6–9 pairs; stipules generally persistent, suborbicular, obovate, oblanceolate, or pandurate, 4–6 × 1–3 mm, glabrous or sparsely strigillose, apex erect to spreading, obtuse to rounded. Inflorescences paniculate, pyramidal to broadly obconic in outline, branched to 3 or 4 orders, 10–12 × 12–15 cm, densely strigillose to hirtellous, pedunculate; peduncle 0.8–1 cm; bracts linear to narrowly lanceolate, 0.5–2 mm. Flowers sessile or subsessile. Calyx with hypanthium portion subglobose, 1–1.5 mm, densely puberulent to strigillose; limb deeply lobed; lobes triangular to lanceolate, 0.5–1 mm, glabrous. Corolla white, tubular or tubular-funnelform, glabrous outside; tube 3–4 mm, villosulous in throat; lobes ovate, 0.8–1.5 mm. Anthers elliptic, ca. 1 mm, subsessile, partially exserted. Stigma 2-lobed, ca. 0.3 mm. Capsules subglobose, 1.5–2 mm in diam., moderately to sparsely strigillose. Fl. and fr. Jul–Aug.

Forests. Taiwan (Taidong) [?India, Philippines, ?Vietnam].

*Wendlandia membranifolia* was cited by W. C. Chen (in FRPS 71(1): 214. 1999) as a synonym of *W. luzoniensis*, apparently based on Cowan's 1932 treatment (Notes Roy. Bot. Gard. Edinburgh 16: 294. 1932). However, Cowan subsequently (Notes Roy. Bot. Gard. Edinburgh 18: 187. 1934) separated these plants as *W. luzoniensis* var. *membranifolia*; because of the inclusion of the name *W. membranifolia*, this other name is here added too.

**18. *Wendlandia merrilliana*** Cowan, Notes Roy. Bot. Gard. Edinburgh 18: 303. 1935.

海南水锦树 hǎi nán shuǐ jīn shù

Shrubs or rarely trees, 1–3(–12) m tall; branches terete to somewhat flattened or quadrangular, sparsely strigillose or pilosulous to usually glabrous. Leaves opposite; petiole 1–6 mm, glabrous; blade drying leathery or subleathery, adaxially pale green to dark gray-green, abaxially rather pale or reddish brown to dark purple-gray or purple-black, elliptic-oblong, oblong-lanceolate, oblanceolate, or elliptic, 3–14.5 × 0.8–5 cm, glabrous on both surfaces, base cuneate to rounded, truncate, or cordulate, apex acute to acuminate; secondary veins 5–9 pairs; stip-

ules caducous or persistent, spatulate, lanceolate, or leaflike, 1–10 mm, glabrous, apex erect to spreading, acute. Inflorescence cymose to paniculate, narrowly pyramidal, 1.5–10 × 1.5–6.6 cm, branched to 2 orders, puberulent to glabrescent, pedunculate; peduncle 0.3–3 cm; bracts linear, lanceolate, or spatulate, 0.3–3 mm; pedicels 2–3.5 mm. Flowers pedicellate. Calyx glabrous; hypanthium portion subglobose to ellipsoid, 1.5–2 mm; limb deeply lobed; lobes triangular, 0.5–1 mm. Corolla white, salverform, glabrous outside; tube 5–8 mm, pilose in throat; lobes narrowly oblong, 5–6 mm. Filaments 4–4.5 mm; anthers linear-lanceolate, 3–3.3 mm, exserted. Stigma 2-lobed, 1.5–2 mm. Capsules red or purplish black, subglobose to ovoid, 2–3 × 2.5–3.5 mm, glabrous. Fl. and fr. Apr to Jan of following year.

• Open spaces or streamsides and rocks in forests on mountains; 400–1400 m. Hainan.

This species was included by Cowan in a group of generally similar species that are all reduced shrubs, but it apparently becomes rather large compared to the other species; also its stipules are anomalous in the group, as the other species otherwise have very narrow triangular stipules.

- 1a. Branch internodes 0.5–7 cm; leaves larger, 4.5–14.5 × 1.5–5 cm; stipules 4–10 mm, spatulate, lanceolate, or leaflike ..... 18a. var. *merrilliana*
- 1b. Branch internodes 0.4–2.2 cm; leaves smaller, 3–5 × 0.8–1.5 cm; stipules 1–4 mm, spatulate to lanceolate ..... 18b. var. *parvifolia*

**18a. *Wendlandia merrilliana* var. *merrilliana***

海南水锦树(原变种) hǎi nán shuǐ jīn shù (yuán biàn zhōng)

Branch internodes 0.5–7 cm. Leaves 4.5–14.5 × 1.5–5 cm; stipules spatulate, lanceolate, or leaflike, 4–10 mm. Fl. and fr. Apr to Jan of following year.

• Open spaces or streamsides and rocks in forests on mountains; 400–1400 m. Hainan.

**18b. *Wendlandia merrilliana* var. *parvifolia*** F. C. How, Sunyatsenia 7(1–2): 61. 1948.

细叶海南水锦树 xì yè hǎi nán shuǐ jīn shù

Branch internodes 0.4–2.2 cm. Leaves 3–5 × 0.8–1.5 cm; stipules spatulate to lanceolate, 1–4 mm. Fr. Oct.

• On rocks, infrequent. Hainan (Dongfang).

**19. *Wendlandia myriantha*** F. C. How, Sunyatsenia 7(1–2): 57. 1948.

密花水锦树 mì huā shuǐ jīn shù

Shrubs, ca. 3 m tall; branches terete to subquadrangular, brown strigillose. Leaves opposite; petiole 0.7–1.2 cm, puberulent; blade drying subleathery, elliptic, 7–12 × 2.5–6 cm, adaxially glabrescent or sparsely puberulent along midrib, abaxially puberulent, base cuneate, margin sparsely ciliolate, apex shortly acuminate; secondary veins 8–10 pairs; stipules generally persistent, ovate to pandurate, ca. 7 mm, sparsely puberulent, apex spreading to reflexed, rounded to 2-lobed. Inflorescences panic-

ulate, branched to 2–4 orders, 18–20 × 18–20 cm, puberulent, sessile and tripartite or pedunculate; peduncle 3–4 cm; lower bracts leaflike, upper bracts linear-lanceolate, oblong, oblong-lanceolate, or oblanceolate, 2–6 mm, strigillose. Flowers sessile in fasciculate groups. Calyx glabrous or sparsely puberulent; hypanthium portion subglobose, ca. 2 mm; limb lobed nearly to base; lobes ovate or ovate-triangular, ca. 1.5 mm. Corolla white, tubular-funnelform, glabrous outside; tube ca. 4 mm, in throat white hirsute; lobes ovate, ca. 1 mm. Anthers elliptic, ca. 1 mm, subsessile, partially exserted. Stigma 2-lobed. Capsules not seen. Fl. Mar.

- Forests in ravines; ca. 300 m. Guangxi (Shangsi).

**20. *Wendlandia oligantha*** W. C. Chen, Acta Phytotax. Sin. 21: 399. 1983.

龙州水锦树 long zhou shui jin shu

Shrubs or trees, 3–10 m tall; branches flattened to quadrangular, grayish brown, glabrous or sparsely or densely puberulent to pilosulous becoming glabrescent. Leaves opposite; petiole 3–15 mm, glabrous or mealy puberulent; blade drying leathery, adaxially dark brown and often shiny, elliptic, ovate, or ovate-oblong, 3–10.5 × 1.5–5 cm, adaxially glabrous, abaxially glabrous or sparsely to densely strigillose or puberulent along principal veins, base cuneate or acute, apex acute or shortly acuminate; secondary veins 5–7 pairs, hardly visible abaxially; stipules deciduous, spatulate to pandurate, 1.5–2.5 mm, pilosulous or puberulent, apex spreading to reflexed, rounded to obtuse. Inflorescences laxly paniculate, branched to 2 or 3 orders, 7–20 × 4–18 cm, moderately to densely pilosulous, sessile and tripartite or pedunculate; peduncle 0.5–1.5 cm; bracts linear, narrowly oblanceolate, or triangular, 1–5 mm. Flowers sessile to subsessile. Calyx glabrous to sparsely strigillose; hypanthium portion subglobose, ca. 0.5 mm; limb lobed nearly to base; lobes triangular to lanceolate, 0.3–0.5 mm. Corolla white, salverform to funnelform, outside glabrous; tube ca. 2.5 mm, rather abruptly narrowed at base, sparsely villous in throat; lobes triangular, ca. 1 mm. Anthers elliptic, ca. 0.7 mm, subsessile, partially exserted. Stigma 2-lobed, ca. 0.2 mm. Capsules subglobose, ca. 1.5 mm in diam., glabrous. Fl. Jul–Aug, fr. Aug–Dec.

- Rocks in forests or thickets in valleys; 300–1000 m. Guangxi.

**21. *Wendlandia parviflora*** W. C. Chen, Acta Phytotax. Sin. 21: 394. 1983.

小花水锦树 xiao hua shui jin shu

Small trees, 4–5 m tall; branches ferruginous pubescent. Leaves opposite; petiole 0.8–1.5 cm, densely ferruginous pubescent; blade drying leathery, elliptic-oblong or ovate-elliptic, 8.5–17 × 4.5–8.5 cm, adaxially sparsely strigose except densely ferruginous pubescent along veins, abaxially densely ferruginous pubescent, base cuneate, acute, or sometimes obtuse, apex acuminate; secondary veins 8–13 pairs; stipules pandurate, 4–5 mm wide, pilosulous, apex spreading to reflexed. Inflorescences paniculate, ca. 19 × 15 cm, ferruginous pubescent; bracts ovate, ca. 1 mm. Flowers sessile. Calyx glabrous or pilose; hypanthium portion ca. 0.8 mm; limb deeply lobed; lobes semiorbicular, ca. 0.5 mm. Corolla pale green, outside glabrous; tube

1–1.5 mm, white hirsute in throat; lobes ca. 1 mm. Anthers elliptic, ca. 0.5 mm, subsessile, partially exserted. Stigma 2-lobed. Capsules not seen. Fl. Dec.

- Forests on flat land. Yunnan (Mengla).

**22. *Wendlandia pendula*** (Wallich) Candolle, Prodr. 4: 412. 1830.

垂枝水锦树 chui zhi shui jin shu

*Rondeletia pendula* Wallich in Roxburgh, Fl. Ind. 2: 140. 1824.

Shrubs, often straggly, 1–3 m tall; branches pendulous, terete, hispidulous or puberulent to glabrescent. Leaves opposite or ternate, subsessile; blade drying papery, ovate-lanceolate or ovate, 3.5–10 × 1.8–4 cm, adaxially glabrous to sparsely hispidulous, abaxially sparsely to moderately scaberulous or hispidulous with pubescence denser on principal veins, base rounded to cuneate, apex acute to weakly acuminate; secondary veins 4–7 pairs; stipules caducous to persistent, triangular, 1.5–2 mm, glabrescent, apex erect, cuspidate. Inflorescences paniculate, pyramidal in outline, 10–15 × 4–9 cm, branched to 2 or 3 orders, densely hispidulous to puberulent, sessile and tripartite or pedunculate; peduncle 2–4.5 cm; bracts triangular to ovate, 0.5–1 mm; pedicels 0.5–1.2 mm. Flowers shortly pedicellate. Calyx puberulent to glabrous; hypanthium ellipsoid to subglobose, 1–1.5 mm; limb lobed nearly to base; lobes lanceolate or triangular, 0.5–0.8 mm. Corolla red, tubular-funnelform, outside glabrous; tube 4–5 mm, inside pubescent in upper part; lobes oblong to elliptic, ca. 2 mm. Anthers linear-oblong, 1.3–1.5 mm, partially exserted. Stigmas clavate, ca. 1.3 mm. Capsules subglobose, 1.5–2 mm in diam., glabrous or pilose. Fl. and fr. Dec–Feb of following year.

Forests or thickets in ravines; 600–1300 m. Yunnan [Bhutan, India, Myanmar, Nepal].

W. C. Chen (in FRPS 71(1): 221. 1999) described the stipules as caducous, but these are persistent on all the specimens studied.

**23. *Wendlandia pingpiensis*** F. C. How, Sunyatsenia 7(1–2): 51. 1948.

屏边水锦树 ping bian shui jin shu

Shrubs or trees, 3–15 m tall. Petiole 1–3 cm, sparsely strigillose; leaf blade drying papery, elliptic-oblong or oblanceolate-oblong, 7.5–23 × 4–8 cm, adaxially glabrous or sometimes sparsely hispidulous along midrib, abaxially glabrous or sparsely hispidulous along principal veins, base cuneate or attenuate, apex acute or shortly caudate; secondary veins 7–13 pairs; stipules ca. 2 × as wide as branchlets, apex reflexed, subrounded. Inflorescences laxly paniculate, to 30 × 24 cm, ferruginous strigillose. Flowers sessile. Calyx pilosulous to strigillose; hypanthium portion subglobose, 1–1.5 mm; limb deeply lobed; lobes triangular. Corolla white, funnelform, glabrous outside; tube 4–5 mm, white hirsute inside upper part; lobes triangular, ca. 1 mm. Anthers elliptic, ca. 1 mm, subsessile, partially exserted. Stigma 2-lobed. Capsules subglobose, 1.5–2 mm in diam., pubescent or subglabrous. Fl. Apr–Oct, fr. Jun–Nov.

- Forests or thickets in valleys; 200–1500 m. Yunnan.

**24. *Wendlandia pubigera*** W. C. Chen, Acta Phytotax. Sin. 21: 395. 1983.

大叶木莲红 da ye mu lian hong

Shrubs, to 2 m tall; branches pubescent. Leaves opposite or ternate; petiole 0.8–1.8 cm, pubescent; blade drying thinly leathery, obovate-oblong or elliptic, 14.5–18 × 6–7 cm, adaxially glabrous or sparsely puberulent along principal veins, abaxially sparsely pubescent with pubescence denser along principal veins, base cuneate, apex shortly acuminate; secondary veins 10 or 11 pairs; stipules generally persistent, pandurate, 7.5–9 × 2.5–3 mm, nearly as wide as to slightly wider than branches, apex spreading, rounded. Inflorescence paniculate, pyramidal in outline, ca. 12 × 12–15 cm, branched to 2 or 3 orders, yellowish brown pubescent, sessile and tripartite or pedunculate; peduncle 1.8–3 cm. Flowers sessile. Calyx pubescent; hypanthium portion ca. 1.8 mm; limb lobed nearly to base; lobes ovate to deltoid, ca. 1 mm. Corolla white, tubular-salverform, outside glabrous; tube 2–3 mm, white villous inside upper part; lobes rounded to spatulate, ca. 1 mm. Anthers elliptic, ca. 0.7 mm, subsessile, partially exserted. Stigma 2-lobed. Capsules not seen. Fl. Mar.

• Dense forests. Guangxi (Shangsi).

Some of the characters in the description here are augmented with details from the protologue figure.

**25. *Wendlandia salicifolia*** Franchet ex Drake, J. Bot. (Morot) 9: 208. 1895.

柳叶水锦树 liu ye shui jin shu

*Ligustrum thea* H. Léveillé & Dunn.

Shrubs, to ca. 1 m tall; branches flattened to terete, hirtellous or strigillose to glabrescent. Leaves opposite; petiole 0.5–3 mm; blade drying thinly leathery, narrowly lanceolate to narrowly elliptic, 2–6.5 × 0.4–1.2 cm, glabrous on both surfaces or sparsely pubescent along midrib abaxially, base acute, margin usually edged with thickened vein, apex acute to weakly acuminate; secondary veins 5–7 pairs; stipules generally persistent, triangular, 1.5–4 mm, densely strigillose to hirtellous, apex erect, acute to aristate. Inflorescences paniculate, pyramidal in outline, 2–5 × 1–3 cm, branched to 2 or 3 orders, densely hirtellous to strigillose, sessile and tripartite or pedunculate; peduncle 0.4–0.7 cm; bracts linear, 1–5 mm; pedicels 0.3–1 mm. Flowers subsessile to pedicellate. Calyx moderately to sparsely strigillose; hypanthium portion ellipsoid to subglobose, ca. 0.8 mm; limb lobed nearly to base; lobes triangular, 0.3–0.5 mm. Corolla pale reddish white, funnelform, glabrous outside; tube 2–5 mm, apparently pubescent inside upper part; lobes linear-oblong, 2–2.5 mm. Filaments ca. 1 mm; anthers linear-lanceolate, ca. 1.4 mm, partially exserted. Stigma 2-lobed, 0.8–1 mm. Capsules subglobose to ovoid, ca. 1.5 × 2 mm, moderately to sparsely strigillose. Fl. Nov, fr. Jan of following year.

Streamsides in ravines and forests on hill slopes; 100–200 m. Guangxi (Donglan), Guizhou (Guanling), Yunnan [Laos, Vietnam].

**26. *Wendlandia scabra*** Kurz, J. Asiat. Soc. Bengal, Pt. 2, Nat. Hist. 41: 310. 1872.

粗叶水锦树 cu ye shui jin shu

Shrubs or trees, 1–12 m tall; branches terete to quadrangular, densely brown hirtellous to -tomentose. Leaves opposite; petiole 0.5–2.7 cm, densely brown tomentulose to -hirtellous; blade drying papery or leathery, elliptic-obovate, elliptic, or ovate, 6.5–18 × 2.8–9 cm, adaxially sparsely to moderately scaberulous on lamina and densely strigillose to tomentulose on principal veins, abaxially sparsely to densely strigillose, pilosulous, hirtellous, strigose, or pilose, base obtuse, acute, or rounded, apex acute or acuminate; secondary veins 6–10 pairs; stipules generally persistent, spatulate to pandurate, 5–6 mm, strigillose or tomentulose to glabrescent, apex spreading, obtuse. Inflorescences paniculate, pyramidal, 20–30 × 20–25 cm, branched to 2 or 3 orders, erect and congested (var. *scabra*, var. *pilifera*) or pendulous and lax (var. *dependens*), densely hirtellous to tomentose, pedunculate; peduncle ca. 4 cm; bracts linear, 1–2.5 mm. Flowers sessile or subsessile. Calyx densely hirtellous; hypanthium portion turbinate to ellipsoid, ca. 0.5 mm; limb deeply lobed; lobes triangular, 0.5–0.8 mm. Corolla white, tubular-funnelform, glabrous outside or pubescent on lobes (var. *pilifera*); tubes 2.5–3 mm, inside glabrous or sparsely pubescent in lower part (var. *scabra*, var. *dependens*) or white villous or hispid in upper part (var. *pilifera*); lobes oblong, 1–1.25 mm. Anthers elliptic, 0.75–1 mm, subsessile, partially exserted. Stigma 2-lobed, ca. 0.7 mm. Capsules subglobose, ca. 2 mm in diam., hirsute. Fl. Mar–May, fr. May–Jul.

Forests or thickets on mountains; 100–1800 m. Guangxi, Guizhou, Yunnan [Bangladesh, India, Myanmar, Nepal, Thailand, Vietnam].

The application of this name and the report of this species seem to be based on Cowan's incorporation of Kurz's report into his treatment and may deserve re-evaluation.

- 1a. Leaves densely<sup>\*</sup> strigillose or scaberulous adaxially, densely tomentulose abaxially ..... 26c. var. *scabra*
- 1b. Leaves glabrescent adaxially, sparsely strigose or pilose abaxially.
  - 2a. Leaves sparsely strigose abaxially; inflorescences lax, pendulous; corolla tubes inside glabrous or pubescent near middle ..... 26a. var. *dependens*
  - 2b. Leaves pilose abaxially; inflorescences compact, erect; corolla tubes inside white villous or hispid in upper part ..... 26b. var. *pilifera*

**26a. *Wendlandia scabra* var. *dependens*** Cowan, Notes Roy. Bot. Gard. Edinburgh 16: 292. 1932.

悬花水锦树 xuan hua shui jin shu

Leaves glabrescent adaxially, sparsely strigose abaxially. Inflorescence lax, pendulous. Corolla tube inside glabrous or pubescent near middle; lobes glabrous outside. Fl. Mar–Apr.

• Forests or thickets on mountains; 500–1800 m. W Yunnan.

**26b. *Wendlandia scabra* var. *pilifera*** F. C. How ex W. C. Chen, Acta Phytotax. Sin. 21: 395. 1983.

毛粗叶水锦树 mao cu ye shui jin shu

Leaves glabrescent adaxially, pilose abaxially. Inflorescence compact, erect. Corolla tube white villous in upper part inside; lobes pubescent outside. Fl. Apr.

- Thickets on mountains. Guangxi (Shangsi).

**26c. *Wendlandia scabra* var. *scabra***

粗叶水锦树(原变种) *cu ye shui jin shu* (yuan bian zhong)

*Wendlandia paniculata* (Roxburgh) Candolle subsp. *scabra* (Kurz) Cowan; *W. zooi* F. C. How.

Leaves strigillose and/or scaberulous adaxially, tomentulose abaxially. Inflorescence erect, compact. Corolla tube inside sparsely pubescent in lower part or glabrous; lobes glabrous outside. Fl. Apr–May, fr. May–Jul.

Forests or thickets on mountains; 100–1600 m. Guangxi, Guizhou, Yunnan [Bangladesh, India, Myanmar, Nepal, Thailand, Vietnam].

**27. *Wendlandia speciosa* Cowan, Notes Roy. Bot. Gard. Edinburgh 16: 254. 1932.**

美丽水锦树 *mei li shui jin shu*

*Wendlandia speciosa* var. *forrestii* Cowan.

Shrubs or trees, 1–12 m tall; branches flattened, strigillose to glabrescent. Leaves opposite; petiole 0.5–3 cm, strigillose to glabrescent; blade drying papery or subleathery, ovate, obovate, ovate-lanceolate, or elliptic, 6–19 × 2.5–11 cm, on both sides sparsely to moderately strigillose or hirtellous to glabrescent with pubescence often denser on principal veins, base acute or cuneate, apex acute or acuminate; secondary veins 5–12 pairs; stipules generally persistent, spatulate to pandurate, 4–7 mm, strigillose to glabrescent, apex spreading, rounded. Inflorescence paniculate, pyramidal, 20–30 × 20–30 cm, branched to 2 or 3 orders, densely strigillose, pedunculate; peduncle ca. 4.5 cm; bracts linear, spatulate, or lanceolate, 1–3 mm, acute. Flowers subsessile. Calyx strigillose; hypanthium portion turbinate, ca. 1 mm; limb lobed nearly to base; lobes lanceolate to triangular, 1–1.5 mm. Corolla white to cream, yellowish white, salverform or tubular, glabrous outside; tube 5–7 mm, white villous inside; lobes narrowly oblong to oblanceolate, 2–2.5 mm, obtuse to rounded. Anthers linear-lanceolate, exserted, 1.3–2 mm, at base 2-lobed; filaments ca. 1.5 mm. Stigma 2-lobed, 1–1.2 mm. Capsule subglobose, 2.5–3 mm in diam., pubescent. Fl. and fr. Mar–Nov.

Forests in ravines, forest margins; 1500–2800 m. Xizang (Mé-dog), Yunnan [Bhutan, India].

**28. *Wendlandia subalpina* W. W. Smith, Notes Roy. Bot. Gard. Edinburgh 9: 142. 1916.**

高山水锦树 *gao shan shui jin shu*

Shrubs, tufted to prostrate, 0.3–1 m tall; branches subterete, puberulent. Leaves opposite, subsessile; petiole to ca. 1 mm, glabrescent; blade drying leathery, ovate or suborbicular, 0.4–1 × 0.3–0.6 mm, glabrescent on both surfaces, base obtuse to cuneate, apex obtuse, subacute, or shortly acuminate; secondary veins indistinct; stipules deciduous, triangular, ca. 1 mm, glabrescent, apex erect, apparently acute. Inflorescences paniculate to cymose, 6–12-flowered, 0.6–1 × 0.6–1 cm, branched to

2 orders, puberulent, pedunculate; peduncle ca. 0.2 cm; bracts ca. 1 mm; pedicels 2–3 mm. Flowers pedicellate. Calyx puberulent; hypanthium portion ellipsoid, ca. 1.5 mm; limb deeply lobed; lobes triangular or lanceolate, 1.5–2 mm. Corolla white or pale yellow, tubular, outside glabrous; tube ca. 2.5 mm; lobes linear-oblong, ca. 3.5 mm. Filaments ca. 3 mm; anthers linear-lanceolate, ca. 2 mm, exserted. Stigma 2-lobed, ca. 1.2 mm. Capsules subglobose, 2–2.5 mm in diam., pubescent. Fl. May–Jul, fr. Sep–Oct.

- Open spaces or thickets on mountain slopes; 1800–3100 m. Yunnan.

**29. *Wendlandia tinctoria* (Roxburgh) Candolle, Prodr. 4: 411. 1830.**

染色水锦树 *ran se shui jin shu*

*Rondeletia tinctoria* Roxburgh, Fl. Ind. 2: 134. 1824.

Shrubs or trees, to 6 m tall; branches somewhat flattened to terete or quadrangular, densely puberulent, velutinous, or hirtellous usually becoming glabrescent. Leaves opposite; petiole 0.5–2 cm, densely puberulent or strigillose to glabrous; blade drying papery to leathery, oblong-lanceolate, elliptic-ovate, or obovate, 5.5–20 × 2.5–10 cm, adaxially sparsely strigillose at least on principal veins to glabrous throughout, abaxially sparsely to moderately strigillose or tomentose to glabrescent, base acute to obtuse, apex acute to acuminate; secondary veins 10–12 pairs, occasionally with pubescent and/or foveolate domatia; stipules generally persistent, triangular to ovate, 3–5.5 mm, densely strigillose or puberulent to glabrescent, apex cuspidate, erect or slightly spreading with age. Inflorescences paniculate, pyramidal in outline, 9–17 × 9–22 cm, branched to 2–4 orders, densely strigillose, pilosulous, velutinous, tomentose, hirtellous, or villosulous, sessile and tripartite or pedunculate; peduncle 0.8–4 cm; bracts linear to narrowly elliptic, 1–5 mm; pedicels to 0.8 mm. Flowers sessile to shortly pedicellate. Calyx densely hirtellous or pilosulous to glabrous; hypanthium portion subglobose to ellipsoid or turbinate, 0.8–1 mm; limb lobed nearly to base; lobes spatulate, triangular, or lanceolate, 0.8–1 mm. Corolla white, tubular-funnelform, outside glabrous and/or variously densely villosulous or strigillose; tube 3–4 mm, pilose in throat; lobes elliptic to ovate, 0.8–1 mm. Anthers oblong, ca. 0.5 mm, subsessile, partially exserted. Stigma 2-lobed, 0.5–0.8 mm. Capsules ovoid, ca. 1.5 × 2–2.5 mm, hirtellous to glabrous. Fl. and fr. Jan–Dec.

Dry sparse forests, dense forests, or thickets in valleys, in ravines, or on mountain slopes; 200–2800 m. Guangxi, Guizhou, Yunnan [Bangladesh, Bhutan, India, Myanmar, Nepal, Thailand, Vietnam].

Cowan recognized seven infraspecific taxa of this species, with five found in China; two additional infraspecific taxa from China were described by F. C. How. In Cowan's circumscription, *Wendlandia tinctoria* subsp. *tinctoria* was widespread in India and also found in Bhutan, Myanmar, Nepal, and Thailand but not known from China.

- 1a. Inflorescences glabrous or puberulent;  
calyx glabrous or sparsely pubescent.
- 2a. Corolla lobes strigose outside  
..... 29d. subsp. *floribunda*
- 2b. Corolla lobes glabrous outside  
..... 29g. subsp. *orientalis*

1b. Inflorescences densely pilosulous or tomentose.

3a. Calyx with hypanthium portion glabrous, glabrescent, or puberulent, lobes glabrous, glabrescent, or pilosulous.

4a. Corolla lobes pilosulous outside ..... 29b. subsp. *barbata*

4b. Corolla lobes glabrous outside ..... 29f. subsp. *intermedia*

3b. Calyx hirtellous or pilosulous.

5a. Corolla lobes villosulous outside ..... 29a. subsp. *affinis*

5b. Corolla lobes glabrous outside.

6a. Calyx densely hirtellous ..... 29c. subsp. *callitricha*

6b. Calyx pilosulous or sparsely hirtellous ..... 29e. subsp. *handelii*

**29a. *Wendlandia tinctoria* subsp. *affinis*** F. C. How ex W. C. Chen, Acta Phytotax. Sin. 21: 389. 1983.

毛冠水锦树 *mao guan shui jin shu*

Inflorescence densely tomentose. Calyx hirtellous or pilosulous. Corolla lobes villosulous outside. Fl. and fr. Feb–Jun.

• Forests or thickets in valleys or on mountain slopes; 700–1400 m. Guangxi (Longzhou), Yunnan.

In the protologue, this taxon is treated as “subsp.” in the text (both key and description) but its figure is labeled “var.”

**29b. *Wendlandia tinctoria* subsp. *barbata*** Cowan, Notes Roy. Bot. Gard. Edinburgh 16: 268. 1932.

粗毛水锦树 *cu mao shui jin shu*

Inflorescence densely tomentose. Calyx with hypanthium portion glabrous or glabrescent, lobes glabrous or pilosulous. Corolla lobes pilosulous outside. Fl. and fr. Feb–Nov.

Thickets or forests in valleys; 1000–1800 m. Guangxi, Yunnan [Vietnam].

**29c. *Wendlandia tinctoria* subsp. *callitricha*** (Cowan) W. C. Chen, Acta Phytotax. Sin. 21: 389. 1983.

厚毛水锦树 *hou mao shui jin shu*

*Wendlandia tinctoria* var. *callitricha* Cowan, Notes Roy. Bot. Gard. Edinburgh 16: 265. 1932.

Inflorescence densely tomentose. Calyx densely hirtellous. Corolla lobes glabrous outside. Fl. and fr. year-round.

Forests or thickets on mountain slopes or in ravines; 400–2800 m. Guangxi, Yunnan [Myanmar].

**29d. *Wendlandia tinctoria* subsp. *floribunda*** (Craib) Cowan in Craib, Fl. Siam. 2: 23. 1932.

多花水锦树 *duo hua shui jin shu*

*Wendlandia glabrata* Candolle var. *floribunda* Craib, Bull. Misc. Inform. Kew 1911: 386. 1911; *W. floribunda* (Craib) Craib.

Inflorescence glabrous or puberulent. Calyx glabrous or sparsely puberulent. Corolla lobes strigillose outside. Fl. Jul.

Dry sparse forests on mountain slopes; ca. 1100 m. Yunnan (Menglian) [Myanmar, Thailand].

**29e. *Wendlandia tinctoria* subsp. *handelii*** Cowan, Notes Roy. Bot. Gard. Edinburgh 16: 267. 1932.

麻栗水锦树 *ma li shui jin shu*

Inflorescences densely pilosulous. Calyx pilosulous or sparsely hirtellous. Corolla lobes glabrous outside. Fl. and fr. Mar–Dec.

• Forests or thickets on mountain slopes or in ravines; 200–1900 m. Guangxi (Wuming), Guizhou (Wangmo), Yunnan.

**29f. *Wendlandia tinctoria* subsp. *intermedia*** (F. C. How) W. C. Chen, Acta Phytotax. Sin. 21: 390. 1983.

红皮水锦树 *hong pi shui jin shu*

*Wendlandia tinctoria* var. *intermedia* F. C. How, Sunyatsenia 7(1–2): 43. 1948.

Inflorescence densely tomentose. Calyx with hypanthium portion glabrous or puberulent, lobes pilosulous. Corolla lobes glabrous outside. Fl. and fr. Mar–May.

• Forests or thickets in valleys; 1400–1600 m. Yunnan.

**29g. *Wendlandia tinctoria* subsp. *orientalis*** Cowan, Notes Roy. Bot. Gard. Edinburgh 16: 268. 1932.

东方水锦树 *dong fang shui jin shu*

Inflorescence glabrous or puberulent. Calyx glabrous or rarely sparsely puberulent. Corolla lobes glabrous outside. Fl. Mar–May, fr. Apr–Oct.

Thickets or forests on mountains; 200–2100 m. Guangxi, Yunnan [India, Myanmar, Thailand].

**30. *Wendlandia uvariifolia*** Hance, J. Bot. 8: 73. 1870.

水锦树 *shui jin shu*

Shrubs or trees, 2–15 m tall; branches terete to subquad-rangular, tomentulose, pilosulous, or hirsute, often with pubescence of two or more types. Leaves opposite; petiole 0.5–3.5 cm, densely ferruginous hirtellous or -pilosulous; blade drying papery, broadly elliptic, elliptic-oblong, ovate, or oblong-lanceolate, 7–26 × 4–14 cm, adaxially sparsely hirtellous, hispidulous, or scaberulous on lamina and moderately to densely tomentulose to strigillose along principal veins, abaxially moderately to densely hirtellous to pilosulous, base acute to obtuse, apex shortly to abruptly acuminate; secondary veins 8–12 pairs; stipules persistent or sometimes deciduous, obovate to pandurate, 5–12 × 5–12 mm, hispid, apex spreading to reflexed, rounded. Inflorescences paniculate, pyramidal in outline, 10–20 × 10–20 cm, branched to 2–4 orders, densely tomentulose, pilosulous, and/or hirtellous, sessile and tripartite or pedunculate; peduncle 1–4 cm; bracts linear-lanceolate to spatulate, 1–4 mm. Flowers sessile or subsessile. Calyx densely grayish pilose, -strigose, -hirtellous, -tomentose, or subglabrous (subsp. *pilosa*); hypanthium obconic, ca. 0.8 mm; limb lobed nearly to

base; lobes triangular to lanceolate, ca. 1 mm. Corolla white, tubular-funnelform, glabrous outside; tube 2.5–3 mm, inside upper part and throat white hirsute; lobes oblong to elliptic, ca. 1 mm. Anthers elliptic, ca. 0.8 mm, subsessile, partially exserted. Stigma 2-lobed, ca. 0.3 mm. Capsules subglobose, 1–2 mm in diam., densely strigillose to strigose. Fl. Jan–May, fr. Apr–Oct.

Thickets, forests, or forest margins on mountains or hill slopes, in ravines, or at streamsides; below 100–1200 m. Guangdong, Guangxi, Guizhou, Hainan, Taiwan, Yunnan [Vietnam].

Cowan discussed in detail the wide morphological variability in this species, in both vegetative and flower characters.

- 1a. Calyx pilose or subglabrous ..... 30b. subsp. *pilosa*  
 1b. Calyx densely grayish white hirsute, -strigose, -tomentulose, or -strigillose.  
 2a. Leaves rather narrow, elliptic-oblong or oblong-lanceolate, pilosulous abaxially ..... 30a. subsp. *chinensis*  
 2b. Leaves wider, broadly elliptic or ovate, densely grayish brown pilosulous abaxially ..... 30c. subsp. *uvariifolia*

**30a. *Wendlandia uvariifolia* subsp. *chinensis*** (Merrill) Cowan, Notes Roy. Bot. Gard. Edinburgh 16: 288. 1932.

中华水锦树 *zhong hua shui jin shu*

*Wendlandia chinensis* Merrill, Philipp. J. Sci. 15: 257. 1919.

Leaves rather narrow, elliptic-oblong or oblong-lanceolate, pilosulous abaxially. Calyx densely grayish white hirsute, -strigose, -tomentulose, or -strigillose. Fl. Mar–Apr, fr. Apr–Jul.

• Forests or thickets in ravines or on hill slopes; below 100–600 m. Guangdong, Guangxi, Hainan.

**30b. *Wendlandia uvariifolia* subsp. *pilosa*** W. C. Chen, Acta Phytotax. Sin. 21: 393. 1983.

疏毛水锦树 *shu mao shui jin shu*

Leaves densely pilosulous abaxially. Calyx pilose or subglabrous. Fl. Nov.

• Forests; ca. 900 m. Yunnan (Mengla).

**30c. *Wendlandia uvariifolia* subsp. *uvariifolia***

水锦树(原亚种) *shui jin shu* (yuan ya zhong)

*Wendlandia dunniana* H. Léveillé; *W. rotundifolia* Handel-Mazzetti; *W. uvariifolia* subsp. *dunniana* (H. Léveillé) Cowan; *W. uvariifolia* subsp. *rotundifolia* (Handel-Mazzetti) Cowan; *W. uvariifolia* subsp. *rufula* Cowan; *W. uvariifolia* subsp. *yunnanensis* Cowan.

Leaves broadly elliptic or ovate, densely grayish brown pilosulous abaxially. Calyx densely grayish white hirsute, -strigose, -tomentulose, or -strigillose. Fl. Jan–May, fr. Apr–Oct.

Thickets, forests, or forest margins on mountains or at streamsides; below 100–1200 m. Guangdong, Guangxi, Guizhou, Hainan, Taiwan, Yunnan [Vietnam].

**31. *Wendlandia villosa*** W. C. Chen, Acta Phytotax. Sin. 21: 388. 1983.

毛叶水锦树 *mao ye shui jin shu*

Shrubs or trees; branches densely villous becoming glabrescent. Leaves opposite; petiole 8–10 mm, villous becoming glabrescent; blade drying leathery, elliptic or elliptic-oblong, 4.5–13 × 2.5–6 cm, adaxially sparsely strigose or glabrous, abaxially densely yellowish brown villous, base cuneate, apex broad then shortly acuminate; secondary veins 7–9 pairs; stipules generally persistent, triangular to ovate, ca. 6 mm, villous, apex erect, cuspidate. Inflorescence paniculate, pyramidal in outline, 9–12 × 6–11 cm, branched to 2 or 3 orders, densely yellowish brown villosulous to -hirtellous, sessile and tripartite or pedunculate; peduncle ca. 3 cm; bracts lanceolate, ca. 1.5 mm. Flowers sessile or subsessile. Calyx densely hirtellous or villosulous; hypanthium portion ellipsoid, ca. 0.8 mm; limb lobed nearly to base; lobes lanceolate, 0.8–1 mm, ciliate. Corolla tubular-salverform; tube 3–4 mm, outside and inside glabrous; lobes elliptic to ovate, ca. 1 mm, densely villosulous or hirtellous outside. Anthers elliptic, ca. 0.7 mm, subsessile, partially exserted. Stigma 2-lobed, ca. 0.2 mm. Capsules not seen. Fl. Apr.

• Forests. Yunnan.

## 97. XANTHOPHYTUM Reinwardt ex Blume, Bijdr. 989. 1826–1827.

岩黄树属 *yan huang shu shu*

Chen Tao (陈涛); Charlotte M. Taylor

*Paedicalyx* Pierre ex Pitard; *Xanthophytopsis* Pitard.

Small trees, shrubs, or subshrubs, sometimes unbranched (i.e., monocaulous), unarmed, often fleshy; young growth usually densely sericeous to lanate, hirsute, or tomentose with trichomes drying golden yellow to ferruginous. Raphides present. Leaves opposite, isophyllous [or sometimes markedly anisophyllous], without domatia; stipules persistent or deciduous, interpetiolar, generally triangular or somewhat leaflike, sometimes markedly parallel-veined or -fibrous, entire or 2-lobed. Inflorescences axillary, cymose to paniculate or subcapitate, several to many flowered, sessile to pedunculate, bracteate or bracts reduced. Flowers sessile to pedicellate, bisexual, distylous or monomorphic, at least sometimes fragrant. Calyx limb shallowly to deeply 5-lobed; lobes sometimes unequal on an individual flower. Corolla white, yellow, or purple, tubular to funnelform, inside with pubescent ring in upper part of tube; lobes 5, valvate in bud. Stamens 5, exserted or included, inserted near middle to base of corolla tube; filaments reduced to developed; anthers apparently dorsifixed. Ovary 2-celled, ovules numerous in each cell on peltate placentas attached at middle of septum; stigmas clavate to 2-lobed, included or exserted. Infructescences often with peduncle, axes, and pedicels elongating notably. Fruit indehiscent, schizocarpous, or capsular, ovoid to subglobose, dry, with calyx limb persistent or deciduous, sometimes splitting

septicidally into 2 indehiscent mericarps or loculicidally dehiscent valves, these each 1-celled, ellipsoid to plano-convex, each with numerous seeds; seeds small, angled, smooth, often brown.

About 30 species: China, Indonesia (including Borneo, with most of the species), Laos, Malaysia, New Guinea, Pacific islands (Fiji), Philippines, Vietnam; four species in China.

*Xanthophytum* was reviewed for China by Chun and F. C. How (Sunyatsenia 4: 10–15. 1939, as *Paedicalyx*) and then by H. S. Lo (Bull. Bot. Res., Harbin 6(4): 21–33. 1986), who formally synonymized *Xanthophytopsis* and *Paedicalyx* in this region based on previous comments by Bakhuizen but making the necessary combinations. Axelius (Blumea 34: 425–497. 1990) provided the only comprehensive review of *Xanthophytum*. She recognized four types of trichomes characteristic of the genus (loc. cit.: 427, f. 1); also notable in *Xanthophytum* are the fruit with numerous tiny seeds apparently enclosed in drupaceous locules or mericarps, and the stamen filaments that are often fused to the corolla only at the base and appear free or nearly free. Several authors have described the fruit as drupaceous and splitting, but the fruit morphology apparently corresponds better to schizocarpous in the terminology used in this treatment. Axelius observed also that distyly in *Xanthophytum* was apparently not noted by Chinese authors, resulting in somewhat confused descriptions of floral morphology.

- 1a. Inflorescences subcapitate to congested-cymose, subsessile to shortly pedunculate, with peduncles to 0.5 cm in flower, sometimes to 1 cm at fruiting; leaves with secondary veins 9–16 pairs ..... 3. *X. kwangtungense*
- 1b. Inflorescences subcapitate to laxly cymose or paniculate, pedunculate with peduncles 0.5–11 cm; leaves with secondary veins 9–30 pairs.
  - 2a. Fruit septicidally dehiscent; inflorescences laxly cymose to paniculate; peduncles 4–11 cm; leaves with secondary veins 9–15 pairs ..... 2. *X. balansae*
  - 2b. Fruit indehiscent; inflorescences subcapitate to laxly cymose or paniculate; peduncles 0.5–6 cm; leaves with secondary veins 14–30 pairs.
    - 3a. Inflorescences subcapitate; corolla tube 2–2.2 mm ..... 1. *X. attopevense*
    - 3b. Inflorescences laxly cymose to paniculate; corolla tube 1.5–2 mm ..... 4. *X. polyanthum*

**1. *Xanthophytum attopevense*** (Pierre ex Pitard) H. S. Lo, Bull. Bot. Res., Harbin 6(4): 32. 1986.

琼岛岩黄树 qiong dao yan huang shu

*Paedicalyx attopevensis* Pierre ex Pitard in Lecomte, Fl. Indo-Chine 3: 88. 1922.

Shrubs or herbs, to 1 m tall; branches flattened to subterete, densely sericeous to pilose. Petiole 0.2–2 cm, densely sericeous; leaf blade drying membranous or thinly papery, narrowly elliptic or oblanceolate-oblong, 10–20 × 3.5–6 cm, adaxially moderately to sparsely villous to hirsute, abaxially rather densely hirtellous to hirsute on veins and densely sericeous on lamina, base acute and often decurrent, apex acuminate or shortly acuminate; secondary veins 17–30 pairs; stipules persistent, ovate or lanceolate, 12–17 × 4–8 mm, sericeous or pilose to glabrescent, longitudinally veined, caudate or acuminate. Inflorescences subcapitate, densely sericeous; peduncles 0.5–1.5 cm; heads subglobose, 0.5–1 cm in diam.; bracts triangular, 1.5–3 mm; bracteoles reduced; pedicels 0–1 mm. Calyx densely villous or strigose; ovary portion obconic, ca. 1.5 mm; lobes obovate, 1–2.5 mm, sometimes unequal, glabrescent. Corolla white, outside pilosulous at least on lobes; tube 2–2.2 mm; lobes oblong-lanceolate, ca. 1 mm. Fruit indehiscent, subglobose to didymous, ca. 2 × 2.5 mm, hirsute to sericeous. Fl. Jan–Mar, fr. May–Aug.

Dense forests. Hainan [Laos, Vietnam].

This species is circumscribed here following Axelius; many of the specimens that were included in this species by Chinese authors are here separated in *Xanthophytum polyanthum*.

**2. *Xanthophytum balansae*** (Pitard) H. S. Lo, Bull. Bot. Res., Harbin 6(4): 31. 1986.

长梗岩黄树 chang geng yan huang shu

*Xanthophytopsis balansae* Pitard in Lecomte, Fl. Indo-Chine 3: 90. 1922.

Shrubs, ca. 1 m tall; stems subterete, densely sericeous. Petiole 5–15 mm, puberulent to sericeous; leaf blade drying membranous or thinly papery, green above, pale brown below, elliptic or elliptic-oblong to lanceolate, 9–17.5 × 2.5–5 cm, adaxially glabrous or sparsely strigose, abaxially densely sericeous, base cuneate to acute and often decurrent, apex acute; secondary veins 9–15 pairs; stipules persistent, narrowly ovate, ca. 10 × 3 mm, acuminate. Inflorescence laxly cymose to paniculate, pilose to strigillose; peduncles flexuous, 4–11 cm; branched portion broadly pyramidal, 2–7 × 2–10 cm; bracts elliptic, up to 2.5 × 9 cm, acute; bracteoles reduced; pedicels 1–2 mm. Flowers unknown. Fruit septicidally dehiscent, subglobose to ovoid, ca. 2 mm in diam., densely strigillose to strigose, with persistent calyx lobes obovate or oblanceolate, 1–3 × ca. 1 mm, ciliate; seeds yellow. Fl. and fr. Jun–Oct.

Streamsides in dense forests. Guangxi (Shiwan Dashan) [N Vietnam].

**3. *Xanthophytum kwangtungense*** (Chun & F. C. How) H. S. Lo, Bull. Bot. Res., Harbin 6(4): 32. 1986.

岩黄树 yan huang shu

*Xanthophytopsis kwangtungensis* Chun & F. C. How, Sunyatsenia 4: 14. 1939.

Shrubs, 0.5–1 m tall; branches flattened to subterete, densely sericeous to tomentose-pilose. Petiole 0.5–3 cm, densely sericeous to pilose; leaf blade drying papery, elliptic, elliptic-oblong, or ovate, 5–20 × 2.5–7 cm, adaxially glabrous or sparsely pilose at least along veins, abaxially densely sericeous or sericeous-villous, base cuneate to acute and usually long decurrent, apex acuminate; secondary veins 9–16 pairs; stipules drying membranous, persistent, ovate to triangular, 9–15 × 5–7

mm, sericeous or pilose to glabrescent, parallel-veined, acute to acuminate or bilobed for up to 1/2, margins often ciliate. Inflorescences subcapitate to congested-cymose, many flowered, densely strigose to strigillose; peduncles 0.1–0.5 cm; flowering portion subglobose, ca. 1 cm in diam.; bracteoles linear-lanceolate, ca. 2 mm; pedicels 0–3 mm. Calyx densely strigillose to sericeous; ovary portion ellipsoid, 1.1–1.2 mm; limb lobed essentially to base, glabrous internally; lobes subspatulate to ovate or oblanceolate, 1.2–2.5 mm, obtuse to rounded, often ciliate. Corolla pale yellow, campanulate-funnelform, outside pilosulous at least on lobes; tube 2.2–2.3 mm; lobes ovate-triangular to spatulate, 1.2–1.3 mm, obtuse to acute. Infructescences often borne at lower leaf nodes or below leaves, with peduncles up to 1 cm, pedicels up to 2 mm. Fruit capsular, subglobose to ovoid, ca. 2 mm in diam., strigillose to sericeous. Fl. May, fr. Jul–Oct.

Wet places in forests. SE Guangxi, S Yunnan (Hekou) [Vietnam].

The calyx lobe measurements given here are based on Chinese specimens studied and on H. S. Lo (in FRPS 71(1): 24. 1999); Axelius (Blumea 34: 467–469. 1990) reported that these range up to 4.1 mm throughout the range of the species (i.e., in Vietnam). Several specimens of this species, in particular *W. T. Tsang* 23975 and 24532, were distributed as “*Xanthophyllum chinense* Merrill,” but that name has not been published.

**4. *Xanthophyllum polyanthum*** Pitard in Lecomte, Fl. Indo-Chine 3: 91. 1922.

多花岩黄树 duo hua yan huang shu

Low shrubs, ca. 0.5 m, little branched; branches weakly angled or subterete, sometimes rather stout, densely sericeous. Petiole 0.8–5 cm, densely sericeous; leaf blade drying papery, lanceolate to elliptic, elliptic-oblong, or oblanceolate, 9–30 × 3.5–8 cm, adaxially sparsely or moderately hirtellous to villous to subglabrous, abaxially densely pilose to sericeous, base cuneate to acute and usually decurrent, apex acute to acuminate; secondary veins 14–25 pairs; stipules persistent, lanceolate to ovate, 1.8–2.3 × 0.6–0.9 cm, sericeous to glabrescent, acuminate or lobed for up to 1/3. Inflorescences laxly paniculate or cymose, densely villous to hirtellous; peduncles 2–6 cm; branched portion pyramidal, 1.5–5 × 2–5 cm; bracts triangular, 2–5 mm; bracteoles narrowly triangular, 1–2 mm; pedicels 0–3 mm. Calyx densely villosulous; ovary portion subglobose to ellipsoid, ca. 0.5 mm; limb lobed nearly to base, glabrous inside; lobes spatulate to ovate or obovate, 0.6–2.1 mm, obtuse to rounded. Corolla tubular to funnelform, glabrous or with a few stout hairs outside; tube 1.5–2 mm; lobes 0.5–1.5 mm, acute. Fruit indehiscent or perhaps tardily splitting septically, ellipsoid to subglobose or didymous, 1.5–3 mm, villosulous to hirtellous. Fl. Feb, fr. Apr.

Wet forests; ca. 1400 m. Hainan (Jianfeng Ling) [N Vietnam].

The specimens described here were included by Chinese authors in *Xanthophyllum attopevense* but are here separated following Axelius (Blumea 34: 470–472. 1990).

## ACANTHACEAE

爵床科 jue chuang ke

Hu Jiaqi (胡嘉琪 Hu Chia-chi)<sup>1</sup>, Deng Yunfei (邓云飞)<sup>2</sup>, John R. I. Wood<sup>3</sup>, Thomas F. Daniel<sup>4</sup>

Prostrate, erect, or rarely climbing herbs (annual or perennial), subshrubs, shrubs, or rarely small trees, usually with cystoliths (except in following Chinese genera: *Acanthus*, *Blepharis*, *Nelsonia*, *Ophiorrhiziphyllon*, *Staurogyne*, and *Thunbergia*), isophyllous (leaf pairs of equal size at each node) or anisophyllous (leaf pairs of unequal size at each node). Branches decussate, terete to angular in cross-section, nodes often swollen, sometimes spinose with spines derived from reduced leaves, bracts, and/or bracteoles. Stipules absent. Leaves opposite [rarely alternate or whorled]; leaf blade margin entire, sinuate, crenate, dentate, or rarely pinnatifid. Inflorescences terminal or axillary spikes, racemes, panicles, or dense clusters, rarely of solitary flowers; bracts 1 per flower or dichasial cluster, large and brightly colored or minute and green, sometimes becoming spinose; bracteoles present or rarely absent, usually 2 per flower. Flowers sessile or pedicellate, bisexual, zygomorphic to subactinomorphic. Calyx synsepalous (at least basally), usually 4- or 5-lobed, rarely (*Thunbergia*) reduced to an entire cupular ring or 10–20-lobed. Corolla sympetalous, sometimes resupinate 180° by twisting of corolla tube; tube cylindric or funnelliform; limb subactinomorphic (i.e., subequally 5-lobed) or zygomorphic (either 2-lipped with upper lip subtire to 2-lobed and lower lip 3-lobed, or rarely 1-lipped with 3 lobes); lobes ascending or descending cochlear, quincuncial, contorted, or open in bud. Stamens epipetalous, included in or exserted from corolla tube, 2 or 4 and didynamous; filaments distinct, connate in pairs, or monadelphous basally via a sheath (*Strobilanthes*); anthers with 1 or 2 thecae; thecae parallel to perpendicular, equally inserted to superposed, spherical to linear, base muticous or spurred, usually longitudinally dehiscent; staminodes 0–3, consisting of minute projections or sterile filaments. Disk annular and nectar-producing at base of ovary. Ovary superior, 2-locular, placentation axile, with 2 to many ovules per locule; style filiform, simple; stigma funnel-shaped or 2-lobed (one lobe sometimes suppressed), one or both lobes sometimes recurved or recoiled. Fruit a loculicidal, stipitate or not, 2-valved, explosively dehiscent capsule [rarely drupaceous], 2- to many seeded, apex with or without a beak; septa remaining attached to or separating from inner wall of mature capsule. Seeds usually borne on hooklike retinacula (attached to septa of capsule), or retinacula lacking (*Nelsonia*, *Ophiorrhiziphyllon*, *Staurogyne*, *Thunbergia*), surface smooth or roughened, pubescent or lacking trichomes, sometimes with hygroscopic trichomes that expand when moistened.

About 220 genera and ca. 4,000 species: pantropical and subtropical, with a few species in temperate regions; 35 genera (one endemic) and 304 species (134 endemic, eight introduced) in China.

Pollen characters have traditionally been important in delimiting genera and higher taxa in the family; they are used sparingly in the key below.

*Avicennia* Linnaeus, usually placed in either Verbenaceae (and treated as such in Fl. China 17: 49. 1994) or Avicenniaceae, is now included in Acanthaceae on the basis of molecular phylogenetic studies (e.g., A. E. Schwarzbach & L. A. McDade, Syst. Bot. 27: 84–98. 2002).

The major economic importance of the family is horticultural. Species of *Acanthus*, *Aphelandra* R. Brown, *Barleria*, *Crossandra* Salisbury, *Eranthemum*, *Fittonia* Coemans, *Justicia*, *Odontonema* Nees, *Pachystachys* Nees, *Ruellia*, *Sanchezia* Ruiz & Pavon, *Thunbergia*, and numerous other genera are widely cultivated as ornamentals. Many species are cultivated in China but not treated in the present account. These include: *Aphelandra squarrosa* Nees, *Barleria lupulina* Lindley, *Crossandra infundibuliformis* (Linnaeus) Nees, *Eranthemum pulchellum* Andrews, *Fittonia albivenis* (Veitch) Brummitt, *Justicia betonica* Linnaeus, *J. brandegeana* Wasshausen & L. B. Smith, *J. carnea* Lindley, *Pachystachys lutea* Nees, *Ruellia elegans* Poir., *R. simplex* C. Wright, *Sanchezia parvibracteata* Sprague & Hutchinson, *Thunbergia erecta* (Bentham) T. Anderson, and *T. laurifolia* Lindley.

Hu Chiachi & Tsui Hongpin. 2002. Acanthaceae. In: Hu Chiachi, ed., Fl. Reipubl. Popularis Sin. 70: 1–309.

- 1a. Vines; calyx cupular with 10–20 lobes or reduced to an entire ring; capsule with a prominent apical sterile beak; seeds not borne on hooklike retinacula ..... 4. *Thunbergia*
- 1b. Prostrate or erect herbs, shrubs, or rarely small trees; calyx 4- or 5-lobed; capsule lacking a prominent apical sterile beak; seeds borne on hooklike retinacula or not.
  - 2a. Cystoliths absent; retinacula absent (except *Acanthus* and *Blepharis*).
    - 3a. Seeds laterally compressed, borne on hooklike retinacula; corolla 1-lipped (upper lip absent), lobes not with descending cochlear aestivation; anthers 1-thealous.
    - 4a. Leaves opposite; flowers not subtended by up to 5 pairs of bracts; seeds lacking hygroscopic trichomes; lower filaments without an apical appendage ..... 5. *Acanthus*
    - 4b. Leaves usually in pseudo-whorl of 4; flowers subtended by up to 5 pairs of bracts; seeds with hygroscopic trichomes; lower filaments with an apical appendage ..... 6. *Blepharis*
  - 3b. Seeds subspherical or blocky, not borne on hooklike retinacula; corolla 2-lipped, lobes with descending cochlear aestivation; anthers 2-thealous.

<sup>4</sup> Department of Botany, California Academy of Sciences, 55 Music Concourse Drive, Golden Gate Park, San Francisco, California 94118-4503, U.S.A.

- 5a. Prostrate herbs; bracteoles absent; calyx 4-lobed, anterior lobe 2-cleft at apex; stamens 2 ..... 1. *Nelsonia*
- 5b. Erect herbs; bracteoles present; calyx 5-lobed; stamens 2 or 4.
- 6a. Stamens 4, included or slightly exserted from mouth of corolla; anther thecae of a pair parallel; staminodes 0 or 1 ..... 2. *Staurogyne*
- 6b. Stamens 2, long exserted; anther thecae of a pair divergent toward apex; staminodes 2 ..... 3. *Ophiorrhizophyllum*
- 2b. Cystoliths present; retinacula present, hooklike.
- 7a. Calyx lobes heteromorphic, posterior lobe usually largest, anterior lobes connate to a greater degree than other lobes, lateral lobes smallest and innermost; corolla lobe aestivation quincuncial.
- 8a. Corolla large (mostly > 3 cm), upper lip usually appearing 4-lobed and lower lip appearing 1-lobed ..... 29. *Barleria*
- 8b. Corolla small (< 3 cm), upper lip 2-lobed and lower lip 3-lobed.
- 9a. Corolla to 1 cm; anther thecae usually lacking basal appendages; capsule 4–7 mm ..... 30. *Lepidagathis*
- 9b. Corolla ca. 2.5 cm; anther thecae spurred at base; capsule 12–16 mm ..... 31. *Chroesthes*
- 7b. Calyx lobes homomorphic (or nearly so; sometimes partially fused to form a bipartite or tripartite calyx in *Strobilanthes*), not as described above; corolla lobe aestivation not quincuncial.
- 10a. Corolla lobes contorted in bud; stamens (or stamens + staminodes) 4.
- 11a. Style held in place by trichomes on one side of corolla tube; stamens monadelphous (by a sheath) at base ..... 7. *Strobilanthes*
- 11b. Style not held in place by trichomes on one side of corolla tube; stamens not monadelphous at base.
- 12a. Inflorescence secund strobilate spikes with orbicular to reniform bracts; ovules 2 per locule; seeds to 4 per capsule; corolla ca. 0.6 cm; septa with attached retinacula separating from inner wall of mature capsule ..... 8. *Phaulopsis*
- 12b. Inflorescence not as described above; ovules 4 to many per locule; seeds 4 or more per capsule; corolla 0.6–5.5 cm; septa with attached retinacula not separating from inner wall of mature capsule (except in *Ruellia blechum*).
- 13a. Corolla limb distinctly 2-lipped, lobes usually not equal; calyx tube often rupturing in weak hyaline regions between lobes; pollen 4-colporate, interapertural regions multistriate with pseudocolpi ..... 9. *Hygrophila*
- 13b. Corolla limb nearly regular, lobes equal to subequal; mature calyx tube not rupturing in weak hyaline regions between lobes; pollen otherwise.
- 14a. Fertile stamens 2, staminodes 2 ..... 10. *Eranthemum*
- 14b. Fertile stamens 4.
- 15a. Anther thecae spurred at base ..... 11. *Echinacanthus*
- 15b. Anther thecae muticous at base.
- 16a. Stems short; leaves in a basal rosette; anther thecae usually widely separated by a broad connective ..... 12. *Pararuellia*
- 16b. Stems elongate; leaves cauline; anther thecae not separated by a broad connective ..... 13. *Ruellia*
- 10b. Corolla lobes ascending cochlear in bud; stamens 2 (except 4 in *Asystasia*), staminodes 0 or 2.
- 17a. Ovules 3 to many per locule; seeds 6 to many per capsule; pollen with apertural margins conspicuously thickened.
- 18a. Capsule compressed perpendicular to septum; seeds subglobose, glabrous ..... 33. *Andrographis*
- 18b. Capsule linear and 4-angled, not compressed perpendicular to septum; seeds strongly compressed, glabrous or pubescent.
- 19a. Staminodes 0 ..... 32. *Gymnostachyum*
- 19b. Staminodes 2.
- 20a. Corolla tube cylindric and slightly curved ..... 34. *Phlogacanthus*
- 20b. Corolla tube abruptly inflated near middle and usually bent ca. 90° ..... 35. *Cystacanthus*
- 17b. Ovules 2 per locule; seeds 4 per capsule; pollen with apertural margins not thickened.
- 21a. Stamens 4 ..... 14. *Asystasia*
- 21b. Stamens 2.
- 22a. Anthers 1-thecous.
- 23a. Flowers subtended by a single pair of bracteoles; corolla not resupinate 180° by a twisting of corolla tube (i.e., upper lip entire to 2-lobed and lower lip 3-lobed), or if position of lips reversed then this by geniculation (without twisting) of corolla tube ..... 18. *Clinacanthus*
- 23b. Flowers subtended by an involucre of 2 or more pairs of floral bracteoles; corolla resupinate 180° by twisting of corolla tube (i.e., lip in upper position 3-lobed and lip in lower position entire to 2-lobed) ..... 28. *Hypoestes*

- 22b. Anthers 2-theous.
- 24a. Flowers subtended by involucre of 2 or more pairs of floral bracteoles; corolla resupinate 180° (i.e., lip in upper position 3-lobed and lip in lower position entire to 2-lobed).
- 25a. Septa with attached retinacula separating from inner wall of mature capsule ..... 26. *Dicliptera*
- 25b. Septa with attached retinacula remaining attached to inner wall of mature capsule ..... 27. *Peristrophe*
- 24b. Flowers subtended by a single pair of bracteoles (or bracteoles rarely lacking); corolla not resupinate 180° (i.e., upper lip entire to 2-lobed and lower lip 3-lobed).
- 26a. Staminodes 2.
- 27a. Corolla ± salverform (i.e., tube slender and cylindric, limb spreading and inconspicuously 2-lipped), tube conspicuously longer than limb, not or only slightly widened distally ..... 15. *Pseuderanthemum*
- 27b. Corolla ± campanulate to strongly 2-lipped (not salverform), tube not longer than limb, gradually widened distally.
- 28a. Corolla 3–4 cm; anther thecae 4–5 mm ..... 16. *Mackaya*
- 28b. Corolla less than 2 cm; anther thecae less than 3 mm.
- 29a. Corolla campanulate, 6.5–10 mm, externally glabrous; pollen 4-aperturate ..... 22. *Codonacanthus*
- 29b. Corolla strongly 2-lipped, 10–15 mm, externally pubescent (to subglabrous); pollen 3-aperturate ..... 23. *Cosmianthemum*
- 26b. Staminodes absent.
- 30a. Upper lip of corolla lacking a stylar furrow on internal surface; anther thecae lacking basal appendages.
- 31a. Corolla 1.7–4.5 cm; anther thecae subequally to unequally inserted; pollen 2-aperturate ..... 17. *Isoglossa*
- 31b. Corolla less than 10 mm; anther thecae equally to subequally inserted; pollen 3–5-aperturate.\*
- 32a. Corolla glabrous outside ..... 19. *Kudoacanthus*
- 32b. Corolla pubescent outside ..... 21. *Leptostachya*
- 30b. Upper lip of corolla rugulate (i.e., with a furrow on inner surface of lip in which style resides); anther thecae (at least lower theca) usually with a basal appendage.
- 33a. Septa with attached retinacula separating from inner wall of mature capsule; inflorescence often dense with imbricate bracts 2- or 4-ranked (but only 2 ranks fertile) ..... 20. *Rungia*
- 33b. Septa with attached retinacula remaining attached to inner wall of mature capsule; inflorescence not as above.
- 34a. Corolla not with combination of characters noted below ..... 24. *Justicia*
- 34b. Corolla white or greenish white, tube narrowly cylindric, conspicuously longer than limb ..... 25. *Rhinacanthus*

# 1. NELSONIA R. Brown, Prodr. 480. 1810.

瘤子草属 liu zi cao shu

Hu Jiaqi (胡嘉琪 Hu Chia-chi), Deng Yunfei (邓云飞); Thomas F. Daniel

Herbs, pubescent, without cystoliths. Leaves opposite, shortly petiolate; leaf blade pinnately veined, margin entire. Inflorescences axillary or terminal spikes; bracts overlapping. Flowers ± spirally arranged, sessile, subtended by a bract; bracteoles absent. Calyx 4-lobed to base; lobes unequal, anterior lobe apically 2-cleft. Corolla tube slender, sometimes widening into a throat; limb 2-lipped; lower lip 3-lobed, upper lip 2-lobed; lobes ± equal, descending cochlear in bud. Stamens 2, included or slightly exserted; filaments basally pubescent; anthers 2-theous; thecae subspherical, muticous, opening at base by a pore that has a small flap; stami-

nodes absent. Ovary with 8–28 ovules in 2–4 rows per locule; stigma usually unequally 2-lobed. Capsule conical; retinacula absent. Seeds subspherical, small, flattened on 1 face, lacking trichomes.

Five species or fewer: widely occurring in tropical Africa, Asia, Australia, and South America (introduced elsewhere); one species in China.

A single species, *Nelsonia canescens*, is sometimes recognized (e.g., A. B. M. E. Hossain, Willdenowia 14: 397–403. 1984), but Vollesen (e.g., K. Vollesen in J. H. Seyani & A. C. Chikuni, eds., Proceedings of the XIII Plenary Meeting of AETFAT, Zomba, Malawi, 2–11 Apr 1991, 315–325. 1994) presented arguments for recognizing up to five species.

瘤子草 liu zi cao

*Justicia canescens* Lamarck, Tabl. Encycl. 1: 41. 1791.

Herbs 10–20 cm tall, annual, creeping, sprawling, prostrate, or decumbent. Stems subterete, villous, often rooting at nodes. Petiole 0.2–3(–4) cm, villous; leaf blade elliptic to ovate, 1–2.2 × 0.4–1.2 cm but basal ones sometimes 6–12 × 3.5–5 cm, both surfaces villous, secondary veins 3–7 on each side of midvein, base cuneate, margin entire, apex acute. Spikes 1.5–4 cm;

bracts elliptic, 6–7.5 × 3–4 mm, 5–7-veined. Calyx abaxial lobe ca. 2 × 0.6 mm, apex 2-lobed; adaxial lobe ca. 3 × 1 mm; lateral lobes ca. 2 × 0.5 mm. Corolla bluish purple or white, externally glabrous; tube cylindric for ca. 1.5 mm, contracted near midpoint then expanded into throat; lower lip ca. 2.3 mm; upper lip ca. 2 mm. Stamens inserted at base of throat; filaments ca. 0.5 mm, glabrous. Ovary glabrous; ovules 4–8 per locule. Capsule ca. 5 × 2 mm, 8–16-seeded. Seeds broadly ellipsoid, granulate. Fl. Oct–Mar, fr. Mar–May.  $2n = 34 + B, 36$ .

Wet places, open forests; 400–2000 m. Guangxi, Yunnan [Bhutan, Cambodia, India, Indonesia, Laos, Malaysia, Myanmar, Nepal, Philippines, Thailand, Vietnam; Africa, Madagascar].

叉柱花属 cha zhu hua shu

Hu Jiaqi (胡嘉琪 Hu Chia-chi), Deng Yunfei (邓云飞); Thomas F. Daniel

*Ebermaiera* Nees.

Annual or perennial herbs or small shrubs, without cystoliths. Stems very short or elongate. Leaves in a basal rosette or cauline, opposite (or alternate, especially apically), petiolate or sessile; leaf blade margin entire or nearly so. Inflorescences terminal or axillary, racemes or spikes; bracts opposite or alternate, leaflike or usually well differentiated from leaves; bracteoles present. Calyx 5-lobed almost to base; lobes equal or unequal. Corolla tube cylindric or basally cylindric and apically expanding into a campanulate throat; limb subactinomorphic to 2-lipped, 5-lobed; lobes subequal, patent, descending cochlear in bud. Stamens 4, didynamous, included or anterior pair slightly exerted; filaments usually hairy; anthers 2-theous; thecae parallel, usually equal; staminode 1 or more, sometimes absent. Ovary with usually 12–60 ovules arranged in 2 or 4 rows per locule; style glabrous; stigmas 2-lobed, sometimes repeatedly 2-lobed. Capsule oblong, many seeded; retinacula absent. Seeds minute, subspherical or cuboid.

About 140 species: tropical regions worldwide; 17 species (eight endemic) in China.

- 1a. Bracts pinnately veined.

灰背叉柱花 *hui bei cha zhu hua*

*Ophiorrhiziphyllon hypoleucum* (Benoist) Benoist.

Herbs to 1 m tall. Stems glabrous, lenticellate. Petiole 3–6 cm; leaf blade oblong, elliptic, or lanceolate, 13–17 × 4.5–7 cm, both surfaces glabrous, abaxially glaucous, adaxially green, secondary veins 8–11 on each side of midvein, base cuneate and slightly decurrent onto petiole, margin entire or undulate, apex acuminate to sometimes acute. Racemes terminal or in axils of apical leaves, to 15 cm, unbranched or branched at base; rachis gland-tipped pilose; bracts linear, 4–4.5 × ca. 0.8 mm, apex acuminate; bracteoles linear, ca. 2 mm. Flowers alternate. Pedicel 2–3.5 mm. Calyx ca. 5 mm, outside pubescent with gland-tipped trichomes; lobes triangular-ovate, ca. 4 × 1 mm, unequal with lateral 2 lobes smaller, margin ciliate with gland-tipped trichomes. Corolla white, funnel-shaped, ca. 7 mm; lobes suborbicular, ca. 1.5 × 1.3 mm, subequal. Stamens with longer pair ca. 3 mm and shorter pair ca. 2 mm; filaments glabrous; anther thecae ca. 1 mm, those of longer pair of stamens slightly exerted. Ovary ellipsoid, ca. 2 mm; ovules in 2 rows per locule, 12 in each row; style ca. 3 mm, glabrous; stigma 2-cleft. Capsule cylindric, 5–7 mm. Fl. Dec–Apr.

Forests; 300–1800 m. Yunnan [Vietnam].

**2. *Staurogyne longicuneata*** H. S. Lo, Bull. Bot. Res., Harbin 8(1): 2. 1988.

楔叶叉柱花 *xie ye cha zhu hua*

Herbs to 30 cm tall. Stems stout, 4-angled, pubescent. Petiole 2–5 cm, brown pubescent, soon glabrescent; leaf blade elliptic to elliptic-lanceolate, 10–20 × 5–7 cm, both surfaces brown or white pubescent, abaxially pale green, adaxially green, secondary veins 11–17 on each side of midvein, base cuneate and usually decurrent onto petiole, margin entire, apex acute to obtuse. Racemes borne on axillary brachyblasts, to 16 cm; rachis brownish pubescent with gland-tipped trichomes; bracts linear, 3–5 × ca. 1 mm; bracteoles linear, 3–4 × ca. 1 mm. Pedicels 2–5 mm. Calyx ca. 1 cm, outside brown pubescent, inside glabrous; lobes linear, ca. 9 × 1 mm, subequal. Corolla ca. 1.5 cm, outside pubescent; lobes oblong, ca. 2 × 1.5 mm, subequal. Staminal filaments pubescent; anther thecae ca. 1 mm. Style glabrous; stigma 3-lobed. Capsule ellipsoid, 5–6 mm. Seeds black, in 2 rows, pubescent. Fl. Mar–Apr.

• Forests or thickets by streams; 100–400 m. Yunnan.

**3. *Staurogyne sichuanica*** H. S. Lo, Bull. Bot. Res., Harbin 8(1): 2. 1988.

金长莲 *jin chang lian*

Herbs 10–30 cm tall. Stems purplish black, terete, sulcate, pubescent. Petiole purple, 1–2 cm, puberulent; leaf blade ovate-lanceolate to elliptic-lanceolate, 4–9 × 1.3–3 mm, both surfaces sparsely strigillose, secondary veins 6–11 on each side of midvein and abaxially inconspicuous, base cuneate to broadly cuneate and sometimes oblique, margin entire, apex acuminate. Racemes terminal or axillary, 3.5–6 cm, 2–5-flowered; peduncle and rachis slightly puberulent; bracts linear, ca. 5.5 × 0.5 mm, subglabrous, 1-veined, margin ciliate; bracteoles similar to bracts. Pedicel 4–7 mm. Calyx ca. 1.1 cm, subglabrous; lobes linear, 9–11 × 0.6–1.2 mm, subequal, 3-veined, margin ciliate. Corolla purplish blue in bud. Staminal filaments glabrous. Ovary glabrous. Capsule ca. 5 mm. Fl. Feb, fr. Jun–Jul.

• Forests; 500–600 m. Sichuan (Changning, Hejiang).

**4. *Staurogyne sesamoides*** (Handel-Mazzetti) B. L. Burtt, Notes Roy. Bot. Gard. Edinburgh 22: 310. 1958.

大花叉柱花 *da hua cha zhu hua*

*Loxostigma sesamoides* Handel-Mazzetti, Oesterr. Bot. Z. 85: 217. 1936; *Staurogyne dolichocalyx* E. Hossain.

Herbs to 40 cm tall, unbranched. Stems striate, tomentose, soon glabrescent. Petiole 1.5–4 cm, tomentose; leaf blade elliptic-lanceolate, 5–13 × 2–5.5 cm, abaxially pubescent along veins, adaxially glabrous, secondary veins 5–11 on each side of midvein, base cuneate, margin entire or sometimes irregularly undulate, apex acuminate to sometimes acute. Racemes terminal or axillary, densely flowered, elongated after flowering; peduncle and rachis pubescent; bracts lanceolate, 6–7 × 2–2.2 mm, pilose, 3-veined; bracteoles lanceolate, 8–8.5 × ca. 2 mm, pilose. Pedicel 0.8–1 mm but elongated to 5 mm in fruit, tomentose. Calyx 1.8–2.4 mm, outside sparsely pilose or glabrous; lobes lanceolate, 1.6–2.2 × 0.1–0.2 cm, subequal. Corolla white or pinkish on lobes, 3–4 cm; lobes suborbicular, ca. 1 cm in diam., subequal, 3-veined. Stamens with longer pair ca. 1.7 cm and shorter pair ca. 1.3 cm; filaments gland-tipped hairy and apically more densely hairy; anther thecae ca. 2.5 × 1.5 mm, with appendage, margin hispid. Ovary glabrous; ovules ca. 60 in 2 rows; style ca. 2 cm, sparsely pubescent; stigma triangular, 2-cleft; stigma lobes fimbriate on margin, posterior one

elliptic and ca.  $3 \times 2$  mm, anterior one ca.  $4 \times 4$  mm. Capsule narrowly ellipsoid. Seeds small, alveolate. Fl. Mar–May.

Moist places in forests; below 800 m. Guangdong, Guangxi [Vietnam].

**5. *Staurogyne chapaensis*** Benoist, Bull. Mus. Natl. Hist. Nat., sér. 2, 5: 172. 1933.

弯花叉柱花 wan hua cha zhu hua

Herbs to 10 cm tall. Stems short. Leaves in a basal rosette; petiole to 11 cm, brownish tomentose; leaf blade ovate to oblong,  $2.5\text{--}14.5 \times 2\text{--}6$  cm, abaxially glaucous and densely hairy, adaxially green and sparsely hairy, secondary veins 7–9 on each side of midvein, base cordate, margin entire or slightly undulate, apex obtuse. Racemes terminal or axillary; peduncle ca. 4 cm, villous; rachis villous; bracts obovate to linear-spatulate,  $2.5\text{--}3.5$  cm, abaxially villous, adaxially glabrous; bracteoles linear-spatulate, ca.  $5 \times 1.6$  mm, abaxially villous, adaxially glabrous, margin ciliate, apex obtuse. Pedicel  $1.5\text{--}7$  mm, villous. Calyx ca. 1 cm, outside villous, inside glabrous; lobes unequal, margins ciliate, posterior one spatulate and ca.  $8 \times 2$  mm, lateral 2 linear and ca.  $5 \times 0.5$  mm. Corolla light bluish purple, ca. 1.5 cm; lobes orbicular, subequal. Stamens with longer pair ca. 2 mm and shorter pair ca. 1.1 mm; filaments glabrous; anther thecae subequal, base with a rectangular appendage. Ovary ellipsoid, ca. 2 mm, glabrous; style ca. 5.5 mm, glabrous. Capsule obovoid-ellipsoid, ca. 6 mm. Fl. Mar–May, fr. Jul–Aug.

Forests; 1000–2000 m. Guangdong, Guangxi, Hunan, Yunnan [Vietnam].

**6. *Staurogyne sinica*** C. Y. Wu & H. S. Lo, Fl. Hainan. 3: 590. 1974.

中华叉柱花 zhong hua cha zhu hua

*Titanotrichum parviflorum* X. B. Ye & W. T. Lin.

Herbs, annual. Stems very short, densely pubescent. Leaves in a basal rosette; petiole  $0.5\text{--}3$  cm; leaf blade ovate-oblong,  $4\text{--}9 \times 1\text{--}4.5$  cm, papery, abaxially pale green and villous along veins, adaxially green and villous, secondary veins 5–7 on each side of midvein, base rounded to broadly cuneate, margin entire, apex rounded. Racemes terminal or axillary, 3–12 cm; peduncle hispid; bracts linear-spatulate, 3–4 mm, pubescent on both surfaces, 3-veined, apex rounded; bracteoles similar to bracts. Pedicel 4–5 mm, hispid. Calyx 6–9 mm, outside villous; lobes linear-lanceolate, unequal, anterior and posterior ones 6–8 mm and lateral ones 5–7 mm, 3-veined. Corolla whitish purple, tubular-campanulate, ca. 2 cm; tube basally cylindric for ca. 8 mm; lobes oblong,  $1.8\text{--}2.5 \times 1.5\text{--}2$  mm, slightly unequal, apex rounded. Stamens with longer pair ca. 7 mm and shorter pair ca. 6 mm; filaments glabrous; anther thecae ca. 1.8 mm; staminode ca. 1 mm. Ovary ellipsoid, ca. 1.8 mm, glabrous; style ca. 8 mm, glabrous. Capsule oblong-ovoid, ca. 6 mm, glabrous. Fl. Mar–May, fr. Aug.

• Dense forests; 500–1200 m. Guangdong, Hainan.

**7. *Staurogyne paotingensis*** C. Y. Wu & H. S. Lo, Fl. Hainan. 3: 589. 1974.

保亭叉柱花 bao ting cha zhu hua

Herbs 10–20 cm tall, annual. Stems erect, pubescent. Leaves cauline; petiole to 4 cm; leaf blade elliptic, elliptic-lanceolate, or rarely subovate,  $2.5\text{--}6 \times 1\text{--}2$  cm, papery, abaxially green and glabrous, adaxially pale green and glabrous except slightly pubescent along midvein, secondary veins 6–9 on each side of midvein, base cuneate, margin entire, apex obtuse to rounded. Spikes borne on axillary brachyblasts, ca. 1 cm; peduncle and rachis pubescent; bracts elliptic to spatulate-elliptic,  $6\text{--}7 \times$  ca. 3.5 mm, abaxially pubescent, pinnately veined, apex obtuse; bracteoles linear-oblong, ca.  $6 \times 1$  mm, abaxially pubescent, 1-veined, apex acute. Pedicel short or absent. Calyx ca. 1 cm, outside pubescent; lobes linear, 8–9 mm, unequal, margin ciliate. Corolla purple, ca. 9 mm, outside pubescent, inside pubescent at base; tube basally cylindric for ca. 2 mm; lobes suborbicular,  $1.7\text{--}2$  mm in diam., slightly unequal, apex rounded. Stamens with longer pair ca. 5 mm and shorter pair ca. 3 mm; filaments flattened, ciliate; anther thecae ca. 1 mm, base appendaged; staminode ca. 1 mm. Ovary oblong, glabrous; ovules ca. 24 in 2 rows per locule; style ca. 3 mm; stigma 2-lobed, lobes unequal with posterior one 2-dentate. Capsule ovoid-oblong, ca. 6 mm. Seeds orbicular, ca. 0.2 mm in diam. Fl. Dec.

• Wet places, paddy fields. Hainan (Baoting).

**8. *Staurogyne rivularis*** Merrill, Philipp. J. Sci., C, 7: 248. 1912.

瘦叉柱花 shou cha zhu hua

Herbs to 1 m tall, usually ascending from a decumbent base and rooting at nodes on lower portion. Stems striate and lenticellate, glabrous. Petiole 3–6 cm; leaf blade elliptic, oblong, or lanceolate,  $13\text{--}17 \times 4.5\text{--}7$  cm, both surfaces glabrous, secondary veins 8–11 on each side of midvein, base cuneate and slightly decurrent onto petiole, margin entire or undulate, apex acuminate to acute. Racemes terminal or axillary from apical leaves, to 15 cm, unbranched or with 2 branches at base; rachis gland-tipped pubescent; bracts linear,  $4\text{--}4.5 \times$  ca. 0.8 mm, pinnately veined, apex acuminate; bracteoles linear, ca.  $2 \times 0.5$  mm. Pedicel 2–3.5 mm. Calyx ca. 5 mm, outside pubescent with gland-tipped trichomes. Corolla white, funnel-shaped, ca. 7 mm; lobes suborbicular, ca.  $1.5 \times 1.3$  mm, subequal, apex rounded. Stamens with longer pair ca. 3 mm and shorter pair ca. 2 mm; filaments glabrous; anther thecae ca. 1 mm. Ovary ellipsoid, ca.  $2 \times 1$  mm, glabrous; ovules 12 in 2 rows per locule; style ca. 3 cm, glabrous; stigma 2-lobed. Capsule cylindric, 5–7 mm. Fl. Dec–May.

Forests along streams. Hainan, Yunnan [Vietnam].

**9. *Staurogyne brachystachya*** Benoist, Bull. Mus. Natl. Hist. Nat., sér. 2, 5: 174. 1933.

短穗叉柱花 duan sui cha zhu hua

Herbs to 80 cm tall. Stems subterete, sulcate, brown pubescent. Petiole  $0.5\text{--}2$  cm, brown pubescent; leaf blade lanceolate to ovate-lanceolate,  $3\text{--}8 \times 1\text{--}1.6$  cm, both surfaces glabrous, abaxially pale green but brown when dry, adaxially green, secondary veins 8–10 on each side of midvein, base narrowly cuneate, margin irregularly undulate, apex acute. Racemes axil-

lary or terminal, 2–4 cm, 3–5-flowered; peduncle and rachis glabrous; bracts linear, 2.3–5 mm, thickened, 1-veined, glabrous; bracteoles linear, 2.3–3 mm, glabrous, 1-veined. Pedicel 1.2–1.6 cm, glabrous. Calyx 0.9–1.1 cm, glabrous except margin slightly ciliate with gland-tipped trichomes; lobes linear, 7.5–9 × ca. 1 mm, subequal, apex acuminate. Corolla white, 1–1.4 cm, glabrous; lobes orbicular, ca. 2 mm in diam. Stamens with longer pair 7–9 mm and shorter pair 6–8 mm; filaments pubescent (especially apically); anther thecae with a long tie-shaped appendage, apex hirsute; staminode small. Ovary glabrous; style ca. 1 cm, glabrous; stigma 2-lobed. Capsule not seen. Fl. Mar–Apr.

Forests; 800–1200 m. Guangxi, Yunnan [Vietnam].

**10. *Staurogyne concinnula*** (Hance) Kuntze, Revis. Gen. Pl. 2: 497. 1891.

叉柱花 cha zhu hua

*Ebermaiera concinnula* Hance, J. Bot. 6: 300. 1868.

Herbs to 15 cm tall, perennial. Stems generally short, partially subterranean, 0.5–6 cm, usually simple, rarely few branched, terete, densely shortly pubescent. Leaves in a basal rosette; petiole 0.3–3 cm, pubescent; leaf blade oblanceolate, 1.5–7 × 0.5–1.5 cm, scarious, abaxially glaucous and pubescent along veins, adaxially green and sometimes pubescent along veins, secondary veins 5–8 on each side of midvein and abaxially prominent, base gradually attenuate, margin obscurely undulate, apex obtuse to rounded. Racemes 1–4, axillary, sometimes loosely branched and forming a panicle, 5–15 cm; branches slender, with 3–10 interrupted flowers; bracts linear to linear-oblanceolate, 2–4 mm, apex obtuse to subacute; bracteoles borne near middle of pedicel, linear, ca. 2 mm, apex obtuse. Pedicel 1–4 mm, pubescent. Calyx campanulate, 5-lobed almost to base, glabrous except for margin minutely pilose; lobes linear to linear-lanceolate, 5–6 mm but accrescent to 7 mm in fruit, unequal, apex acute. Corolla white, tubular-funnel-form, ca. 1 cm; tube ampliate, ca. 6 mm, ca. 4 mm wide; lobes orbicular, ca. 3 mm, subequal. Stamens with longer pair ca. 5 mm and shorter pair ca. 2.5 mm; filaments glabrous; anther thecae ca. 1.5 mm. Ovary ellipsoid, glabrous; style ca. 5 mm; stigma subulate. Capsule oblong, 4–5 × ca. 1.5 mm, glabrous, shorter than persistent calyx. Seeds suborbicular, ca. 0.2 mm. Fl. Mar–May, fr. Jul–Sep.

Forests along streams. Fujian, Guangdong, Hainan, Taiwan [Japan].

**11. *Staurogyne hainanensis*** C. Y. Wu & H. S. Lo, Fl. Hainan. 3: 589. 1974.

海南叉柱花 hai nan cha zhu hua

Herbs to 30 cm tall, perennial. Stems terete, villous. Leaves cauline, crowded at apex of branches; petiole 1–3 cm, densely villous; leaf blade oblong to oblong-lanceolate, 3–10 × 1.3–3 cm, subleathery, abaxially adpressed villous, adaxially glabrous except midvein slightly villous, secondary veins 6–10 on each side of midvein, base cuneate to broadly cuneate, margins entire or irregularly undulate, apex rounded. Racemes terminal or axillary, to 16 cm; rachis pubescent; bracts linear-spat-

ulate to linear, ca. 2.5 mm, 1-veined; bracteoles similar to bracts. Pedicel ca. 3 mm. Calyx 6–7 mm, subglabrous; lobes linear, unequal, 3-veined, apex acuminate. Corolla purple, ca. 8 mm; lobes ovate-oblong, 1.2–1.4 × ca. 1 mm, apex rounded. Stamens with longer pair ca. 5 mm and shorter pair ca. 3 mm; filaments glabrous; anther thecae of longer stamens unequal and of shorter stamens equal; staminode ca. 0.7 mm. Ovary ovoid, ca. 1 mm, glabrous; style ca. 6 mm. Capsule ovoid-oblong, ca. 5 mm, glabrous. Fl. Feb–May, fr. Jul–Aug.

• Streamsides; 600–900 m. Hainan.

**12. *Staurogyne strigosa*** C. Y. Wu & H. S. Lo, Fl. Hainan. 3: 590. 1974.

琼海叉柱花 qiong hai cha zhu hua

Herbs, annual. Stems very short, villous. Leaves in a basal rosette; petiole 0.5–2.2 cm, strigose; leaf blade elliptic, oblong, ovate, or oblong-obovate, 1–1.5 × 0.8–2.5 cm, papery, abaxially villous, adaxially strigose, secondary veins 5–7 on each side of midvein, base cuneate to rounded, margin entire, apex rounded to obtuse. Raceme terminal or axillary, to 6 cm, simple or rarely branched; peduncle villous; bracts spatulate-linear, ca. 6 mm, abaxially villous, apex obtuse, rounded, or acute; bracteoles similar to bracts. Pedicel 1–3 mm, villous. Calyx 6–8 mm, abaxially villous; lobes linear, 3-veined, apex acuminate. Corolla ca. 5.5 mm; lobes orbicular, ca. 1 mm in diam. Staminal filaments glabrous; anther thecae of longer stamens ca. 0.7 mm and of shorter stamens ca. 0.2 mm; staminode ca. 1 mm. Ovary glabrous; stigma 2-lobed. Capsule ovoid-oblong, ca. 6 mm, glabrous. Fl. Feb–Mar, fr. Jul–Aug.

• Forests; below 200 m. Hainan (Qionghai).

**13. *Staurogyne stenophylla*** Merrill & Chun, Sunyatsenia 2: 322. 1935.

狭叶叉柱花 xia ye cha zhu hua

Herbs, perennial. Stems short, densely villous. Leaves usually crowded at apex of branches (but not forming a basal rosette); petiole ca. 1 cm, pubescent; leaf blade linear to lanceolate-linear, 6–12 × 0.5–0.9 cm, papery, abaxially paler and villous especially along veins, adaxially dark green, densely white papillose, and subglabrous except for margin slightly pubescent, secondary veins 8–13 on each side of midvein, base attenuate, margin entire or undulate, apex obtuse. Racemes axillary, 5–10 cm, unbranched or with 1 or 2 branches at base; peduncle and rachis villous; bracts linear, 3.8–4.5 mm, abaxially pubescent, 1-veined; bracteoles linear, ca. 3.7 mm, abaxially pubescent. Pedicel 2–3.5 mm. Calyx ca. 6 mm, abaxially slightly villous; lobes linear-triangular, 4.5–5.1 × 0.5–0.6 mm, unequal, margin ciliate. Corolla pink, ca. 8 mm; tube basally cylindric for ca. 1.5 mm then gradually widened, convex at one side; lobes orbicular to suborbicular, 2.2–2.5 × ca. 2 mm, unequal. Stamens 4 with longer pair ca. 4.5 mm and shorter pair ca. 3 mm; filaments glabrous; staminode ca. 0.7 mm. Ovary ellipsoid, ca. 2 × 1 mm, glabrous; style unequally 3-lobed. Capsule ovoid-oblong, ca. 3 mm. Fl. Mar–May, fr. Aug–Sep.

• Dense forests; 1000–2000 m. Hainan.

**14. *Staurogyne yunnanensis*** H. S. Lo, Bull. Bot. Res., Harbin 8(1): 3. 1988.

云南叉柱花 *yun nan cha zhu hua*

Herbs to 0.7 m tall. Stems densely pubescent. Leaves cauline; petiole 1.5–2 cm; leaf blade ovate-lanceolate, elliptic-lanceolate, or lanceolate, 4.5–10.5 × 2–3.5 cm, abaxially villous along veins, adaxially glabrous, secondary veins 9–14 on each side of midvein, abaxially conspicuous, and adaxially inconspicuous, base cuneate, margin undulate or inconspicuously dentate, apex obtuse. Racemes terminal only, to 8–15 cm in fruit; peduncle and rachis densely hirsute; bracts linear, 2.5–3 × ca. 0.5 mm, adaxially densely pubescent, 1-veined, apex acuminate to acute; bracteoles linear, ca. 1.2 mm, glabrous, apex acuminate. Pedicel 2–3 mm in fruit. Calyx ca. 4 mm, glabrous; lobes extremely unequal, anterior one triangular, 2.5–3 × ca. 0.5 mm, and apex acuminate, posterior and lateral ones subtriangular and ca. 1 mm. Corolla not seen. Capsule ± oblong, 3.5–4 mm. Seeds light brown. Fr. Jul.

• Forests. Yunnan (Hekou).

**15. *Staurogyne petelotii*** Benoist, Arch. Bot. Bull. Mens. 4: 75. 1930.

中越叉柱花 *zhong yue cha zhu hua*

Herbs 10–30 cm tall, ascending from a decumbent base. Stems erect, densely pubescent, unbranched or rarely branched in apical part, base with 1.5–3 cm internodes. Leaves cauline; petiole 2–4 cm, pubescent; leaf blade ovate to oblong, 3–6 × 2–3.5 cm, membranous, abaxially glabrous, adaxially darker and sparsely pubescent, secondary veins 4–6 on each side of midvein, base broadly cuneate to rounded, margin entire, apex obtuse. Raceme terminal, ca. 5 cm; bracts obovate, ca. 8 × 4 mm, abaxially sparsely pubescent, base attenuate, margin distally ciliate, apex rounded; bracteoles oblong, ca. 6 × 1 mm, abaxially pubescent especially apically, base gradually attenuate, apex rounded. Calyx ca. 6 mm; lobes spatulate with apex slightly enlarged and rounded, unequal, anterior one ca. 5 × 0.5 mm and others ca. 3 × 0.2 mm. Corolla 1.5–1.7 cm, slightly curved; lobes orbicular, ca. 5 × 5 mm. Staminal filaments glabrous. Ovary glabrous; style 1.8–2 mm, glabrous; stigma 2-cleft. Capsule ellipsoid, ca. 7 mm, glabrous. Fl. Jan–Apr.

Forests along ravines or on slopes; 1400–1700 m. Yunnan [Vietnam].

**16. *Staurogyne vicina*** Benoist, Bull. Mus. Natl. Hist. Nat., sér. 2, 5: 171. 1933.

密花叉柱花 *mi hua cha zhu hua*

Herbs to 50 cm tall. Stems erect, 4-angled, sulcate, tuberculate on basal part, pubescent on apical part. Leaves cauline; petiole 2–4 cm, pubescent; leaf blade elliptic, 6–15 × 3–7 cm, both surfaces glabrous except for pubescence along veins, abaxially glaucous, adaxially green, secondary veins 10–12 on each side of midvein, base acute, margin entire or serrate, apex acute to shortly acuminate. Racemes terminal only, unbranched or sometimes branched, 10–16 cm; peduncle 2–5 cm, glabrous; bracts linear, 4–7 × ca. 1 mm, glabrous, apex acute; bracteoles lanceolate, 2–3 × ca. 1 mm, glabrous, apex acute. Pedicel 2–3 mm, glabrous. Calyx 5–7 mm, glabrous; lobes linear, unequal, apex obtuse. Corolla white, 1.8–2.2 cm, outside glabrous; lobes oblong, ca. 4 × 3 mm, subequal, apex rounded. Staminal filaments glabrous; anther thecae spherical, ca. 1 mm in diam. Ovary glabrous; style glabrous; stigma 2-cleft. Capsule oblong, ca. 8 mm, glabrous. Fl. Apr.

Yunnan [Vietnam].

**17. *Staurogyne debilis*** (T. Anderson) C. B. Clarke ex Merrill, Philipp. J. Sci., C, 2: 302. 1907.

菲律宾叉柱花 *fei lü bin cha zhu hua*

*Ebermaiera debilis* T. Anderson, J. Linn. Soc., Bot. 9: 452. 1866.

Herbs 10–15 cm tall, somewhat succulent. Stems terete, ascending, unbranched or rarely branched, pubescent. Leaves cauline; petiole 5–8 mm, pubescent; leaf blade elliptic, oblong, or oblong-ovate, 2.5–4 × 0.8–1.7 cm, abaxially pale green and glabrous except pubescent along veins, adaxially green and glabrous, secondary veins 6 or 7 on each side of midvein, base cuneate to rounded, margin undulate, apex obtuse. Racemes terminal or axillary, to 7 cm, 4–7-flowered; rachis sometimes branched at base, slightly pubescent; bracts linear, ca. 2 × 0.4 mm; bracteoles subulate, ca. 1 × 0.3 mm. Pedicel ca. 2 mm. Calyx 5–6 mm; lobes linear, subequal, margin sparsely hirsute. Corolla white, ca. 1 cm, glabrous; lobes oblong, ca. 2 × 2 mm, subequal. Stamens with longer pair ca. 3 mm and shorter pair ca. 2 mm; filaments strigose; anther thecae ellipsoid, ca. 1 × 0.7 mm. Ovary ca. 1.8 mm, glabrous; style ca. 8 mm, glabrous; stigma 2-cleft. Capsule oblong, ca. 6 mm, compressed, glabrous. Fl. Feb–Mar, fr. Aug.

Evergreen broad-leaved forests; 300–400 m. Taiwan [Philippines].

### 3. *OPHIORRHIZIPHYLLON* Kurz, J. Asiat. Soc. Bengal, Pt. 2, Nat. Hist. 40: 76. 1871.

蛇根叶属 *she gen ye shu*

Hu Jiaqi (胡嘉琪 *Hu Chia-chi*), Deng Yunfei (邓云飞); Thomas F. Daniel

*Phyllophiorhiza* Kuntze.

Herbs, erect, without cystoliths. Leaves opposite, petiolate; leaf blade pinnately veined, margin entire. Inflorescence terminal spikes to racemes, unbranched or branched at base; bracts subopposite to alternate; bracteoles present. Calyx subequally 5-lobed. Corolla tube expanded apically, annular hairy at throat or glabrous; limb 2-lipped; lower lip 3-lobed; upper lip 2-lobed; lobes descending cochlear in bud. Stamens 2, exserted; anthers 2-theous; thecae ellipsoid to oblong, divergent toward apex; staminodes 2. Ovary ovoid-spherical; ovules 13–18 per locule, arranged in 2 rows per locule; style exserted; stigma 2-lobed. Capsule ovoid, with numerous seeds; retinacula absent. Seeds subglobose.

Two species: China, Laos, Myanmar, Thailand, Vietnam; one species in China.

Other species previously treated in this genus pertain to other genera. *Ophiorrhizophyllon hypoleucum* (Benoist) Benoist = *Staurogyne hypoleuca* Benoist and *O. laxum* Lindau = *Justicia* sp., according to Hossain (A. B. M. E. Hossain, Studies in the Classification and Affinities of Acanthaceae (Ph.D. Dissertation), University of Edinburgh, United Kingdom. 1971).

**1. *Ophiorrhizophyllon macrobotryum*** Kurz, J. Asiat. Soc. Bengal, Pt. 2, Nat. Hist. 40: 76. 1871.

蛇根叶 she gen ye

*Ophiorrhizophyllon poilanei* Benoist.

Herbs to 1 m tall, erect. Young branches terete to 4-angled, brown pubescent. Petiole 3–8 cm, sulcate, pubescent; leaf blade oblong-ovate, oblong-elliptic, or lanceolate, (8–)15–17 × (2–)5–7 cm, abaxially pale green and pubescent along veins, adaxially green and glabrous, secondary veins 7–10 on each side of mid-vein, base cuneate to subrounded and sometimes decurrent onto petiole, margin entire, apex acute. Rachises, peduncles, pedi-

cels, bracts, and bracteoles brown pubescent with gland-tipped trichomes. Spikes or racemes terminal, unbranched or branched at base; peduncle 0–2 mm; bracts subulate to lanceolate, ca. 4 × 1 mm; bracteoles linear, ca. 1 mm. Pedicel 0–1 mm. Calyx ca. 5 mm, outside sparsely pubescent with gland-tipped trichomes; lobes triangular, ca. 2 mm, margin ciliate with gland-tipped trichomes. Corolla yellowish white, ca. 7 mm; lobes suborbicular, ca. 2 × 2 mm. Staminal filaments ca. 8 mm, glabrous; staminodes included. Ovary glabrous; style ca. 8 mm, glabrous. Capsule 3.5–5.5 mm. Fl. Oct–Feb, fr. Mar.

Dense forests, along streams; 100–1300 m. S Yunnan [Laos, Myanmar, Thailand, Vietnam].

#### 4. **THUNBERGIA** Retzius, Physiogr. Sölsk. Handl. 1(3): 163. 1780, nom. cons., not Montin (1773).

山牵牛属 shan qian niu shu

Hu Jiaqi (胡嘉琪 Hu Chia-chi), Deng Yunfei (邓云飞); Thomas F. Daniel

Vines [or shrubs], lacking cystoliths. Leaves petiolate; leaf blade margin entire to lobed to dentate. Flowers solitary or paired in leaf axils, or in terminal dichasiate thyrses, pedunculate; bracteoles leaflike, paired, enclosing calyx and most or all of corolla tube, distinct or fused along one side, persistent. Calyx much shorter than bracteoles, cupular with 10–20 subulate lobes or reduced to an entire ring. Corolla funnel-shaped, large; tube with short cylindric base then widened; limb ± equally 5-lobed. Stamens 4, often didynamous, inserted near base of corolla tube, included; anthers 2-theous; thecae oblong or ovoid, parallel, spurred or not at base, sometimes bearded. Disk shortly annular or pulvinate. Ovary fleshy; ovules 2 per locule, collateral; style glabrous or pubescent; stigma 2-cleft, entire, or fringed. Capsule basally subglobose, apically prominently beaked, 2–4-seeded; retinacula absent. Seeds compressed to spherical, lacking trichomes.

More than 100 species: Old World tropical regions; six species (one introduced) in China.

Some species of *Thunbergia* are naturalized in the New World tropics.

*Thunbergia erecta* (Benth.) T. Anderson and *T. laurifolia* Lindley, both cultivated in gardens, are not treated here.

1a. Calyx reduced to an entire ring.

2a. Leaves glabrous ..... 3. *T. eberhardtii*

2b. Leaves pubescent.

3a. Corolla bluish; capsule pubescent ..... 1. *T. grandiflora*

3b. Corolla red; capsule glabrous ..... 2. *T. coccinea*

1b. Calyx bearing 10–20 slender subulate lobes.

4a. Leaves pinnately veined ..... 4. *T. lutea*

4b. Leaves palmately 3–5-veined.

5a. Petiole conspicuously winged; corolla orange with throat dark purple internally ..... 5. *T. alata*

5b. Petiole wingless; corolla entirely white ..... 6. *T. fragrans*

**1. *Thunbergia grandiflora*** Roxburgh, Bot. Reg. 6: 495. 1820.

山牵牛 shan qian niu

*Thunbergia adenophora* W. W. Smith; *T. chinensis* Merrill; *T. lacei* Gamble.

Vines to 10 m or longer, woody. Stems 4-angled, sulcate, pubescent. Petiole 1–7 cm, grooved, pubescent; leaf blade ovate to triangular-ovate, 5–10 × 4–8 cm, papery, both surfaces pubescent, palmately 3–7-veined, base subcordate to truncate, mar-

gin undulate, irregularly angular on basal half, or rarely entire, apex acuminate to acute. Flowers solitary, paired in leaf axils, or arranged in terminal racemes with 2–4 flowers per node; peduncle 4–7 cm, sulcate, pubescent; rachis pubescent with large cyathiform glands; apical inflorescence bracts subulate to linear-subulate, 2–6 × 1–1.5 mm, pubescent; bracteoles oblong to ovate, 2.5–4 × 1.5–2.2 cm, both surfaces pubescent, 5–7-veined, base truncate, margin entire or ciliate, apex acute with a short mucro. Calyx ca. 2 mm, annular, unlobed, densely pubescent. Corolla bluish with a yellowish throat, 4–6 cm, outside

glabrous; tube basally cylindric and ca. 3 mm wide for ca. 7 mm then gradually widened to ca. 5 mm at throat; limb subactinomorphic; lobes ovate, ca.  $3 \times 2.5$  cm. Staminal filaments 7–9 mm; anther thecae pubescent, basally appendaged. Style glabrous; stigma with 2 subequal lobes. Capsule 1.2–1.5 cm, pubescent, basal part 1.3–1.8 cm in diam., beak ca. 2.5 cm. Seeds ovate in outline, compressed, verrucose. Fl. Aug–Jan, fr. Nov–Mar.  $2n = 56$ .

Thickets; 400–1500 m. Fujian, Guangdong, Guangxi, Hainan, Yunnan [India, Myanmar, Thailand, Vietnam].

*Thunbergia grandiflora* is naturalized in tropical regions worldwide.

## 2. *Thunbergia coccinea* Wallich, Tent. Fl. Nepal. 1: 48. 1826.

红花山牵牛 hong hua shan qian niu

*Hexacentris coccinea* (Wallich) Nees.

Vines, woody. Stems 9-angled, subglabrous, pubescent at nodes. Petiole 2–7 cm, grooved; leaf blade broadly ovate, ovate, or lanceolate,  $8\text{--}15 \times 3.5\text{--}11$  cm, both surfaces pubescent, palmately 3–5-veined, base rounded to cordate, margin undulate or remotely toothed, apex acuminate. Racemes axillary or terminal, to 35 cm, pendulous; peduncle 3–4 cm, pubescent; bracts lanceolate, abaxially pubescent, adaxially glabrous; bracteoles oblong,  $2.2\text{--}2.6 \times 1.1\text{--}1.5$  cm, apex acute. Calyx ca. 2 mm, reduced to a minute rim. Corolla red; tube basally cylindric for 5–6 mm, throat 1.5–1.6 cm; lobes suborbicular, ca. 7 mm in diam. Staminal filaments 1.2–1.5 cm, glabrous but with a tuft of trichomes at base; anther thecae parallel, unequal with longer one ca. 5.5 mm and shorter one ca. 4.5 mm, spurred at base. Ovary glabrous; style glabrous, exserted; stigma 2-cleft. Capsule glabrous, basal part  $1\text{--}1.2 \times 1.5\text{--}2$  cm, beak 1.5–2.3 cm. Seeds compressed, ovate in outline, verrucose. Fl. Sep–Jan, fr. Jan–May.  $2n = 20$ .

Forested montane slopes; 800–1000 m. SE Xizang, Yunnan [Laos, Myanmar, Thailand].

## 3. *Thunbergia eberhardtii* Benoist, Bull. Mus. Natl. Hist. Nat. 27: 543. 1921.

二色山牵牛 er se shan qian niu

Vines to 12 m, woody. Stems 4-angled, sulcate, pubescent, soon glabrescent, pilose at nodes. Petiole 3–4 cm; leaf blade broadly ovate to ovate-lanceolate, ca.  $10 \times 5$  cm, both surfaces glabrous, palmately 5–7-veined, base cordate, margin remotely dentate or sometimes entire, apex acuminate to acute. Racemes axillary or terminal, erect; peduncle pubescent; bracts lanceolate, pubescent, 1–3-veined, margin dentate, apex acute; bracteoles ovate-lanceolate,  $1\text{--}1.4 \times 0.8\text{--}1$  mm, abaxially tomentose, apex acuminate. Calyx annular, unlobed. Corolla to 2 cm; tube yellowish brown; lobes ovate-elliptic, ca. 1.1 cm, subequal, lower lobes red, upper lobes yellow. Anther thecae glabrous, those of lower pair of stamens long spurred at base, those of upper pair of stamens spurred at base of only one theca per anther. Ovary pubescent. Capsule basal part 1–1.5 cm in diam., beak ca. 1.6 cm. Seeds hemispherical, verrucose. Fl. Aug–Nov, fr. Jan–Apr.

Dense forests; 300–800 m. Hainan [Vietnam].

## 4. *Thunbergia lutea* T. Anderson, J. Linn. Soc., Bot. 9: 448. 1866.

羽脉山牵牛 yu mai shan qian niu

*Thunbergia salwenensis* W. W. Smith.

Vines to 5 m or longer, climbing. Stems glabrous except for a circle of trichomes on nodes. Petiole 5–7.5 cm, glabrous; leaf blade ovate to lanceolate-ovate,  $4\text{--}13 \times 2\text{--}6$  cm, abaxially subglabrous, adaxially pubescent or setose, base rounded to broadly cuneate and decurrent onto petiole, margins obscurely toothed to sometimes irregularly denticulate, apex acuminate. Flowers axillary, solitary; bracteoles elliptic,  $2.1\text{--}2.4 \times 1.5\text{--}1.7$  cm, abaxially glabrous, adaxially gland-tipped hairy, palmately 7-veined, apex mucronate. Calyx minute, 10-toothed. Corolla pinkish or white; tube basally cylindric for ca. 7 mm, throat ca. 3.5 cm; lobes orbicular, ca. 1.2 cm in diam., equal. Staminal filaments glabrous, ca. 1 cm; anther thecae ca. 7 mm, barbate, spurred at base, spurs hairlike. Ovary glabrous; style ca. 2.5 cm, glabrous; stigma funnel-shaped, 2-cleft. Capsule glabrous, basal part ca.  $1 \times 1.8$  cm, beak ca. 1.8 cm. Seeds reniform, ca.  $8 \times 5$  mm. Fl. Aug–Dec, fr. Mar–May.

Forests or thickets; 1000–2500 m. SE Xizang, Yunnan [Bhutan, India, Myanmar].

## 5. *Thunbergia alata* Bojer ex Sims, Bot. Mag. 52: t. 2591. 1825.

翼叶山牵牛 yi ye shan qian niu

Vines, herbaceous. Stems  $\pm$  4-angled to flattened, bisulcate, pubescent. Petiole 1.5–3 cm, winged, sparsely pubescent; leaf blade sagittate to deltoid ovate,  $2\text{--}7.5 \times 2\text{--}6$  cm, abaxially hirsute, adaxially sparsely strigose, palmately 5-veined, base hastate to cordate, margin entire or undulate, apex acute. Flowers axillary, solitary; peduncle 2.5–3 cm, sparsely strigose; bracteoles ovate,  $1.5\text{--}1.8 \times 1\text{--}1.4$  cm, abaxially hirsute, 5–7-veined, apex acute, acuminate, or obtuse. Calyx annular, unequally 10–13-lobed. Corolla orange with dark purple glandular “eye” in throat, 2.5–4.5 cm; tube basally cylindric for 2–4 mm, throat 1–1.5 cm; lobes obovate, apically truncate. Staminal filaments ca. 4 mm, glabrous; anther thecae 3.5–4 mm, unequal, pubescent at margin and base. Ovary glabrous; style ca. 8 mm, glabrous; stigma funnel-shaped, unequally 2-lobed, lower lobe spreading, upper lobe erect. Capsule pubescent, basal part ca.  $7 \times 10$  mm, 2-seeded; beak ca. 1.4 cm, ca. 3 mm wide at base. Seeds reticulate on dorsal surface. Fl. Oct–Mar, fr. Feb–May.  $2n = 18$ .

Cultivated in gardens and naturalized along roads. Guangdong, Yunnan [native to Africa].

*Thunbergia alata* is widely cultivated and naturalized in tropical regions.

## 6. *Thunbergia fragrans* Roxburgh, Pl. Coromandel 1: 47. 1795.

碗花草 wan hua cao

*Flemingia grandiflora* Rottler; *Thunbergia bodinieri* H. Lévillé; *T. fragrans* subsp. *hainanensis* (C. Y. Wu & H. S. Lo) H. P. Tsui; *T. hainanensis* C. Y. Wu & H. S. Lo.

Vines, herbaceous. Stems almost 4-angled to flattened, sulcate, hirsute. Petiole 0.5–4.5 cm, hirsute; leaf blade oblong-ovate to ovate to broadly ovate to oblong-lanceolate to lanceolate, 3–14 × 1.8–7 cm, both surfaces puberulent to subglabrous except for trichomes along veins or rarely glabrous, palmately 3–5-veined, base rounded to sometimes cuneate or cordate, margin entire, irregularly sinuate, or shallowly coarsely dentate, apex acute to acuminate. Flowers axillary, solitary; peduncle 1.5–5.5 cm; bracteoles ovate, 1.5–2.5 × 0.8–1.5 cm, puberulent, apex acute. Calyx 3–5 mm, unequally 10–17-dentate, glabrous. Corolla white, 3–5 cm, sparsely puberulent; tube basally cylindric for 4–7 mm, throat 1.8–2.3 cm; lobes obovate, 1.3–2.5 × 1.5–2.3 cm. Stamens included; filaments 6–10 mm, glabrous;

anther thecae ca. 3 mm, divergent, glabrous. Ovary glabrous; style 1.5–2 cm, exserted; stigma funnel-shaped, ca. 2 mm. Capsule glabrous, basal part ca. 7 × 10–13 mm, beak 1.5–1.9 cm. Seeds 4–5 mm in diam., smooth or with scales. Fl. Aug–Jan, fr. Nov–Mar.

Thickets, roadsides; 800–2300 m. Guangdong, Guangxi, Guizhou, Hainan, Sichuan, Taiwan, Yunnan [Cambodia, India, Indonesia, Laos, Philippines, Sri Lanka, Thailand, Vietnam].

Variation in the shape, size, pubescence, and margin form of the leaves is extensive in *Thunbergia fragrans*, and taxa have been recognized based on these characters. Additional studies of the species from throughout its range are needed to determine whether these should be accorded formal taxonomic status.

## 5. ACANTHUS Linnaeus, Sp. Pl. 2: 639. 1753.

老鼠簕属 *lao shu le shu*

Hu Jiaqi (胡嘉琪 Hu Chia-chi), Deng Yunfei (邓云飞); Thomas F. Daniel

*Acanthodius* Rafinesque.

Shrubs or perennial herbs, erect or decumbent, without cystoliths. Leaves opposite [whorled or in a basal cluster], petiolate; leaf blade margin entire, pinnatifid, or spinously toothed. Inflorescences in terminal [or axillary], uninterrupted spikes; bracts imbricate, ovate, growing in size as plant matures, margin spiny; bracteoles 2 or sometimes absent. Calyx 4-lobed, posterior and anterior lobes larger, lateral pair of lobes smaller. Corolla tube very short, horny; limb of a single (lower) lip (upper lip sometimes rudimentary); lip elongate, obtusely 3-lobed. Stamens 4, paired, inserted at top of corolla tube, exserted; filaments stout, thickened, bony; anthers 1-theous; theca linear-oblong, usually densely bearded, lacking basal appendages; staminodes absent. Ovary with 2 ovules per locule; style slender; stigma 2-cleft. Capsule not stipitate, ellipsoid, shiny, 4-seeded; retinacula present. Seeds ± compressed.

About 20–25 species: tropical and subtropical regions of Old World; three species in China.

*Acanthus mollis* Linnaeus is cultivated in Chinese gardens so is not treated here.

- 1a. Bracteoles absent ..... 1. *A. ebracteatus*  
 1b. Bracteoles 2.  
   2a. Bracts broadly ovate, margin entire ..... 2. *A. ilicifolius*  
   2b. Bracts ovate to obovate, margin apically spiny ..... 3. *A. leucostachyus*

### 1. *Acanthus ebracteatus* Vahl, Symb. Bot. 2: 75. 1791.

小花老鼠簕 *xiao hua lao shu le*

*Acanthus ilicifolius* Linnaeus var. *ebracteatus* (Vahl) Benoist; *Dilivaria ebracteata* (Vahl) Persoon.

Shrubs 1–3 m tall. Stems terete, stout, glabrous, often with stipulelike spines at nodes. Petiole 1–4 cm, glabrous; leaf blade oblong to obovate-oblong, 5–12 × 3–5 cm, rigid, subleathery, glabrous, secondary veins 3 or 4 on each side of midvein and spreading to spinose teeth, base cuneate, margin 3- or 4-toothed or irregularly pinnatifid, apex truncate to slightly mucronate and obtuse. Inflorescences terminal spikes to 4 cm; bracts broadly ovate, 6–7 × 4–5 mm; bracteoles absent. Calyx posterior and anterior lobes broadly ovate and 8–12 × 5–9 mm, lateral lobes elliptic and ca. 10 × 4 mm. Corolla white [blue or purplish], ca. 2.5 cm; tube basally cylindric and ca. 2.5 mm wide for 5–8 mm; lip oblong, ca. 2.2 cm; lobes oblong, outside glabrous, inside appressed pubescent. Stamens subequal; filaments ca. 9 mm; anther theca oblong, ca. 8 mm, with a line of trichomes on both sides of suture. Capsule ca. 1.8 cm. Seeds yellow, ca. 10 × 7 mm, rugose. Fl. Apr–May, fr. Aug–Sep.  $2n = 44$ .

Mangrove swamps; near sea level. Guangdong, Hainan [Cambodia, India, Indonesia, Myanmar, Papua New Guinea, Thailand, Vietnam; Australia, Pacific islands].

### 2. *Acanthus ilicifolius* Linnaeus, Sp. Pl. 2: 639. 1753.

老鼠簕 *lao shu le*

*Acanthus ebracteatus* Vahl var. *xiamenensis* (R. T. Zhang) C. Y. Wu & C. C. Hu; *A. ilicifolius* var. *xiamenensis* (R. T. Zhang) Y. F. Deng, N. H. Xia & Heng B. Chen; *A. xiamenensis* R. T. Zhang; *Dilivaria ilicifolia* (Linnaeus) Jussieu.

Shrubs to 2 m tall, erect. Stems stout, scarcely branched, glabrous, often with stipulelike spines at nodes. Petiole 3–6 mm, thick, glabrous; leaf blade oblong to oblong-lanceolate, 6–14 × 2–5 cm, glabrous, secondary veins 5–7 on each side of midvein, base cuneate, margin pinnatifid and with few large spines, serrate, or subentire, apex truncate. Spikes terminal, to 16.5 cm; bracts broadly ovate, 7–8 mm, caducous; bracteoles ovate, ca. 5 mm, leathery. Calyx posterior and anterior lobes 1–1.3 cm, margin scarious and sometimes crispate, apex emarginate; lateral lobes ovate, ca. 1 cm, margin entire. Corolla

white [bluish to pinkish], 3–4 cm; tube ca. 6 mm; lip obovate, 2.2–3 cm, thinly leathery, outside with soft trichomes, apex 3-cleft. Stamens equal; filaments ca. 1.5 cm; anther theca with a line of trichomes on both sides of suture. Style ca. 2.2 cm. Capsule 2.5–3 cm. Seeds light yellow, reniform. Fl. Feb–Mar, fr. Aug–Sep.  $2n = 44, 48$ .

Mangrove swamps, marshes; near sea level. Fujian, Guangdong, Guangxi, Hainan [Cambodia, India, Indonesia, Malaysia, Myanmar, Papua New Guinea, Philippines, Sri Lanka, Thailand, Vietnam; Australia, Pacific islands].

This species is used medicinally.

**3. *Acanthus leucostachyus*** Wallich ex Nees, Pl. Asiat. Rar. 3: 98. 1832.

刺苞老鼠簕 ci bao lao shu le

Herbs to 1 m tall, erect, unbranched. Stem brown, ca. 4 mm in diam., hairy. Petiole 0.8–2.5 cm; leaf blade elliptic, ovate-lanceolate, oblanceolate, or lanceolate, 9–23 × 2–4.5 cm, abaxially glabrescent or brown pubescent along veins, adaxially glabrous, secondary veins 5–8 on each side of midvein and

netted near margin, tertiary veins inconspicuous, base rounded to subcordate, margin slightly spinose-dentate but sometimes inconspicuously dentate or occasionally entire, apex acute. Inflorescences terminal spikes, to 16 cm, 4-ranked; rachis grayish pubescent; bracts ovate to obovate, 1–1.5 × 0.5–0.8 cm, abaxially pubescent, palmately veined, base rounded, margins apically spiny, apex acute to acuminate; bracteoles lanceolate to oblanceolate, 1.3–2 × 0.2–0.4 cm, abaxially pubescent, base rounded, margin entire and ciliate, apex rounded with a short tip. Calyx ca. 2 cm, pubescent; lobes unequal, margin ciliate, anterior lobe ca. 1.7 × 0.4 cm, lateral lobes lanceolate and ca. 1.5 × 2.5 mm, posterior lobe oblong-lanceolate and ca. 2 × 0.5 cm. Corolla white, ca. 2.1 cm, villous; lobes orbicular, ca. 5 × 5 mm, apex emarginate. Staminal filaments ca. 8 mm, glabrous, upper pair curved (S-shaped); anther theca ca. 4.5 mm, pilose. Ovary ca. 3 mm; style ca. 1.1 cm. Capsule ca. 10 × 3 mm, glabrous. Seeds reniform, ca. 2 × 2.5 mm, glabrous. Fl. Feb–May, fr. Aug–Sep.

Dense forests, wet places; 600–1200 m. Yunnan [India, Laos, Myanmar, Thailand, Vietnam].

## 6. BLEPHARIS Jussieu, Gen. Pl. 103. 1789.

百箭花属 bai le hua shu

Hu Jiaqi (胡嘉琪 Hu Chia-chi), Deng Yunfei (邓云飞); Thomas F. Daniel

Herbs, perennial [annual herbs or shrubs], without cystoliths, anisophyllous. Leaves usually in pseudo-whorls of 4 [or opposite], sessile to subsessile; leaf blade margin entire to dentate. Flowers axillary and solitary or many in terminal dense headlike spikes; bracts often clustered in up to 5 pairs, imbricate, leathery, margin often bristly dentate with bristles barbed; bracteoles absent [or 2]. Calyx included in bracts or ± exserted, 4-lobed; lobes in 2 unequal opposite pairs, thickened-horny at base, posterior and anterior lobes larger and 2–7-veined, lateral pair smaller and 1-veined. Corolla tube shorter than limb, expanded from base and constricted near apex; limb a single (lower) lip; lip elongate, 3[–5]-lobed. Stamens 4, didynamous, inserted at or near apex of corolla tube; filaments bony, with lower pair straight and upper pair curved, broad, flattened, usually bifurcate apically into a branch bearing an anther and a toothlike appendage; anthers 1-theous; theca bearded. Ovary glabrous, with 2 ovules per locule; style linear; stigma 2-cleft. Capsule not stipitate, oblong to ellipsoid, 2(–4)-seeded; retinacula present. Seeds discoid, covered with long branched hygroscopic trichomes.

About 130 species: Old World tropical and subtropical regions; one species in China.

*Blepharis* was recently revised by K. Vollesen (*Blepharis* (Acanthaceae): A Taxonomic Revision, 1–342. 2000).

**1. *Blepharis maderaspatensis*** (Linnaeus) B. Heyne ex Roth, Nov. Pl. Sp. 320. 1821.

百勒花 bai le hua

*Acanthus maderaspatensis* Linnaeus, Sp. Pl. 2: 639. 1753; *Blepharis boerhaviifolia* Persoon, nom. illeg. superfl.; *B. boerhaviifolia* var. *maderaspatensis* (Linnaeus) Nees.

Herbs to 30 cm tall, perennial. Stems trailing or scrambling to decumbent, sometimes elongate, scabrous or pubescent. Leaves usually 4 per pseudo-whorl of 2 unequal pairs; petiole ca. 2 mm, puberulent; leaf blade elliptic to obovate-lanceolate, 2.5–5 × 1–2 cm, puberulent, secondary veins 3–5 on each side of midvein, base cuneate, margin undulate or dentate, apex acute. Flowers axillary and solitary or in clusters of few-

flowered spikes; bracts paired, broadly spatulate to obovate-oblong, 4–13 × 2–6 mm, unequal with inner pairs larger than outer ones, strongly 3-veined, margin bristly ciliate. Calyx puberulent, unequally lobed; posterior and anterior lobes oblong, 1.2–1.8 × 0.4–0.6 cm, 3-veined, apex of anterior lobe often 2-cleft; lateral lobes linear-lanceolate, 9–12 × 2–3 mm, margin ciliate. Corolla whitish, often with pink or purple; lip obovate, 1.6–1.7 × ca. 0.8 cm, spreading; lobes ovate-oblong. Staminal filaments ca. 5 mm. Style ca. 1.2 cm. Capsule ellipsoid, ca. 8 mm, glabrous. Seeds ca. 3 × 2 mm. Fl. Dec.  $2n = 16, 22, 24, 26, 28, 30$ .

Limestone cliffs or rocks; ca. 800 m. Hainan [Bangladesh, Cambodia, India, Myanmar, Pakistan, Sri Lanka, Thailand, Vietnam; tropical and subtropical Africa, SW Asia, Madagascar].

Herbs, subshrubs, shrubs, [or small trees], isophyllous or weakly to strongly anisophyllous, woody species commonly pliestesial (living for several years then dying after flowering and fruiting). Stems and branches usually 4-angled, often sulcate, basally becoming woody and hollow with age. Leaves opposite, petiolate or sessile; leaf blade adaxially usually with prominent linear cystoliths and sometimes also abaxially, margin variously dentate, serrate, crenate, undulate, or entire. Inflorescences axillary and/or terminal, bracteate heads, headlike clusters, spikes (sometimes distinctly secund), or less commonly of pedicellate flowers forming an open panicle; sterile bracts usually resembling reduced leaves and often present in compound inflorescences; floral bracts usually different from leaves, persistent or caducous as flowers open, very variable in size and shape, sometimes of two types with basal sterile bracts (outermost bracts in a capitate inflorescence) differing from inner or apical fertile ones; bracteoles 2 per pedicel, usually small, sometimes absent. Calyx usually 5-lobed to base, commonly accrescent in fruit; lobes equal or with middle one distinctly longer than others, sometimes partially fused to form a bipartite or tripartite calyx. Corolla nearly always bluish, rarely white, yellow, or pink, tubular or funnel-shaped, inside glabrous apart from trichomes retaining style except in *Strobilanthes parvifolia*, *S. oresbia*, and related species; tube either gradually widened from base or narrowly cylindric and then abruptly widened, campanulate or gibbous; limb 5-lobed; lobes usually ovate, equal or subequal, spreading, contorted in bud. Stamens usually 4 and didynamous (rarely 2, 2 fertile with 2 staminodes, or 4 fertile with a central staminode), basally monadelphous; usually 2 filaments distinctly longer than other 2; anthers included or exerted, 2-theous; thecae oblong or subspherical, parallel, erect or incurved, glabrous, basally mucous, rarely with connective extended to a mucronate tip; pollen spherical or ellipsoid, echinulate and/or variously ribbed, usually tricolporate. Ovary oblong to obovoid, 2-locular, with 2(–8) ovules per locule; style filiform, long, slender, simple, sometimes persistent after corolla falls, retained in place by trichomes on one side of corolla tube; stigma 2-cleft with one branch longer. Capsule characteristically oblong to narrowly obovoid but sometimes fusiform to narrowly ellipsoid, (2–)4(–16)-seeded; retinacula strong, curved. Seeds usually ovate or orbicular in outline and lenticular by being flattened, usually pubescent with appressed mucilaginous trichomes which become spreading when wetted, trichomes caducous in a very few species with seed glabrescent; areola usually very small but occasionally extending as a glabrous area over much of seed surface.

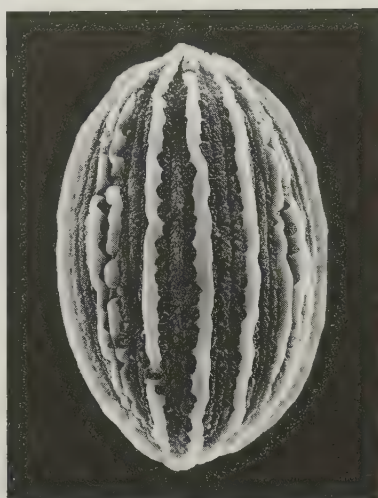

About 400 species: tropical Asia; 128 species (57 endemic) in China.

Note on indumentum: in many species the young inflorescence, even when a few capsules are present, is glabrous or nearly so. As the inflorescence matures, sessile glands become stipitate and older inflorescences become gland-tipped pilose, a process parallel to the development of glands and trichomes as the ovary matures into the capsule. The calyx is also accrescent in many species and the apex appears to continue growing, so calyx lobes, which are linear-oblong at anthesis, may become subspatulate in fruit. There is also a tendency for the corolla indumentum to fall as the corolla opens. Corolla indumentum is most easily observed on buds.

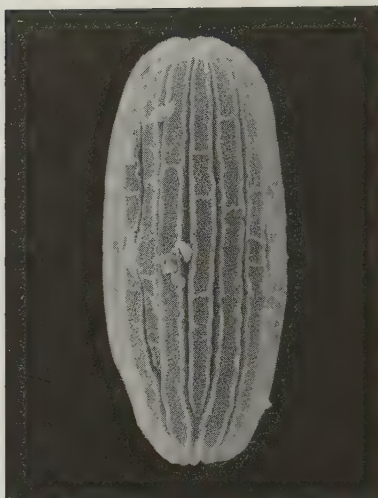

Note on pollen: fig. 1 and fig. 2 show 18 pollen types found in Chinese *Strobilanthes*. It should be noted that the pollen of some 20% of Chinese species is unknown and the types shown here could be construed as an oversimplification. However, the images do show the range of variation found in the genus. Two important caveats should be taken into account. Many publications illustrating *Strobilanthes* pollen from China are marred by the use of misidentified material. This is the explanation for cases where a different pollen type is given to that in a published source. A second problem relates to the degree of infraspecific variation in pollen morphology. This is largely unstudied but it is known that some of the more widespread and variable species are somewhat diverse in their pollen morphology although all plants sampled have pollen of one general type. Species known to have somewhat variable pollen include *S. atropurpurea*, *S. echinata*, *S. speciosa*, and *S. tomentosa*.

Attempts to divide *Strobilanthes* (*Strobilanthininae* sensu Bremekamp) into segregate genera have proved unsatisfactory largely because the level of homoplasy displayed by morphological characters has to date rendered subdivision impossible. Molecular studies have not yet greatly clarified the situation because of insufficient sampling, and this too is likely to prove problematic because many species are known only from the type collection or from material inadequate for molecular study. Clusters of related species are clearly discernible, but insufficient information is currently available to produce a satisfactory infrageneric classification. Species in the following account are grouped with morphologically similar and presumably related species, but the linear sequence and lack of adequate data implies that the order of species is at least partially arbitrary.

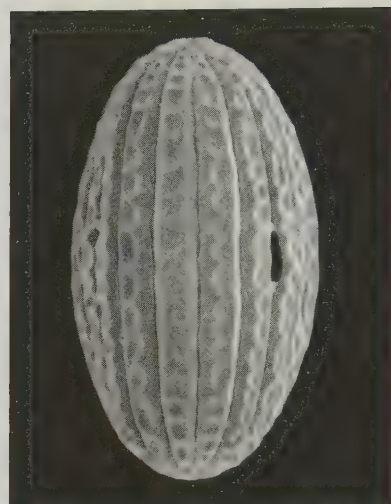

*Strobilanthes lactucifolia* H. Léveillé is not treated in the present account because no material has been traced. It is probably not a species of *Strobilanthes*. *Strobilanthes straminea* W. W. Smith (*Goldfussia straminea* (W. W. Smith) C. Y. Wu & C. C. Hu) from N Myanmar, included in FRPS (70: 169. 2002), is excluded from the present account because no Chinese specimen can be traced. *Strobilanthes deutzifolia* H. Léveillé is *Abelia macrotera* (Graebner & Buchwald) Rehder in the Linnaeaceae (see p. 645). *Strobilanthes gentiliana* H. Léveillé is *Sesamum indicum* Linnaeus in the Pedaliaceae (see Fl. China 18: 226. 1998). *Strobilanthes hypericifolia* H. Léveillé is *Abelia uniflora* R. Brown in the Linnaeaceae (see p. 645).

Type 17. *S. cyclus* from Maire 730.

Type 18. *S. serrata* from Lace 6019.

Figure 2. *Strobilanthes* pollen. SEM images of species with spheroidal (globose) pollen types.

- 1a. Low herbs, sometimes trailing, always isophyllous; corolla less than 2.5 cm and often less than 2 cm, not obviously curved.
- 2a. Inflorescences of solitary flowers in leaf axils.
- 3a. Calyx 2-lipped, upper 3 calyx lobes partially fused ..... 43. *S. rankanensis*
- 3b. Calyx not 2-lipped, subequally 5-lobed to base.
- 4a. Leaf blade oblong to lanceolate, 7 mm wide or less; capsule glabrous ..... 7. *S. sinica*
- 4b. Leaf blade ovate to obovate, 8 mm wide or more; capsule apically pilose ..... 8. *S. szechuanica*
- 2b. Inflorescences of terminal or sometimes axillary heads or spikes.
- 5a. Corolla outside glabrous; capsule 6–16-seeded.
- 6a. Leaves sessile; corolla yellow ..... 4. *S. fluviatilis*
- 6b. Leaves petiolate; corolla blue or white.
- 7a. Leaf blade pubescent, base abruptly truncate to slightly cordate; corolla blue ..... 5. *S. reptans*
- 7b. Leaf blade subglabrous, base cuneate to rounded; corolla white ..... 6. *S. cumingiana*
- 5b. Corolla outside pubescent; capsule 4-seeded.
- 8a. Stems, leaves, and inflorescences white pilose ..... 10. *S. labordei*
- 8b. Stems, leaves, and inflorescences glabrous or very sparsely hirsute.
- 9a. Corolla less than 1 cm ..... 9. *S. wilsonii*
- 9b. Corolla 1.5–2 cm.
- 10a. Leaf blade ovate to oblong-elliptic, 2–3 × as long as broad; ovary and capsule apically pubescent ..... 11. *S. tetrasperma*
- 10b. Leaf blade lanceolate, ca. 4 × as long as broad; ovary and capsule glabrous ..... 12. *S. japonica*
- 1b. Herbs or subshrubs, never trailing, usually greater than 50 cm tall, anisophyllous or isophyllous; corolla greater than 2 cm, often strongly curved.
- 11a. Inflorescences subcapitate or capitellate, with flowers densely clustered in groups of 4 or more, heads occasionally becoming subspicate in fruit.
- 12a. Anthers incurved but shorter ones sometimes reflexed, ± as broad as long so subspherical or ellipsoid; bracts and bracteoles if present caducous except in *S. cuneata*, *S. kingdonii*, *S. glomerata*, and sometimes *S. capitata* and *S. speciosa*.
- 13a. Bracts greater than 1.5 cm, outermost commonly infertile, persistent, or if caducous then ovate.
- 14a. Plants isophyllous; flowers in subsessile axillary clusters; leaf blade ovate ..... 100. *S. cuneata*
- 14b. Plants anisophyllous; flowers in pedunculate heads; leaf blade ovate to oblong-elliptic.
- 15a. Indumentum of somewhat rigid purplish trichomes ..... 101. *S. glomerata*
- 15b. Indumentum of soft whitish trichomes.
- 16a. Outermost bracts linear-oblong to lanceolate, margin often dentate, apex obtuse; isolated flowers sometimes present below main head ..... 104. *S. kingdonii*
- 16b. Outermost bracts lanceolate or ovate, margin entire, apex acute or acuminate; inflorescences strictly capitate.
- 17a. Bracts ovate, equaling or shorter than head; heads relatively stout, 1–3 cm broad; plants weakly anisophyllous ..... 102. *S. capitata*
- 17b. Bracts lanceolate, commonly overtopping head; heads relatively slender, 1–1.5 cm broad; plants usually strongly anisophyllous ..... 103. *S. speciosa*
- 13b. Bracts less than 1 cm, all normally flower-bearing, often scarious and early caducous.
- 18a. Corolla outside glabrous even on lobes and in bud.
- 19a. Leaf blade abaxially whitish; bracts fugacious; calyx in fruit with lobes subequal ..... 114. *S. discolor*
- 19b. Leaf blade abaxially paler but not whitish; bracts usually present at anthesis; calyx in fruit with one lobe longer than others.
- 20a. Calyx without gland-tipped trichomes ..... 107. *S. ningmingensis*
- 20b. Calyx with gland-tipped trichomes.
- 21a. Apex of bracts acute to acuminate ..... 108. *S. dimorphotricha*
- 21b. Apex of bracts rounded or obtuse.
- 22a. Bracts glabrous; inflorescences strictly capitellate; plants weakly anisophyllous ..... 106. *S. penstemonoides*
- 22b. Bracts gland-tipped pubescent; some flower pairs usually present below capitulum; plants strongly anisophyllous ..... 116. *S. multidentis*
- 18b. Corolla pubescent or gland-tipped pubescent at least on lobes or in bud.
- 23a. Inflorescences subterminal, arising only from apical leaf axils; leaf blade abaxially whitish, falcate ..... 117. *S. oligocephala*
- 23b. Inflorescences not subterminal; leaf blade if abaxially whitish then not falcate.
- 24a. Bracts fugacious, usually absent at anthesis; calyx lobes subequal.
- 25a. Plants isophyllous or weakly anisophyllous; leaves petiolate; leaf blade apex acuminate; corolla tube and lobes gland-tipped pubescent ..... 113. *S. oxycalycina*

- 25b. Plants strongly anisophyllous; leaves sessile; leaf blade apex acute; corolla pilose only on lobes ..... 115. *S. rhombifolia*
- 24b. Bracts usually present; calyx with one lobe longer than others.
- 26a. Apex of bracts obtuse or rounded.
- 27a. Peduncle longer so inflorescence exceeding subtending leaves ..... 110. *S. formosana*
- 27b. Peduncle very short so inflorescence shorter than subtending leaves ..... 111. *S. ovatibracteata*
- 26b. Apex of bracts acute or acuminate.
- 28a. Bracts gland-tipped pubescent ..... 109. *S. glandibracteata*
- 28b. Bracts not gland-tipped pubescent.
- 29a. Plants anisophyllous ..... 108. *S. dimorphotricha*
- 29b. Plants isophyllous ..... 112. *S. hupehensis*
- 12b. Anthers erect, oblong, ca.  $2 \times$  as long as broad; bracts persistent at least until fruit is formed.
- 30a. Flowers arranged in small clusters along an axis forming a spike or panicle of capitula.
- 31a. Capsule 6–8-seeded; calyx lobes linear-lanceolate; anthers apiculate with an excurrent connective ..... 1. *S. tomentosa*
- 31b. Capsule 4-seeded; calyx lobes ovate and abruptly narrowed to an apiculate apex; anthers muticous ..... 70. *S. congesta*
- 30b. Flowers arranged in axillary or terminal capitula.
- 32a. Capsule 6-seeded or more; calyx hirsute inside at least near apex.
- 33a. Corolla blue, bracts obtuse to acute ..... 2. *S. quadrifaria*
- 33b. Corolla yellow, bracts apically beaked ..... 3. *S. chinensis*
- 32b. Capsule 2–4-seeded; calyx glabrous inside (except in *S. cruciata*, *S. oligantha*, and *S. wangiana*).
- 34a. Calyx 2-lipped, upper 3 lobes partially fused.
- 35a. Fertile stamens 2; leaf blade margin entire ..... 38. *S. aprica*
- 35b. Fertile stamens 4; leaf blade margin serrate.
- 36a. Lower calyx lip with 2 lobes, lobes distinct to base; capsule 2-seeded ..... 30. *S. cyclus*
- 36b. Lower calyx lip 2-dentate, lobes connate for most of length; capsule 4-seeded ..... 95. *S. bipartita*
- 34b. Calyx subequally 5-lobed to base.
- 37a. Corolla completely glabrous even on lobes and tube and in bud.
- 38a. Isophyllous herbs; corolla purple ..... 16. *S. sarcorrhiza*
- 38b. Anisophyllous subshrubs; corolla white or rarely blue.
- 39a. Stems winged; leaves sessile; anthers muticous ..... 96. *S. retusa*
- 39b. Stems unwinged; leaves petiolate; anthers apiculate.
- 40a. Outer bracts sessile, ovate ..... 99. *S. echinata*
- 40b. Outer bracts with a broad petiolar base, pandurate in outline.
- 41a. Petiolar base of bracts forming a rigid involucre, lamina spreading and ovate ..... 97. *S. cruciata*
- 41b. Petiolar base not forming an involucre, bracts pandurate, apical portion narrowly lanceolate ..... 98. *S. simonsii*
- 37b. Corolla pubescent at least on lobes or tube or in bud.
- 42a. Bracts oblanceolate, obovate, subrhomboidal, or spatulate, broadest near apex, pilose with reddish or white trichomes.
- 43a. Bracts with reddish or brownish trichomes.
- 44a. Leaves and stem reddish brown setose ..... 20. *S. hossei*
- 44b. Leaves and stem without reddish brown trichomes.
- 45a. Bracts subrhomboidal-obovate, tips erect; pollen type 3 ..... 21. *S. torrentium*
- 45b. Bracts obovate, tips commonly recurved; pollen type 2 ..... 22. *S. anamitica*
- 43b. Bracts with white trichomes.
- 46a. Bracts distinct from leaves, obovate, with gland-tipped trichomes, apex rounded ..... 18. *S. lihengiae*
- 46b. Bracts oblanceolate to obovate, with a few marginal teeth, densely white pilose, without gland-tipped trichomes, apically narrowed to an obtuse apex.
- 47a. Corolla 2.2–2.8 cm; plants drying dark green; inflorescences often becoming spicate in fruit ..... 15. *S. austrosinensis*
- 47b. Corolla 2.8–3.2 cm; plants not drying dark green; inflorescences not becoming spicate in fruit ..... 17. *S. procumbens*
- 42b. Bracts linear, lanceolate, or oblong-elliptic, widest below middle.
- 48a. Bracts commonly yellowish, overtopping capitula and giving a characteristic eared appearance ..... 19. *S. esquirolii*
- 48b. Bracts with white trichomes, not overtopping capitula which do not have an eared appearance.
- 49a. Heads strictly terminal; calyx lobes with trichomes apically on inner surface.
- 50a. Leaf blade abaxially glabrous except on veins; corolla 3.5–4 cm ..... 13. *S. wangiana*
- 50b. Leaf blade usually pubescent or rarely glabrous; corolla less than 3.5 cm ..... 14. *S. oligantha*

- 49b. Heads arising from apical leaf axils; calyx glabrous inside.
- 51a. Leaf blade glabrous ..... 24. *S. fengiana*
- 51b. Leaf blade pilose or pubescent on both surfaces.
- 52a. Corolla straight or nearly so; heads clearly axillary; plants isophyllous ..... 23. *S. yunnanensis*
- 52b. Corolla strongly bent; heads from apical leaf axils only; plants anisophyllous.
- 53a. Heads slightly elongate; floral bracts lanceolate to oblong, pilose but margin not ciliate ..... 25. *S. lamium*
- 53b. Heads very compact; floral bracts elliptic, margin ciliate ..... 26. *S. cyphantha*
- 11b. Inflorescences spicate or flowers in leaf axils or arranged singly or in opposite pairs in a panicle.
- 54a. Leaf blade pinnatifid ..... 34. *S. pinnatifida*
- 54b. Leaf blade margin dentate or serrate but never pinnatifid.
- 55a. Bracts decurrent as a wing on peduncle ..... 48. *S. pteroclada*
- 55b. Bracts not decurrent on peduncle.
- 56a. Anthers incurved and shorter ones sometimes reflexed, subspherical or ellipsoid,  $\pm$  as broad as long; bracts and bracteoles if present caducous except in *S. longgangensis* and cultivated forms of *S. hamiltoniana* and sometimes in *S. lamiifolia*.
- 57a. Inflorescences an open panicle; flowers not arranged in opposite pairs.
- 58a. Corolla arcuate, less than 3 cm; inflorescence branches with non-glandular trichomes ..... 126. *S. euantha*
- 58b. Corolla straight, greater than 3 cm; inflorescence branches glabrous or with gland-tipped trichomes.
- 59a. Inflorescences branching at a narrower angle from axis, ultimate branches relatively stout and similar to primary branches ..... 124. *S. hamiltoniana*
- 59b. Inflorescences branches at 90° from axis, ultimate branches very slender ..... 125. *S. tenuiflora*
- 57b. Inflorescences spicate; flowers in opposite pairs, sometimes aggregated into a panicle.
- 60a. Inflorescences a terminal panicle of spikes.
- 61a. Leaf blade ovate, base rounded to broadly cuneate; basal leaves shortly petiolate, apical ones sessile ..... 122. *S. mastersii*
- 61b. Leaf blade narrowly oblong-elliptic, base narrowly cuneate; leaves all petiolate ..... 123. *S. tenax*
- 60b. Inflorescences terminal or axillary but spikes never paniculate.
- 62a. Inflorescences terminal or from apical leaf axils only.
- 63a. Inflorescences a short terminal spike; bracts mostly 1.5–2.5 cm, relatively persistent ..... 105. *S. lamiifolia*
- 63b. Inflorescences of flower pairs scattered along axis but often crowded and subcapitellate near apex; bracts mostly less than 1.5 cm, caducous.
- 64a. Corolla glabrous; bracts gland-tipped pilose ..... 116. *S. multident*
- 64b. Corolla gland-tipped pubescent on lobes; bracts not gland-tipped pilose ..... 117. *S. oligocephala*
- 62b. Inflorescences axillary spikes.
- 65a. Corolla outside pubescent.
- 66a. Calyx less than 1.3 cm; bracts often present at least on young parts; leaf blade margin serrate ..... 119. *S. thomsonii*
- 66b. Calyx 1.6–2 cm; bracts very caducous; leaf blade margin entire or sinuate ..... 121. *S. secunda*
- 65b. Corolla outside glabrous.
- 67a. Leaf blade ovate, base rounded to cordate; anthers slightly exerted ..... 118. *S. medogensis*
- 67b. Leaf blade narrowly elliptic, base cuneate; anthers included ..... 120. *S. longgangensis*
- 56b. Anthers erect, oblong, ca. 2  $\times$  as long as broad; bracts persistent at least until fruit is formed.
- 68a. Corolla outside glabrous but pubescent inside; leaves subentire; inflorescences leafy or 1–3-flowered axillary spikes.
- 69a. Leaf blade abaxially whitish; inflorescences paniculate ..... 127. *S. parvifolia*
- 69b. Leaf blade abaxially reddish brown; inflorescences 1–3-flowered axillary spikes ..... 128. *S. ferruginea*
- 68b. Corolla pubescent, or if outside glabrous then also inside glabrous except for trichomes retaining style; inflorescences not as above.
- 70a. Flowers in axillary spikes, with basal persistent expanded leaflike bracts; flowers not imbricate; spikes sometimes reduced so flowers are solitary in leaf axils, not aggregated into a terminal panicle.
- 71a. Calyx 2-lipped with upper three calyx lobes distinctly connate for half their length.
- 72a. Corolla blue, not resupinate ..... 62. *S. flexicaulis*
- 72b. Corolla white, resupinate ..... 63. *S. lanyuensis*
- 71b. Calyx subequally 5-lobed to base.
- 73a. Corolla outside glabrous.
- 74a. Leaf blade large with some greater than 10 cm, drying blackish; corolla straight, 3.5–5 cm ..... 61. *S. cusia*
- 74b. Leaf blade mostly less than 6 cm, not drying blackish; corolla bent at mouth, 2.5–3.5 cm.

- 75a. Calyx lobes linear, 1–1.5 mm wide, apex acute or rarely obtuse ..... 64. *S. atropurpurea*  
 75b. Calyx lobes ovate-elliptic, 3–5 mm wide, apex obtuse ..... 65. *S. latisejala*  
 73b. Corolla outside pubescent.  
 76a. Rachis of inflorescences strongly winged.  
 77a. Calyx less than 2 cm; capsule glabrous ..... 66. *S. tibetica*  
 77b. Calyx 2.5–3.6 cm; capsule comose ..... 67. *S. pterygorrhachis*  
 76b. Rachis of inflorescences not winged.  
 78a. Bracts margin entire, apex obtuse; plants subglabrous ..... 68. *S. urophylla*  
 78b. Bracts margin dentate, apex acuminate; plants usually densely hirsute or rarely  
 (in *S. inflata* var. *gongshanensis*) subglabrous ..... 69. *S. inflata*  
 70b. Flowers in axillary or terminal spikes but if axillary without leaflike bracts (except sometimes  
*S. oresbia*); flowers imbricate or not; spikes aggregated into a terminal panicle or not.  
 79a. Flowers in axillary leafless spikes (sometimes from apicalmost axils); bracts distinct from leaves,  
 often inconspicuous and merging into bracteoles and calyx lobes; spikes not aggregated into a  
 leafless panicle except in *S. nobilis* and *S. rostrata*; corolla outside glabrous.  
 80a. Calyx glabrous or with gland-tipped trichomes, margin never ciliate or ciliolate.  
 81a. Inflorescences with flowers solitary on one side of spike; bracts linear, persistent.  
 82a. Spikes strictly axillary; inflorescences glabrous ..... 54. *S. helicta*  
 82b. Spikes aggregated into a terminal panicle; inflorescences with gland-tipped trichomes ..... 55. *S. rostrata*  
 81b. Inflorescences with flowers paired and on two sides of spike; bracts ovate to  
 oblong-elliptic, somewhat caducous.  
 83a. Corolla bent; leaf blade abaxially whitish, margin entire to crenate ..... 52. *S. rubescens*  
 83b. Corolla straight; leaf blade abaxially green, margin coarsely serrate.  
 84a. Apex of bracts acute to obtuse; stems winged ..... 41. *S. pateriformis*  
 84b. Apex of bracts truncate; stems not winged ..... 42. *S. truncata*  
 80b. Calyx lobes sometimes also with gland-tipped trichomes, margin ciliate or ciliolate.  
 85a. Bracts with a recurved tip; inflorescences reddish brown ..... 92. *S. brunnescens*  
 85b. Bracts with an erect tip; inflorescences greenish or rarely reddish brown.  
 86a. Bracts ovate, obovate, or broadly elliptic, distinctly shorter than calyx.  
 87a. Bracts abaxially with 2 raised eyelike structures ..... 84. *S. biocullata*  
 87b. Bracts abaxially without raised eyelike structures although sometimes with large  
 sessile glands.  
 88a. Spikes from apical axils; bracts obovate-spatulate ..... 80. *S. pseudocollina*  
 88b. Spikes not restricted to apical axils; bracts ovate to elliptic.  
 89a. Bracts not abruptly narrowed and without a mucronate apex.  
 90a. Spikes commonly branched; flower pairs close along rachis; calyx 2-lipped  
 with 3 upper lobes partially fused ..... 81. *S. longzhouensis*  
 90b. Spikes simple; flower pairs distant along rachis; calyx subequally 5-lobed  
 to base ..... 82. *S. cystolithigera*  
 89b. Bracts abruptly narrowed with a mucronate and sometimes caducous apex.  
 91a. Plant drying olive-green; bracts abaxially with sessile glandular area, apex  
 not fimbriate, lacking reddish brown trichomes ..... 83. *S. abbreviata*  
 91b. Plant drying blackish green; bracts abaxially without glandular area, apex  
 often fimbriate with reddish brown trichomes ..... 91. *S. fimbriata*  
 86b. Bracts lanceolate, ovate, or oblong, usually equaling or exceeding calyx.  
 92a. Leaf blade often pandurate, base rounded; apical leaves sessile; spikes elongating  
 beyond leaves and inflorescence often of paniculate spikes in fruit ..... 93. *S. nobilis*  
 92b. Leaf blade not pandurate, base cuneate; all leaves petiolate; inflorescence not paniculate  
 in fruit.  
 93a. Spikes only from terminal leaf axils.  
 94a. Spikes 1–3 per axil; bracts abaxially with sessile black glands ..... 89. *S. heteroclita*  
 94b. Spikes 1 per axil; bracts abaxially lacking black glands ..... 90. *S. mucronatoproducta*  
 93b. Spikes not restricted to terminal axils.  
 95a. Spikes 1–5 per leaf axil ..... 94. *S. polyneuros*  
 95b. Spike usually 1 per leaf axil.  
 96a. Bracts 2–3 cm, much exceeding calyx ..... 88. *S. compacta*  
 96b. Bracts less than 1.5 cm,  $\pm$  equaling calyx.  
 97a. Stems, leaves, and bracts pubescent ..... 87. *S. guangxiensis*  
 97b. Plant completely glabrous except for ciliolate margin of calyx lobes.

- 98a. Spikes often branched, robust; leaf blade oblong, some greater than 15 cm ..... 85. *S. longespicata*
- 98b. Spikes simple, slender; leaf blade elliptic, less than 12 cm ..... 86. *S. myura*
- 79b. Inflorescences terminal or terminal and axillary, sometimes forming a panicle of spikes, branches bearing leaves below spikes, if apparently axillary then corolla outside pubescent or bracts expanded and clearly different from calyx.
- 99a. Fertile stamens 2.
  - 100a. Spikes simple; capsule glabrous apart from a few apical glands ..... 29. *S. henryi*
  - 100b. Spikes branched forming a terminal panicle of spikes; capsule pubescent.
    - 101a. Bracts broadly oblong-ovate to oblong-obovate, not imbricate so flowers clearly separate ..... 31. *S. serrata*
    - 101b. Bracts obovate, imbricate ..... 32. *S. tubiflos*
- 99b. Fertile stamens 4.
  - 102a. Bracts imbricate.
    - 103a. Bracts greater than 1.5 cm.
      - 104a. Bracts distinct from apical leaves, ca. 3 cm, margin without prominent white cilia.
        - 105a. Bracts not sticky glandular; capsule 12-seeded ..... 2. *S. quadrifaria*
        - 105b. Bracts sticky glandular; capsule 4-seeded ..... 60. *S. cognata*
      - 104b. Bracts indistinct from apical leaves, less than 2 cm, margin with prominent white cilia.
        - 106a. Bracts ovate to elliptic; corolla 3–3.5 cm ..... 14. *S. oligantha*
        - 106b. Bracts obovate; corolla 2.2–2.8 cm ..... 15. *S. austrosinensis*
    - 103b. Bracts less than 1.5 cm.
      - 107a. Leaves sessile; leaf blade oblong; spikes axillary as well as terminal ..... 35. *S. auriculata*
      - 107b. Leaves petiolate; leaf blade ovate or elliptic; spikes all terminal on leafy branches or main stem.
      - 108a. Anthers strongly exerted from corolla ..... 33. *S. affinis*
      - 108b. Anthers included in corolla.
        - 109a. Corolla outside glabrous.
          - 110a. Bracts linear-spatulate, broadest at apex ..... 57. *S. tonkinensis*
          - 110b. Bracts oblong or elliptic, broadest in middle or base.
            - 111a. Bracts elliptic, 5–6 mm wide ..... 27. *S. strigosa*
            - 111b. Bracts oblong, 2–3 mm wide ..... 58. *S. stolonifera*
        - 109b. Corolla outside pubescent.
          - 112a. Leaves glabrous ..... 28. *S. longiflora*
          - 112b. Leaves pubescent.
            - 113a. Calyx 2-lipped, 3 upper lobes partially fused ..... 36. *S. mogokensis*
            - 113b. Calyx subequally 5-lobed to base ..... 37. *S. argentea*
    - 102b. Bracts not imbricate so flowers clearly separate apart from basalmost.
      - 114a. Inflorescences a 15–25 cm uninterrupted spike from apicalmost leaf axils ..... 59. *S. vallicola*
      - 114b. Inflorescences a much shorter spike but if similar in length then basalmost flowers widely spaced.
        - 115a. Corolla outside glabrous.
          - 116a. Calyx subequally 5-lobed to base.
            - 117a. Stems and leaves sparsely pubescent ..... 51. *S. taoana*
            - 117b. Stems and leaves completely glabrous.
              - 118a. Inflorescences branched; calyx glabrous; leaf blade broadly ovate to suborbicular; floral bracts 7–11 mm ..... 53. *S. pinetorum*
              - 118b. Inflorescences of simple terminal spikes; calyx gland-tipped pilose; leaf blade elliptic; floral bracts 5–6.5 mm ..... 56. *S. chrysodelta*
          - 116b. Calyx 2-lipped, 3 upper lobes partially fused.
            - 119a. Bracts 2–3 cm, much longer than calyx ..... 46. *S. adpressa*
            - 119b. Bracts less than 1.4 cm, equaling or shorter than calyx.
              - 120a. Bracts ovate ..... 49. *S. ovata*
              - 120b. Bracts linear-lanceolate or oblong.
                - 121a. Spikes with 1–3 flower pairs; bracts greater than 10 mm ..... 47. *S. atroviridis*
                - 121b. Spikes with 1–7 flower pairs; bracts less than 8 mm.
                  - 122a. Bracts linear-lanceolate; rachis unwinged; plant drying blackish green ..... 44. *S. longispica*
                  - 122b. Bracts oblong-ovate; rachis winged; plant not drying blackish green ..... 45. *S. dryadum*

- 115b. Corolla outside pubescent at least in bud, on lobes, or tube.
- 123a. Plants strongly anisophyllous; corolla densely white pubescent in bud; capsule glabrous.
- 124a. Bracts linear, attenuate; calyx lobes finely acute ..... 39. *S. dalzielii*
- 124b. Bracts oblanceolate; calyx lobes obtuse ..... 40. *S. bantonensis*
- 123b. Plants not strongly anisophyllous; corolla not densely white pubescent in bud; capsule gland-tipped pubescent at apex.
- 125a. Leaves sessile.
- 126a. Leaf blade ovate to suborbicular,  $\pm$  as long as broad, abaxially whitish; bracts orbicular to obovate, 5–8 mm ..... 50. *S. tamburensis*
- 126b. Leaves narrowly ovate, ca. 3  $\times$  as long as broad, abaxially green; bracts lanceolate, 7–10 mm ..... 75. *S. forrestii*
- 125b. Leaves petiolate.
- 127a. Corolla ventricose and strongly bent just below mouth, pubescent over its whole length.
- 128a. Corolla inside pubescent especially on lobes.
- 129a. Bracts oblong, margin entire or with a few apical teeth; spikes 2-sided ..... 71. *S. larium*
- 129b. Bracts broadly to narrowly ovate to lanceolate, margin mostly serrate; spikes often secund ..... 72. *S. oresbia*
- 128b. Corolla inside glabrous even on lobes.
- 130a. Bracts much reduced even at base of spike; leaf blade mostly greater than 5 cm; petiole 2–5 cm ..... 73. *S. flexa*
- 130b. Bracts leaflike almost to spike apex; leaf blade mostly less than 5 cm; petiole (0–)1–3 cm ..... 74. *S. versicolor*
- 127b. Corolla gradually widened above base, curved but not very strongly so, pubescent on lips only.
- 131a. Spikes extremely lax, with apical flower pairs commonly separated by greater than 1 cm along rachis; bracts ovate; calyx lobes conspicuously spatulate in fruit ..... 78. *S. extensa*
- 131b. Spikes apically relatively dense, with flower pairs becoming imbricate along rachis; bracts linear to lanceolate; calyx lobes not usually conspicuously spatulate.
- 132a. Inflorescences mostly of simple terminal spikes; leaf blade glabrous ..... 79. *S. spiciformis*
- 132b. Inflorescences a panicle of spikes; leaf blade pubescent at least when young.
- 133a. Leaf blade ovate, obovate, or broadly elliptic, ca. 2  $\times$  as long as broad ... 76. *S. lachenensis*
- 133b. Leaf blade narrowly oblong-elliptic, 3–4  $\times$  as long as broad ..... 77. *S. nemorosa*

**1. *Strobilanthes tomentosa* (Nees) J. R. I. Wood, Kew Bull. 64: 16. 2009.**

尖药花 jian yao hua

*Aechmanthera tomentosa* Nees in Wallich, Pl. Asiat. Rar. 3: 87. 1832; *A. gossypina* (Wallich) Nees; *A. tomentosa* var. *wallichii* C. B. Clarke; *A. wallichii* Nees, nom. illeg. superfl.; *A. wallichii* var. *gossypina* (Wallich) Nees; *A. wallichii* var. *tomentosa* (Nees) Nees; *Ruellia gossypina* Wallich; *Strobilanthes blinii* H. Léveillé; *S. bodinieri* H. Léveillé; *S. cavaleriei* H. Léveillé.

Subshrubs to 1 m tall, erect, isophyllous. Stems usually gray tomentose but sometimes thinly pilose and greenish. Petiole 1–3 cm, with yellow multicellular gland-tipped trichomes; leaf blade elliptic-ovate to elliptic-oblong, 3–13  $\times$  2–6.5 cm, abaxially sericeous, adaxially densely covered with linear cystoliths, secondary veins 7–10 on each side of midvein, base subrounded, cuneate, or cordate and sometimes shortly decurrent onto petiole, margin crenate, apex acute. Inflorescences usually paniculate, to 30 cm, with 3–8-flowered clusters commonly on 3–8 cm axillary branches in axils of leaflike sterile

bracts, clusters sometimes aggregated to form axillary thyrses or more distant and forming an open panicle; floral bracts linear-ligulate, 0.8–1.2 cm, abaxially and marginally gland-tipped pubescent, apex obtuse; bracteoles narrowly ligulate, ca. 5 mm, similar to and smaller than or equaling calyx lobes. Calyx 0.8–1.2 cm, deeply 5-lobed to base; lobes linear, unequal with 2 longer and 3 shorter, slightly gland-tipped pilose, apex obtuse. Corolla blue, funnel-shaped, 2.5–3.5 cm, straight, ventricose, outside glabrous, inside glabrous except for trichomes retaining style; tube basally cylindric and narrow for 4–8 mm then gradually widened to ca. 1 cm at mouth; lobes ca. 5 mm, subequal, apex obtuse. Stamens 4, included; shorter filament pair ca. 6 mm, glabrous; longer filament pair 1.1–1.2 cm, pilose; anther thecae oblong, apex mucronate; connective minutely excurrent; pollen type 6. Ovary comose; style sparsely hairy. Capsule oblong, 7–10 mm, pubescent, 6–8-seeded. Seeds discoid, densely hairy, sometimes glabrescent. Fl. Jun–Dec, fr. Aug–Dec.  $2n = 30$ .

Grassy mountain slopes, open forests in relatively dry areas; 500–2300 m. Guangxi, Guizhou, Yunnan [Bangladesh, Bhutan, India, Laos, Myanmar, Nepal, Pakistan].

This is a distinctive and apparently isolated species on account of the excurrent anther connective combined with the 6–8-seeded capsule and seeds with caducous trichomes.

*Strobilanthes tomentosa* was incorrectly reported as *S. glutinosa* Nees (*Pseudaechmanthera glutinosa* (Nees) Bremekamp) by Handel-Mazzetti (Symb. Sin. 7: 894. 1936).

**2. *Strobilanthes quadrifaria*** (Wallich ex Nees) Y. F. Deng, Acta Phytotax. Sin. 45: 849. 2007.

四列马蓝 si lie ma lan

*Ruellia quadrifaria* Wallich ex Nees in Wallich, Pl. Asiat. Rar. 3: 83. 1832; *Hemigraphis quadrifaria* (Wallich ex Nees) T. Anderson; *Sericocalyx quadrifarius* (Wallich ex Nees) Bremekamp.

Subshrubs (0.2–)1–1.5 m tall, isophyllous. Stems hirsute with large-celled trichomes. Petiole (0.3–)1.5–4 cm, hirsute; leaf blade elliptic to ovate, 5–18 × 2–7 cm, both surfaces scabrous and rather sparsely pilose with large pustulose white trichomes especially on veins, adaxially darker and with cystoliths, base attenuate, margin crenate-dentate, apex acute. Inflorescences axillary or terminal, subcapitate to shortly spicate, 2–5 × ca. 2 cm, very compact, densely covered with long silky white large-celled trichomes; peduncle 0.5–1.5 cm, hirsute; bracts ovate, elliptic, or broadly lanceolate, 1.5–2.5 × 0.6–1 cm, pilose with white large-celled trichomes, apically obtuse to acute; bracteoles linear-lanceolate, ca. 10 × 2 mm, pilose with white large-celled trichomes. Calyx 8–11 mm, outside pilose, inside sericeous toward apex, subequally 5-lobed; lobes linear, apex acuminate. Corolla pale purple with a whitish tube, 3–3.2 cm, straight, subglabrous except for pubescent lobes; tube basally cylindric and narrow for 8–10 mm then gradually widened to 8–9 mm at mouth; lobes ovate, ca. 4 × 4 mm, apex rounded. Stamens 4, included; shorter filament pair 2–3 mm, glabrous; longer filament pair 4–7 mm, pilose; anther thecae oblong, ca. 2 × 0.8 mm; pollen type 6. Ovary oblong, comose; style 2–2.2 cm, pilose. Capsule oblong, 1–1.2 cm, sparsely pubescent near apex, 12-seeded. Seeds ca. 1 mm in diam., pubescent. Fl. Oct–Jan.

Moist shaded places in forests; 500–900 m. Yunnan [Laos, Myanmar, Thailand].

**3. *Strobilanthes chinensis*** (Nees) J. R. I. Wood & Y. F. Deng, Bot. J. Linn. Soc. 150: 388. 2006.

黄球花 huang qiu hua

*Ruellia chinensis* Nees in A. Candolle, Prodr. 11: 147. 1847; *Hemigraphis chinensis* (Nees) T. Anderson ex Hemsley; *Sericocalyx chinensis* (Nees) Bremekamp.

Herbs or subshrubs, 30–50(–150) cm tall, isophyllous. Stems often procumbent and rooting at base, 4-angled when young, hirsute, basally slightly woody. Petiole 4–10 mm; leaf blade obovate, obovate-elliptic, or sometimes oblong-elliptic, 1.5–11 × 1–4.5 cm, both surfaces sparsely hispid, adaxially densely covered with cystoliths, midvein impressed, secondary veins 5 on each side of midvein, purplish, and scabrous, base attenuate and decurrent onto petiole, margin crenate to slightly dentate, apex acute to shortly acuminate. Inflorescences axillary

or terminal, subcapitate; bracts imbricate, broadly to narrowly ovate, 1.5–2 cm, hirsute, usually 3-veined, apically beaked to a subobtusate point; bracteoles linear, ca. 9 mm, resembling calyx lobes. Calyx 5–11 mm, subequally 5-lobed to base; lobes linear-lanceolate, ca. 10 × 0.5 mm, outside gland-tipped pilose, inside apically pubescent, apex attenuate. Corolla yellow, 1.6–2 cm, straight; tube basally cylindric and ca. 1 mm wide for ca. 5 mm then gradually widened to ca. 1 cm at mouth, outside pubescent, inside villous; lobes orbicular, ca. 4 mm in diam. Stamens 4, included or longer pair slightly exerted; shorter filament pair ca. 2 mm; longer filament pair ca. 5 mm; anther thecae oblong, ca. 2 mm. Ovary pilose; style ca. 2 cm, villous; stigma pilose. Capsule ca. 1 cm, pubescent, 8-seeded. Seeds yellowish, broadly ovate in outline, ca. 2 × 2 mm, subglabrous; areole large. Fl. Oct–Mar, fr. Jun–Jul.

Moist hollows along streams; near sea level to 1300 m. Guangdong, Guangxi, Hainan [Cambodia, Laos, Vietnam].

**4. *Strobilanthes fluviatilis*** (C. B. Clarke ex W. W. Smith) Moylan & Y. F. Deng, Bot. J. Linn. Soc. 150: 389. 2006.

*Hemigraphis fluviatilis* C. B. Clarke ex W. W. Smith, Notes Roy. Bot. Gard. Edinburgh 10: 182. 1918; *Sericocalyx fluviatilis* (C. B. Clarke ex W. W. Smith) Bremekamp.

Herbs to 20 cm tall, isophyllous. Stems decumbent, hirsute, basally woody. Petiole 1–5 mm, coarsely pilose; leaf blade oblong, narrowly oblong-elliptic, or elliptic, 1.5–5 × 1–1.5 cm, abaxially subglabrous to thinly but coarsely pilose with pustulose trichomes, adaxially darker green with prominent linear cystoliths and glabrous or strigose-pilose, secondary veins 4 or 5 on each side of midvein, base cuneate, margin crenulate, apex obtuse. Inflorescences terminal, spikes, ca. 2.5 cm; bracts oblong, 1–1.5 cm, persistent, pilose, base cuneate, apex obtuse; bracteoles narrowly linear-elliptic, ca. 7 × 1 mm, pilose. Calyx ca. 8 mm, pilose, subequally 5-lobed almost to base; lobes linear, apex acute. Corolla yellow, 0.9–1.1 cm, glabrous; tube basally cylindric and narrow for ca. 3 mm then gradually widened to ca. 3 mm at mouth; lobes orbicular, ca. 2 mm in diam., spreading. Stamens 4, included; filaments with a few scattered trichomes, shorter pair ca. 1 mm, longer pair ca. 2 mm; anther thecae oblong; pollen type 6. Ovary oblong, comose; style glabrous or with a few trichomes. Capsule oblong, ca. 8 mm, comose, 8–14-seeded. Seeds ca. 0.8 mm, pubescent; areola large. Fl. Feb–May.

Along streams on rocks; 200–800 m. Guangxi, Guizhou, Yunnan [Myanmar, Thailand].

**5. *Strobilanthes reptans*** (G. Forster) Moylan ex Y. F. Deng & J. R. I. Wood, **comb. nov.**

匍匐半插花 pu fu ban cha hua

Basionym: *Ruellia reptans* G. Forster, Fl. Ins. Austr. 44. 1786; *Hemigraphis okamotoi* Masamune; *H. pacifica* Hosokawa; *H. primulifolia* (Nees) Fernández-Villar; *H. reptans* (G. Forster) T. Anderson ex Hemsley; *H. tawadana* Ohwi; *R. primulifolia* Nees.

Herbs to 50 cm tall, perennial, isophyllous. Stems some-

times rosette-forming but usually prostrate and rooting at nodes, sparsely to densely covered with multicellular trichomes. Petiole 0.5–8 cm, pubescent, glabrescent; leaf blade oblong, elliptic, oblong-ovate, or suborbicular, 1.5–8 × 1–4 cm, both surfaces pubescent with multicellular trichomes, secondary veins 4 or 5 on each side of midvein, base abruptly truncate to slightly cordate, margin crenate to subentire, apex acute to obtuse. Inflorescences terminal, spikes, elongating to 6–8 cm at maturity; bracts oblanceolate to elliptic, 8–12 × 2–5 mm, persistent, pubescent on veins, margin entire and ciliate; bracteoles absent. Calyx 6.5–10 mm, 5-lobed to base; lobes linear-lanceolate, ciliate and pubescent along veins, apex finely attenuate. Corolla white or pale violet with darker veins, 1.3–1.5 cm, glabrous; tube basally cylindric for 4–6 mm; lobes orbicular, 2–5 mm, glabrous. Stamens 4, included; shorter filament pair ca. 1 mm, glabrous; longer filament pair ca. 2 mm, base slightly villous; anther thecae ca. 1 mm; pollen type 7. Ovary apex pubescent; style sparsely villous. Capsule 7–9 mm, apically pubescent, 8–16-seeded. Seeds orbicular in outline, ca. 1 mm in diam., pubescent. Fl. Apr–Sep, Dec.

Weed of roadsides, ponds, and streamsides; near sea level to 400 m. Taiwan [Indonesia, Japan, Malaysia, Papua New Guinea, Philippines; Australia, Pacific islands (New Caledonia)].

The apparent earlier homonym, "*Strobilanthes reptans* Bojer" (Nees in Candolle, Prodr. 11: 368. 1847) was merely cited as a synonym and was therefore not validly published (*Vienna Code*, Art. 34.1(c)); hence it does not preclude valid publication of the new combination made here. The apparent new combination "*Strobilanthes primulifolia*" (Y. F. Deng & J. R. I. Wood, J. Trop. Subtrop. Bot. 18: 483. 2010), based on *Ruellia primulifolia* Nees, was not validly published because a full and direct reference to the place of valid publication of the basionym was not provided (Art. 33.4; "in DC., Prodr. 11: 144. 1847" was cited, but that publication cited the actual place: Nov. Actorum Acad. Caes. Leop.-Carol. Nat. Cur. 19(Suppl. 1): 382. 1843).

*Strobilanthes reptans* is an ornamental plant.

**6. *Strobilanthes cumingiana* (Nees) Y. F. Deng & J. R. I. Wood, J. Trop. Subtrop. Bot. 18: 483. 2010.**

直立半插花 zhi li ban cha hua

*Ruellia cumingiana* Nees in A. Candolle, Prodr. 11: 148. 1847; *Hemigraphis cumingiana* (Nees) Fernández-Villar.

Herbs to 50 cm tall, erect, isophyllous. Stems 4-angled, thinly pubescent with multicellular trichomes. Petiole 0.8–2.5 cm, sulcate, pubescent; leaf blade ovate-lanceolate, ovate, or elliptic, 4–10 × 1.5–5 cm, both surfaces densely covered with cystoliths, abaxially strigose along veins, adaxially darker and glabrous, secondary veins 5 or 6 on each side of midvein, base cuneate to rounded and often oblique, margin shallowly crenate, apex shortly acuminate. Inflorescences axillary or terminal, spikes, to 4 cm; peduncle 0.3–2 cm, pubescent to puberulent; rachis glabrous; bracts ovate, persistent, margin slightly ciliate, apex obtuse; basalmost bracts sterile, leaflike, 1.5–2 × 0.6–1 cm, margin undulate; apical bracts fertile, ca. 10 × 6 mm, margin entire; bracteoles absent. Calyx 6.5–9.5 mm, subequally 5-lobed to base; lobes lanceolate, margin ciliate, apically attenuate. Corolla white, 1.3–1.8 cm, glabrous; tube basally cylindric for 4–6 mm; lobes orbicular, ca. 2.5 mm in diam. Stamens 4,

included; shorter filament pair 1–1.5 mm, glabrous; longer filament pair 2–3 mm, villous; anther thecae oblong, ca. 1.5 mm; pollen type 8. Ovary comose; style ca. 1 cm, hirsute. Capsule ca. 9 mm, apically pubescent, 6–8-seeded. Seeds ca. 2 × 1.2–2 mm, pubescent. Fl. Feb–May.

Forests; 100–300 m. Taiwan (Lan Yu) [Indonesia, Malaysia, Philippines].

**7. *Strobilanthes sinica* (H. S. Lo) Y. F. Deng, comb. nov.**

安龙马蓝 an long ma lan

Basionym: *Dyschoriste sinica* H. S. Lo, Acta Phytotax. Sin. 17(4): 85. 1979.

Herbs to 10 cm tall, isophyllous. Stems prostrate, 4-angled, glabrous, internodes usually less than 1 cm, rooting at basal nodes. Leaves shortly petiolate or sessile; leaf blade oblong-lanceolate, 0.7–3 × 0.3–0.7 cm, both surfaces glabrous, secondary veins ca. 3 on each side of midvein, base cuneate, margin entire or apically inconspicuously serrate, apex obtuse. Flowers axillary, solitary. Bracts similar to leaves but smaller; bracteoles linear-spatulate, 4.5–5 mm, apex obtuse. Calyx 5.5–6 mm, 5-lobed almost to base; lobes lanceolate, margin sparsely ciliate. Corolla purple, ca. 1.1 cm, straight; tube basally cylindric and narrow for ca. 4 mm then widened to ca. 4.5 mm at throat, outside reported, perhaps erroneously, to be glabrous; lobes ?obcordate, 2–2.5 mm, subequal. Stamens 4, included; filaments glabrous, shorter pair ca. 1.2 mm, longer pair ca. 3.5 mm; anther thecae parallel; pollen type 10. Ovary glabrous; style ca. 8 mm, slightly hairy. Capsule oblong, ca. 6.5 mm, glabrous, 4-seeded. Seeds ovate in outline, ca. 2 × 2 mm, densely appressed pubescent. Fl. Aug–Sep.

● Grassy slopes; ca. 1300 m. Guizhou (Anlong).

**8. *Strobilanthes szechuanica* (Batalin) J. R. I. Wood & Y. F. Deng, Bot. J. Linn. Soc. 150: 375. 2006.**

四川马蓝 si chuan ma lan

*Hemigraphis szechuanica* Batalin, Trudy Imp. S.-Peterburgsk. Bot. Sada 13: 384. 1894.

Herbs to 20 cm tall, isophyllous. Stems decumbent, 4-angled, subglabrous, rooting at basal nodes. Petiole 3–5 mm, puberulent; leaf blade ovate to obovate, becoming suborbicular toward branch tips, 1–2 × 0.8–1 cm, glabrous or margin with a few scattered cilia, both surfaces densely covered with whitish cystoliths, secondary veins 3 or 4 on each side of midvein, base broadly cuneate and decurrent onto petiole, margin entire, apex obtuse to rounded. Flowers axillary, solitary; bracteoles oblanceolate, 5–7 × ca. 1 mm, pilose and with abundant cystoliths, margin thinly ciliate. Calyx 8–10 mm, with abundant cystoliths, 5-lobed almost to base; lobes linear to linear-lanceolate, margin ciliate, apex obtuse. Corolla pale lilac, funnel-shaped, 1.8–2.3 cm, outside pubescent; tube basally cylindric and narrow for ca. 5 mm then gradually widened to ca. 8 mm at mouth; lobes suborbicular, ca. 3 × 3 mm, margin ciliate. Stamens 4, included; shorter filament pair ca. 3 mm, glabrous; longer filament pair ca. 5 mm, pilose; anther thecae oblong, ca. 2 × 1.2 mm; pollen type 10 (requires confirmation). Ovary oblong, comose; style

1.4–1.8 cm, pilose. Capsule ca. 1 cm, pilose at tip, 4-seeded. Seeds ca. 2 mm in diam., pilose. Fl. Jul–Sep.

• Streamsides, on rocks; 700–1500 m. Sichuan.

**9. *Strobilanthes wilsonii*** J. R. I. Wood & Y. F. Deng, Bot. J. Linn. Soc. 150: 371. 2006.

乐山马蓝 le shan ma lan

Herbs to 30 cm tall, perennial, isophyllous. Stems procumbent, sulcate, glabrous, rooting at nodes; flowering branches arising in pairs from nodes, apparently erect, 3–20 cm, sparsely bifariously pilose especially apically, with reflexed whitish large-celled trichomes. Petiole 0.5–2 cm, bifariously hirsute with short reflexed whitish trichomes; leaf blade narrowly elliptic, broadly elliptic, or obovate-spatulate, 1.5–3 × 1–1.5 cm, glabrous except for a few marginal trichomes near petiole, adaxially with prominent cystoliths, secondary veins 3–5 on each side of midvein, base attenuate, margin serrate, apex very shortly acuminate to obtuse. Inflorescences axillary or terminal, headlike spikes, 1–1.5 cm, few flowered; peduncle 0.2–1.8 cm, pilose; bracts obovate-spatulate, 4–10 × 2–6 mm, apically diminishing in size, abaxially glabrous, adaxially with a few trichomes toward base, margin basally entire and ciliate with thick white spreading trichomes and apically toothed and not ciliate, apex ± obtuse; bracteoles oblanceolate to obovate-spatulate, 2–3 × ca. 0.5 mm, margin ciliate with a few large white trichomes to 2 mm, apex ± rounded. Calyx ca. 4 mm, subequally 5-lobed to ca. 1 mm above base; lobes pale but with a green tip, linear-oblong, ca. 3.2 × 1 mm, pilose with large-celled but mostly marginal trichomes, apex obtuse. Corolla blue, 7–8 mm, funnel-shaped, outside pilose; tube basally cylindric and ca. 1 mm wide for ca. 2 mm then gradually widened to ca. 5 mm at mouth; lobes ovate, ca. 1.5 × 1.5 mm, apex acute. Stamens 4; filaments glabrous, shorter pair ca. 2 mm, longer pair ca. 4 mm and slightly exserted; anther thecae oblong, ca. 0.5 × 0.2 mm; central staminode present, ca. 1 mm; pollen type 9. Ovary pilose; style ca. 8 mm. Capsule (immature) ca. 2.5 mm, pilose with large-celled trichomes, 4-seeded. Seeds ovate in outline, lenticular, ca. 2 × 2 mm, densely covered with appressed trichomes; areola small, glabrous. Fl. Sep–Oct.

• Moist shaded places; 800–1100 m. Sichuan.

**10. *Strobilanthes labordei*** H. Lévillé, Repert. Spec. Nov. Regni Veg. 12: 20. 1913.

薄叶马蓝 bao ye ma lan

*Acanthopale debilis* C. B. Clarke ex S. Moore; *A. labordei* (H. Lévillé) Handel-Mazzetti; *Championella debilis* Bremekamp; *C. labordei* (H. Lévillé) E. Hossain; *Strobilanthes debilis* Hemsley (1890), not C. B. Clarke (1885).

Herbs, creeping, branched, isophyllous. Stems white villous, rooting at nodes. Petiole 5–10 mm; leaf blade ovate, 2–3 × 1.5–2 cm, both surfaces white hirsute, abaxially glaucous, adaxially green and sometimes purplish dotted, secondary veins 4 or 5 on each side of midvein, base broadly cuneate to rounded, margin sparsely crenulate, apex acuminate. Inflorescences terminal, abbreviated to headlike spikes, ca. 1 cm, densely covered with large-celled white trichomes; bracts leaflike, 1–2 cm;

bracteoles linear, ca. 5 mm. Calyx 5–7 mm, 5-lobed almost to base; lobes linear-lanceolate, densely white hirsute. Corolla purplish blue to violet, 1.5–1.8 cm, outside pubescent, inside glabrous except for trichomes retaining style; tube basally cylindric and narrow then gradually widened to ca. 1.2 cm at mouth; lobes oblong, ca. 3 × 3 mm, subequal, apex rounded. Stamens 4; shorter filament pair ca. 3 mm; longer filament pair ca. 7 mm, exserted; anther thecae ca. 1.8 × 1 mm, weakly exserted; pollen type 11. Ovary pilose at tip; style ca. 1.2 cm, pilose. Capsule narrowly obovoid, 6–8 mm, 4-seeded, apex pilose. Seeds ovate in outline, ca. 2 × 2 mm, pubescent. Fl. Aug–Dec.

• Valleys, moist places; 400–1800 m. Chongqing, Guangdong, Guangxi, Guizhou, Hubei, Hunan, Jiangxi, Sichuan.

**11. *Strobilanthes tetrasperma*** (Champion ex Benth) Druce, Rep. Bot. Soc. Exch. Club Brit. Isles 1916: 649. 1917.

四子马蓝 si zi ma lan

*Ruellia tetrasperma* Champion ex Benth, Hooker's J. Bot. Kew Gard. Misc. 5: 132. 1853; *Acanthopale radicans* (T. Anderson ex Benth) C. B. Clarke ex Benoist; *A. tetrasperma* (Champion ex Benth) Handel-Mazzetti; *Championella tetrasperma* (Champion ex Benth) Bremekamp; *Strobilanthes radicans* T. Anderson ex Benth.

Herbs 30–50 cm tall, isophyllous. Stems often procumbent and rooting at base, 4-angled, sulcate, retrorsely pubescent along sulci, glabrescent, basally slightly woody. Petiole 0.5–2.5 cm, sulcate, glabrous; leaf blade ovate, elliptic, or oblong, 1.5–11 × 1–4.5 cm, glabrous, adaxially darker and densely covered with cystoliths, secondary veins ca. 5 on each side of midvein, base attenuate or decurrent onto petiole, margin serrate to dentate, apex acuminate to acute. Inflorescences terminal or (sometimes) axillary, short often headlike spikes, few flowered, often reduced to a single flower pair; bracts leaflike, obovate to spatulate, 1–1.5 × 0.4–0.5 cm, sparsely pilose, pinnately veined; bracteoles linear, 5–6 × ca. 1 mm, abaxially glabrous or sparsely pilose and densely covered with cystoliths. Calyx 5-lobed almost to base; lobes linear, 5–7 × ca. 1 mm, accrescent to ca. 8 mm in fruit, glabrous except for large-celled trichomes on margin, densely covered with cystoliths. Corolla purple to purplish blue, funnel-shaped, 1.5–2 cm, straight, outside pubescent, inside villous; tube basally cylindric and ca. 2 mm wide for ca. 5 mm then gradually widened to ca. 1.5 cm at mouth; lobes oblong, ca. 4 × 5 mm, apex obtuse. Stamens 4, included; shorter filament pair ca. 2 mm, glabrous; longer filament pair ca. 5 mm, sparsely pubescent; anther thecae oblong, ca. 2 mm; pollen type 10. Ovary ovoid, ca. 3 mm, hispid at tip, with 4 ovules per locule; style ca. 1.5 cm, hirsute; stigma 2-lobed, lobes unequal. Capsule oblong, 7–10 mm, apically pubescent, 4-seeded. Seeds ovate in outline, ca. 2 × 2 mm, pubescent. Fl. Jul–Dec.

Forests, shaded grasslands, rocks by streams, roadsides; 100–1000 m. Chongqing, Fujian, Guangdong, Guangxi, Guizhou, Hainan, Hubei, Hunan, Jiangxi, Sichuan [Vietnam].

**12. *Strobilanthes japonica*** (Thunberg) Miquel, Ann. Mus. Bot. Lugduno-Batavi 2: 124. 1866.

日本马蓝 ri ben ma lan

*Ruellia japonica* Thunberg in Murray, Syst. Veg., ed. 14,

576. 1784; *Acanthopale japonica* (Thunberg) C. B. Clarke ex S. Moore; *Championella japonica* (Thunberg) Bremekamp; *Strobilanthes bonatiana* H. Lévillé.

Herbs 20–50 cm tall, isophyllous. Stems slender, herbaceous, much branched; branchlets purplish red, 4-angled then terete, glabrous. Petiole 2–5 cm, white pubescent; leaf blade narrowly elliptic to lanceolate, 2–5 × 0.5–1.8 cm, both surfaces glabrous and densely covered with prominent linear cystoliths, secondary veins 3–5 on each side of midvein, base cuneate to broadly cuneate, margin crenulate, apex long acuminate. Inflorescences terminal, spikes, 1–3(–5) cm, sometimes reduced to a single flower pair; bracts imbricate, oblanceolate to oblong-lanceolate, 7–10 × 2–3 mm, as long as corolla tube, glabrous except for pubescence at base, apically densely covered with cystoliths, margin entire, apex obtuse; bracteoles linear, ca. 5 mm. Calyx equally 5-lobed almost to base; lobes linear, 6–7 mm, margin ciliate, apex rounded. Corolla purplish white or white, funnel-shaped, ca. 1.5 cm, straight, outside pubescent, inside glabrous except for trichomes retaining style; tube basally cylindric for 5–6 mm; lobes oblong-elliptic, 5–6 mm, equal. Stamens 4, included; shorter filament pair ca. 8 mm; longer filament pair ca. 1.2 cm; anther thecae oblong, ca. 1.5 mm; pollen type 10. Ovary glabrous; style filiform, ca. 1.2 cm, pilose; stigma 2-cleft. Capsule oblong, ca. 7 mm, presumably glabrous, 4-seeded. Seeds ovate in outline, ca. 3 mm, densely appressed pubescent. Fl. Aug–Sep, fr. Oct–Nov.  $2n = 30$ .

Often near temples and religious sites; 500–1100 m. Chongqing, Guizhou, Hubei, Hunan, Sichuan [Japan].

*Strobilanthes japonica* differs from *S. tetrasperma* in its lanceolate leaves and glabrous ovary. We have seen two collections intermediate between these two species (*Yu Xunlin 91690* from Hunan and *Exped. To Flora of Yunnan, Guizhou and Guangxi 50124* from Guizhou).

"*Dyschoriste grandiflora* H. S. Lo" (C. C. Hu, FRPS 70: 79. 2002) belongs here but is a nomen nudum and was therefore not validly published (*Vienna Code*, Art. 32.1(d)).

**13. *Strobilanthes wangiana*** Y. F. Deng & J. R. I. Wood, J. Trop. Subtrop. Bot. 18: 473. 2010.

启无马蓝 qí wú mǎ lán

Herbs to 1 m tall, perennial, isophyllous. Stems sulcate, obscurely bifariously pubescent, glabrescent; nodes pustulose, sparsely pubescent. Petiole 4–5(–20) mm, almost glabrous; leaf blade elliptic to ovate-elliptic, 2.5–6 × 1.1–2.8 cm, both surfaces glabrous except for large-celled trichomes adaxially along midvein, cystoliths prominent, secondary veins 5–7 on each side of midvein, base cuneate and attenuate onto petiole, margin crenate, apex obtuse. Inflorescences terminal, subcapitate spikes, 2–4 cm, few flowered; bracts leaflike; basal bracts elliptic, 2–4 × 1–1.4 cm, apically diminishing in size, margin serrate; apical bracts oblong, 1.4–2 × 0.4–0.6 cm, abaxially sparsely pubescent, adaxially glabrous, margin ciliate and entire except for a few teeth near apex; bracteoles linear-lanceolate, 9–11 × ca. 1 mm, abaxially silky pubescent, adaxially glabrous, margin ciliate. Flowers imbricate on rachis, sessile. Calyx 1–1.3 cm, 5-lobed to ca. 3 mm above base; lobes linear-oblanceolate, 10–14 × 0.6–1 mm, outside silky pubescent, inside silky pubescent from middle apically and glabrescent toward base, margin ciliate. Corolla purplish, 3.5–4 cm,

ventricose and bent to ca. 90° at mouth, outside pubescent, inside glabrous except for trichomes retaining style; tube basally cylindric and ca. 2 mm wide for ca. 1 cm then gradually widened to ca. 1 cm at mouth; lobes ovate, 4–5 × 4–5 mm, apex obtuse. Stamens 4, included; filaments pubescent, shorter pair 1–2 mm, longer pair 3–4 mm; anther thecae oblong, ca. 1.5 mm. Ovary ca. 2 mm, glabrous except for a few trichomes at tip. Capsule oblong, ca. 10 × 3 mm, glabrous, 4-seeded. Seeds ovate in outline, ca. 3 × 2 mm, compressed, pubescent; areola small. Fl. Aug–Sep, fr. Nov.

• Forests; 1200–2300 m. Yunnan.

**14. *Strobilanthes oligantha*** Miquel, Ann. Mus. Bot. Lugduno-Batavi 2: 124. 1866.

少花马蓝 shǎo huā mǎ lán

*Acanthopale oligantha* (Miquel) C. B. Clarke ex S. Moore; *Championella oligantha* (Miquel) Bremekamp.

Herbs 40–50 cm tall, isophyllous. Stems 4-angled, sulcate, sparsely and retrorsely white hairy. Petiole 3.5–4 cm, thinly pilose; leaf blade broadly ovate to elliptic, 4–7(–10) × 2–4 cm, both surfaces with prominent white cystoliths, abaxially thinly pilose on veins, adaxially glabrous to thinly pubescent, secondary veins 4–6 on each side of midvein, base broadly cuneate, margin remotely serrate, apex acuminate. Inflorescences short spikes, elongating to ca. 4 cm in fruit, sometimes reduced to a single flower pair; bracts leaflike; outer bracts ca. 1.5 cm; inner bracts smaller, densely covered with white large-celled trichomes; bracteoles linear-spatulate, ca. 1 cm, densely covered with white large-celled trichomes. Flowers imbricate on rachis. Calyx ca. 8 mm, subequally 5-lobed almost to base; lobes linear, subequaling bracteoles, inside apically with trichomes. Corolla bluish purple, 3–3.5 cm, usually bent, outside sparsely pubescent on lobes, inside glabrous except for trichomes retaining style; tube basally cylindric and narrow for ca. 1.5 cm then gradually widened to ca. 1.3 cm at mouth, expanded part campanulate and ca. 2.5 cm; lobes ca. 5 mm, subequal. Stamens 4, included; shorter filament pair ca. 2 mm, glabrous; longer filament pair ca. 5 mm, pilose; anther thecae oblong, ca. 2 × 1 mm; pollen type 10. Ovary pubescent at tip; style ca. 3.2 cm, pilose. Capsule narrowly obovoid, ca. 1 cm, pubescent at tip, 4-seeded. Seeds ovate in outline, ca. 2.5 × 2 mm, pubescent. Fl. Jul–Sep, fr. Oct–Nov.  $2n = 60$ .

Forests, shaded moist grasslands; 100–800 m. Anhui, Fujian, Jiangxi, Zhejiang [Japan, Korea].

**15. *Strobilanthes austrosinensis*** Y. F. Deng & J. R. I. Wood, J. Trop. Subtrop. Bot. 18: 470. 2010.

华南马蓝 huá nán mǎ lán

Herbs to 50 cm, perennial, drying a distinct dark green color, isophyllous. Stems basally procumbent and rooting at nodes but eventually ascending, sulcate, bifariously pubescent especially apically, with reflexed whitish large-celled trichomes. Petiole 0–2 cm, bifariously hirsute with reflexed whitish large-celled trichomes; leaf blade elliptic to suborbicular, 2–8 × 1–4.5 cm, abaxially pilose along veins, adaxially pilose and hirsute especially toward base and densely covered

with white cystoliths, secondary veins 3–5 on each side of midvein, base attenuate, margin serrate but becoming subentire toward base, apex acute to obtuse. Inflorescences terminal, headlike spikes, 1–2 cm, often elongating at maturity, leafy, few flowered; rachis densely whitish pilose; bracts shortly petiolate, leaflike, broadly obovate-spatulate,  $1.5\text{--}1.8 \times 0.5\text{--}0.8$  cm, abaxially densely covered with whitish multicellular trichomes toward base, adaxially subglabrous, margin basally entire and apically 1–3-dentate, apex rounded to obtuse; bracteoles spatulate,  $8\text{--}11 \times 1\text{--}2.5$  mm, abaxially toward base densely covered with whitish multicellular large-celled trichomes, adaxially whitish pilose. Calyx 1–1.2 cm, 5-lobed almost to base; lobes oblong-lanceolate, outside pilose, inside subglabrous, midvein prominent, margin ciliate with thick white apically spreading cilia, apex obtuse. Corolla bluish purple, funnel-shaped, 2.2–2.8 cm, ventricose, straight to slightly curved, outside pilose when young but glabrescent, inside glabrous except for trichomes retaining style; tube basally cylindric and ca. 2 mm wide for 1.2–1.5 cm then gradually widened to ca. 1.5 cm at mouth; lobes ovate-elliptic, ca. 5 mm. Stamens 4, included; filaments hirsute, shorter pair ca. 6 mm, longer pair ca. 8 mm; anther thecae oblong, ca.  $1.2 \times 0.4$  mm; pollen type 10. Ovary ovoid, ca. 2 mm, glabrous except for comose tip; style ca. 1.5 cm, hirsute; stigma unequally 2-cleft. Capsule oblong,  $9\text{--}10 \times$  ca. 3 mm, glabrous except for pilose tip and along suture, 4-seeded. Seeds ovate in outline, ca.  $2.5 \times 2$  mm, densely pilose; areola small, glabrous. Fl. Jul–Sep, fr. Oct–Nov.

• Thickets, forest margins; 100–1500 m. Guangdong, Guangxi, Hunan, Jiangxi.

**16. *Strobilanthes sarcorrhiza*** (C. Ling) C. Z. Zheng ex Y. F. Deng & N. H. Xia, *Novon* 17: 154. 2007.

菜头肾 *cai tou shen*

*Championella sarcorrhiza* C. Ling, *Acta Phytotax. Sin.* 13(3): 93. 1975.

Herbs 20–40 cm tall, unbranched, isophyllous. Rhizomes swollen, fleshy. Stems 4-angled, sulcate, densely pubescent. Petiole 0–3 mm; leaf blade oblong-lanceolate,  $4\text{--}18 \times 1.5\text{--}3$  cm, abaxially pubescent along veins, adaxially glabrous and densely covered with acerose cystoliths, secondary veins 5–9 on each side of midvein, base narrowly cuneate, margin dentate to undulate, apex acuminate. Inflorescences terminal, subcapitate spikes, 2–4(–5) cm, 4–10-flowered; rachis pubescent; bracts leaflike, obovate-elliptic,  $1\text{--}2 \times 0.3\text{--}1$  cm, glabrous; bracteoles linear-lanceolate, ca. 8 mm, glabrous except for large-celled trichomes on margin, abaxially densely covered with white clavate cystoliths. Calyx ca. 1 cm, 5-lobed almost to base; lobes linear, unequal, glabrous except for large-celled trichomes on margin, outside densely covered with white clavate cystoliths. Corolla purple, funnel-shaped, 3.5–4.5 cm, ventricose, outside glabrous, inside glabrous except for trichomes retaining style; tube basally cylindric and ca. 3 mm wide for ca. 7 mm then gradually widened to ca. 1.5 cm at mouth; lobes oblong, ca.  $4 \times 3$  mm, subequal, apex emarginate. Stamens 4, included; filaments pilose, shorter pair ca. 4 mm, longer pair ca. 6 mm; anther thecae oblong, ca. 1.5 mm; pollen type 3. Ovary glabrous; style filiform, ca. 3.2 cm, pubescent. Capsule glabrous, 4-

seeded. Seeds ovate in outline, ca.  $2.5 \times 2$  mm, densely pubescent. Fl. Aug–Sep, fr. Nov.

• Forests in valleys; 200–600 m. Zhejiang.

This species is used medicinally.

**17. *Strobilanthes procumbens*** Y. F. Deng & J. R. I. Wood, *J. Trop. Subtrop. Bot.* 18: 476. 2010.

金佛山马蓝 *jin fo shan ma lan*

Herbs to 70 cm tall, perennial, isophyllous. Stems at first procumbent and rooting at nodes then erect, sulcate, densely pubescent with multicellular trichomes. Petiole 3–11 mm, sulcate, densely pubescent with multicellular trichomes; leaf blade ovate to rhomboidal,  $0.8\text{--}3 \times 0.3\text{--}2$  cm, both surfaces pubescent with multicellular trichomes, adaxially with numerous cystoliths, secondary veins 3–5 on each side of midvein, abaxially elevated, and adaxially impressed, base cuneate and slightly decurrent onto petiole, margin crenate, apex acute. Inflorescences terminal, subcapitate spikes, ca. 1 cm; bracts leaflike, oblanceolate,  $4\text{--}12 \times 2\text{--}4$  mm, apically diminishing in size, abaxially pubescent, adaxially pubescent with white to slightly yellowish multicellular trichomes, margin entire or with 1 or 2 teeth and silky ciliate, apex obtuse; bracteoles linear-spatulate, ca.  $5 \times 1$  mm, indumentum as for bracts. Calyx subequally 5-lobed to base, white pilose; lobes linear, apex obtuse. Corolla white, funnel-shaped, 2.8–3.3 cm, straight to slightly curved, outside pubescent especially on lobes, inside glabrous except for trichomes retaining style; tube basally cylindric and ca. 1 mm wide for ca. 6 mm then gradually widened to ca. 1 cm at mouth; lobes oblong, ca.  $2 \times 2$  mm. Stamens 4, included; shorter filament pair ca. 2 mm, glabrous; longer filament pair ca. 4 mm, pubescent; anther thecae oblong, ca. 1.3 mm; pollen type ?4. Ovary glabrous except for comose tip; style ca. 1 cm, glabrous. Capsule oblong, ca. 0.8 cm, glabrous except for comose tip, 4-seeded. Seeds elliptic in outline, ca.  $1 \times 1$  mm, pubescent; areola small. Fl. Aug–Sep, fr. Nov.

• Streamsides; 800–1000 m. Chongqing (Nanchuan).

**18. *Strobilanthes lihengiae*** Y. F. Deng & J. R. I. Wood, *Bot. J. Linn. Soc.* 150: 379. 2006.

李恒马蓝 *li heng ma lan*

Herbs to 40 cm tall, perennial, isophyllous. Stems rounded to slightly sulcate, apparently ascending, bifariously pubescent to subglabrous. Petiole 0.2–4 cm, pilose with large white multicellular trichomes; leaf blade ovate to ovate-elliptic,  $1.5\text{--}11 \times 0.5\text{--}6$  cm, both surfaces pilose with large-celled trichomes especially on veins but adaxially sparser, secondary veins 4 on each side of midvein, base cuneate, margin dentate to crenate, apex shortly acuminate. Inflorescences terminal on main stem and on small axillary branchlets, headlike spikes, very compact; bracts obovate,  $8\text{--}11 \times 6\text{--}9$  mm, shortly and densely greenish tomentose and also pilose with long large-celled white gland-tipped and non-glandular trichomes, margin entire, apex rounded; bracteoles oblong-oblanceolate, ca.  $6 \times 1.5\text{--}2$  mm, margin long ciliate. Calyx subequally 5-lobed to ca. 1 mm from base; lobes green-tipped, lanceolate-oblong,  $8\text{--}9 \times$  ca. 1.3 cm, exceeding bracteoles, margin long ciliate, apex obtuse. Corolla

with a whitish tube base and blue apical part of tube and lobes, 3.2–4 cm, ventricose, sparsely pilose on lobes; tube basally cylindric and ca. 1 mm wide for 8–10 mm then bent and expanded gradually to ca. 1.5 cm wide at mouth; lobes ovate, ca. 5 × 5 mm, apex acute. Stamens 4, included; filaments coarsely pilose, shorter pair ca. 3 mm, longer pair ca. 5 mm; anther thecae narrowly oblong, ca. 3 × 0.5 mm; pollen type 3. Ovary villous; style 2.5–3 cm, basally sparsely pilose. Capsule cylindric, ca. 12 × 3 mm, comose, 4-seeded. Seeds ovate-elliptic in outline, ca. 2.5 × 2 mm, pilose. Fl. Nov–Dec.

• Disturbed evergreen broad-leaved forests; ca. 2000 m. Yunnan (Tengchong).

**19. *Strobilanthes esquirolii*** H. Léveillé, Repert. Spec. Nov. Regni Veg. 12: 18. 1913.

白头马蓝 *bai tou ma lan*

*Pyrrothrix heterochroa* (Handel-Mazzetti) C. Y. Wu & C. C. Hu; *Strobilanthes heterochroa* Handel-Mazzetti; *S. leucocephala* Craib; *Tetragoga angustiphylla* Q. H. Chen; *T. esquirolii* (H. Léveillé) E. Hossain.

Subshrubs 0.5–2 m tall, much branched, anisophyllous. Stems 4-angled, basally glabrescent, apically rust-colored retrorsely setose. Petiole 1–3 cm, hispid-pilose; leaf blade ovate-elliptic to oblong-elliptic, 4–17 × 2–8 cm, smaller of pair ca. 3/4 size of larger one, roughly hirsute, abaxially paler, adaxially with prominent cystoliths, secondary veins 7–10 on each side of midvein, abaxially prominent, and adaxially impressed, base cuneate and attenuate, margin serrulate and ciliate, apex acute to caudate. Inflorescences terminal, heads, often yellowish, 2–3 × ca. 2 cm, 8–10-flowered; rachis densely white sericeous with gland-tipped trichomes; bracts oblong-lanceolate, 1–3 × 0.5–0.7 cm, outer ones longer with caudate tips giving inflorescences an eared appearance, inner ones smaller, indumentum variable, white sericeous, with gland-tipped or non-glandular trichomes, and apically often becoming brownish; bracteoles oblanceolate, 7–9 × ca. 2 mm, abaxially basally white sericeous, trichomes apically often slightly rust-colored. Flowers imbricate on rachis. Calyx 7–10 mm, 5-lobed almost to base; lobes linear-oblan-ceolate, densely white sericeous toward base but slightly rust-colored toward apex, apex acute. Corolla violet, 3–3.5 cm, curved, ventricose, outside densely white pilose, inside glabrous except for trichomes retaining style; tube basally cylindric and ca. 4 mm wide for ca. 6 mm then gradually widened to ca. 1 cm at mouth; lobes ovate, ca. 4 × 5 mm, apex obtuse. Stamens 4, included; shorter filament pair ca. 4 mm, glabrous; longer filament pair ca. 7 mm, white pilose; anther thecae oblong, ca. 3 × 1 mm; pollen type 3. Ovary densely white pilose; style ca. 2.8 cm, white pilose. Capsule oblong, 7–10 mm, apically white pilose, 4-seeded. Seeds ovate in outline, ca. 3.5 × 2 mm, densely pubescent; areola small. Fl. Sep–Dec.

Mountain slopes; 200–800 m. Guizhou, Yunnan [Laos, Thailand, Vietnam].

**20. *Strobilanthes hossei*** C. B. Clarke, Bot. Jahrb. Syst. 41: 67. 1907.

红毛马蓝 *hong mao ma lan*

*Championella fulvihilspida* (D. Fang & H. S. Lo) C. C. Hu & C. Y. Wu; *Pyrrothrix hossei* (C. B. Clarke) C. Y. Wu & C. C. Hu; *P. rufohirta* (C. B. Clarke ex W. W. Smith) C. Y. Wu & C. C. Hu; *Strobilanthes fulvihilspida* D. Fang & H. S. Lo; *S. rufohirta* C. B. Clarke ex W. W. Smith.

Herbs or subshrubs 20–30(–100) cm tall, much branched, anisophyllous. Stems slender, erect, 4-angled, basally glabrescent, apically reddish brown setose. Petiole 1.5–2.5 cm, densely reddish setose; leaf blade ovate to ovate-lanceolate, 8–9 × 3.5–4 cm, both surfaces reddish brown setose on veins, abaxially whitish, adaxially dark green, cystoliths absent or obscure, secondary veins ca. 5 on each side of midvein, base broadly cuneate to subrounded, margin crenate, apex acuminate. Inflorescences axillary, spikes, 2–4 cm; rachis densely reddish setose; bracts spatulate, 1.3–1.6 × ca. 0.3 cm, persistent, basal claw pale reddish setose, expanded apex green and leaflike; bracteoles linear-spatulate, 0.8–1.2 cm, reddish setose. Calyx ca. 1.3 cm, 5-lobed almost to base; lobes linear-spatulate, reddish setose. Corolla pale blue, 4–5 cm, straight, outside puberulent, inside glabrous except for trichomes retaining style; tube basally cylindric and ca. 2 mm wide for ca. 8 mm then gradually widened to ca. 1.2 cm at mouth; lobes orbicular, 6–7 mm in diam. Stamens 4, included; filaments white villous, shorter pair ca. 4 mm, longer pair ca. 6 mm; anther thecae oblong, ca. 2 × 1 mm; pollen type 3. Capsule light brown, fusiform, ca. 1 cm, gland-tipped pubescent, 4-seeded, apex apiculate. Seeds brown, ovate in outline, ca. 2 × 2 mm, compressed, pubescent, apex shortly apiculate; areola absent. Fl. Aug–Dec, fr. Nov–Feb.

Thickets, mountain slopes; 1000–1800 m. Guangxi, Yunnan [Indonesia, Laos, Malaysia, Myanmar, Thailand, Vietnam].

**21. *Strobilanthes torrentium*** Benoist, Bull. Mus. Natl. Hist. Nat. 28: 188. 1922.

急流马蓝 *ji liu ma lan*

Subshrubs to 1 m tall, isophyllous or slightly anisophyllous. Stems dark green, erect, 4-angled, sulcate, bifariously pubescent. Petiole 0.5–3 cm, pubescent and slightly hispid; leaf blade ovate to elliptic, 3–13 × 1.5–5.5 cm, abaxially densely yellow pilose along veins, adaxially sparsely pubescent, hispid, and with numerous cystoliths, secondary veins 5–7 on each side of midvein, base narrowly cuneate and decurrent onto petiole, margin serrate, apex acuminate and slightly falcate. Inflorescences axillary or terminal, headlike spikes, 1.5–3 cm, very compact, densely covered with long silky rufous trichomes; bracts imbricate, somewhat variable in size and shape; outer bracts leaflike, obovate to subrhombic, 1.5–1.7 × 0.5–0.7 cm, distinctly angled, densely villous, apex acute; inner bracts obovate, ca. 10 × 5 mm, angled, villous, apex subacute; bracteoles oblanceolate, ca. 7 mm, margin ciliate, apex obtuse. Calyx 1–1.1 cm, villous, 5-lobed to ca. 3 cm from base; lobes linear-oblong 7–8 × ca. 1 mm, with 2 slightly shorter than others, margin ciliate, apex obtuse. Corolla with a white tube and blue to mauve lobes, 3–4.5 cm, curved, outside sparsely pubescent on tube and on lobes, inside glabrous except for trichomes retaining style; tube basally cylindric and narrow for 8–10 mm then gradually widened to 1–1.2 cm at mouth; lobes ovate, ca. 3 × 5 mm, apex obtuse. Stamens 4, included; filaments pilose,

shorter pair ca. 2 mm, longer pair ca. 5 mm; anther thecae oblong, ca. 2.5 mm; pollen type 3. Ovary villous; style ca. 3.3 cm, basally glabrous, apically pubescent. Capsule oblong, ca. 9 mm, pilose at tip, 4-seeded. Seeds unknown. Fl. Aug–Nov.

Forests by streams; 1900–2300 m. Yunnan [India, Myanmar].

**22. *Strobilanthes anamitica*** Kuntze, Revis. Gen. Pl. 2: 498. 1891.

海南马蓝 hai nan ma lan

*Championella machurei* (Merrill) C. Y. Wu & H. S. Lo;  
*Strobilanthes machurei* Merrill.

Herbs 50–100 cm tall, isophyllous. Stems reddish, stout, erect or procumbent and rooting at nodes, hirsute when young, glabrescent. Petiole 1–2 cm; leaf blade oblong-ovate, 3–13 × 1.5–5.5 cm, both surfaces golden to brown hirsute, adaxially densely covered with cystoliths, secondary veins ca. 5 on each side of midvein, base cuneate to subrounded, margin crenulate, apex acuminate to shortly acuminate. Inflorescences axillary or terminal, headlike spikes, 1–3 cm, very compact, elongated after flowering; bracts obovate, ca. 1 cm, brown hirsute, pinnately veined, apex reflexed; bracteoles spatulate-linear, ca. 10 × 1 mm, abaxially hirsute on apical half, adaxially subglabrous, margin ciliate. Calyx 6–8 mm, hirsute, 5-lobed almost to base; lobes linear, ca. 1 mm wide, outside hirsute on apical half, margin ciliate. Corolla light blue or white, ca. 3 cm, outside pubescent on tube, inside glabrous except for trichomes retaining style; tube basally cylindric and ca. 0.2 mm wide for ca. 1.2 cm then gradually widened to ca. 1 cm at mouth; lobes oblong, ca. 6 mm. Stamens 4, included; filaments pilose, shorter pair ca. 3 mm, longer pair ca. 6 mm; anther thecae oblong, ca. 2 × 1 mm; pollen type 2. Ovary pubescent at tip; style ca. 2.5 cm, hirsute. Capsule light brown, ca. 7 mm, pubescent at tip, 4-seeded. Seeds ovate in outline, ca. 2.5 × 2 mm, pubescent. Fl. Sep–Jan, fr. Dec–Mar.

Forests, on rocks by streams; 400–1800 m. Guangxi, Hainan, Yunnan [Vietnam].

**23. *Strobilanthes yunnanensis*** Diels, Notes Roy. Bot. Gard. Edinburgh 5: 164. 1912.

云南马蓝 yun nan ma lan

*Pteracanthus hygrophiloides* (C. B. Clarke ex W. W. Smith) H. W. Li; *P. hygrophiloides* var. *brachytrichus* (Handel-Mazzetti) C. Y. Wu; *P. mekongensis* (W. W. Smith) C. Y. Wu & C. C. Hu; *P. yunnanensis* (Diels) C. Y. Wu & C. C. Hu; *Strobilanthes hygrophiloides* C. B. Clarke ex W. W. Smith; *S. hygrophiloides* var. *brachytricha* Handel-Mazzetti; *S. hygrophiloides* var. *subnuda* Benoist; *S. limprichtii* Diels; *S. mekongensis* W. W. Smith.

Subshrubs 0.5–2.5 m tall, much branched, isophyllous. Stems 4-angled, bifariously whitish pubescent, sometimes glabrescent. Petiole 2–4 cm, whitish pubescent; leaf blade ovate, elliptic, or elliptic-ovate, 3–11 × 2–5 cm, abaxially pale green and sparsely pubescent, adaxially dark green and pubescent, cystoliths abundant on both surfaces, secondary veins 4–7 on each side of midvein, base narrowly cuneate and decurrent onto petiole, margin crenate-serrate, apex acuminate and sometimes falcate. Inflorescences axillary or terminal, subcapitate spikes,

rarely reduced to a single flower; peduncle 0–4 mm, densely white pubescent; bracts persistent, hirsute; outermost sterile bracts leaflike, petiolate, lanceolate to ovate-lanceolate, 1.5–2.5 × 0.3–0.4 cm; inner floral bracts linear-oblong, 1.2–1.6 cm, with 1 reddish brown vein; bracteoles linear to oblanceolate, ca. 10 × 2 mm, pilose, apex obtuse. Flowers usually only one sterile per node. Calyx 1.2–1.6 cm, 5-lobed almost to base; lobes linear-lanceolate, 11–15 × 1–1.5 mm, subhyaline, pilose especially on midvein, margin ciliate, apex finely acuminate. Corolla pale blue to pinkish, 3.5–4.5 cm, straight, outside densely white pilose, inside glabrous except for trichomes retaining style; tube basally cylindric and 8–9 mm wide for 1–1.5 cm then gradually widened to ca. 2 cm at mouth; lobes orbicular, 6–8 mm in diam. Stamens 4, included; filaments pilose, shorter pair ca. 2 mm, longer pair 4–7 mm; anther thecae oblong, ca. 4 × 1 mm; pollen type 3. Ovary whitish comose; style 2.8–3.4 cm, sparsely pilose. Capsule oblong, 11–13 × ca. 2.5 mm, apically sparsely gland-tipped pubescent, 4-seeded. Seeds ovate in outline, 2.5–3.5 × 2–2.5 mm, densely appressed pilose. Fl. Jul–Sep, fr. Oct–Nov.

• Moist open shady places in thickets; 800–2800 m. Gansu (Wenxian), Sichuan, Xizang (Mêdog, Zayü), Yunnan.

**24. *Strobilanthes fengiana*** Y. F. Deng & J. R. I. Wood, J. Trop. Subtrop. Bot. 18: 481. 2010.

冯氏马蓝 feng shi ma lan

Subshrubs to 50 cm tall, perennial, weakly anisophyllous. Stems 4-angled, sulcate, glabrescent. Petiole 1–2 cm, sulcate, bifariously pubescent; leaf blade ovate, smaller of pair 6–8 × 3–4 cm and larger one 10–14 × 4–6 cm, abaxially glabrous except pilose along midvein, adaxially glabrous and with prominent cystoliths, secondary veins 4–7 on each side of midvein, base rounded to broadly cuneate, margin undulate and ciliate, apex acuminate. Inflorescences terminal, subcapitate spikes, 1.5–3 cm; rachis pubescent; bracts lanceolate, 10–15 × ca. 2 mm, abaxially glabrescent, adaxially sparsely pubescent; bracteoles lanceolate, 8–10 × ca. 2 mm, abaxially glabrous, adaxially densely covered with multicellular large-celled trichomes. Calyx ca. 1.2 cm, 5-lobed almost to base; lobes linear-spatulate, outside apically covered with multicellular large-celled trichomes, margin ciliate with multicellular large-celled trichomes, apex acute. Corolla purple, 3–3.5 cm, outside pilose with large-celled trichomes, inside glabrous except for trichomes retaining style; tube basally cylindric and ca. 2 mm wide for ca. 1.5 cm then bent to ca. 90° above middle and gradually widened to ca. 1.3 cm at mouth; lobes rounded. Stamens 4, included; filaments pilose, shorter pair ca. 6 mm, longer pair ca. 8 mm; anther thecae oblong, ca. 2 mm. Capsule oblong, 12–14 × 3–4 mm, glabrous, 4-seeded. Seeds ovate in outline, ca. 3 × 2 mm, pubescent; areola small. Fl. Sep–Dec, fr. Nov–Feb.

• Forests; 1200–1800 m. Yunnan (Xichou).

**25. *Strobilanthes lamium*** C. B. Clarke ex W. W. Smith, Notes Roy. Bot. Gard. Edinburgh 10: 195. 1918.

野芝麻马蓝 ye zhi ma ma lan

*Pteracanthus lamium* (C. B. Clarke ex W. W. Smith) C. Y. Wu & C. C. Hu.

Herbs 30–80 cm tall, unbranched, anisophyllous. Stems 4-angled, sulcate, basally glabrescent, apically whitish gland-tipped pubescent. Leaves apically denser; petiole 3–10 mm, hirsute; leaf blade ovate to ovate-lanceolate, 4–5 × 2.5–3 cm, both surfaces with very small conspicuous cystoliths, abaxially paler, sparsely pilose, and setose along veins, adaxially dark green, sparsely hirsute, and yellowish brown setose along midvein, secondary veins 7 or 8 on each side of midvein, base broadly cuneate and decurrent onto petiole, margin coarsely serrate, apex acute. Inflorescences terminal, subcapitate spikes, 3–5 cm, 4–8-flowered; bracts oblong to lanceolate, resembling reduced leaves, 1.4–1.6 × 0.6–0.7 cm, persistent, abaxially hirsute especially on veins; bracteoles narrowly oblong-elliptic, ca. 1.2 cm, abaxially gland-tipped pilose. Flowers imbricate on rachis. Calyx ca. 1.1 cm, gland-tipped pilose, 5-lobed almost to base; lobes linear-lanceolate, subequal, pilose, apex acute. Corolla purple, ca. 3.5 cm, bent at mouth, outside sparsely pilose, inside glabrous except for trichomes retaining style; tube basally cylindric and ca. 2 mm wide for ca. 6 mm then gradually widened to ca. 1 cm at mouth; lobes orbicular, ca. 6 mm in diam. Stamens 4, included; filaments densely pilose, shorter pair ca. 5 mm, longer pair ca. 7 mm; anther thecae oblong, ca. 2.3 × 1.3 mm, erect. Ovary pilose at tip; style pilose. Capsule not seen. Fl. Jul–Aug.

- Forests, slopes; 800–1500 m. Chongqing, Hubei, Hunan.

**26. *Strobilanthes cyphantha*** Diels, Notes Roy. Bot. Gard. Edinburgh 5: 162. 1912.

弯花马蓝 wan hua ma lan

*Pteracanthus cyphanthus* (Diels) C. Y. Wu & C. C. Hu.

Subshrubs 45–60 cm tall. Stems 4-angled. Petiole 2–5 cm; leaf blade ovate, 3–7 × 1.5–4.5 cm, both surfaces pilose, adaxially with numerous obscure cystoliths, secondary veins 6–8 on each side of midvein, base decurrent onto petiole, margin serrate, apex acute. Inflorescences terminal or in apical leaf axils, subcapitate, dense, sessile or with peduncle to 5 mm, white pilose; outer sterile bracts leaflike; inner floral bracts elliptic, ca. 12 × 5 mm, white pilose, margin dentate and ciliate; bracteoles linear, ca. 16 × 1 mm, thinly pilose. Calyx 1–1.3 cm, 5-lobed almost to base; lobes linear, ca. 11 × 1 mm, subequal, thinly pilose. Corolla blue, 3–4 cm, strongly bent and ventricose, outside thinly pilose, inside pubescent on lobes and glabrous in tube except for trichomes retaining style; tube basally cylindric and ca. 3 mm wide for ca. 1 cm then bent to ca. 90° at middle and widened to ca. 1.2 cm at mouth; lobes oblong, ca. 5 × 4 mm. Stamens 4, included; shorter filament pair ca. 2 mm, glabrous; longer filament pair ca. 3 mm, glabrous except for a few trichomes basally; anther thecae oblong, ca. 2 × 1–1.5 mm; pollen type 3. Ovary comose; style 2.7–3.2 cm, pubescent. Capsule ca. 1.4 cm, pilose at tip, 4-seeded. Seeds ovate in outline, ca. 2.5 × 2 mm, densely covered with appressed trichomes. Fl. Jul–Oct, fr. Nov–Dec.

- Mixed forests; 1200–3200 m. Gansu (Wenxian), Sichuan, SE Xizang, Yunnan.

"*Strobilanthes curviflorus* [sic!] C. B. Clarke" (C. Y. Wu, Index Fl. Yunnan. 2: 1685. 1984) belongs here but was not validly published because it was merely cited as a synonym (*Vienna Code*, Art. 34.1(c)).

**27. *Strobilanthes strigosa*** D. Fang & H. S. Lo, Guihaia 17: 36. 1997.

糙毛马蓝 cao mao ma lan

Subshrubs 30–60 cm tall, isophyllous. Stems black when dry, 4-angled, sulcate, bifariously pubescent and hirsute. Petiole 5–12 mm, pubescent and hirsute; leaf blade elliptic to broadly ovate, 3.5–8 × 2–5 cm, both surfaces sparsely hispid pilose and with conspicuous cystoliths, secondary veins ca. 7 on each side of midvein and prominent, base cuneate to attenuate, margin serrate, apex acute. Inflorescences terminal or in apical leaf axils, spikes, 2–3 cm; bracts elliptic, 9–10 × 5–6 mm, persistent, pinnately veined, margin gland-tipped ciliate, apex acute; bracteoles oblanceolate, ca. 9 mm, densely covered with linear cystoliths, margin gland-tipped ciliate. Flowers imbricate on rachis. Calyx ca. 1.2 cm, 5-lobed to base; lobes falcately spatulate, ca. 2 mm wide, unequal, margin gland-tipped ciliate. Corolla purplish, ca. 4.5 cm, slightly bent, outside glabrous, inside glabrous except for trichomes retaining style; tube basally cylindric for ca. 1.5 cm then gradually widened to ca. 1 cm at mouth; lobes ovate, ca. 7 mm, apex rounded. Stamens 4, included; shorter filament pair ca. 2.5 mm, glabrous; longer filament pair ca. 5 mm, pilose; anther thecae oblong, ca. 2 × 1.3 mm; pollen type 4. Ovary comose; style ca. 2.8 cm, sparsely pilose. Capsule not seen. Fl. Dec.

- Limestone slopes; 400–600 m. Guangxi (Jingxi).

*Strobilanthes strigosa* is a poorly understood species whose placement is uncertain.

**28. *Strobilanthes longiflora*** Benoist, Bull. Mus. Natl. Hist. Nat. 28: 94. 1922.

长花马蓝 chang hua ma lan

*Championella longiflora* (Benoist) C. Y. Wu & C. C. Hu.

Herbs to 50 cm tall, isophyllous. Stems sulcate, glabrous. Petiole 2–4 mm, pubescent; leaf blade broadly lanceolate to ovate, to ca. 10 × 5 cm, glabrous, cystoliths very prominent on both surfaces, secondary veins 3–5 on each side of midvein, base cuneate, margin minutely crenulate, apex acuminate. Inflorescences terminal or from apical axils, spikes, 0–4 cm, 8–12-flowered but sometimes reduced to a single flower in leaf axils; bracts oblanceolate-spatulate, 10–13 × 1.5–3 mm, sparsely pilose, apex entire to weakly 3-lobed; bracteoles oblong, ca. 6 × 1 mm, pilose with a comose apex, apex obtuse. Calyx ca. 1 cm, 5-lobed almost to base; lobes linear, ca. 9 × 1.5 mm, comose. Corolla blue, funnel-shaped, ca. 5 cm, strongly bent, outside pubescent, inside glabrous except for trichomes retaining style; tube basally cylindric and ca. 2 mm wide for ca. 8 mm then gradually widened to ca. 9 mm at mouth; lobes ovate, ca. 4 × 3 mm, apex obtuse. Stamens 4, included; filaments pilose, shorter pair ca. 4 mm, longer pair ca. 6 mm; anther thecae oblong, ca. 2.5 × 1.2 mm; pollen type 15. Ovary glabrous but pubescent at tip; style sparsely white pilose; stigma linear. Capsule oblong-fusiform, ca. 8 × 2 mm, glabrous apart from a few apical trichomes, 4-seeded. Fl. Aug–Oct, fr. Nov–Dec.

- Thickets; 700–1500 m. Yunnan.

**29. *Strobilanthes henryi*** Hemsley, J. Linn. Soc., Bot. 26: 240. 1890.

南一笼鸡 nan yi long ji

*Gutzlaffia anisandra* (Benoist) Handel-Mazzetti; *G. anisandra* var. *drosothyrsa* Handel-Mazzetti; *G. forrestii* S. Moore; *G. henryi* (Hemsley) C. B. Clarke ex S. Moore; *G. lyi* (H. Léveillé) E. Hossain; *G. multiramosa* Handel-Mazzetti; *Paragutzlaffia henryi* (Hemsley) H. P. Tsui; *P. lyi* (H. Léveillé) H. P. Tsui; *Ruellia lyi* H. Léveillé; *Strobilanthes anisandra* Benoist.

Subshrubs to 70 cm tall, variable from hirsute to subglabrous, weakly anisophyllous. Stems slender, erect or ascending, 4-angled, much branched, villous to subglabrous. Petiole 0.5–3 cm; leaf blade ovate, ovate-elliptic, or subrhomboidal, 2–9 × 1.5–4.5 cm, both surfaces thinly to densely pilose, abaxially paler, adaxially with linear cystoliths, secondary veins 5 or 6 on each side of midvein, base broadly cuneate, slightly oblique, and usually decurrent onto petiole, margin crenulate, apex acute. Inflorescences terminal, spikes, usually 3–8 cm; bracts at base of spike resembling sessile reduced leaves; floral bracts oblong to spatulate, 6–7 × 1–2 mm, persistent, abaxially gland-tipped pubescent to subglabrous; bracteoles linear, ca. 7 × 0.8 mm, abaxially gland-tipped pubescent to subglabrous. Flowers paired, varying considerably in density, basally distant on rachis but apically becoming imbricate. Calyx 8–11 mm, subequally 5-lobed almost to base; lobes linear, 6–7 mm, outside gland-tipped pubescent to subglabrous. Corolla light purple, blue, or white, funnel-shaped, 1.7–2.3 cm, outside pubescent, inside glabrous except for trichomes retaining style; tube basally cylindric and narrow for 3.5–6 mm then bent and gradually widened to ca. 1 cm at mouth; lobes orbicular, ca. 2 mm in diam., spreading. Fertile stamens 2, staminodes 2; filaments ca. 3.5 mm, pubescent; anther thecae ovoid-oblong, exserted; pollen type 15. Ovary oblong, glabrous but with a few apical glands; style ca. 2 cm, glabrous. Capsule oblong, 7–10 mm, glabrous apart from a few apical glands, 4-seeded. Seeds suborbicular in outline, ca. 2 × 2 mm, densely villous; areola small. Fl. Jan, Apr, Jul–Oct.

• Mountain slopes; 1000–2800 m. Guizhou, Hubei, Hunan, Sichuan, SE Xizang, Yunnan.

**30. *Strobilanthes cyclus*** C. B. Clarke ex W. W. Smith, Notes Roy. Bot. Gard. Edinburgh 10: 192. 1918.

环毛马蓝 huan mao ma lan

Subshrubs 40–60 cm tall, isophyllous, whole plant with hispid trichomes. Stems erect or suberect, with whitish multicellular trichomes. Petiole 2–5 mm, densely pilose; leaf blade broadly ovate to suborbicular, 2.5–5.5 × 2–4.5 cm, abaxially pale green and hirsute along veins, adaxially dark green, densely hirsute, and with prominent linear cystoliths, secondary veins 4 or 5 on each side of midvein, base broadly cuneate to subrounded, margin crenate to sometimes subentire, apex rounded to acute. Inflorescences axillary or terminal, capitate spikes, 1–3 cm, shortly pedunculate; bracts narrowly oblong-elliptic, 10–12 × 5–6 mm, densely pilose; bracteoles oblong, ca. 7 × 2 mm, densely pilose on apical half, apex obtuse. Calyx ca. 7 mm, outside pilose, weakly 2-lipped; lobes linear-oblong;

lower 2 lobes distinct to base; upper 3 lobes fused in their basal half, with central lobe slightly longer. Corolla blue, 2–2.5 cm, substraight, outside glabrous except for pubescence on lobes, inside glabrous except for trichomes retaining style; tube basally cylindric and ca. 2 mm wide for ca. 1.2 cm then gradually widened to ca. 1 cm at mouth; lobes suborbicular, ca. 5 mm in diam. Stamens 4; filaments glabrous, shorter pair ca. 3 mm and included, longer pair ca. 5 mm and exserted; anther thecae oblong, ca. 2.2 × 1.3 mm; pollen type 17. Ovary comose; style ca. 2 cm. Capsule ellipsoid, ca. 7 × 3.5 mm, pilose at tip, 2-seeded with basal retinacula sterile. Seeds ovate to suborbicular in outline, ca. 1 mm, flattened, pubescent; areola small but prominent. Fl. Aug.

• Forests; 1800–2300 m. Yunnan.

**31. *Strobilanthes serrata*** J. B. Imlay, Bull. Misc. Inform. Kew 1939: 117. 1939.

齿叶马蓝 chi ye ma lan

*Gutzlaffia glandulosa* Lace.

Subshrubs 50–100 m tall, perennial, erect, slightly anisophyllous. Stems sulcate, glabrous or with a few crisped trichomes. Petiole 0.5–7 cm, diminishing in length apically on stems, glabrous or sparsely pubescent; leaf blade ovate to oblong-ovate, 5–12 × 4–6 cm, abaxially uniformly violet to light green and glabrous except for pubescence along veins, adaxially green variegated with white patches and glabrous, secondary veins 7–9 on each side of midvein, base gradually narrowed and then ± decurrent to 2 cm onto petiole, margin coarsely serrate, apex acuminate. Inflorescences from apical leaf axils, simple or branched pedunculate spikes, commonly forming a terminal panicle of spikes; spikes 2–7 cm, densely gland-tipped pilose; peduncle of panicles 2–10 cm, subglabrous to thinly pubescent; rachis and branches densely gland-tipped pilose; bracts oblong-ovate to oblong-obovate, 3–4 × 1.5–2.5 mm, persistent, densely gland-tipped pilose, apex obtuse; bracteoles oblong to obovate, 3–4 × 1–1.5 mm, abaxially densely gland-tipped pilose, adaxially glabrous but densely covered with white cystoliths, apex obtuse. Flowers in opposite pairs, basally 1–2 cm apart on rachis, clearly separate all along spike except at very apex. Calyx 5–6 mm, subequally 5-lobed to base; lobes oblong, outside densely gland-tipped villous, inside glabrous and densely covered with white cystoliths. Corolla pale blue with a white tube, 2–2.6 cm, straight or slightly bent, outside sparsely to densely pilose with large-celled trichomes; tube basally cylindric and narrow for 6–8 mm then widened to ca. 1 cm at mouth; lobes ovate, ca. 3 × 3 mm, apex obtuse. Fertile stamens 2; filaments ca. 4 mm, glabrous; anther thecae ca. 1.5 mm, included; pollen type 18. Ovary villous; style ca. 2 cm, glabrous. Capsule oblong, 5–7 × ca. 2 mm, silky pubescent, 4-seeded. Seeds ca. 2 × 2 mm, pubescent. Fl. Sep–Jan.

Partly shaded moist places in evergreen broad-leaved forests; 700–1600 m. Yunnan [Myanmar, Thailand].

**32. *Strobilanthes tubiflos*** (C. B. Clarke) J. R. I. Wood, Edinburgh J. Bot. 51: 264. 1994.

管花马蓝 guan hua ma lan

*Strobilanthes petiolaris* Nees var. *tubiflos* C. B. Clarke in J. D. Hooker, Fl. Brit. India 4: 458. 1884.

Subshrubs of unknown habit. Stems 4-angled to subterete, sulcate, glabrous except for a few trichomes in grooves. Petiole 5–10 mm; leaf blade ovate-elliptic, 6.5–16 × 3.5–8 cm, abaxially paler, sometimes purplish, and glabrous except for appressed trichomes on midvein, adaxially glabrous and with prominent cystoliths, secondary veins 4–7 on each side of midvein, base cuneate and decurrent as a wing onto petiole, margin dentate, apex acuminate. Inflorescences terminal, branched spikes, 2–4 cm; rachis gland-tipped pilose; sterile bracts leaf-like, ovate, 9–10 × ca. 6 mm, with prominent cystoliths; floral bracts obovate, 5–6 × 2.5–3.5 mm, persistent, densely yellowish gland-tipped pubescent, cystoliths abaxially prominent, apex usually emarginate; bracteoles oblanceolate, ca. 5 × 1 mm, abaxially gland-tipped pubescent especially apically, apex obtuse. Calyx 7–8 mm, subequally 5-lobed almost to base; lobes oblong, ca. 1 mm wide, outside ciliate and apically gland-tipped pilose, inside glabrous. Corolla blue, 2–3 cm, curved, outside pilose, inside glabrous except for trichomes retaining style; tube basally cylindric and ca. 1 mm wide for ca. 3 mm then gradually widened to ca. 1 cm at mouth; lobes broadly ovate, ca. 2 × 3 mm, apex rounded. Fertile stamens 2, included; filaments glabrous, ca. 4 mm; anther thecae oblong, erect, ca. 2 × 0.8 mm; pollen type 3. Ovary oblong-ovate, ca. 1 mm, apically pilose; style ca. 2 cm, glabrous. Capsule oblong, ca. 6 × 2 mm, pubescent, 4-seeded. Seeds suborbicular in outline, ca. 1 × 1 mm, pubescent; areole prominent. Fl. Aug.

● Valleys, streamsides; 200–300 m. Xizang (Mêdog).

**33. *Strobilanthes affinis*** (Griffith) Terao ex J. R. I. Wood & J. R. Bennett, Kew Bull. 58: 134. 2003.

肖笼鸡 xiao long ji

*Adenosma affinis* Griffith, Not. Pl. Asiat. 4: 133. 1854; *Strobilanthes acrocephala* T. Anderson; *S. darrisii* H. Léveillé; *S. thirionnii* H. Léveillé; *Tarphochlamys affinis* (Griffith) Bremekamp; *T. darrisii* (H. Léveillé) E. Hossain.

Herbs to 60 cm tall, isophyllous. Stems 4-angled, sulcate, white pubescent with large-celled trichomes. Petiole 0.5–1.5 cm, pubescent; leaf blade ovate to ovate-elliptic, 3–8 × 2–4.5 cm, both surfaces sparsely strigose, abaxially yellowish green, adaxially dark green and densely covered with subulate cystoliths, secondary veins 5–7 on each side of midvein, base subrounded to cuneate and decurrent onto petiole, margin crenulate, apex acute. Inflorescences axillary or terminal, dense spikes, 2–6 cm; peduncle 0.5–2 cm, densely gland-tipped pubescent; sterile bracts sometimes present, sessile, suborbicular to ovate, 5–10 × 5–10 mm, strigose; floral bracts imbricate, broadly obovate, rhomboidal, or elliptic, 6–7 × 3–4 mm, gland-tipped pilose with large-celled trichomes, 5-veined, margin ciliate, apex sometimes reflexed; bracteoles oblong-linear, ca. 5 × 1.2 mm, slightly shorter than calyx, gland-tipped pubescent, margin ciliate. Calyx 5–7 mm, 5-lobed almost to base; lobes linear, one slightly longer than others, gland-tipped pubescent, 1-veined, margin ciliate, apex obtuse. Corolla purplish blue to violet, ca. 1.5 cm, curved, outside pilose, inside glabrous except for trichomes retaining style; tube basally cylindric and ca. 1

mm wide for ca. 7 mm then gradually widened to ca. 7 mm at mouth; limb somewhat 2-lipped, lower lip 3-lobed, upper lip 2-lobed; lobes orbicular, ca. 3 × 3 mm, unequal. Stamens 4; shorter filament pair ca. 4 mm, glabrous; longer filament pair ca. 6 mm, hirsute; anther thecae oblong, ca. 2 × 1.2 mm, strongly exserted; pollen type 14. Ovary pilose; style pilose, ca. 1.2 cm. Capsule oblong, 7–9 mm, pubescent, 4-seeded. Seeds brown, ovate to suborbicular in outline, ca. 1.5 × 1.5 mm, pubescent, glabrescent; areola small, glabrous. Fl. Sep–Nov.

Mountain slopes, thickets; 600–1300 m. Guangxi, Guizhou, Hunan, Yunnan [India, Myanmar, Vietnam].

*Strobilanthes affinis* is a very distinct species. Not only is the pollen unique but also the species is distinctive for having 4 exserted stamens and trichomes caducous on the seeds.

**34. *Strobilanthes pinnatifida*** C. Z. Zheng, J. Hangzhou Univ. Nat. Sci. Ed. 8: 431. 1981.

羽裂马蓝 yu lie ma lan

*Pteracanthus pinnatifidus* (C. Z. Zheng) C. Y. Wu & C. C. Hu.

Herbs to 40 cm tall, unbranched, isophyllous. Stems erect, brown hirsute. Petiole 1.5–2 cm, hirsute; leaf blade elliptic to ovate-elliptic, 3–13 × 1–5 cm, whitish appressed hirsute, secondary veins 6 or 7 on each side of midvein, base cuneate to attenuate and often decurrent onto petiole, margin coarsely dentate to deeply pinnatifid or lobed, apex acuminate to caudate. Inflorescences terminal, spikes, 5–9 cm; bracts spatulate-obovate, to 1.2 cm, pubescent; bracteoles linear, 1–1.5 cm, pubescent. Flowers distant on rachis. Calyx 1–1.5 cm, pubescent with gland-tipped trichomes, 5-lobed almost to base; lobes linear, equal. Corolla purplish blue, ca. 3.5 cm, ventricose, outside pubescent, inside glabrous except for trichomes retaining style; tube basally cylindric and ca. 3 mm wide for ca. 1.2 mm then gradually widened to ca. 1 cm at mouth; lobes oblong, ca. 4 × 3.5 mm, apex emarginate to obtuse. Stamens 4, included; filaments pilose, shorter pair ca. 4 mm, longer pair ca. 6 mm; anther thecae oblong, ca. 2 mm. Ovary oblong, glabrous; style ca. 3 mm, sparsely hirsute. Capsule oblong, sparsely pubescent, 4-seeded. Seeds ovate in outline, ca. 2.5 × 2 mm, pubescent; areola small. Fl. Aug–Sep, fr. Nov.

● Forests in moist areas; 600–700 m. Zhejiang (Jingning, Qingyuan).

*Strobilanthes pinnatifida* is unique because of its pinnatifid or lobed leaves.

**35. *Strobilanthes auriculata*** Nees in Wallich, Pl. Asiat. Rar. 3: 86. 1832.

耳叶马蓝 er ye ma lan

*Perilepta auriculata* (Nees) Bremekamp; *P. edgeworthiana* (Nees) Bremekamp; *P. siamensis* (C. B. Clarke) Bremekamp; *Strobilanthes auriculata* var. *edgeworthiana* (Nees) C. B. Clarke; *S. auriculata* var. *siamensis* C. B. Clarke; *S. edgeworthiana* Nees; *S. siamensis* C. B. Clarke.

Subshrubs 0.5–2 m tall, much branched, weakly to strongly anisophyllous. Stems 4-angled, sometimes zigzag, gla-

brous or sparsely hirsute. Leaves sessile; leaf blade narrowly to broadly oblong-elliptic or oblong-oblancoate, rarely ovate for small leaves,  $2-20 \times 1.5-6$  cm, both surfaces sparsely pilose, abaxially pale green or reddish when young, adaxially green, secondary veins 12–15 on each side of midvein, base attenuate, cuneate, rounded, or auriculate, margin serrate to undulate, apex acuminate. Inflorescences axillary or terminal, spikes, 3–10 cm, sometimes branched; peduncle 2–4 cm, 4-angled, sulcate, bracteate; sterile bracts ovate,  $0.8-2 \times$  ca. 1.5 cm; floral bracts imbricate, broadly ovate to obovate-spatulate, 4–9 mm, often becoming recurved, persistent, densely villous and ciliate, apex usually apiculate but sometimes rounded or emarginate; bracteoles absent. Calyx 6–12 mm, gland-tipped pilose, 5-lobed almost to base; lobes linear, unequal with 2 slightly shorter than others, margin usually ciliate, apex subacute. Corolla pale purple to violet, funnel-shaped, 2.5–3 cm, curved, outside gland-tipped pilose on lobes, inside glabrous; tube basally cylindric and narrow for ca. 4 mm then weakly to strongly bent, abruptly inflated, and widened to ca. 2.5 cm at mouth; limb weakly 2-lipped, lower lip 3-lobed, upper lip 2-lobed; lobes ca. 3 mm. Stamens 4, included; filaments glabrous, shorter pair ca. 2 mm, longer pair ca. 4 mm; anther thecae oblong, ca.  $1.5 \times 1$  mm; pollen type 3. Ovary glabrous; style ca. 3.2 cm. Capsule narrowly oblong-obovoid,  $8-10 \times$  ca. 2 mm, glabrous, 4-seeded, apex apiculate. Seeds ovate-suborbicular in outline, ca.  $2 \times 1.8$  mm, pubescent; areola very small. Fl. Sep–Jan, fr. Jan–Feb.

Valleys; 300–1500 m. Guangxi, Yunnan [Bangladesh, India, Malaysia (Langkawi Island), Myanmar, Nepal, Pakistan, Thailand].

*Strobilanthes auriculata* var. *dyeriana* (Masters) J. R. I. Wood with leaf blade abaxially reddish rather than green is from Myanmar and Vietnam and is grown as a cultivated plant in Guangdong and Yunnan.

*Strobilanthes auriculata* is one of the few species of *Strobilanthes* that can be recognized in a sterile state with confidence on account of its sessile, sometimes auriculate, oblong to oblanceolate leaves. It is known to be pleisthesial in part of its range.

**36. *Strobilanthes mogokensis*** Lace, Bull. Misc. Inform. Kew 1915: 406. 1915.

卵叶马蓝 luan ye ma lan

Subshrubs to 60 cm tall. Stems 4-angled, sulcate, white gland-tipped pubescent, glabrescent. Petiole 0.6–1.5 cm, sulcate, pubescent; leaf blade variable in size and shape, basal ones broadly ovate and  $4-9 \times 2-5$  cm, apicalmost ones cordate and  $3-6 \times 2-4.5$  cm, both surfaces pubescent, secondary veins 4–6 on each side of midvein, base truncate to narrowly cuneate and slightly decurrent onto petiole, margin crenulate-serrate, apex acuminate to obtuse. Inflorescences terminal, spikes, 3–5 cm; rachis gland-tipped pubescent; bracts lanceolate-oblong,  $11-12 \times$  ca. 4 mm, abaxially yellowish gland-tipped pubescent, adaxially gland-tipped pubescent; bracteoles narrowly oblong-elliptic,  $7-8 \times$  ca. 1 mm, abaxially glabrous, adaxially gland-tipped pubescent. Calyx ca. 1 cm, outside pubescent, inside gland-tipped pubescent, 2-lipped, lower lip 2-lobed almost to base, upper lip 3-lobed to middle; lobes linear, ca. 1 mm wide. Corolla color not recorded, 2.5–3 cm, ventricose, curved, outside pubescent, inside glabrous except for trichomes retaining style; tube basally cylindric and ca. 2 mm wide for ca. 8 mm then

gradually widened to ca. 1 cm at mouth; lobes ovate, ca.  $4 \times 4$  mm. Stamens 4, included; filaments glabrous, shorter pair ca. 3 mm, longer pair ca. 7 mm; anther thecae oblong, ca.  $2 \times 1.2$  mm, erect; pollen type 9. Ovary white pilose at tip; style ca. 2.5 cm, apically hirsute. Capsule ca. 1 cm, pilose at tip, 4-seeded. Seeds ovate in outline, ca.  $2.5 \times 2$  mm, compressed, densely pilose. Fl. Oct–Dec, fr. Jan–Feb.

Streamsides; 600–800 m. Yunnan (Ruili) [Myanmar].

**37. *Strobilanthes argentea*** J. B. Imlay, Bull. Misc. Inform. Kew 1939: 121. 1939.

银毛马蓝 yin mao ma lan

Subshrubs to 50 cm tall, anisophyllous. Stems somewhat sulcate, bifariously pilose with large-celled trichomes, eventually glabrescent, basally woody. Petiole 0.2–4.3 cm, pilose; leaf blade ovate,  $4-12 \times 2-6$  cm, smaller of pair ca. 1/2 size of larger one, both surfaces thinly or rather densely pilose with large white trichomes especially along veins, abaxially paler and with prominent cystoliths, base attenuate and  $\pm$  decurrent onto petiole, margin crenulate to dentate, apex acute to shortly acuminate and commonly falcate. Inflorescences terminal, spikes, simple or branched, 1–4 cm, 2–10-flowered; peduncle 1–2.5 cm, pilose; rachis pilose; bracts oblong-lanceolate but basal ones spatulate,  $7-10 \times 1.5-3.5$  mm, densely pilose with gland-tipped and non-glandular trichomes, apex acute; bracteoles oblong-lanceolate,  $6-7 \times 1.5-2$  mm, densely pilose with gland-tipped trichomes, apex acute. Flowers paired, basally distant on rachis but apically becoming confluent. Calyx subequally 5-lobed almost to base; lobes lanceolate, abaxially pilose with gland-tipped and non-glandular trichomes, apex acute; central upper lobe longer than laterals. Corolla blue, 2.3–3.5 cm, ventricose and strongly bent, outside pilose, inside glabrous except for trichomes retaining style; tube basally cylindric and ca. 2 mm wide for ca. 1 cm then gradually widened to 7–8 mm at mouth; lobes broadly ovate, ca.  $4 \times 4$  mm, apex rounded. Stamens 4, included; filaments glabrous, shorter pair 2–3 mm, longer pair 5–7 mm; anther thecae oblong, ca.  $2 \times 1$  mm. Ovary pilose at tip; style ca. 2.5 cm, pilose. Capsule not seen. Fl. Oct–Nov.

Partly shaded and moist places along streams; 1100–1700 m. Yunnan [Thailand].

**38. *Strobilanthes aprica*** (Hance) T. Anderson in Benth., Fl. Hongk. 262. 1861.

山一笼鸡 shan yi long ji

*Gutzlaffia aprica* Hance, Hooker's J. Bot. Kew Gard. Misc. 1: 143. 1849; *G. aprica* var. *glabra* (J. B. Imlay) H. S. Lo; *G. dielsiana* (W. W. Smith) S. Moore; *Phlebophyllum apricum* (Hance) Benth.; *Strobilanthes aprica* var. *glabra* J. B. Imlay; *S. cavaleriei* H. Léveillé var. *angustifolia* H. Léveillé; *S. dielsiana* W. W. Smith; *S. mairei* H. Léveillé.

Shrubs or perennial herbs, to 70 cm tall, isophyllous. Stems 4-angled, sulcate, retrorsely white hirsute. Petiole 5–10 mm, shortly white pubescent; leaf blade elliptic to oblong-elliptic,  $2-7 \times 1-3$  cm, leathery, indumentum very variable, both surfaces usually scabrous-hispid but abaxially sometimes whitish

silky tomentose and occasionally glabrous except for pubescent midvein, secondary veins 5–7 on each side of midvein, base broadly cuneate, margin entire and scabrid to thinly ciliate, apex acute. Inflorescences axillary or terminal, short dense subcapitate spikes, becoming clustered in apicalmost leaf axils; spikes usually sessile but occasionally basal ones with a 0.5–3(–7) cm peduncle; bracts ovate-lanceolate, 13–15 × 3–5 mm, subleathery, abaxially and on margin with white multicellular trichomes, adaxially glabrous, apex long acuminate; bracteoles linear, 10–11 × ca. 1 mm, both surfaces covered with white cystoliths, abaxially and on margin sparsely pilose with multicellular trichomes, adaxially glabrous. Calyx 1–1.3 cm, 5-lobed for ca. 1/2 its length; lobes linear, lower 2 becoming distinct, upper 3 remaining connate, outside pubescent to subglabrous, inside glabrous, margin pilose. Corolla lilac with a white tube, funnel-shaped, 2.5–3.5 cm, outside glabrous, inside glabrous except for trichomes retaining style; tube basally cylindric and ca. 1 mm wide for 1.3–1.5 cm then abruptly inflated to ca. 1 cm in diam.; lobes suborbicular, ca. 5 × 5 mm, subequal, apex obtuse. Stamens 2, exserted; filaments ca. 1 cm, glabrous; anther thecae ellipsoid, ca. 2.5 mm; pollen type 11. Ovary white, narrowly oblong, pilose at tip; style ca. 3.5 cm, curved, pilose. Capsule oblong, 1–1.3 cm, glabrous except for a few trichomes at tip, 4-seeded. Seeds ovate in outline, ca. 2 mm, convex on both surfaces, pubescent; areola large, glabrous. Fl. Aug–Jan, fr. Sep–Feb.

Dry forests, montane thickets; below 2200 m. Guangdong, Guangxi, Guizhou, Jiangxi, Sichuan, Yunnan [Cambodia, Laos, Myanmar, Thailand, Vietnam].

**39. *Strobilanthes dalzielii*** (W. W. Smith) Benoist in Lecomte, Fl. Indo-Chine 4: 679. 1935.

曲枝马蓝 qu zhi ma lan

*Acanthopale dalzielii* W. W. Smith, Notes Roy. Bot. Gard. Edinburgh 11: 193. 1919; *Championella dalzielii* (W. W. Smith) Bremekamp; *C. dalzielii* var. *glabra* Benoist; *Pteroptychia dalzielii* (W. W. Smith) H. S. Lo; *Strobilanthes dalzielii* var. *inaequalis* Benoist.

Subshrubs or perennial herbs, 40–100 cm tall, branched, strongly anisophyllous. Stems slender, erect, zigzag, slightly pubescent to subglabrous. Petiole 0–3 mm; leaf blade ovate to ovate-lanceolate, smaller of pair 2–5 × 1–2 cm and larger one 9–14 × 3–5 cm, abaxially glaucous and glabrous or sparsely pubescent along veins, adaxially green, glabrous, and with prominent cystoliths, secondary veins 3–5 on each side of midvein, base rounded but cordate for apical leaves, margin serrate, apex acuminate to acute and sometimes falcate. Inflorescences axillary or terminal, spikes, 2–5 cm, 2–5-flowered; rachis usually zigzag, sparsely white puberulent; bracts linear-lanceolate, ca. 3 × 1 mm, glabrous, 1-veined; bracteoles linear, ca. 5 × 1 mm, glabrous or puberulent with gland-tipped trichomes. Flowers distant on rachis, solitary, not paired. Calyx ca. 1 cm, densely white pilose at base and along midvein, 5-lobed almost to base; lobes linear, apex finely acuminate. Corolla purplish blue or white, 3.5–4.5 cm, curved, outside densely white pilose in bud, inside glabrous except for trichomes retaining style; tube basally cylindric and ca. 2 mm wide for ca. 1 cm then ventricose

and gradually widened to 1–1.5 cm at mouth; lobes suborbicular, ca. 8 mm in diam. Stamens 4, slightly exserted; filaments hirsute, shorter pair ca. 5 mm, longer pair ca. 8 mm; anther thecae oblong, ca. 2 mm; pollen type 13. Ovary glabrous; style ca. 3.2 cm, pilose. Capsule linear-oblong, 1.8–2.2 cm, compressed, glabrous, 4-seeded, apex apiculate. Seeds ovate in outline, ca. 2 × 2 mm, densely appressed tomentose; areola very small. Fl. Oct–Jan.

By streams; 400–1200 m. Fujian, Guangdong, Guangxi, Guizhou, Hainan, Hubei, Hunan, Jiangxi, Taiwan, Yunnan [Laos, Thailand, Vietnam].

The strongly anisophyllous sessile leaves combined with the densely pubescent buds make *Strobilanthes dalzielii* very distinct.

Specimens misidentified as *Difflugossa divaricata* (Nees) Bremekamp (H. P. Tsui & C. C. Hu, FRPS 70: 172. 2002; C. C. Hu & X. P. Fu, Higher Pl. China 10: 377. 2004) belong here.

**40. *Strobilanthes bantonensis*** Lindau, Bull. Herb. Boissier 5: 650. 1897.

桂越马蓝 gui yue ma lan

Shrubs of unknown size, strongly anisophyllous. Stems zigzag, glabrous. Petiole 2–5 mm; leaf blade ovate-elliptic, smaller of each pair deciduous, larger one 7–15 × 4–7 cm, glabrous, secondary veins 4 or 5 on each side of midvein, base cuneate, margin sinuate-dentate, apex acute. Inflorescences axillary or terminal, spikes 3–13 cm, fertile apically only; bracts oblanceolate to obovate, ca. 2 × 1 mm, sparsely gland-tipped pilose, ± persistent, apex obtuse to rounded; bracteoles linear-oblanceolate, ca. 5 mm, sparsely gland-tipped pilose. Flowers 2 or 3 per spike, 1–1.4 cm apart, one fertile at each node alternately. Calyx 7–10 mm; lobes linear, 7–9 × ca. 1 mm, subequal, glabrous or becoming sparsely gland-tipped pilose, apex obtuse. Corolla purplish blue or white, ca. 3.2 cm, outside densely pubescent in bud, inside glabrous except for trichomes retaining style; tube basally cylindric and ca. 2 mm wide for ca. 8 mm then ventricose and gradually widened to ca. 1.3 cm at mouth; lobes oblong, ca. 4 × 6 mm. Stamens 4, included; filaments of shorter stamen pair ca. 2 mm and glabrous, longer pair ca. 5 mm and sparsely hirsute; anther thecae oblong ca. 2 mm; pollen type 1. Ovary glabrous; style ca. 3 cm, sparsely hirsute. Capsule fusiform, 1.2–1.3 cm, glabrous, 4-seeded. Seeds ovate in outline, ca. 3 mm, appressed pubescent. Fr. Dec.

Forests in limestone hills; 600–1500 m. Guangxi [Vietnam].

*Strobilanthes bantonensis* is a little-known species with very distinct pollen.

**41. *Strobilanthes pateriformis*** Lindau, Bull. Herb. Boissier 5: 653. 1897.

翅枝马蓝 chi zhi ma lan

*Pteracanthus alatiramosus* (H. S. Lo & D. Fang) C. Y. Wu & C. C. Hu; *Pteroptychia pateriformis* (Lindau) Bremekamp; *Strobilanthes alatiramosa* H. S. Lo & D. Fang.

Herbs to 50 cm tall, anisophyllous, drying blackish green. Stems somewhat zigzag, internodes winged, wing 1.5–4 mm wide. Petiole 1–3 cm, glabrous; leaf blade oblong-ovate to lanceolate, smaller of pair 2–8 × 1–3 cm and larger one 6–13(–17)

× 2.5–5.5 cm, glabrous, secondary veins 4–6 on each side of midvein, base cuneate and decurrent onto petiole, margin dentate to crenate, apex acute. Inflorescences axillary or terminal, spikes, 3–10 cm; bracts ovate to lanceolate, 2.5–5 mm, caducous, glabrous, apex acute to obtuse; bracteoles spatulate-linear to linear, 4–7 mm, caducous, glabrous. Flowers 5–10 mm apart on rachis, often one sterile per node. Calyx 6–12 mm, glabrous, subequally 5-lobed or with 2 lobes slightly longer; lobes lanceolate, ca. 10 × 1 mm but accrescent in fruit, apex acute. Corolla pale purple, 3–4 cm, ventricose, outside glabrous, inside glabrous except for trichomes retaining style; tube basally cylindric and ca. 2 mm wide for ca. 5 mm then gradually widened to ca. 1 cm at mouth; lobes ovate, 3–4 mm, subequal, apex emarginate. Stamens 4, included; shorter filament pair ca. 2 mm, glabrous; longer filament pair ca. 5 mm, hirsute; anther thecae oblong, ca. 2.5 × 1 mm; pollen type 12. Ovary apex minutely pubescent; style ca. 2.5 cm. Capsule fusiform, ca. 1.4 cm, glabrous except apically, 4-seeded. Seeds ovate in outline, ca. 3 × 2.5 mm, densely appressed pubescent. Fl. Sep–Nov, fr. Dec–Feb.

Dense forests; 400–1700 m. Guangxi, Guizhou, Hainan, Sichuan, Yunnan [Indonesia, Laos, Thailand, Vietnam].

**42. *Strobilanthes truncata*** D. Fang & H. S. Lo, Guihaia 17: 31. 1997.

截头马蓝 jie tou ma lan

Herbs to 3 m tall, perennial, anisophyllous. Stems 4-angled, somewhat zigzag, sulcate, glabrous. Petiole 0.6–7 cm; leaf blade broadly ovate, ovate, ovate-elliptic, or rarely elliptic, smaller of pair 3.5–7 × 2–4 cm and larger one 10–19 × 4.5–11.5 cm, glabrous, densely covered with linear cystoliths especially along abaxial veins, secondary veins 4–7 on each side of midvein, reticulate veins conspicuous, base broadly cuneate and oblique, margin remotely dentate to rarely serrate, apex acute. Inflorescences axillary or terminal, spikes, 7–15(–26) cm, sometimes branched; peduncle 0.5–5.5 cm, glabrous; rachis 4-angled, strongly zigzag, sulcate, bifariously pubescent; bracts elliptic, 5–7 × ca. 4 mm, caducous, glabrous, margin ciliate, apex truncate to retuse; bracteoles yellowish but apically black, linear-lanceolate, ca. 8 × 1.5 mm, persistent, abaxially sparsely puberulent, margin ciliate, apex truncate to rounded. Flowers distant on rachis. Calyx yellowish with a black apex, 8–10 mm, sparsely pubescent, usually sparsely covered with cystoliths, 2-lipped, lower lip 2-lobed almost to base, upper lip 3-lobed; lobes lanceolate, 5–6 mm, margin apically ciliate. Corolla white, 3.5–4 cm, slightly curved, outside glabrous, inside glabrous except for trichomes retaining style; tube basally cylindric and ca. 4 mm wide for 1–1.5 cm then ± ventricose and gradually widened to ca. 2 cm at mouth; lobes ovate, ca. 7 × 5 mm, apex obtuse. Stamens 4, included; shorter filament pair ca. 3 mm, glabrous; longer filament pair ca. 7 mm, sparsely hirsute; anther thecae oblong, 3–4 × ca. 1.5 mm; pollen type 12. Ovary comose; style ca. 2.7 cm, sparsely hirsute. Capsule fusiform, ca. 1.7 cm, glabrous except at apex, 4-seeded. Seeds ovate in outline, ca. 3 × 2.5 mm, densely appressed pubescent. Fl. Oct–Dec, Apr.

Forests on limestone hills; 900–1300 m. Guangxi (Napo) [Vietnam].

*Strobilanthes truncata* is doubtfully distinct from *S. pateriformis*, differing only in its truncate bracts and unwinged stem.

**43. *Strobilanthes rankanensis*** Hayata, Icon. Pl. Formosan. 9: 84. 1920.

兰嵌马蓝 lan qian ma lan

*Parachampionella rankanensis* (Hayata) Bremekamp.

Herbs 15–30 cm tall, rarely branched, isophyllous. Stems slender, 4-angled, procumbent, usually rooting at basal nodes, sulcate, bifariously pubescent. Petiole 0.5–1.5 cm, sulcate, bifariously pubescent or subglabrous; leaf blade ovate to elliptic, (0.5–)1–3.5 × 0.5–1.8 cm, glabrous or sparsely hirsute along veins, secondary veins 3 or 4 on each side of midvein, base cuneate to subrounded, margin serrate, apex acute. Flowers solitary in leaf axils. Bracts absent; bracteoles linear-spatulate, 6–9 × 0.7–0.9 mm, sparsely hirsute, apex obtuse. Calyx 6–9 mm, slightly hirsute, 2-lipped, lower lip 2-lobed almost to base, upper lip unequally 3-lobed; lobes linear, margin ciliate. Corolla purple with white stripes, funnel-shaped, ca. 2 cm, outside glabrous, inside glabrous except for a few trichomes at base of filaments and adaxially in throat; tube basally cylindric and ca. 1.5 mm wide for ca. 2.5 mm then gradually widened to ca. 2 cm at mouth; lobes oblong, ca. 3 × 4 mm, subequal, apex emarginate. Stamens 4, longer pair slightly exerted; filaments glabrous, shorter pair ca. 3 mm, longer pair ca. 6 mm; anther thecae oblong, ca. 2 mm, basally divergent; pollen type 11. Ovary ellipsoid, glabrous; style ca. 2 cm, basally sparsely gland-tipped pilose. Capsule fusiform, 1–1.2 cm, glabrous, 4-seeded. Seeds ovate in outline, ca. 2.5 × 1.5 mm, lenticular, densely covered with long appressed trichomes. Fl. May–Sep.

• Moist places in ravines; 600–1700 m. Taiwan.

*Strobilanthes rankanensis* is a distinctive, superficially isolated species because of the unique combination of trailing habit, 2-lipped calyx, and globose echinulate pollen.

**44. *Strobilanthes longispica*** (H. P. Tsui) J. R. I. Wood & Y. F. Deng, Bot. J. Linn. Soc. 150: 383. 2006.

长穗腺背蓝 chang sui xian bei lan

*Adenacanthus longispicus* H. P. Tsui, Fl. Reipubl. Popul. Sin. 70: 348. 2002; *Strobilanthes tripartita* J. R. I. Wood.

Herbs to 1.2 m tall, isophyllous, drying blackish green. Stems 4-angled, sulcate, bifariously pubescent. Petiole (0.2–)1–2.8 cm, hirsute; leaf blade elliptic to long ovate, 4.5–13 × 1.4–5 cm, both surfaces slightly strigose, adaxially densely covered with linear cystoliths, secondary veins 7 or 8 on each side of midvein, base attenuate, margin serrate, apex acuminate. Inflorescences axillary or terminal, spikes, 3–20 cm, with 2–7 flower pairs; peduncle ca. 1 cm, pubescent; rachis pubescent with gland-tipped trichomes; bracts linear-lanceolate, 6–8 × 1–2 mm, persistent, abaxially pubescent with gland-tipped trichomes, 1-veined, apex acute; bracteoles linear, 4–6 × ca. 1 mm, pubescent with gland-tipped trichomes, apex acute. Flowers 1.5–3.5 cm apart on rachis, usually only one sterile per node. Calyx 1.2–1.8 cm, outside pilose with gland-tipped trichomes, 2-lipped; lower lip 2-lobed almost to base, lobes lanceolate and 10–16 × 1.2–1.5 mm; upper lip 3-lobed, lobes triangular and 4–

6 × 1.2–1.5 mm. Corolla violet blue, ca. 3.5 cm, slightly curved, outside glabrous, inside glabrous except for trichomes retaining style; tube basally cylindric and narrow for ca. 7 mm then gradually widened to ca. 1 cm at mouth; lobes oblong-ovate, ca. 7 × 6 mm, apex emarginate. Stamens 4, included; filaments hirsute, shorter pair ca. 2.2 mm, longer pair ca. 5 mm; anther thecae oblong, ca. 2 mm; pollen type 3. Ovary ellipsoid, ca. 3 mm, glabrous; style ca. 1.8 cm, sparsely gland-tipped pubescent. Capsule oblong, 1.5–1.8 cm, gland-tipped pubescent at tip, 4-seeded. Seeds ovate in outline, ca. 3 × 2 mm, convex, densely pilose; areola small, glabrous. Fl. Oct–Jan.

Thickets on mountain slopes; 1300–1600 m. Yunnan (Gongshan) [Myanmar].

*Strobilanthes longispica* is very close to *S. dryadum*, differing only in its lanceolate rather than ovate-oblong bracts, unwinged inflorescence rachis, and less dense inflorescence indumentum.

**45. *Strobilanthes dryadum*** Benoist, Bull. Mus. Natl. Hist. Nat. 28: 94. 1922.

林马蓝 lin ma lan

*Pteracanthus dryadum* (Benoist) C. Y. Wu & C. C. Hu.

Herbs to 1 m tall, much branched, nearly isophyllous. Stems 4-angled, sulcate, bifariously pubescent. Petiole 1–3 cm, sulcate, bifariously pubescent; leaf blade ovate to lanceolate, to 25 × 8 cm, glabrous, abaxially pale, secondary veins 6 or 7 on each side of midvein, base attenuate and decurrent onto petiole forming wings, margin crenate-dentate, apex acuminate. Inflorescences terminal, spikes, 3–6 cm, with 2–6 flower pairs; rachis pubescent with gland-tipped trichomes, winged, wing ca. 1 mm; bracts ovate-oblong, 4–7 × 1–2 mm, persistent, gland-tipped pubescent, apex obtuse; bracteoles oblong, ca. 4 × 0.5 mm, gland-tipped pubescent. Flowers distant on rachis, usually one sterile per node. Calyx 1–1.5 cm, accrescent in fruit, outside gland-tipped pubescent, 2-lipped; lower lip 2-lobed almost to base; upper lip 3-lobed to below middle, lobes linear-oblong and 11–15 × 1–2 mm. Corolla blue, outside glabrous, inside glabrous except for trichomes retaining style; tube basally cylindric and ca. 2 mm wide for ca. 8 mm then gradually widened to ca. 1 cm at mouth; lobes oblong, ca. 8 × 8 mm. Stamens 4, included; filaments hirsute, shorter pair ca. 4 mm, longer pair ca. 6 mm; anther thecae oblong, ca. 2 mm; pollen type 4. Ovary puberulent at tip; style ca. 2.2 cm, sparsely pilose; stigma linear, compressed. Capsule narrowly oblong-obovoid, 1–1.2 cm, apically gland-tipped pubescent, 4-seeded. Seeds pilose; areola small. Fl. May, Sep–Nov, fr. Jan–Mar.

• Moist places in forests; 1300–2500 m. Guangxi, Yunnan.

**46. *Strobilanthes adpressa*** J. R. I. Wood, Kew Bull. 58: 110. 2003.

紧贴马蓝 jin tie ma lan

Subshrubs to 2 m tall, anisophyllous. Stems somewhat sulcate, bifariously pilose with large-celled trichomes, eventually glabrescent, basally woody; nodes pustulose, pubescent. Leaves basally petiolate, apically sessile; petiole (0–)1–2.5 cm, sulcate, sparsely pilose; leaf blade ovate-elliptic, (4–)6–16 × (1–)3.5–8.5 cm, smaller of pair ca. 2/3 size of larger one, thinly

leathery, both surfaces villous with large-celled trichomes especially on veins, secondary veins 9–13 on each side of midvein, curved, and netted near margin, base decurrent onto petiole or those apically on stem amplexicaul, margin shallowly serrate, apex acuminate. Inflorescences terminal, spikes, 5–7 cm; rachis 4-angled, gland-tipped pilose; bracts somewhat imbricate, oblong, 1.1–1.7 × 0.5–0.7 cm, gland-tipped pilose, tardily deciduous as flowers open; bracteoles linear-oblong, 9–15 × 1.2–2 mm, persistent, abaxially gland-tipped pilose, apex acute. Flowers arranged in pairs, erect, ± appressed to rachis. Calyx 1.2–1.6 cm, 2-lipped; lower lip 2-lobed almost to base; upper lip 3-lobed, lobes 12–14 × ca. 1.5 mm. Corolla yellow or blue, outside glabrous, inside glabrous except for trichomes retaining style; tube basally cylindric, ca. 2.5 mm wide for ca. 1.5 cm then gradually ventricose and widened to ca. 1.5 cm at mouth, strongly bent ca. 2.5 cm above base; lobes ovate, ca. 6 × 5 mm, apex obtuse. Stamens 4, included; filaments sparsely pilose, shorter pair ca. 4 mm, longer pair ca. 8 mm; anther thecae oblong, ca. 4 × 1.5 mm. Ovary comose with shortly stipitate glands; style ca. 2.5 cm, pilose. Capsule not seen. Fl. Oct–Dec.

Streamsides in forests; 1500–1800 m. Yunnan (Maguan) [Vietnam].

**47. *Strobilanthes atroviridis*** Y. F. Deng & J. R. I. Wood, J. Trop. Subtrop. Bot. 18: 480. 2010.

景东马蓝 jing dong ma lan

Subshrubs to 3 m tall, isophyllous or slightly anisophyllous, blackish green when dry. Stems branched, 4-angled, sulcate, glabrous, densely covered with white prominent cystoliths; nodes pustulose, pubescent. Petiole 2–5 cm, bifariously pubescent; leaf blade ovate-elliptic, 9–22 × 5.5–14 cm, abaxially paler green and glabrous, adaxially green, subglabrous with sparse large-celled trichomes, and sparsely covered with prominent cystoliths especially along veins, secondary veins 6–10 on each side of midvein, prominent on both surfaces, curved, and netted near margin, tertiary veins conspicuous, base decurrent onto petiole, margin crenulate, apex acute to long acuminate. Inflorescences axillary, shortly pedunculate spikes, 1–3(–6) cm, 2(–8)-flowered but commonly reduced to a subcapitate flower pair; rachis gland-tipped pubescent; bracts linear-lanceolate, 9–14 × 2–3 mm, abaxially gland-tipped pubescent, adaxially glabrous; bracteoles linear-lanceolate, 9–13 × ca. 2.5 mm, abaxially gland-tipped pubescent, adaxially glabrous. Flowers paired. Calyx 1–1.5 cm, outside gland-tipped pubescent, inside glabrous, 2-lipped; lower lip 2-lobed almost to base, lobes linear-lanceolate, 9–14 × 2–3 mm, and apex acute; upper lip with 3 lanceolate 5–7 mm teeth connate for 4–7 mm. Corolla purplish blue, 3–4 cm, straight, outside glabrous, inside glabrous except for trichomes retaining style; tube ca. 2 mm wide at base then gradually widened to ca. 2 cm at mouth; lobes ovate, ca. 1 × 1 cm, apex emarginate. Stamens 4, included; filaments basally pubescent, shorter pair ca. 6 mm, longer pair ca. 8 mm; anther thecae oblong; pollen type 3. Ovary not examined; style ca. 2 cm, glabrous. Capsule not seen. Fl. Apr, Jun, Nov.

• Moist places in forests; 2100–2400 m. Yunnan (Jingdong).

延苞马蓝 *yan bao ma lan*

*Hymenochlaena pteroclada* (Benoist) C. Y. Wu & C. C. Hu.

Subshrubs or perennial herbs, to 1 m tall, slightly anisophyllous, becoming black when dry. Stems 4-angled, sulcate, glabrous or subglabrous. Petiole (0–)0.5–1.5(–4) cm; leaf blade lanceolate, 7–20 × 3–8 cm, glabrous, abaxially densely covered with white cystoliths along veins, adaxially cystoliths prominent, secondary veins 5–9 on each side of midvein, base cuneate and decurrent onto petiole, margin serrulate to crenate, apex acuminate. Inflorescences axillary or terminal, spikes, 5–12 cm; peduncle 2–4.5 cm, apically widened to ca. 1.6 cm to form base of bract; bracts lanceolate to narrowly ovate, 1.5–2 × 0.8–1.6 cm, glabrous or gland-tipped pubescent, pinnately veined, base gradually narrowed and decurrent onto peduncle, margin entire or slightly dentate, apex acute to acuminate; bracteoles narrowly lanceolate, 5–7 × ca. 0.8 mm, glabrous, apex acuminate. Flowers ca. 3 cm apart on rachis. Calyx 7–9 mm, glabrous, weakly 2-lipped; lower lip 2-lobed, lobes 6–8 mm; upper lip 3-lobed, lobes lanceolate, ca. 6 mm, and apex acuminate. Corolla purplish blue, 3–4 cm, outside glabrous, inside glabrous except for trichomes retaining style; tube basally cylindric and ca. 2.5 mm wide for ca. 1.4 cm and then gradually widened to ca. 1.8 cm at mouth; lobes ovate, ca. 6 × 5 mm, subequal, apex obtuse. Stamens 4, included; filaments pilose at base, shorter pair ca. 4 mm, longer pair ca. 7 mm; anther thecae oblong, ca. 2.5 × 1.5 mm; pollen type 3. Ovary glabrous; style ca. 2.4 cm, sparsely pubescent. Capsule fusiform, ca. 1.3 cm, glabrous, 4-seeded. Seeds white, ovate in outline, ca. 2 × 2 mm, densely appressed tomentose. Fl. Apr–May, fr. Jun–Jul.

Thickets or forests by streams; 300–900 m. Guangxi, Guizhou [Vietnam].

**49. *Strobilanthes ovata*** Y. F. Deng & J. R. I. Wood, Novon 20: 143. 2010.

滇西马蓝 *dian xi ma lan*

Herbs 30–40 cm tall, perennial. Stems with a narrow wing to 0.8 mm wide on each side, densely covered with cystoliths, glabrous. Leaves basally petiolate and apically becoming sessile; petiole of basal leaves 3–5 mm, glabrous; leaf blade ovate-elliptic, 2–5 × 1–2.3 cm, both surfaces glabrous and with prominent cystoliths, abaxially paler and with prominent veins covered by cystoliths, secondary veins 2–4 on each side of midvein, base decurrent onto petiole, margin crenate to crenate-serrate, apex acuminate. Inflorescences terminal on main stem or on branches arising from apicalmost leaf axils, spikes, 1–7 cm; rachis narrowly winged, pilose with multicellular trichomes and some gland-tipped trichomes; bracts ovate, oblong-ovate, or rounded, 3–7 × 1–5 mm, pubescent; bracteoles oblanceolate, ca. 5 × 1 mm, subglabrous to pilose with multicellular trichomes and some gland-tipped trichomes, apex rounded. Calyx subglabrous or gland-tipped pilose on margin, slightly 2-lipped; upper lip 8–10 mm, 3-lobed to 3 mm from base, lobes triangular and 5–7 mm; lower lip 2-lobed almost to base, lobes linear-oblan-

ceolate to subspatulate, 9–10 mm, and apex obtuse. Corolla light blue, 3–3.5 cm, gently curved, subventricose, outside glabrous, inside glabrous except for trichomes retaining style; tube basally cylindric and ca. 2 mm wide for ca. 1 cm and then gradually widened to ca. 1.3 cm at mouth; lobes ovate, ca. 4 × 4 mm, subequal. Stamens 4, included; shorter filament pair ca. 2 mm, glabrous; longer filament pair ca. 5 mm, basally pilose; anther thecae oblong, ca. 2 × 1 mm; pollen type 3. Ovary oblong, ca. 2 mm, comose at tip; style ca. 2.2 cm, sparsely pilose. Capsule narrowly oblong-ellipsoid, ca. 12 × 2 mm, glabrous except for gland-tipped pubescent tip, 4-seeded. Seeds ovate to suborbicular in outline, ca. 3 × 2 mm, pilose. Fl. Oct–Feb, fr. Dec–Mar.

• Moist forests; 1600–2200 m. Yunnan.

**50. *Strobilanthes tamburensis*** C. B. Clarke in J. D. Hooker, Fl. Brit. India 4: 454. 1884.

毛冠马蓝 *mao guan ma lan*

Herbs to 50 cm tall, perennial, slightly anisophyllous. Stems decumbent and basally rooting then ascending, 4-angled, sulcate, bifariously pilose. Leaves usually sessile or with a petiole to 3 mm; leaf blade ovate to suborbicular, 8–45 × 8–45 cm, both surfaces glabrous or pilose, abaxially whitish, adaxially green, secondary veins 5–7 on each side of midvein, base rounded to subcordate, margin entire or obscurely crenulate-serrate, apex acute to obtuse. Inflorescences terminal, spikes, 3–6 cm; bracts orbicular to obovate, 5–8 × 5–8 mm, persistent until flowers fall, pilose; bracteoles obovate, ca. 3 × 3 mm, pilose. Flowers ca. 2.5 cm apart basally on rachis but imbricate apically. Calyx 6–10 mm, 5-lobed almost to base; lobes linear-spatulate, margin ciliate. Corolla blue, 2.5–3 cm, outside pilose, inside glabrous except for trichomes retaining style; tube basally cylindric and ca. 3 mm wide for ca. 1 cm then bent to ca. 90° and abruptly widened to 8–10 mm at mouth; lobes broadly ovate, ca. 5 × 6–7 mm. Stamens 4, included; filaments subglabrous, shorter pair ca. 4 mm, longer pair ca. 7 mm; anther thecae oblong, ca. 2 × 1 mm; pollen type 16. Ovary gland-tipped; style ca. 2.5 cm, sparsely pilose, apically glabrous. Capsule ca. 1.2 cm, gland-tipped pilose, 4-seeded. Seeds orbicular in outline, ca. 3 × 3 mm, densely pilose; areola absent. Fl. Aug–Nov.

Wet places in forests; 1200–2100 m. Xizang (Cona) [Bhutan, India, Nepal].

**51. *Strobilanthes taoana*** Y. F. Deng & J. R. I. Wood, J. Trop. Subtrop. Bot. 18: 479. 2010.

陶氏马蓝 *tao shi ma lan*

Subshrubs, weakly anisophyllous, becoming black when dry. Stems somewhat sulcate, pilose with large-celled trichomes, eventually glabrescent, basally woody. Petiole 0–2 mm, pilose; leaf blade ovate, 4–10 × 2–5 cm, smaller of pair ca. 2/3 size of larger one, abaxially paler, glabrous except for a few trichomes on veins, and densely covered with prominent cystoliths, adaxially green with inconspicuous cystoliths and subglabrous except for a few scattered hispid trichomes and a strigose or scurfy midvein, base slightly asymmetric, rounded to subcordate, and briefly decurrent onto petiole, margin serrate, apex

acute to shortly acuminate and commonly falcate. Inflorescences axillary or terminal, spikes, 2–5 cm; rachis straight, pilose; sterile bracts leaflike, apically diminishing in size, subsessile, ovate, 1–4 × 0.7–2.2 cm, apex acuminate; floral bracts oblong-elliptic, 3–6 × 2–4 mm, glabrous, apex acuminate; bracteoles obovate to oblong-lanceolate, 3–5 × 1–2 mm, glabrous. Flowers in opposite pairs but often solitary. Calyx 9–16 × 1–2 mm, subequally 5-lobed to ca. 1 mm from base; lobes almost colorless, linear, glabrous, covered with cystoliths, apex obtuse. Corolla white, 2–2.5 cm, straight, outside glabrous, inside glabrous except for trichomes retaining style; tube basally ca. 2 mm wide then gradually widened to ca. 1.2 cm at mouth; lobes ovate, 4–6 mm, apex rounded. Stamens 4, included; filaments glabrous, shorter pair ca. 2 mm, longer pair ca. 6 mm; anther thecae spherical, ca. 1 mm in diam., glabrous. Ovary glabrous; style ca. 2 cm, glabrous. Capsule not seen. Fl. Jan.

● Limestone hills; ca. 2200 m. Yunnan (Jinghong).

西畴马蓝 xi chou ma lan

Herbs to 1 m tall, perennial, slightly anisophyllous. Stems 4-angled, sulcate, glabrous. Petiole (1.5–)4–8 cm, glabrous; leaf blade elliptic, (4.5–)11–17 × (2.5–)7–10 cm, both surfaces glabrous, abaxially paler, adaxially green and with numerous cystoliths, secondary veins (6–)9–12 on each side of midvein, base subrounded and decurrent onto petiole, margin dentate, apex acute. Inflorescences axillary, branched spikes, bearing a pair of reduced leaves at branching point and forming a lax terminal panicle of spikes, ultimate branches slightly zigzag; bracts spatulate-linear, 2–3 mm, persistent, glabrous, both surfaces with abundant white cystoliths; bracteoles linear, ca. 3 mm. Flowers only one fertile per pair. Calyx ca. 1 cm, glabrous, outside densely covered with white cystoliths, inside with cystoliths in 2 lines along lobe margin, 5-lobed to ca. 2 mm from base; lobes linear, equal. Corolla blue, ca. 3.8 cm, ventricose, outside glabrous, inside glabrous except for trichomes retaining style; tube basally cylindric and ca. 2 mm wide for ca. 1.2 cm, bent to ca. 45° at middle, and gradually widened to ca. 1 cm at mouth. Stamens 4; filaments included, shorter pair ca. 6 mm, longer pair ca. 8 mm; anther thecae oblong, ca. 2 mm. Ovary glabrous; style ca. 2.7 cm, pilose. Capsule ca. 1.6 cm, glabrous, 4-seeded, apex with a ca. 4 mm beak. Seeds ovate in outline, ca. 2 × 2 mm, appressed pilose; areola small. Fl. Aug–Sep, fr. Nov.

• Forests by streams in limestone areas; 1400–1600 m. Yunnan (Xichou).

**56. *Strobilanthes chrysodelta*** J. R. I. Wood, Kew Bull. 64: 41. 2009.

金三角马蓝 jin san jiao ma lan

Herbs 30–60 cm tall, perennial, anisophyllous. Stems slightly 4-angled, sulcate, glabrous. Petiole 0.5–2.5 cm, glabrous; leaf blade elliptic, 3–9 × 1.7–4 cm, smaller of pair ca. 2/3 size of larger one but similar in shape, both surfaces glabrous, abaxially with prominent cystoliths, adaxially much paler, secondary veins 4 on each side of midvein, base attenuate and slightly decurrent onto petiole, margin slightly serrate, apex acute. Inflorescences terminal, spikes, 2–10 cm, 2–10-flowered; rachis gland-tipped pilose; basal sterile bracts leaflike but sessile or almost so, ovate, base rounded; apical floral bracts ovate-elliptic, 5–6.5 × ca. 2 mm, persistent, gland-tipped pilose, apex obtuse; bracteoles oblong-oblancheolate, ca. 8 × 1 mm, persistent until after anthesis, gland-tipped pilose, apex obtuse. Flowers

opposite pairs, 1–2 cm apart on rachis. Calyx 1–1.1 cm, accrescent to ca. 1.5 cm in fruits; lobes linear, gland-tipped pilose, apex obtuse; lower 2 lobes distinct to base; upper 3 lobes connate for ca. 3 mm from base but becoming distinct in fruit, central lobe slightly longer than others and becoming subspatulate. Corolla pale violet with a white tube, 3.7–4 cm, straight, outside glabrous; tube basally cylindric and ca. 2.5 mm wide for ca. 1.1 cm then gradually widened to ca. 1.2 cm at mouth; lobes ovate, 9–10 × ca. 7 mm, apex rounded. Stamens 4, all fertile, included; filaments erect, very sparsely pilose, shorter pair ca. 2 mm, longer pair ca. 4 mm; anther thecae oblong, ca. 2 × 0.5 mm, erect, mucous. Ovary comose; style pilose. Capsule ca. 1.5 cm, glabrous except for a few gland-tipped trichomes at apex, 4-seeded. Seeds ca. 3 × 2.5 mm, lenticular, pilose; areola almost lacking. Fl. and fr. Apr.

Moist places; 2100–2400 m. Yunnan [Myanmar].

**57. *Strobilanthes tonkinensis*** Lindau, Bull. Herb. Boissier 5: 651. 1897.

糯米香 nuo mi xiang

Herbs 50–100 cm tall, weakly anisophyllous. Stems 4-angled, pubescent, glabrescent, fragrant when dry. Petiole to 2 cm, pubescent; leaf blade broadly oblong-elliptic, to 18.5 × 6 cm, both surfaces sparsely pubescent especially on veins, adaxially with prominent cystoliths, secondary veins 4–7 on each side of midvein, base cuneate and decurrent onto petiole, margin crenate, apex acute. Inflorescences terminal, simple spikes, 3–11 cm, sometimes with branches arising in apical leaf axils; rachis pubescent with gland-tipped trichomes; bracts linear-spatulate, 10–12 × 2–2.5 mm, sparsely pubescent and gland-tipped pubescent, densely covered with white cystoliths, 1-veined; bracteoles linear, ca. 5 × 1 mm, pubescent, abaxially densely covered with cystoliths. Calyx 5-lobed to base; lobes linear, 8–9 × ca. 1 mm, subequal, pubescent, outside covered with prominent cystoliths. Corolla pink to pure white, ca. 3.2 cm, straight, outside glabrous, inside glabrous except for trichomes retaining style; tube basally cylindric and ca. 2 mm wide for ca. 1 cm then gradually widened to ca. 1 cm at mouth; lobes orbicular, ca. 5 mm in diam. Stamens 4, included; shorter filament pair ca. 4 mm, glabrous; longer filament pair ca. 7 mm, puberulent; anther thecae oblong, ca. 3 mm; pollen type 4. Ovary obovoid, ca. 3 mm, gland-tipped pilose at tip; style ca. 1.5 cm, glabrous. Capsule narrowly oblong-obovoid, 8–10 × ca. 2.5 mm, gland-tipped pilose, 4-seeded, apex apiculate. Seeds ovate in outline, ca. 2 × 2 mm, pubescent; areola small, glabrous. Fl. Apr–Jun, Dec, fr. Jun–Jul.

Moist forests; 200–1500 m. Guangxi, Yunnan [Thailand, Vietnam].

*Strobilanthes tonkinensis* is a medicinal and aromatic plant.

The name "*Semnostachya menglaensis*" (H. P. Tsui, FRPS 70: 349. 2002) belongs here but was not validly published because the herbarium where the type specimen is conserved was not specified (Vienna Code, Art. 37.7).

**58. *Strobilanthes stolonifera*** Benoist, Bull. Mus. Natl. Hist. Nat. 28: 98. 1922.

匍枝马蓝 pu zhi ma lan

Subshrubs to 20 cm tall, isophyllous. Stems ascending, usually rooting at nodes, glabrous but with cystoliths. Petiole 3–15(–20) mm, glabrous; leaf blade elliptic, (3–)5–10 × (1–)2–2.5 cm, both surfaces with prominent cystoliths, abaxially pale green to whitish and sparsely pubescent, adaxially pubescent but soon glabrescent, secondary veins 5–7 on each side of midvein, base decurrent onto petiole, margin crenate to crenate-serrate, apex acuminate. Inflorescences terminal, spikes, 1–2 cm; rachis pilose; sterile bracts at base of inflorescence leaflike; floral bracts oblong to elliptic, 9–13 × 2–3 mm, pubescent; bracteoles oblong, ca. 8 × 1.5 mm, pilose with large-celled trichomes. Calyx lobes linear, 11–14 × ca. 1 mm, pubescent with some trichomes gland-tipped. Corolla violet, 3–3.5 cm, subventricose, outside glabrous, inside glabrous except for trichomes retaining style; tube basally cylindric and ca. 2 mm wide for ca. 1 cm then slightly curved and gradually widened to ca. 1 cm at mouth; lobes ovate, ca. 4 × 4 mm. Stamens 4, included; filaments pilose, shorter pair ca. 3 mm, longer pair ca. 6 mm; anther thecae oblong, 2.5–3 × ca. 0.8 mm; pollen type 4, requires confirmation. Ovary oblong, 3–4 mm, puberulent at tip with some gland-tipped trichomes; style ca. 3 cm, villous. Capsule narrowly oblong, ca. 13 × 3 mm, pilose, 4-seeded. Seeds orbicular in outline, ca. 3 × 3 mm, villous. Fl. Jun.

- Dry places; 1800–2400 m. Yunnan.

**59. *Strobilanthes vallicola*** Y. F. Deng & J. R. I. Wood, Bot. J. Linn. Soc. 150: 380. 2006.

河口马蓝 he kou ma lan

Herbs 0.8–1.5 m tall, perennial, isophyllous. Stems black, 4-angled, apically sulcate, glabrous. Petiole 1.3–2.5 cm, glabrous; leaf blade oblong-elliptic, 15–25 × 6.5–11 cm, both surfaces glabrous and with prominent cystoliths, abaxially paler and with prominent veins covered with cystoliths, secondary veins 6–9 on each side of midvein, base cuneate, margin serrate, apex acuminate. Inflorescences terminal, spikes, 15–25 cm, branched or rarely unbranched; rachis densely pilose with large-celled trichomes; bracts ovate-oblong, 8–12 × ca. 4 mm, persistent, pilose with large-celled trichomes and some gland-tipped trichomes; bracteoles lanceolate, 9–13 × 1.1–1.3 mm, persistent, pilose with large-celled trichomes and some gland-tipped trichomes. Flowers opposite pairs, sessile, 0.8–2 cm apart on rachis. Calyx 14–18 × 1–1.5 mm, persistent, pilose with large-celled trichomes, some trichomes gland-tipped. Corolla white, 3–3.5 cm, outside glabrous except for lobe margin, inside glabrous except for trichomes retaining style; tube basally cylindric and narrow for 1–1.5 cm then gradually ventricose and strongly bent 1.5–2.5 cm from base; lobes ovate, ca. 4 × 5 mm, apex obtuse. Stamens 4, included; filaments glabrous, shorter pairs 2–3 mm, longer pairs 3–5 mm; anther thecae oblong, 3–4 × ca. 1 mm, glabrous; pollen type 9. Ovary ca. 3 × 1 mm, glabrous; style ca. 2.5 cm. Capsule oblong, 1.5–2 × 0.2–0.3 cm, narrowed at both ends, comose, 4-seeded. Seeds ovate to suborbicular in outline, ca. 3 × 3 mm, pilose. Fl. Apr–Jun.

- Moist places, stream and riversides in moist forests; below 200 m. Yunnan (Hekou).

**60. *Strobilanthes cognata*** Benoist, Bull. Mus. Natl. Hist. Nat. 28: 189. 1922.

奇瓣马蓝 qi ban ma lan

*Pteracanthus cognatus* (Benoist) C. Y. Wu & C. C. Hu.

Herbs to 50 cm tall, isophyllous, drying blackish. Stems stout, 4-angled, lenticellate, glabrous. Petiole ca. 1 cm, glabrous; leaf blade oblong to lanceolate, 6–12 × 3–4.5 cm, both surfaces densely covered with small cystoliths, very sparsely pilose with scattered large-celled trichomes, secondary veins 8–10 on each side of midvein, base cuneate, margin crenate, apex acuminate. Inflorescences terminal, spikes, 3–5 cm; bracts lanceolate, 7–20 × ca. 6 mm, sparsely pilose with large-celled white trichomes, margin ciliate, apex acuminate; bracteoles oblong, ca. 11 × 2 mm, gland-tipped pilose, apex acute. Flowers imbricate on rachis. Calyx 1–1.2 cm, outside gland-tipped pilose, 5-lobed almost to base; lobes linear, ca. 1 mm wide, apex acute. Corolla violet, 4–5 cm, ventricose, outside glabrous, inside glabrous except for trichomes retaining style; tube basally cylindric and ca. 3 mm wide for ca. 2.5 cm then gradually widened to ca. 1.5 cm at mouth; lobes oblong, ca. 6 × 5 mm, apex obtuse. Stamens 4, included; filaments erect, shorter pair ca. 6 mm, longer pair ca. 8 mm; anther thecae oblong, ca. 3 × 1 mm; pollen type 4. Ovary glabrous except pilose at tip; style 3.5–4.2 cm. Capsule ca. 1.8 cm, pilose at tip, 4-seeded. Seeds ovate in outline, ca. 3 × 2.5 mm, densely appressed pubescent. Fl. Aug–Oct, fr. Nov–Dec.

- Moist places by streams; 1200–1400 m. Guizhou, Hubei, Hunan.

**61. *Strobilanthes cusia*** (Nees) Kuntze, Revis. Gen. Pl. 2: 499. 1891.

板蓝 ban lan

*Goldfussia cusia* Nees in Wallich, Pl. Asiat. Rar. 3: 88. 1832; *Baphicacanthus cusia* (Nees) Bremekamp; *Dipteracanthus calycinus* Champion; *Ruellia indigofera* Griffith; *R. indigotica* Fortune; *Strobilanthes balansae* Lindau; *S. championii* T. Anderson; *S. flaccidifolia* Nees.

Herbs 0.5–1.5 m tall, erect, branched, drying blackish, isophyllous to weakly anisophyllous. Stems glabrous or minutely brown puberulent. Petiole 0.5–7 cm; leaf blade elliptic to ovate, 4–20 × 2–9 cm, both surfaces glabrous or abaxially minutely puberulent along veins, abaxially paler green, adaxially dark green, secondary veins 7–9 on each side of midvein, base attenuate, margin serrate, apex acute. Inflorescences terminal or axillary, bracteate spikes, 1–6 cm, often aggregated to form a leafy branched panicle; peduncle 1–12 cm; bracts leaflike, petiolate, oblanceolate, obovate, or spatulate, 1.2–2.5 cm, basally usually sterile; bracteoles linear-oblanceolate, 2–3 mm, deciduous before bracts. Calyx 0.8–1.5 mm in flower, accrescent to ca. 2.5 cm in fruit, minutely puberulent, 5-lobed almost to base; 4 lobes linear-lanceolate, apex acute to obtuse; 1 lobe oblanceolate and much longer. Corolla blue, 3.5–5 cm, straight to slightly bent, outside glabrous; tube basally cylindric and ca. 3 mm wide for 1–1.5 cm then slightly curved and gradually widened to ca. 1.5 cm at mouth; lobes oblong, ca. 9 × 9 mm, subequal. Stamens 4, included; filaments glabrous, shorter pair ca. 3 mm, longer pair ca. 7 mm; anther thecae oblong, ca. 3 mm; pollen type 4. Ovary oblong, apex puberulent with few gland-tipped

trichomes; style ca. 3.2 cm, glabrous. Capsule 1.5–2.2 cm, glabrous, 4-seeded. Seeds ovate in outline, ca. 3.5 mm, covered with appressed trichomes; areola small. Fl. Jul–Feb, fr. Dec–Feb.  $2n = 16, 32$ .

Usually in moist wooded places, sometimes cultivated; 100–2000 m. Fujian, Guangdong, Guangxi, Guizhou, Hainan, Hunan, Sichuan, Taiwan, SE Xizang, Yunnan, Zhejiang [Bangladesh, Bhutan, India, Laos, Myanmar, Thailand, Vietnam].

*Strobilanthes cusia* is reported to flower irregularly. The species is perhaps pliestesial.

In at least part of its stated range *Strobilanthes cusia* may be cultivated rather than native.

This is a medicinal and dye plant and is the source of "Assam indigo."

**62. *Strobilanthes flexicaulis*** Hayata, Icon. Pl. Formosan. 5: 135. 1915.

曲茎兰 嵌马蓝 qu jing lan qian ma lan

*Parachampionella flexicaulis* (Hayata) C. F. Hsieh & T. C. Huang; *Strobilanthes fauriei* Benoist; *S. glandulifera* Hayata; *S. prionophylla* Hayata; *Trianaecanthus flexicaulis* (Hayata) C. F. Hsieh & T. C. Huang.

Subshrubs to 1 m tall, much branched, anisophyllous. Stems 4-angled, winged, glabrous. Petiole 0.2–2.5 cm, glabrous or sparsely pubescent; leaf blade ovate, ovate-lanceolate, or ovate-elliptic, 3.5–18 × 1.8–5 cm, abaxially glaucous, adaxially sparsely pilose to subglabrous, secondary veins 4–6 on each side of midvein, base narrowly cuneate and decurrent onto petiole, margin serrate to crenate, apex acuminate. Inflorescences axillary or terminal, spikes, ca. 3 cm, few flowered; rachis often zigzag, glabrous to gland-tipped pilose; bracts persistent, basally merging into leaves, ovate to suborbicular, and shortly petiolate, apically becoming ovate to oblanceolate and sessile, 4–15 × 2–10 mm, apically diminishing in size, glabrous, apex obtuse; bracteoles linear, ca. 4 × 0.5 mm at anthesis but accrescent to ca. 14 × 1 mm, glabrous or sparsely gland-tipped pilose. Pedicel to 1 mm or flowers sessile. Calyx 0.9–1.1 cm at anthesis, strongly accrescent to ca. 3.2 cm in fruit, 2-lipped; lower lip 2-lobed almost to base, lobes linear; upper lip 3-lobed to middle, lobes linear, ca. 6 × 1 mm at anthesis, margin ciliate with gland-tipped trichomes but soon glabrescent, and apex obtuse. Corolla blue to purple, campanulate, ca. 4 cm, outside glabrous or glabrescent, inside glabrous except for trichomes retaining style; tube basally cylindric and ca. 4 mm wide for ca. 1.5 cm then gradually widened to ca. 1.5 cm at mouth; limb slightly 2-lipped; lower lip ca. 1 cm, 3-lobed, center lobe orbicular, ca. 6 × 7 mm, base contracted, and apex emarginate, lateral lobes orbicular, somewhat oblique, and apex emarginate; upper lip 2-lobed, lobes semiorbicular and ca. 5 × 8 mm. Stamens 4; shorter filament pair ca. 2 mm, glabrous; longer filament pair ca. 7 mm, hirsute; anther thecae oblong-linear, ca. 3.5 × 1 mm; pollen type 3. Ovary obovoid, glabrous; style filiform, ca. 3 cm, pubescent with gland-tipped trichomes; stigma subulate. Capsule linear-oblong, 1.6–2 cm, glabrous, 4-seeded. Seeds oblong-ovate in outline, ca. 3.5 × 2 mm, densely covered with appressed trichomes. Fl. Sep–Nov, fr. Feb.  $2n = 30$ .

Streamsides in forests; 200–2300 m. Taiwan [Japan (Ryukyu Islands)].

*Strobilanthes tashiroi* Hayata (*S. flexicaulis* var. *tashiroi* (Hayata) Yamazaki) is endemic to the Ryukyu Islands (K. Iwatsuki et al., eds., Fl. Japan 3a: 391. 1993).

**63. *Strobilanthes lanyuensis*** Seok, C. F. Hsieh & J. Murata, J. Jap. Bot. 79: 151. 2004.

兰屿马蓝 lan yu ma lan

Subshrubs to 1.5 m tall, anisophyllous. Stems 4-angled, retrorsely pubescent. Petiole 0.5–5 cm, appressed pubescent; leaf blade variable in shape and size, oblong-lanceolate, oblong-ovate, or ovate, 3–20 × 2–8 cm, abaxially glabrous or sometimes pubescent along veins, adaxially glabrous and with numerous cystoliths, secondary veins 3–5 on each side of midvein and abaxially prominent, base cuneate to narrowly cuneate and decurrent onto petiole, margin mucronate-serrate, apex acute to acuminate. Inflorescences terminal or from apical leaf axils, spikes, 5–10 cm; rachis 4-angled, glabrous or gland-tipped pubescent; bracts obovate, narrowly oblong, or linear-oblanceolate, 1–2.5 × 0.3–2 cm, abaxially glabrous or sparsely pubescent and with numerous cystoliths, apex obtuse; bracteoles linear, 10–20 × 3–4 mm, abaxially glabrous or sparsely pubescent. Calyx 1.3–2.4 cm, accrescent to ca. 4 cm in fruit, 2-lipped, lower lip 2-lobed almost to base, upper lip 3-lobed to 2/3 of length; lobes linear, glabrous, pubescent, or rarely gland-tipped pilose on margin, cystoliths numerous, apex acute. Corolla white, funnel-shaped, ca. 4 cm, bent near mouth, outside glabrous, inside glabrous except for trichomes retaining style; tube basally cylindric and ca. 3 mm wide for ca. 8 mm then gradually widened to ca. 1.5 cm at mouth; lobes oblong, ca. 5 × 4 mm. Stamens 4, included; filaments densely pilose, shorter pairs ca. 2 mm, longer pair ca. 2.5 mm; anther thecae oblong, ca. 2 mm; pollen type 3. Ovary glabrous; style ca. 2.5 cm; stigma very unequally 2-lobed. Capsule cylindric-fusiform, ca. 1.7 cm, glabrous, 4-seeded. Seeds ovate in outline, ca. 3 × 3 mm, densely appressed pubescent. Fl. Sep–Nov, fr. Jan.

● Moist places in forests; 200–1000 m. Taiwan (Lan Yu).

*Strobilanthes lanyuensis* is close to *S. flexicaulis*, itself a variable species, differing only in the white, resupinate corolla and a few other minor characters. Further studies are needed to confirm its status.

**64. *Strobilanthes atropurpurea*** Nees in Wallich, Pl. Asiat. Rar. 3: 86. 1832.

翅柄马蓝 chi bing ma lan

Herbs 30–50(–100) cm tall, perennial, much branched, isophyllous or slightly anisophyllous. Stems slender, 4-angled, rooting at nodes, glabrous or pubescent. Leaves basally petiolate, apically sessile; petiole 0–2 cm, winged, glabrous or pubescent; leaf blade ovate, elliptic, or narrowly lanceolate, 1–6(–16) × 0.5–3.5(–6.5) cm, puberulent or glabrous, adaxially with linear cystoliths, secondary veins 5 or 6 on each side of midvein, base rounded to attenuate and shortly decurrent onto petiole, margin serrate to coarsely crenate, apex acute to acuminate. Inflorescences axillary, spikes, 2–7 cm, zigzag, secund, few flowered, often much reduced to flowers solitary or paired in leaf axil on main stem; bracts leaflike, ovate to subcordate, 8–

10 × ca. 3 mm, apically smaller, persistent, glabrous, 3-veined or pinnately veined; bracteoles linear-oblong, ca. 5 × 2 mm. Calyx 1–1.5 cm, accrescent to 2–2.5 cm in fruit, 5-lobed almost to base; lobes linear, 11–20 × 1–1.5 mm, unequal with one slightly larger than others, glabrous or pilose, rarely gland-tipped pubescent, abaxially with linear cystoliths. Corolla pale purple, bluish purple, or rarely white, 2.5–3.5 cm, outside glabrous, inside glabrous except for trichomes retaining style; tube basally cylindric and ca. 2 mm wide for ca. 1 cm then inflated, widened to 1.5–1.8 cm, and bent at mouth; lobes oblong, ca. 3 × 4 mm, apex obtuse. Stamens 4, included; filaments glabrous, shorter pair ca. 4 mm, longer pair ca. 7 mm; anther thecae oblong, ca. 2 mm; pollen type 3. Ovary glabrous; style ca. 2 cm, glabrous; stigma acute. Capsule fusiform, 1.2–1.8 cm, glabrous, 4-seeded. Seeds ovate in outline, ca. 3 × 3 mm, pubescent with appressed trichomes; areola 0.2–0.3 mm. Fl. Jun–Oct.

Moist places on mountain slopes, forests, by rivers; 700–2900 m. Chongqing, Guangdong, Guangxi, Guizhou, Hubei, Hunan, Jiangxi, Sichuan, Taiwan, Xizang, Yunnan, Zhejiang [Bhutan, India, Myanmar, Nepal, Pakistan, Vietnam].

There are no reports of *Strobilanthes atropurpurea* being pleistocene flowering from China or the E Himalaya, although this is a well-known phenomenon in this species in the W Himalaya.

**65. *Strobilanthes latisejala* Hemsley, J. Linn. Soc., Bot. 26: 241. 1890.**

薄萼马蓝 *bao e ma lan*

Herbs to 50 cm tall, perennial, isophyllous. Stems 4-angled, sulcate, glabrous. Petiole 1–2.5 cm, glabrous; leaf blade lanceolate to ovate-lanceolate, 2–6 × 1–2.5 cm, abaxially glabrous and paler, adaxially with a few scattered trichomes and abundant cystoliths, secondary veins 4–6 on each side of midvein, base cuneate and decurrent onto petiole, margin crenulate, apex acuminate. Inflorescences axillary, subcapitate, 1–2 cm, 2–4-flowered; peduncle 0–2 cm; bracts leaflike, ovate, 6–9 × 3–5 mm, persistent, glabrous, margin subentire, apex acute; bracteoles linear, 5–6 × ca. 2 mm, glabrous. Calyx 8–10 mm, 5-lobed almost to base; lobes ovate-elliptic, 6–10 × 3–5 mm, unequal with one larger than others, outside sparsely pilose, apex obtuse. Corolla pale blue, ca. 3.2 cm, slightly curved, outside glabrous, inside glabrous except for trichomes retaining style; tube basally cylindric and ca. 2 mm wide for ca. 8 mm then gradually widened to ca. 1 cm at mouth; lobes ovate, ca. 4 × 3 mm. Stamens 4; filaments glabrous, shorter pair ca. 4 mm, longer pair ca. 8 mm; anther thecae oblong, ca. 2 × 1.2 mm, erect; pollen type 3. Ovary glabrous; style ca. 2.7 cm, glabrous. Capsule not seen.

- Forests. Hubei (Xingshan).

*Strobilanthes latisejala* is only known from the type and is possibly conspecific with the very variable *S. atropurpurea*, from which it can be distinguished by its distinctive broad sepals.

**66. *Strobilanthes tibetica* J. R. I. Wood, Edinburgh J. Bot. 51: 262. 1994.**

西藏马蓝 *xi zang ma lan*

*Pteracanthus tibeticus* (J. R. I. Wood) C. Y. Wu & C. C. Hu.

Subshrubs to 1.5 m tall, gregarious, probably pleistocene, nearly isophyllous. Stems slightly 4-angled, glabrous or obscurely bifariously pubescent. Petiole 1–3 cm, sparsely pilose; leaf blade ovate to elliptic, 7–14 × 3–9 cm, abaxially paler and subglabrous except for a few trichomes near base of midvein, adaxially green, subglabrous except for a few scattered short hispid trichomes, strigose or scurfy along midvein, and with conspicuous cystoliths, secondary veins 5 or 6 on each side of midvein, base narrowly cuneate and decurrent nearly to petiole base, margin strongly serrate, apex shortly acuminate and slightly falcate. Inflorescences axillary, spikes, 4–12 cm, secund, sometimes reduced to single axillary flowers; rachis finely puberulent to gland-tipped pilose, straight or obscurely zigzag, winged, wings 0.2–1 mm wide; bracts glabrous; basal bracts leaflike, with a petiole to 4 mm, ovate, 1.5–2.5 cm, apex acuminate; apical bracts sessile, narrowly oblong-elliptic, 1–1.2 cm, apex acuminate; bracteoles oblong, 2.5–4 mm, apex obtuse. Flowers to 1.5 cm apart on rachis. Calyx 0.9–2 cm, apparently not accrescent, subequally 5-lobed to ca. 1 mm above base; lobes almost colorless, linear, glabrous or sparsely gland-tipped pilose, apex obtuse. Corolla violet, 3.2–4 cm, outside pubescent but silky gray in bud, inside glabrous; tube strongly inflated from near base then widened to ca. 1.5 cm at middle and finally bent to ca. 90° but not narrowed at mouth; lobes ovate, ca. 5 × 7 mm, apex rounded to slightly emarginate. Stamens 4, included; filaments ca. 2.5 mm, all equal in length, glabrous; anther

thecae oblong, ca. 1.5 mm. Ovary glabrous; style ca. 2 cm, glabrous or with a few trichomes. Capsule oblong, 1.1–1.2 cm, glabrous, 4-seeded, apex apiculate. Seeds oblong in outline, ca. 3 × 2 mm, covered with stiff white trichomes. Fl. Aug–Sep, fr. Oct–Nov.

*Tsuga* forests; 2300–2700 m. Xizang (Zayü) [India].

**67. *Strobilanthes pterygorrhachis*** C. B. Clarke, J. Linn. Soc., Bot. 25: 54. 1889.

翅轴马蓝 *chi zhou ma lan*

Subshrubs to 3.8 m tall, vigorous, subglabrous. Stems and branches weakly 4-angled. Petiole 2–9 cm, glabrous; leaf blade ovate, ca. 15 × 7.5 cm, glabrous, adaxially darker and with abundant cystoliths, base cuneate and shortly decurrent onto petiole, margin serrate, apex acute to shortly acuminate. Inflorescences terminal or axillary, spikes, secund; rachis 3–25 cm, slightly zigzag, strongly winged, glabrous; bracts at base of spike leaflike, petiolate, lanceolate, to 2 × 0.7 cm but diminishing in size apically to 6 × 3 mm; bracteoles linear-oblan-ceolate, 5–10 mm. Flowers mostly paired, to 4 cm apart basally on rachis but somewhat confluent apically. Calyx 2.5–3.6 cm, subequally 5-lobed to near base; lobes narrowly lanceolate, 2.2–3.2 × ca. 0.3 cm, margin minutely ciliolate, apex narrowed into a finely acuminate or aristate point. Corolla yellow, ca. 3.5 cm, outside pubescent, inside glabrous except for trichomes retaining style; tube short, basally cylindric then abruptly widened and bent just below mouth. Filaments glabrous, shorter pair 3–4 mm, longer pair 5–6 mm; anther thecae oblong, 3–3.5 × ca. 1 mm. Ovary comose; style ca. 3 cm, glabrous. Capsule comose. Fl. Aug.

Moist places in forests; ca. 1800 m. Xizang (Mêdog) [India].

**68. *Strobilanthes urophylla*** Nees in A. Candolle, Prodr. 11: 192. 1847.

尾叶马蓝 *wei ye ma lan*

*Pteracanthus urophyllus* (Nees) Bremekamp; *Strobilanthes urophylla* var. *sikkimensis* C. B. Clarke.

Subshrubs, much branched, glabrous, anisophyllous. Stems 4-angled, glabrous. Petiole 0.8–1.6 cm; leaf blade narrowly ovate-elliptic, 5–14 × 1.5–5.5 cm, abaxially pale green, pubescent along veins, and with inconspicuous cystoliths, adaxially yellowish green, secondary veins 6–9 on each side of midvein, base cuneate to broadly cuneate and decurrent onto petiole, margin remotely serrate, apex shortly acuminate to caudate. Inflorescences axillary, short spikes; bracts leaflike, petiolate, ovate-elliptic, 0.8–4.5 cm, very persistent, abaxially with conspicuous cystoliths, pinnately veined, margin subentire, apex obtuse; bracteoles petiolate, obovate-spatulate, ca. 4 mm, persistent, subglabrous, 3-veined. Flowers in opposite pairs, 1–1.5 cm apart on rachis, in axils of leaflike bracts. Calyx 7–8 mm, pubescent, 5-lobed almost to base; lobes lanceolate with one longer than others, accrescent in fruit, apex acuminate. Corolla pale purple, 2–2.5 cm, ventricose, outside pubescent, inside subglabrous except for trichomes retaining style; tube basally cylindric and ca. 6 mm wide for ca. 5 mm then slightly bent and regularly widened to ca. 1.2 cm at mouth; lobes oblong, ca. 5 ×

4 mm, apex obtuse. Stamens 4, included; filaments hirsute, shorter pair ca. 4 mm, longer pair ca. 6 mm; anther thecae oblong, ca. 2.5 × 1.2 mm; pollen type 3. Ovary comose; style ca. 1.7 cm, hirsute. Capsule ca. 1.4 cm, glabrous, 4-seeded. Seeds ovate in outline, ca. 2.5 × 2 mm, pubescent; areola small. Fl. May–Jun, fr. Jul–Aug.

Evergreen broad-leaved forests; 1200–2000 m. Xizang (Mêdog) [India].

**69. *Strobilanthes inflata*** T. Anderson, J. Linn. Soc., Bot. 9: 476. 1867.

锡金马蓝 *xi jin ma lan*

Herbs 50–100 cm tall, branched, isophyllous. Stems straight or somewhat zigzag, glabrous, slightly 4-angled, sulcate, pubescent or with dense brown large-celled trichomes. Petiole 3–3.5(–7.5) cm, subglabrous, pubescent, or densely yellowish brown hirsute; leaf blade oblong-ovate, elliptic, or ovate, 5–20 × 1–10 cm, abaxially hirsute, pubescent, or subglabrous and with conspicuous cystoliths, adaxially pubescent or glabrous except brownish and whitish tomentose along veins, sparsely setose, densely yellowish brown hirsute on midvein, and with numerous cystoliths, secondary veins 6–8 on each side of midvein, base oblique and broadly rounded to cuneate and decurrent onto petiole, margin serrate to crenate, apex acuminate to caudate. Inflorescences spikes, 2.5–12(–21) cm, secund, sometimes reduced to 1 or 2 flower pairs; peduncle 1.5–3 cm; rachis usually geniculate at first node then straight or somewhat zigzag; bracts variable in size and shape with basalmost ones leaflike, with a 3–4 mm petiole, ovate to narrowly ovate, 2–3 × 0.8–1.3 cm, and margin serrate; apical bracts petiolate, obovate, elliptic, or ovate-spatulate, 0.6–3 × 0.3–1.2 cm, persistent, pubescent, margin usually with 1 or 2 teeth; bracteoles oblong to linear, 2–3.5 mm, apex rounded. Flowers 1–2 cm apart on rachis. Calyx 1.1–1.4 cm, white pilose with large-celled gland-tipped trichomes, 5-lobed to base; lobes linear, unequal, reflexed, glabrous in anthesis, sometimes gland-tipped pubescent in fruit, densely covered with white linear cystoliths, margin paler, apex acute. Corolla pinkish blue to blue, 3.5–4 cm, outside pubescent, inside glabrous except for trichomes retaining style; tube basally cylindric and narrow for ca. 5 mm then abruptly widened to ca. 1.3 cm at mouth, just basal to mouth slightly narrowed and bent to ca. 90°; lobes oblong, ca. 5 × 6 mm. Stamens 4, included; filaments glabrous, shorter pair 3–4 mm and incurved, longer pair 5–6 mm; anther thecae oblong, ca. 2 × 1 mm; pollen type 3. Ovary comose; style ca. 1.8 cm, sparsely gland-tipped pubescent at base. Capsule brownish yellow, narrowly ellipsoid, 1.6–2 cm, glabrous, 4-seeded. Seeds orbicular in outline, ca. 3 mm in diam., villous; areola inconspicuous. Fl. Jun–Nov.

Evergreen broad-leaved forests, streamsides in shady places, forests, forest margins; 1700–3200 m. Xizang, Yunnan [Bhutan, India, Indonesia, Myanmar, Nepal].

密序马蓝 mǐ xù mǎ lán

*Pteracanthus congestus* (Terao) C. Y. Wu & C. C. Hu.

Subshrubs 0.6–1.8 m tall, anisophyllous. Stems subterete, whitish to brownish yellow pubescent with large-celled trichomes. Petiole 1–7 mm, densely hirsute; leaf blade ovate-lanceolate,  $2\text{--}9 \times 0.8\text{--}3.5$  cm, smaller of pair ca.  $2/3$  size of larger one, both surfaces brownish to yellow hirsute, secondary veins 4–7 on each side of midvein and inconspicuous, base attenuate, oblique, and shortly decurrent onto petiole, margin crenate and ciliate, apex acuminate and often falcate. Inflorescences axillary or terminal, spicate with 1–4 small capitula borne singly along rachis; capitula 2–8-flowered, to 4 cm apart; rachis 3–7 cm, often basally with a pair of sterile leaflike bracts so leaves sometimes appearing verticillate, densely white or yellow pi-

lose; bracts linear-ob lanceolate,  $3\text{--}8 \times 0.8\text{--}1.5$  mm, persistent, pilose, apex obtuse; bracteoles ca.  $6 \times 1$  mm, linear, white pilose. Calyx 5-lobed almost to base; lobes ovate to lanceolate, pilose on both surfaces except basally inside, abruptly narrowed at middle with an obtuse often apically recurved cauda  $11\text{--}14 \times 1.5\text{--}5$  mm; one lobe ca. 2 mm longer than others. Corolla pale whitish purple, ca. 2.5 cm, curved, outside pubescent; tube basally narrow and cylindric for ca. 6 mm then abruptly inflated and widened to ca. 1 cm at mouth; lobes oblong, ca.  $4 \times 3.5$  mm. Stamens 4, included; shorter filament pair ca. 3 mm, glabrous; longer filament pair 5–6 mm, base pilose; anther thecae oblong, ca.  $2 \times 0.5$  mm; pollen type 3. Ovary glabrous; style ca. 1.8 cm, pilose and gland-tipped pubescent. Capsule oblong, ca.  $10 \times 3$  mm, glabrous, 4-seeded; seeds ovate in outline, ca.  $3 \times 2.5$  mm, pubescent. Fl. Jul–Aug, fr. Dec.

Thickets, tropical forests; 1600–1800 m. Yunnan [Myanmar, ?Nepal].

*Strobilanthes congesta* is a very distinct species because of the form of its inflorescence and unique calyx.

**71. *Strobilanthes larium*** Handel-Mazzetti, Symb. Sin. 7: 893. 1936.

闭花马蓝 bì huā mǎ lán

Herbs to 1.5 m tall, isophyllous. Branches 4-angled, sulcate, silky gland-tipped pubescent. Petiole 2–5 cm, sulcate, subglabrous; leaf blade ovate-elliptic,  $(5\text{--})7\text{--}12 \times (2\text{--})3\text{--}7$  cm, abaxially glabrous except pilose along midvein, glaucous, and with numerous cystoliths, adaxially green and subglabrous except for few large-celled multicellular trichomes along veins, secondary veins 6–8 on each side of midvein, base cuneate and decurrent onto petiole, margin dentate and ciliate, apex acuminate and falcate. Inflorescences axillary, spikes,  $(1\text{--})3\text{--}10$  cm; bracts oblong,  $1.5\text{--}4 \times 0.2\text{--}0.5$  cm, variable in size and apically diminishing in size, abaxially densely covered with white large-celled multicellular trichomes especially toward base, margin subentire; bracteoles linear, ca.  $4 \times 1$  mm, puberulent. Calyx 1–1.2 cm, 5-lobed almost to base; lobes unequal with one larger than others, outside puberulent, margin large-celled multicellular pubescent with gland-tipped trichomes. Corolla purplish, curved, 3.5–4 cm, outside densely whitish pubescent when young but glabrescent, inside densely pubescent when young but glabrescent except for trichomes below lobe bases; tube basally cylindric and ca. 3 mm wide for ca. 5 mm then ventricose, bent to ca.  $90^\circ$ , and finally abruptly widened to ca. 1.3 cm at mouth; lobes oblong, ca.  $5 \times 4$  mm, apex emarginate. Stamens 4, included; filaments glabrous, shorter pair 3–4 mm, longer pair 6–7 mm; anther thecae oblong, ca.  $3 \times 1$  mm. Ovary glabrous; style 2.8–3 cm, apical part pilose. Capsule clavate, ca. 1.5 cm, glabrous except for pilose apex, 4-seeded. Seeds ca.  $2 \times 1.5$  mm, lenticular, densely covered with scalelike trichomes; areola ca. 0.3 mm. Fl. May–Sep.

• By streams; 600–2700 m. Chongqing, Hubei, Hunan, Sichuan.

**72. *Strobilanthes oresbia*** W. W. Smith, Notes Roy. Bot. Gard. Edinburgh 10: 196. 1918.

山马蓝 shān mǎ lán

*Goldfussia grandissima* H. P. Tsui; *Pteracanthus grandissimus* (H. P. Tsui) C. Y. Wu & C. C. Hu; *P. oresbius* (W. W. Smith) C. Y. Wu & C. C. Hu; *Strobilanthes grandissima* (H. P. Tsui) J. R. I. Wood.

Herbs to 2 m tall, erect, nearly isophyllous. Stems 4-angled, densely white pubescent with gland-tipped trichomes, glabrescent. Petiole 2–13 cm, gland-tipped pubescent, glabrescent, apically winged; leaf blade ovate to orbicular, 7–22 × 4–18 cm, pubescent especially along veins, cystoliths abundant on both surfaces, secondary veins 9–11 on each side of midvein, base cuneate, rounded, or sometimes subcordate and decurrent onto petiole, margin deeply dentate or serrate, apex acute to acuminate. Inflorescences axillary, spikes, to 15 cm, secund, sometimes reduced to single flowers; peduncle 0.5–7 cm, densely gland-tipped pubescent; rachis somewhat zigzag; bracts at base of spike leaflike, petiolate, ovate, to 4 × 2 cm, gland-tipped pubescent, base cuneate, margin serrate, apex obtuse; bracts toward spike apex lanceolate, diminishing apically to ca. 10 × 1 mm, margin entire, apex obtuse; bracteoles linear-oblancheolate, ca. 7 × 1 mm, gland-tipped pubescent, apex obtuse. Flowers usually 1 per node, 0.8–2.5 cm apart on rachis. Calyx 1.2–2.1 cm, densely gland-tipped pubescent, 5-lobed almost to base; lobes linear-oblancheolate, apex obtuse; one lobe to 2 mm longer than others. Corolla purplish blue, 4–5 cm, ventricose, outside sparsely white pubescent, inside pubescent; tube basally cylindric and narrow for ca. 5 mm then bent to ca. 90°, strongly ventricose, and widened to ca. 1.5 cm at mouth; lobes oblong, ca. 6 × 5 mm, apex obtuse. Stamens 4; filaments glabrous, shorter pair ca. 2.5 mm, longer pair ca. 4 mm; anther thecae oblong, ca. 2.5 × 1 mm; pollen type 4. Ovary glabrous; style ca. 2.2 cm, shortly pilose. Capsule oblong, ca. 15 × 2–3 mm, glabrous except for very few stalked glands near apex, 4-seeded. Seeds blackish brown, elliptic in outline, 3–3.5 × ca. 2.5 mm, densely pilose; areola very small. Fl. Jul–Sep, fr. Oct–Dec.

Moist alpine meadows and forests; 1600–3300 m. Chongqing, Sichuan, Xizang (Zayü), Yunnan [India, Myanmar].

城口马蓝 cheng kou ma lan

*Pteracanthus flexus* (Benoist) C. Y. Wu & C. C. Hu.

Herbs to 60 cm tall, isophyllous. Stems 4-angled, glabrescent. Petiole 1–5 cm, thinly pubescent; leaf blade ovate to elliptic, 3.5–15 × 3–7 cm, both surfaces glabrous except basally on abaxial midvein, cystoliths apparently absent, secondary veins 6–8 on each side of midvein, base cuneate and decurrent onto petiole, margin coarsely dentate or serrate, apex acute. Inflorescences axillary or terminal, spikes, 3–6 cm, lax, sometimes reduced to a single flower in axil of apical leaves; rachis gland-tipped pilose; bracts leaflike, oblong-oblancheolate, 1.5–2 × 0.2–0.4 cm, apically diminishing in size, gland-tipped pubescent, apex acute to acuminate; bracteoles oblong, 7–8 × ca. 1 mm, gland-tipped pubescent, apex obtuse. Flowers basally to 1 cm apart on rachis but apically becoming congested. Calyx 0.8–1.2 cm, accrescent in fruit, gland-tipped pubescent, 5-lobed almost to base; lobes linear-oblong, 7–10 × ca. 1 mm, subequal, apex obtuse. Corolla purplish blue, 3.5–4 cm, outside pilose,

inside glabrous except for trichomes retaining style; tube basally cylindric and ca. 2 mm wide for ca. 1 cm then abruptly inflated, bent to ca. 90° above middle, and finally widened to ca. 1.4 cm at mouth; lobes ovate, ca. 5 × 5 mm, apex rounded. Stamens 4, included; filaments glabrous, shorter pair ca. 2 mm, longer pair ca. 4 mm; anther thecae oblong, ca. 2 × 1 mm, erect; pollen type 4. Ovary comose; style ca. 3.2 cm, sparsely pilose. Capsule oblong, 1.5–1.8 cm, apically gland-tipped pubescent, 4-seeded. Fl. Aug–Sep, fr. Oct–Dec.

• Forests; 1400–3600 m. Chongqing, Guizhou, Hubei, Sichuan, Yunnan.

*Strobilanthes flexa* appears to intergrade with *S. versicolor* and may just be a more robust form.

**74. *Strobilanthes versicolor*** Diels, Notes Roy. Bot. Gard. Edinburgh 5: 163. 1912.

变色马蓝 bian se ma lan

*Pteracanthus versicolor* (Diels) H. W. Li.

Herbs to 50(–100) cm tall, with several annual stems arising from a perennial base, isophyllous. Stems sparsely to densely pubescent, glabrescent. Petiole (0–)1–3 cm, pubescent; leaf blade obovate to suborbicular, 2.5–6 × 1–3.5 cm, both surfaces thinly pilose especially on veins, densely covered with cystoliths, secondary veins 4–6 on each side of midvein, base broadly cuneate and decurrent onto petiole, margin coarsely serrate, apex acute. Inflorescences terminal or axillary, spikes, 4–15 cm, simple or sparingly branched; bracts leaflike, 1.2–3.5 × 0.3–1 cm, persistent, apically diminishing in size, thinly pilose; basal bracts petiolate, suborbicular to oblong-elliptic, margin dentate; apical bracts sessile, narrowly oblong-elliptic, margin entire; bracteoles linear-oblancheolate, 4–8 × 1–2 mm, pilose. Flower pairs 1–1.5 cm apart on rachis even apically. Calyx ca. 1.5 cm, 5-lobed almost to base; lobes linear, 10–11 × ca. 1 mm, subequal, pilose with large-celled trichomes, apex obtuse. Corolla white or blue, 3.5–4 cm, outside pilose, inside glabrous except for trichomes retaining style; tube basally cylindric and ca. 2.5 mm wide for 1–1.5 cm then abruptly bent to ca. 90° above middle and finally widened to ca. 1.5 cm at mouth; lobes ovate, ca. 6 × 5 mm, apex rounded. Stamens 4, included; filaments pilose, shorter pair ca. 5 mm, longer pair ca. 7 mm; anther thecae oblong, 2–2.5 × ca. 0.8 mm; pollen type 6. Ovary comose; style ca. 2.8 cm, pilose. Capsule ca. 1.4 cm, gland-tipped pubescent, 4-seeded. Seeds ovate in outline, ca. 3 × 3 mm, appressed pubescent. Fl. May–Aug.

• Grasslands at forest margins; 2800–3300 m. Sichuan, S Xizang, Yunnan.

**75. *Strobilanthes forrestii*** Diels, Notes Roy. Bot. Gard. Edinburgh 5: 162. 1912.

腺毛马蓝 xian mao ma lan

*Pteracanthus forrestii* (Diels) H. P. Tsui; *P. rotundifolius* (Benoist) Bremekamp; *Strobilanthes panpienkaiensis* H. Léveillé; *S. rotundifolia* Benoist.

Herbs to 30–75 cm tall, isophyllous. Stems 4-angled, thinly pilose with gland-tipped trichomes, glabrescent, basally

woody. Leaves subsessile; leaf blade ovate to rarely ovate-oblong, 2–5 × 1.2–3 cm, both surfaces thinly pilose, adaxially with cystoliths, secondary veins ca. 4 on each side of midvein, base rounded, cordate, or rarely cuneate, margin crenate to subentire, apex acute to obtuse. Inflorescences terminal or very rarely also from apical leaf axils, spikes, 5–15 cm; rachis pilose with gland-tipped trichomes; bracts leaflike, pilose with gland-tipped trichomes; basal bracts ovate-elliptic, 1–3 × 1–2 cm, margin obscurely crenate; apical bracts lanceolate, 7–10 × ca. 3 mm, margin entire; bracteoles linear to narrowly oblong, 6–11 × ca. 1 mm, pilose with gland-tipped trichomes. Flowers 1–2.5 cm apart on rachis. Calyx 0.8–1.2 cm, 5-lobed almost to base; lobes linear with one ca. 2 mm longer than others, pilose with gland-tipped trichomes. Corolla blue to purple, 3.2–4 cm, curved, outside with a few trichomes, inside glabrous except for trichomes retaining style; tube basally cylindric and ca. 2 mm wide for ca. 5 mm then bent to ca. 90° and widened to ca. 1.5 cm at mouth; lobes ovate, ca. 6 × 7 mm, apex obtuse. Stamens 4, included; shorter filament pair ca. 2 mm; longer filament pair ca. 8 mm, shortly pubescent; anther thecae oblong, ca. 2 × 0.8 mm; pollen type 3. Ovary gland-tipped puberulent at tip; style ca. 2.8 cm. Capsule oblong, ca. 1.2 cm, apically gland-tipped pilose, 4-seeded. Seeds dark brown, ovate in outline, ca. 3 mm, pubescent; areola white, small. Fl. Jul–Aug.

- Forests, grass slopes; ca. 3000 m. Yunnan.

*Strobilanthes forrestii* was misidentified as *S. extensa* (*Pteracanthus extensus*) by Handel-Mazzetti (Symb. Sin. 7: 895. 1936), C. Y. Wu (Index Fl. Yunnan. 2: 1682. 1984), and H. P. Tsui and C. C. Hu (FRPS 70: 136. 2002; Fl. Yunnan. 16: 696. 2006).

**76. *Strobilanthes lachenensis*** C. B. Clarke in J. D. Hooker, Fl. Brit. India 4: 465. 1884.

白毛马蓝 bai mao ma lan

*Championella xanthantha* (Diels) Bremekamp; *Pteracanthus lachenensis* (C. B. Clarke) Bremekamp; *P. leucotrichus* (Benoist) C. Y. Wu & C. C. Hu; *Strobilanthes leucotricha* Benoist; *S. xanthantha* Diels.

Herbs 30–100 cm tall, isophyllous. Stems erect, basally glabrescent, apically pubescent. Petiole 0.5–3.5 cm, thinly pubescent to glabrescent; leaf blade ovate, obovate, or broadly elliptic, 3–11 × 2–6.5 cm, both surfaces thinly white pubescent especially along veins, secondary veins 5–9 on each side of midvein, base cuneate and often decurrent onto petiole, margin serrate to crenate, apex acute to shortly acuminate. Inflorescences axillary or terminal, spikes, 3–10 cm, often forming a diffuse panicle of spikes; rachis gland-tipped pilose; bracts variable in size and shape; basal bracts leaflike, sessile, ovate, 2–5 × 0.5–2 cm, persistent, margin often toothed; apical bracts oblong to sometimes elliptic, 5–12 × 1–2 mm, persistent until flowers fall; bracteoles linear, 4–5 × ca. 1 mm, white gland-tipped pilose. Flowers basally to 2.5 cm apart on rachis but apically congested. Calyx 0.8–1.6 cm, accrescent in fruit, gland-tipped pilose, 5-lobed almost to base; lobes linear, 7–12 × ca. 1 mm, one longer and becoming spatulate. Corolla blue, 3–3.6 cm, curved, outside pubescent on lobes, inside glabrous except for trichomes retaining style; tube basally cylindric and ca. 2 mm wide for ca. 8 mm, slightly bent at mouth, and gradually

widened to ca. 1.2 cm at mouth; lobes ovate, ca. 4 × 4 mm. Stamens 4, included; shorter filament pair 2–3 mm, glabrous; longer filament pair 7–8 mm, sparsely pilose; anther thecae oblong, ca. 2 × 1.3 mm, erect; pollen type 3. Ovary comose; style 2.7–3.2 cm, sparsely gland-tipped pilose. Capsule 1.1–1.4 cm, gland-tipped pilose at tip, 4-seeded. Seeds ovate in outline, ca. 3 × 2 mm, densely appressed pubescent. Fl. Jun–Oct.

Forests; 1800–3400 m. Sichuan, Xizang (Dinggyê), Yunnan [Bhutan, India, Nepal].

*Strobilanthes lachenensis* was incorrectly reported as *Pteracanthus urticifolius* (Kuntze) Bremekamp by H. W. Li (Fl. Xizang. 4: 179. 1985).

**77. *Strobilanthes nemorosa*** Benoist, Bull. Mus. Natl. Hist. Nat. 28: 97. 1922.

琴叶马蓝 qin ye ma lan

*Difflugossa muliensis* H. P. Tsui; *Pteracanthus nemorosus* (Benoist) C. Y. Wu & C. C. Hu; *P. panduratus* (Handel-Mazzetti) C. Y. Wu & C. C. Hu; *Strobilanthes pandurata* Handel-Mazzetti.

Herbs to 60 cm tall, much branched, isophyllous. Stems 4-angled, sulcate, pubescent, basally woody. Leaves sessile or with petiole to 1.5 cm; leaf blade lanceolate to oblong-elliptic, occasionally basally pandurate, 5–15(–20) × 1.5–6 cm, both surfaces sparsely pilose but glabrescent, adaxially dark green and densely covered with cystoliths, secondary veins 6–12 on each side of midvein, base rounded to attenuate, margin remotely serrate, apex acuminate. Inflorescences terminal or axillary, spikes, usually several spikes forming a panicle; rachis densely pilose, with gland-tipped trichomes; basal bracts leaflike, ovate-lanceolate, to 6 × 2 cm; apical bracts linear to narrowly oblong-elliptic, 7–12 × 1–3 mm, persistent, pilose with gland-tipped trichomes; bracteoles linear, ca. 5 × 1 mm, pilose with gland-tipped trichomes. Calyx 1–1.5 cm, pilose with gland-tipped trichomes, 5-lobed almost to base; lobes linear with one longer than others, apex obtuse. Corolla blue, 3–3.7 cm, ventricose, outside sparsely pubescent, inside glabrous except for trichomes retaining style; tube basally cylindric and ca. 2 mm wide for ca. 5 mm then gradually widened to ca. 1 cm at mouth; lobes oblong, ca. 5 × 4 mm, apex rounded. Stamens 4, included; shorter filament pair ca. 4 mm; longer filament pair ca. 6 mm, base pilose; anther thecae oblong, ca. 2.5 mm; pollen type 3. Ovary comose; style 2.8–3.2 cm, glabrous. Capsule clavate, ca. 1.6 cm, apically gland-tipped pilose, 4-seeded. Seeds ovate in outline, ca. 2.5 × 2 mm, densely appressed pubescent. Fl. Aug.

- *Pinus-Quercus* forests, thickets; 1900–3400 m. Sichuan, Yunnan.

*Strobilanthes nemorosa* is similar to *S. lachenensis*, differing in little more than leaf shape. It may not be a distinct species.

Y. Wu & C. C. Hu; *P. extensus* (Nees) Bremekamp; *Strobilanthes claviculata* C. B. Clarke ex W. W. Smith; *S. duclouxii* C. B. Clarke ex Benoist.

Subshrubs 0.5–2 m tall, much branched, anisophyllous. Stems erect, glabrous or pilose. Petiole (0–)5–10 mm, narrowly winged, sparsely pubescent; leaf blade ovate, lanceolate, or oblong-lanceolate, 4–15 × 1–5 cm, both surfaces with prominent cystoliths, abaxially subglabrous to pilose, adaxially glabrous or sparsely pilose, secondary veins ca. 5 on each side of midvein, base cuneate, margin remotely serrate, apex acuminate and falcate. Inflorescences axillary or terminal, spikes, to 5 cm, very lax, 2–6-flowered; peduncle and rachis densely hirsute; sterile bracts intergrading with leaves but sessile, ovate to lanceolate, to 6 × 2.5 cm, glabrous or pubescent, base cuneate to cordate; floral bracts ovate to linear, 3–6 × 1.5–4 mm, persistent, gland-tipped pilose; bracteoles oblong to elliptic, ca. 4 × 1–3 mm, gland-tipped pilose. Flowers usually paired, basally to 4 cm apart on rachis but apically closer. Calyx 1–2 cm, strongly accrescent in fruit, gland-tipped pilose, 5-lobed almost to base; lobes oblong-ob lanceolate, one lobe 2–3 mm longer than others, apex spatulate and darker green. Corolla pale whitish purple to violet, 3.2–4 cm, ventricose, outside pubescent only on lobes, inside glabrous except for trichomes retaining style; tube basally cylindric and ca. 2 mm wide for ca. 1.2 mm then gradually widened to ca. 1.5 cm and bent at mouth; lobes orbicular, ca. 5 mm in diam. Stamens 4, included; filaments glabrous, shorter pair 3–4 mm, longer pair 7–8 mm; anther thecae oblong, ca. 2.5 × 1 mm, erect; pollen type 3. Ovary glabrous, apex with numerous sessile glands; style ca. 3.2 cm, sparsely pilose. Capsule clavate, 10–16 × ca. 2 mm, apically thinly gland-tipped pilose, 4-seeded. Seeds ovate in outline, ca. 3 × 2.5 mm, pubescent; areola small. Fl. Aug–Oct, fr. Oct–Dec.

Mixed forests; 1900–2200 m. Sichuan, Yunnan [Bhutan, India, ?Nepal].

*Strobilanthes extensa* is very variable in leaf blade, bract, and bracteole shape and in the density of the indumentum.

**79. *Strobilanthes spiciformis*** Y. F. Deng & J. R. I. Wood, J. Trop. Subtrop. Bot. 18: 473. 2010.

黄连山马蓝 huang lian shan ma lan

Subshrubs to 50 cm tall, anisophyllous. Stems to 5 mm in diam., young part sulcate and angled, subglabrous apart from pubescent at nodes, basally woody. Leaves petiolate or apically subsessile; petiole (0.5–)1.3–2.3(–2.5) cm, glabrous; leaf blade ovate, smaller of pair 4–7 × 2–3.5 cm and larger one 9–15 × 3–6 cm, both surfaces glabrous, adaxially with prominent cystoliths, secondary veins 5 or 6 on each side of midvein, base cuneate and decurrent onto petiole, margin serrate, apex acuminate. Inflorescences terminal, spikes, 4–9 cm; rachis 4-angled, gland-tipped pilose; bracts ovate, ca. 8 × 5 mm, deciduous as flowers open, abaxially sparsely gland-tipped pilose, adaxially glabrous, apex rounded; bracteoles absent. Calyx 1–1.6 cm; lobes linear-oblong, 8–16 × 1–2 mm, unequal with one distinctly longer than others, gland-tipped pilose, margin entire and ciliate, apex acute. Corolla color not noted, probably bluish, ca. 2.5 cm, straight, outside pubescent in bud but soon glabrescent, inside glabrous; tube basally cylindric and ca. 2 mm

wide for ca. 1 cm then gradually widened to ca. 8 mm at mouth; lobes orbicular, ca. 3 × 3 mm, apex obtuse. Stamens 4, included; filaments pilose, shorter pair ca. 5 mm, longer pair ca. 2 cm; anther thecae oblong, ca. 2 × 1 mm; pollen type 3. Ovary ca. 2.5 × 0.8 mm, glabrous except for a few gland-tipped pilose trichomes at tip; style ca. 2 cm, glabrous. Capsule oblong, 1.5–2 × 0.3–0.4 cm, glabrous except for a few gland-tipped pilose trichomes at tip and along ribs toward tip, 4-seeded. Seeds ovate to suborbicular in outline, ca. 3 × 3 mm, pilose. Fl. Aug–Oct.

• Moist places in forests; 1200–2400 m. Yunnan.

**80. *Strobilanthes pseudocollina*** K. J. He & D. H. Qin, Acta Phytotax. Sin. 45: 701. 2007.

阳朔马蓝 yang shuo ma lan

Herbs to 50 cm tall, ascending, weakly anisophyllous. Stems terete, lenticellate, glabrous. Petiole 0.5–2.5 cm, sulcate; leaf blade ovate to lanceolate-ovate, 2.5–13 × 1.5–6 cm, smaller of pair 1/2–2/3 size of larger one, glabrous, cystoliths prominent, secondary veins 4–8 on each side of midvein, base obtuse to cuneate, margin subentire to sparsely crenulate, apex acuminate. Inflorescences from terminal leaf axils, spikes, (1–)3–11 cm, 4–16-flowered; bracts subspatulate, 6–10 × 1.5–3 mm, leathery, glabrous, margin ciliate, apex acute; bracteoles lanceolate, ca. 4 × 0.6 mm, margin ciliate. Flower pairs 0.5–1.5 cm apart on rachis. Calyx 0.9–1.1 cm, 5-lobed almost to base; lobes linear, ca. 1 mm wide, unequal, margin ciliate. Corolla purple, ca. 4.5 cm, outside glabrous, inside glabrous except for trichomes retaining style; tube basally cylindric and ca. 1.5 mm wide for ca. 1 cm then gradually widened to ca. 1.5 cm at mouth; lobes suborbicular, 7–8 × 8–9 mm, apex obtuse. Stamens 4, included; shorter filament pair ca. 3 mm, glabrous; longer filament pair ca. 6 mm, sparsely hirsute; anther thecae oblong, ca. 2.5 × 1 mm, apiculate; connective shortly extended; pollen type 3. Ovary glabrous; style ca. 3 cm, glabrous. Capsule 1–1.5 cm, glabrous. Seeds ovate in outline, ca. 4 × 2 mm, densely pubescent. Fl. Sep–Oct, fr. Oct–Nov.

• Forests on limestone hills; 100–300 m. Guangxi (Yangshuo).

**81. *Strobilanthes longzhouensis*** H. S. Lo & D. Fang, Guihaia 17: 34. 1997.

龙州马蓝 long zhou ma lan

*Perilepta longzhouensis* (H. S. Lo & D. Fang) C. Y. Wu & C. C. Hu.

Shrubs to 2.5 m tall, slightly anisophyllous. Stems basally gray, apically purplish black, glabrous. Petiole 0.5–1.5 cm, glabrous; leaf blade lanceolate-ovate to oblong-elliptic, 3–15.5 × 2.5–6 cm, leathery, glabrous, cystoliths numerous, secondary veins 5–7(–9) on each side of midvein and prominent on both surfaces, base cuneate, margin serrulate to undulate, apex acuminate to acute. Inflorescences axillary, branched spikes, 1.5–5 cm, to 4 per leaf axil, sometimes becoming compound and paniculate; bracts ovate, 3–4 × ca. 2 mm, persistent, abaxially glabrous with numerous cystoliths, margin ciliate, apex acute; bracteoles ca. 6 × 1.2 mm. Flowers 1 sterile per node. Calyx 8–10 mm, with prominent cystoliths, 2-lipped; lower lip 2-lobed, upper lip 3-lobed; lobes lanceolate-triangular, ca. 6 mm, mar-

gins white ciliolate. Corolla pale purple, 3–3.5 cm, ventricose, outside glabrous, inside glabrous except for trichomes retaining style; tube basally cylindric and ca. 2 mm wide for ca. 1 cm then gradually widened to ca. 1.5 cm at mouth; lobes broadly obovate, ca. 5 mm, apex emarginate. Stamens 4, included; shorter filament pair ca. 2 mm, glabrous; longer filament pair ca. 7 mm, villous; anther thecae oblong, ca. 2 mm; pollen type 3. Ovary glabrous; style ca. 2 cm, basally villous. Capsule oblong, 1.2–1.4 cm, glabrous, 4-seeded. Seeds ovate in outline, ca.  $2.5 \times 2.5$  mm, densely covered with appressed trichomes. Fl. Sep–Dec, fr. Dec–Feb.

Hilly limestone areas; 200–500 m. Guangxi, Hainan [Vietnam].

**82. *Strobilanthes cystolithigera*** Lindau, Bull. Herb. Boissier 5: 651. 1897.

串花马蓝 chuan hua ma lan

*Pteracanthus botryanthus* (D. Fang & H. S. Lo) C. Y. Wu & C. C. Hu; *Strobilanthes botryantha* D. Fang & H. S. Lo; *S. myriostachya* D. Fang & H. S. Lo.

Subshrubs 1.5–3.5 m tall, isophyllous, drying green. Stems 4-angled, sulcate, glabrous. Petiole 0.5–2 cm, sulcate; leaf blade narrowly elliptic, narrowly ovate, or rarely ovate-elliptic, (2–)4–17  $\times$  1.5–4.5 cm, glabrous, densely covered with linear cystoliths, secondary veins 4–6 on each side of midvein, base cuneate and decurrent onto petiole, margin subentire to irregularly crenate, apex acuminate. Inflorescences axillary, spikes, 2–6(–12) cm, sometimes branched, (2–)8–14-flowered; peduncle 0.5–1.5 cm; bracts elliptic, 4–6  $\times$  3–4 mm, persistent, abaxially with prominent cystoliths and frequently a single black squamate gland, margin ciliolate, apex obtuse to acute; bracteoles ovate-lanceolate, ca. 5  $\times$  1 mm, glabrous except for ciliolate margin, densely covered with cystoliths, apex acute. Flowers in opposite pairs, ca. 0.5 mm apart on rachis. Calyx 8–10 mm, subequally 5-lobed to base; lobes linear-lanceolate, 5–6  $\times$  ca. 1 mm, basally overlapping, glabrous, apex obtuse. Corolla purple, 3–4.5 cm, slightly curved, outside glabrous, inside glabrous except for trichomes retaining style; tube basally cylindric and narrow for ca. 1 cm then gradually widened to ca. 1.8 cm at mouth; lobes broadly ovate, ca. 6  $\times$  7 mm, apex rounded. Stamens 4, included; filaments pilose, shorter pair ca. 2 mm, longer pair ca. 5 mm; anther thecae oblong, ca. 2  $\times$  1 mm; pollen type 3. Ovary glabrous; style ca. 2.8 cm, hirsute; stigma glabrous. Capsule oblong, ca. 1.7 cm, glabrous, 4-seeded. Seeds ovate in outline, ca. 1 cm, pilose; areola small, glabrous. Fl. Sep–Nov, fr. Dec.

Ravines or streamsides on limestone hills; 800–1200 m. Guangxi, Hainan, Yunnan [Vietnam].

**83. *Strobilanthes abbreviata*** Y. F. Deng & J. R. I. Wood, Bot. J. Linn. Soc. 150: 377. 2006.

短尖马蓝 duan jian ma lan

Shrubs to 3 m tall, isophyllous, drying green. Stems terete, ca. 9 mm in diam., sulcate, striate, glabrous; bark dull brown, smooth. Petiole 1–2.5 cm, glabrous; leaf blade oblong-elliptic, 6–25  $\times$  2.5–9 cm, both surfaces glabrous and with numerous small cystoliths, abaxially olive-green, adaxially dark green,

base long attenuate and decurrent onto petiole, margin serrate, apex tapered, long acuminate, and sometimes falcate. Inflorescences axillary, spikes, 2–14 cm, basally rarely with a reduced second spike, usually some forming a 30–50 cm leafless panicle of spikes; peduncle 1–3 mm; rachis glabrous; bracts broadly oblong-obovate, 5–7  $\times$  3–4 mm, concave, rigid, persistent into fruit, abaxially densely covered with cystoliths and dotted with small sessile brownish glands and often with larger sticky gland-tipped patches along midvein, apex abruptly truncate and with a short deciduous mucro; bracteoles lanceolate to oblong-lanceolate, 10–13  $\times$  1–2 mm, slightly shorter than calyx, concave, rather rigid, glabrous or (rarely) scurfy along margin, abaxially densely covered with cystoliths and with scattered sessile glands sometimes becoming stipitate in fruit, apex obtuse. Flowers arranged in opposite pairs, both usually fertile, basally to 1 cm apart on rachis, apically confluent. Calyx 1.2–1.5 cm, slightly accrescent in fruit, subequally 5-lobed to just above base; lobes narrowly lanceolate, 10–14  $\times$  1–2 mm, glabrous except for apical glands that sometimes become stipitate, outside non-glandular except for a few sessile glands near apex, densely covered with cystoliths, apex acute to acuminate. Corolla bluish purple, 4–4.5 cm, sometimes apically bent, outside glabrous; tube basally cylindric and ca. 1.5 mm wide for 7–8 mm then ventricose and widened to ca. 1.5 cm at mouth; lobes ovate, ca. 5  $\times$  5 mm. Stamens 4, included; filaments setose, shorter pair ca. 2 mm, longer pair ca. 4 mm; anther thecae narrowly oblong, ca. 3  $\times$  0.5 mm; pollen type 3. Ovary comose; style ca. 2.5 cm, densely villous. Capsule oblong, 17–18  $\times$  ca. 3 mm, comose with a few trichomes, 4-seeded. Seeds ovate in outline, flattened, densely pilose; areola small, glabrous. Fl. Jun–Oct, fr. Dec–Mar.

Forests by streams; 200–1500 m. Yunnan [Cambodia, India, Myanmar, Thailand, Vietnam].

**84. *Strobilanthes biocullata*** Y. F. Deng & J. R. I. Wood, Novon 20: 406. 2010.

湖南马蓝 hu nan ma lan

Subshrubs 0.8–2 m tall, gregarious, anisophyllous. Stems subterete, bisulcate, glabrous. Petiole 1–5 cm, sulcate, glabrous; leaf blade oblong-elliptic to elliptic, smaller of pair 6–12  $\times$  2–4 cm and larger ones 13–26  $\times$  4–8 cm, both surfaces glabrous and densely covered with cystoliths, secondary veins 5–10 on each side of midvein and prominent on both surfaces, tertiary veins prominent, base narrowly cuneate, margin serrate, apex acuminate. Inflorescences axillary, simple spikes, (3–)7–10 cm, solitary, leafless; rachis glabrous; bracts ovate, 3.5–5  $\times$  2.5–3 mm, glabrous, abaxially with 2 swollen bulges resembling eyes, apex long acuminate to mucronate; bracteoles ovate-oblong, ca. 4  $\times$  2 mm, somewhat fragile and caducous, glabrous, apex acuminate to mucronate. Flowers in opposite pairs, 1–2 cm apart on rachis. Calyx 1–1.2 cm, sparsely pubescent when young, glabrescent, subequally 5-lobed almost to base; lobes yellowish brown, lanceolate, 1-veined, apex long acuminate. Corolla purplish blue, 3.5–4 cm, outside glabrous, inside glabrous except for trichomes retaining style; tube basally cylindric and ca. 3 mm wide for 6–11 mm then bent to ca. 90° and gradually widened to ca. 2 cm at mouth; lobes ovate, ca. 4  $\times$  7 mm, apex emarginate. Stamens 4, included; filaments pilose, shorter pair ca. 3 mm, longer pair ca. 1 cm; anther thecae oblong, ca. 3  $\times$  1.2 mm;

pollen type 3. Ovary ca. 3 mm, glabrous; style ca. 2.8 cm. Capsule clavate, 1.5–2 cm, glabrous, 4-seeded. Seeds ca. 3 × 3 mm, lenticular, densely appressed pubescent; areola small. Fl. Jul–Oct, fr. Nov.

• On rocks by streams; 200–800 m. Guangdong, Guangxi, Hunan.

长穗马蓝 cháng suǐ mǎ lán

*Semnostachya longespicata* (Hayata) C. F. Hsieh & T. C. Huang.

Shrubs 1.2–2 m tall, much branched, drying green. Branches ± 4-angled, sulcate, glabrous. Petiole 1–3 cm, sulcate, glabrous; leaf blade lanceolate to oblong-oblancoate, 7–20 × 2–6 cm, glabrous, both surfaces with abundant cystoliths, secondary veins 6–10 on each side of midvein, base attenuate, margin remotely serrate, apex acute to shortly acuminate. Inflorescences axillary, spikes, (5–)10–15 cm, simple or less commonly branched; peduncle and rachis pubescent; bracts narrowly ovate to lanceolate, (5–)10–13 × (3–)6–7 mm, glabrous, cystoliths prominent, base truncate, apex acuminate; bracteoles linear-lanceolate, 9–11 × ca. 2 mm, scurfy-pubescent, apex acuminate. Flowers in opposite pairs, basally ca. 1 cm apart on rachis but apically imbricate. Calyx 5-lobed almost to base, accrescent in fruit; lobes linear-lanceolate, 9–15 × 2–3 mm, scurfy-pubescent, prominently 1-veined, margin ciliate, apex acuminate. Corolla pale purple, 4.5–5 cm, straight or slightly bent, outside glabrous, inside glabrous except for trichomes retaining style; tube basally cylindric and ca. 3 mm wide for ca. 1 cm then gradually widened to 1.5–2 cm at mouth; lobes oblong, ca. 8 × 7 mm, subequal, apex emarginate. Stamens 4, included; filaments glabrous, shorter pair ca. 2 mm, longer pair ca. 8 mm; anther thecae oblong, 2–2.5 × ca. 1 mm; pollen type 3. Ovary cylindric-oblong, apically slightly hispid; style filiform, 3–3.2 mm, hispid. Capsule linear, ca. 1.7 cm, glabrous, 4-seeded. Seeds suborbicular in outline, ca. 3 mm in diam., flattened. Fl. Sep–Dec, fr. Feb–May.

• Forests; 200–1000 m. Taiwan.

**86. *Strobilanthes myura*** Benoist, Bull. Mus. Natl. Hist. Nat. 28: 95. 1922.

鼠尾马蓝 shǔ wěi mǎ lán

Shrubs, drying green. Stems subterete, glabrous. Petiole 1–2.5 cm, glabrous; leaf blade ovate to elliptic, to 7–16 × 3–6 cm, glabrous, adaxially with cystoliths, secondary veins 8–11 on each side of midvein, base cuneate, margin crenate-dentate, apex acuminate. Inflorescences axillary, spikes, 5–8 cm; bracts ovate-triangular, 6–9 × ca. 2 mm, glabrous, midvein abaxially lined by cystoliths, margin sparsely ciliate, apex acuminate; bracteoles narrowly ovate, ca. 3.5 × 1 mm, margin sparsely ciliate, apex acuminate. Flowers basally ca. 1.5 cm apart on rachis but apically somewhat confluent. Calyx 5-lobed to base; lobes lanceolate, ca. 7 × 1 mm, equal, margin minutely ciliate, apex acuminate and shortly apiculate. Corolla purple, 2.5–3.4 cm, outside glabrous, inside glabrous except for trichomes retaining

style; tube basally cylindric and narrow for ca. 5 mm then bent and abruptly widened to 1–1.2 cm at mouth; lobes oblong-ovate, ca. 5 × 4 mm. Stamens 4, included; filaments pilose, shorter pair ca. 4 mm, longer pair ca. 6 mm; anther thecae oblong, ca. 2 × 1 mm; pollen type 3. Ovary sparsely pilose; style ca. 2.8 cm, sparsely pilose. Capsule unknown. Fl. Jul.

• Thickets; 600–800 m. Guizhou (Dushan).

**87. *Strobilanthes guangxiensis*** S. Z. Huang, Guihaia 6: 179. 1986.

广西马蓝 guāng xī mǎ lán

*Pteracanthus guangxiensis* (S. Z. Huang) C. Y. Wu & C. Hu.

Herbs to 1 m tall, perennial, anisophyllous. Stems erect or ascending, densely pubescent, soon glabrescent. Petiole 0.3–3.5 cm, densely pubescent; leaf blade elliptic, smaller of pair 4–9 × 2.3–4.5 cm and larger one 9–14(–18) × 3.3–6(–8) cm, abaxially pale green and slightly pubescent, adaxially green, glabrous, and densely covered with prominent ca. 0.5 mm cystoliths, secondary veins 4–8 on each side of midvein, base cuneate, margin entire or slightly undulate, apex acuminate. Inflorescences axillary or terminal, spikes, 4–8 cm; peduncle ca. 4 cm, densely pubescent; rachis densely pubescent, usually with 2–6 nodes; bracts oblong to lanceolate, 10–13 × 2–3 mm, persistent, abaxially pubescent, adaxially glabrous, margin ciliate, apex acuminate to caudate; bracteoles oblong to lanceolate, 11–16 × 2–3 mm, abaxially pubescent, adaxially glabrous, margin ciliate, apex acuminate to caudate. Flowers 0.8–1.2 cm apart on rachis. Calyx ca. 1 cm, 5-lobed almost to base; lobes linear, ca. 9 × 1 mm, equal, outside pubescent, inside glabrous, margin ciliate from middle apically, apex acute. Corolla purple, 3.5–4 cm, ventricose, outside glabrous, inside glabrous except for trichomes retaining style; tube basally cylindric and ca. 3 mm wide for ca. 1.2 cm then gradually widened to ca. 1.4 cm at mouth; lobes oblong, ca. 5 × 5 mm, unequal, apex emarginate. Stamens 4, included; filaments glabrous, shorter pair ca. 3 mm, longer pair ca. 6 mm; anther thecae oblong, 2.5–3.5 × ca. 2 mm. Ovary oblong, ca. 3 mm, pilose at tip; style 2.5–3 cm, villous; stigma linear, glabrous. Capsule not seen. Fl. Oct–Dec.

• Shaded valleys; 200–400 m. Guangxi (Liujiang).

This species is used medicinally.

**88. *Strobilanthes compacta*** D. Fang & H. S. Lo, Guihaia 17: 31. 1997.

密苞马蓝 mǐ bāo mǎ lán

Subshrubs to 2 m tall, slightly anisophyllous. Stems 4-angled, glabrous. Petiole 1–3 cm, sulcate, glabrous; leaf blade elliptic to ovate-elliptic, 8.5–15 × 3.5–7 cm, both surfaces glabrous and densely covered with cystoliths, adaxially blackish when dry, secondary veins 8 or 9 on each side of midvein and prominent, base cuneate to attenuate, margin serrate, apex acuminate. Inflorescences axillary, simple spikes, 1.5–8(–10) × ca. 1.2 cm, very dense; basal sterile bracts ovate-oblong, 3–4 × ca. 1 cm, leathery, abruptly narrowed at middle with a long caudate apex; floral bracts ovate, 2–3 × 0.4–0.6 cm, leathery, persistent, abaxially glabrous, margin minutely ciliate or glabrous, apex

long acuminate; bracteoles ovate, ca.  $1 \times 0.5$  cm, glabrous, densely covered with cystoliths, margin minutely ciliolate, apex acuminate. Flowers imbricate on rachis. Calyx 5-lobed almost to base; lobes broadly lanceolate,  $12\text{--}15 \times 3\text{--}4$  mm, subequal, basally overlapping, margin minutely ciliolate but otherwise glabrous, apex acuminate. Corolla purple,  $3.5\text{--}4.8$  cm, outside glabrous, inside glabrous except for trichomes retaining style; tube basally cylindric and ca. 2 mm wide for ca. 1 cm then slightly ventricose and gradually widened to ca. 1.5 cm at mouth; lobes ovate, ca. 5 mm, apex rounded. Stamens 4, included; filaments pubescent, shorter pair ca. 2.5 mm, longer pair ca. 6 mm; anther thecae oblong, ca.  $3 \times 1$  mm, glabrous. Ovary sparsely hirsute at tip; style ca. 2.5 cm, slightly hirsute at base and glabrous apically. Capsule fusiform, ca. 1.5 cm, somewhat hirsute on apical part, 4-seeded. Seeds ovate in outline, ca.  $3 \times 2$  mm, densely appressed hairy. Fl. Aug–Sep.

• Forests on limestone hills; 200–300 m. Guangdong, Guangxi.

**89. *Strobilanthes heteroclita*** D. Fang & H. S. Lo, Guihaia 17: 32. 1997.

异序马蓝 yi xu ma lan

Herbs or subshrubs, to 1.5 m tall, gregarious, isophyllous. Stems  $\pm$  4-angled, sulcate, glabrous. Petiole to 5 cm; leaf blade broadly ovate, elliptic, broadly elliptic, or suborbicular,  $5.5\text{--}19 \times 2.5\text{--}10$  cm, glabrous, both surfaces densely covered with linear cystoliths, secondary veins 7–10 on each side of midvein and prominent, base rounded to broadly cuneate, margin serrate, apex shortly caudate. Inflorescences axillary from apical axils, spikes, 1.5–5 cm, compact, 1–3 per axil; peduncle 0–1.3 cm; bracts broadly lanceolate,  $11\text{--}12 \times 3\text{--}4$  mm, leathery, persistent, rust-colored scurfy pubescent, abaxially with black sessile glands, glabrescent, apex acuminate; bracteoles lanceolate, 8–9 mm, leathery, rust-colored tomentose, apex acuminate. Calyx 1.2–1.4 cm, 5-lobed almost to base; lobes narrowly lanceolate, with 2 lobes slightly longer than others, apex acuminate. Corolla purple to light blue,  $3.5\text{--}4$  cm, outside glabrous, inside glabrous except for trichomes retaining style; tube basally cylindric and ca. 3 mm wide for ca. 1 cm then ventricose and gradually widened to ca. 1.2 cm at mouth; lobes ovate,  $5\text{--}6 \times 5\text{--}6$  mm, apex obtuse. Stamens 4, included; filaments pilose, shorter pair ca. 2 mm, longer pair ca. 7 mm; anther thecae oblong, 2–2.5 mm. Ovary sparsely hirsute at tip; style ca. 1.7 cm; stigma hirsute. Capsule fusiform, 1.5–2 cm, pilose at tip, 4-seeded. Seeds ovate in outline, ca.  $3 \times 3$  mm, appressed pubescent. Fl. Jul–Sep, fr. Nov.

• Forests on limestone hills; 100–500 m. Guangxi (Long'an).

**90. *Strobilanthes mucronatoproducta*** Lindau, Bull. Herb. Boissier 5: 650. 1897.

尾苞马蓝 wei bao ma lan

Shrubs to 1.5 m tall, weakly anisophyllous, drying blackish. Stems  $\pm$  4-angled, glabrescent. Petiole 0.5–3 cm, scurfy pubescent; leaf blade ovate, elliptic, or oblong-elliptic,  $8.5\text{--}15 \times 3.5\text{--}7$  cm, abaxially puberulent along veins, adaxially glabrous, both surfaces densely covered with cystoliths, secondary veins 8 or 9 on each side of midvein, base cuneate to attenuate, margin dentate, serrulate, or subentire, apex acuminate. In-

florescences terminal and from apical leaf axils, simple spikes, 4–9 cm, solitary; peduncle 0.3–1 cm, rust-colored pubescent; bracts lanceolate, ca.  $2.4 \times 0.6$  cm, persistent, rust-colored pilose, apex acuminate; bracteoles lanceolate, ca.  $5 \times 4$  mm, rust-colored pilose, apex long acuminate and aristate. Flowers imbricate on rachis. Calyx 1.7–1.8 cm, 5-lobed almost to base; lobes lanceolate,  $16\text{--}17 \times$  ca. 2 mm, subequal, rust-colored pilose, apex acuminate. Corolla purple,  $3.5\text{--}4$  cm, slightly curved, outside glabrous, inside glabrous except for trichomes retaining style; tube basally cylindric and ca. 3 mm wide for ca. 1 mm then gradually widened to ca. 1.3 cm at mouth; lobes ovate, ca.  $7 \times 7$  mm, apex obtuse. Stamens 4, included; filaments sparsely pubescent, shorter pair ca. 2 mm, longer pair ca. 4 mm; anther thecae oblong, ca.  $2 \times 1.3$  mm; pollen type 3. Ovary pilose; style ca. 2.7 cm; stigma ca. 3 mm, pubescent. Capsule fusiform, 2–2.2 cm, pilose, 4-seeded. Seeds ovate in outline, ca.  $4 \times 3.5$  mm, appressed pubescent. Fl. Sep–Oct, fr. Dec.

Forests on mountain slopes; 400–700 m. Guangxi, Yunnan [Vietnam].

流苏马蓝 liu su ma lan

*Endopogon macrostegius* Nees; *Strobilanthes fimbriata* var. *majuscula* W. W. Smith; *S. macrostegia* (Nees) C. B. Clarke; *S. neesii* Kurz.

Shrubs 0.6–1.5 m tall, drying blackish green. Branches terete, apically thinly brown pubescent, glabrescent. Petiole 0.5–2.5 cm; leaf blade oblong-elliptic to elliptic, to  $18 \times 7$  cm, both surfaces with cystoliths, abaxially glabrous except for brown scurfy pubescence along veins, adaxially glabrous, secondary veins 8–12 on each side of midvein, base cuneate, margin subentire, apex acuminate. Inflorescences axillary, spikes, 3–6 cm, with 6–8 flower pairs; peduncle 0–0.3 cm, glabrous; bracts obovate, ca.  $13 \times 5$  mm, both surfaces densely covered with cystoliths, apical margin ciliate with rigid brown trichomes, apex abruptly narrowed to a mucro; bracteoles oblanceolate, ca.  $1 \times 3$  mm, abaxially apically fulvous pubescent, margin with a distinct shoulder, apex cuspidate. Flowers imbricate on rachis. Calyx 1–1.3 cm at anthesis, accrescent to ca. 2 cm; lobes linear-lanceolate; to  $18 \times 1$  mm, apex long acuminate. Corolla violet, ca. 4.5 cm, outside and inside glabrous except for trichomes retaining style; tube basally cylindric for ca. 8 mm then abruptly widened to 1.5–1.8 cm at mouth; lobes broadly ovate, ca.  $6 \times 7$  mm, apex rounded. Stamens 4, included; shorter filament pair ca. 2 mm, glabrous; longer filament pair ca. 7 mm, pilose; anther thecae oblong, ca.  $3 \times 1.5$  mm, erect; pollen type 3. Ovary glabrous except for densely comose tip; style ca. 4 cm, pilose. Capsule oblong, 1–2 cm, comose, 4-seeded. Seeds ovate in outline, ca.  $4 \times 3$  mm, densely appressed pilose. Fl. May.

Moist places in forests; ca. 1000 m. Xizang (Médog) [Bangladesh, India, Myanmar].

**92. *Strobilanthes brunnescens*** Benoist, Bull. Mus. Natl. Hist. Nat. 27: 544. 1921.

*Perilepta refracta* (D. Fang, Y. G. Wei & J. Murata) C. Y. Wu & C. C. Hu; *Strobilanthes refracta* D. Fang, Y. G. Wei & J. Murata.

Subshrubs 1–2 m tall, anisophyllous, drying blackish. Stems 4-angled, sulcate, brownish puberulent. Petiole 0.2–2.5 cm, brownish puberulent; leaf blade ovate to rarely obovate-elliptic, (2–)4.5–21 × (1–)2.5–9.5 cm, both surfaces densely covered with cystoliths, abaxially puberulent along veins, adaxially glabrous, secondary veins 4–12 on each side of midvein, base cuneate, margin subentire to crenulate, apex shortly acuminate. Inflorescences axillary, spikes, 1.5–3 cm; bracts oblong-obovate with a broad base, ca. 11 × 4–5 mm, concave, rigid, abaxially pubescent and with marginal cilia of rigid brown trichomes, apex acute and becoming reflexed; bracteoles linear, 10–12 × ca. 1 mm, apically brownish pubescent, apex often reflexed. Flowers imbricate on rachis. Calyx 1.2–1.5 cm, subequally 5-lobed; lobes lanceolate, ca. 10 × 1 mm, pubescent with rigid trichomes, apex acuminate. Corolla purple, ca. 4 cm, slightly curved, outside glabrous, inside glabrous except for trichomes retaining style; tube basally cylindric and narrow for ca. 1 cm then gradually widened to ca. 2 cm at mouth; lobes ovate, ca. 5 mm, apex emarginate. Stamens 4, included; shorter filament pair ca. 3 mm, glabrous; longer filament pair ca. 7 mm, pilose; anther thecae oblong, 3–3.5 mm. Ovary hirsute at tip; style ca. 2.7 cm, pilose; stigma obconical. Capsule not seen. Fl. Dec.

Forests in valleys; 300–500 m. Guangxi, Yunnan [Vietnam].

**93. *Strobilanthes nobilis*** C. B. Clarke in J. D. Hooker, Fl. Brit. India 4: 471. 1884.

沙坝马蓝 sha ba ma lan

*Strobilanthes petelotii* Benoist.

Herbs 50–100 cm tall, perennial, isophyllous, drying blackish. Stems ± 4-angled, sulcate, reddish brown pubescent, apically with distinctive scattered wartlike excrescences. Petiole 1–1.5 cm or leaves sessile; leaf blade ovate-lanceolate to oblong-elliptic, sometimes pandurate, 7–17(–25) × 3.5–8 cm, glabrous or thinly pilose especially on abaxial veins, margin, and adaxial surface, abaxially paler, adaxially with cystoliths, secondary veins 6 or 7 on each side of midvein and somewhat parallel, base cuneate to rounded and auriculate, margin crenate, apex shortly acuminate. Inflorescences axillary or terminal, simple or basally branched spikes, 5–20 cm, often forming a panicle when mature; rachis reddish brown puberulent, apically becoming very slender; bracts lanceolate, 1.5–2 × 0.2–0.4 cm, persistent, glabrous except for ciliolate margin, occasionally developing stipitate glands when mature, 1-veined, apex long acuminate; bracteoles similar to bracts but narrowly linear-lanceolate, ca. 18 × 1 mm. Flowers 1–1.5 cm apart on rachis and apically not very confluent. Calyx 1–2.2 cm, accrescent in fruit, 5-lobed almost to base; lobes linear, 14–20 × ca. 1 mm, equal, occasionally developing stipitate glands when mature, margin ciliolate, apex finely acuminate. Corolla blue, ca. 3 cm, outside glabrous, inside glabrous except for trichomes retaining style; tube basally cylindric and ca. 2.5 mm wide for ca. 7 mm then strongly bent and abruptly widened to 1–1.4 cm at mouth; lobes ovate, ca. 4 × 4 mm, apex emarginate. Stamens 4, included; shorter filament pair 2–3 mm, glabrous; longer filament pair ca.

7 mm, basally pilose; anther thecae oblong, ca. 3 × 1.2 mm; pollen type 3. Ovary glabrous, with 2 ovules per locule; style ca. 2.5 cm, pilose. Capsule 1.2–2.2 cm, glabrous, 4-seeded. Seeds ovate in outline, ca. 3 × 2.5 mm, densely appressed pubescent; areola small. Fl. Sep–Nov, fr. Mar.

Streamsides, forests; 1100–1800 m. Yunnan [India, Myanmar, Vietnam].

**94. *Strobilanthes polyneuros*** C. B. Clarke ex W. W. Smith, Notes Roy. Bot. Gard. Edinburgh 10: 198. 1918.

多脉马蓝 duo mai ma lan

Shrubs to 2 m tall, isophyllous. Stems 4-angled, sulcate, glabrous. Petiole 1–5 cm, sulcate, subglabrous; leaf blade elliptic to broadly lanceolate, 13–30 × 5–11 cm, glabrous, abaxially paler, adaxially with numerous cystoliths, secondary veins 12–20 on each side of midvein and parallel, base cuneate, margin serrate, apex acuminate. Inflorescences axillary, spikes, 2–8 cm, composed of 1–5 simple dense spikes arising at apex of peduncle forming a dense cluster of spikes; peduncle ca. 1 cm, puberulent and sometimes with warty excrescences; sterile bracts ovate at base of spike, ca. 1 × 0.5 cm; floral bracts lanceolate, 1.5–3 × 0.3–0.4 cm, abaxially minutely puberulent, apex finely acuminate and slightly incurved; bracteoles linear-lanceolate, ca. 2 cm, minutely puberulent, apex acuminate. Flowers imbricate on rachis. Calyx 1.7–2.3 cm, somewhat accrescent and sometimes becoming gland-tipped pilose at maturity, 5-lobed almost to base; lobes linear-lanceolate, thinly puberulent, apex finely acuminate. Corolla purple, 3.5–4 cm, straight, outside sparsely pilose, inside glabrous except for trichomes retaining style; tube basally cylindric and ca. 3 mm wide for ca. 1.4 cm then gradually widened to ca. 1.4 cm at mouth; lobes orbicular, ca. 6 mm in diam. Stamens 4, included; filaments glabrous, shorter pair ca. 2 mm, longer pair ca. 5 mm; anther thecae oblong, ca. 3.5 × 1 mm; pollen type 3. Ovary sparsely gland-tipped pilose at tip; style ca. 3.5 cm, pilose. Capsule ca. 20 × 3 mm, glabrous or with a very few apical trichomes, 4-seeded. Seeds ovate in outline, 3–5 × 2–4 mm, densely appressed pubescent. Fl. Oct–Jan, fr. Mar.

Forests; 200–1600 m. Yunnan [Myanmar, Thailand, Vietnam].

**95. *Strobilanthes bipartita*** Terao ex J. R. I. Wood, Kew Bull. 58: 122. 2003.

双萼马蓝 shuang e ma lan

Subshrubs 50–100 cm tall, isophyllous. Stems terete, glabrous. Petiole 0.7–1.5 cm, sparsely brown pilose; leaf blade elliptic, 6–22 × 3.5–10 cm, hirsute especially along veins, abaxially cystoliths prominent, secondary veins 12–16 on each side of midvein, base cuneate, margin remotely serrate, apex acute. Inflorescences axillary or terminal, abbreviated to headlike spikes, ca. 2 cm; peduncle 2–4 mm, brown pubescent; bracts ovate, 3–3.5 × 1.2–1.7 cm, glabrous except for ciliate margin, margin entire or apically serrate, apex acute; bracteoles oblong-lanceolate, ca. 15 × 3 mm, glabrous. Calyx with appressed silky trichomes on both surfaces, 2-lipped; lower lip ca. 1.2 cm, 2-lobed, lobes triangular and ca. 1.5 × 1.5 mm; upper lip ca. 1.3 cm, 3-dentate to ca. 1 mm. Corolla purplish blue, ca. 4 cm, ventricose, outside glabrous, inside glabrous except for trichomes

retaining style; tube basally cylindric and ca. 2 mm wide for ca. 1.2 cm then gradually widened to ca. 1.4 cm at mouth; lobes ovate, ca.  $5 \times 7$  mm, apex obtuse. Stamens 4, included; shorter filament pair ca. 2 mm, glabrous; longer filament pair ca. 4.5 mm, sparsely pilose; anther thecae oblong, ca.  $3 \times 1$  mm. Ovary glabrous; style ca. 3.2 cm, pilose. Capsule not seen. Fl. Dec.

Thickets on limestone hills; 300–900 m. Yunnan (Jinghong) [Laos].

**96. *Strobilanthes retusa*** D. Fang, Acta Phytotax. Sin. 38: 187. 2000.

凹苞马蓝 ao bao ma lan

*Perilepta retusa* (D. Fang) C. Y. Wu & C. C. Hu.

Herbs to 80 cm tall, branched, anisophyllous. Stems black when dry, 4-angled, glabrous, winged between nodes, wing 0.5–2 mm wide. Leaves sessile; leaf blade elliptic, rhombic-elliptic, obovate, or ovate, 6.5–20.5  $\times$  4–8.5 cm, abaxially glabrous except sparsely pilose along veins, adaxially pubescent and densely covered with cystoliths, secondary veins 5–9 on each side of midvein and prominent on both surfaces, basally attenuate to rarely broadly cuneate, base auriculate, amplexicaul, and decurrent onto petiole, margin crenate, apex acute to acuminate. Inflorescences axillary or terminal, subcapitate, 2.5–3.5  $\times$  2–2.5 cm, elongating after flowering; peduncle 1–4 cm; bracts ovate, ca. 2.2  $\times$  1.5 cm, abaxially puberulent, base cordate, margin deeply crenate, apex acute; bracteoles elliptic, 1.4–1.6  $\times$  ca. 0.7 cm, margin undulate, apex obtuse to emarginate. Calyx ca. 1.2 cm, accrescent to ca. 1.8 cm in fruit, subequally 5-lobed; lobes oblanceolate, puberulent, lower 2 ca. 9.5 mm and connate at base, upper 3 ca. 1.2 cm and extremely shortly connate. Corolla white with purplish stripes on upper lobes, ca. 4 cm, slightly curved, outside glabrous; tube basally cylindric and narrow for ca. 1 cm then gradually widened to ca. 2 cm at mouth; lobes oblong, ca.  $5 \times 5$  mm, apex subrounded. Stamens 4, included; filaments pilose, shorter pair ca. 2.5 mm and basally sparsely pilose, longer pair ca. 5 mm; anther thecae oblong, 3–4 mm. Ovary glabrous; style ca. 2.5 cm, pubescent; stigma unequally 2-lobed. Capsule ellipsoid, ca. 1.8 cm, glabrous, 4-seeded. Seeds ovate in outline, ca. 2.5  $\times$  2.5 mm, densely appressed pilose. Fl. Jul.

• Moist places by streams; 500–600 m. Guangxi (Huanjiang).

**97. *Strobilanthes cruciata*** (Bremekamp) Terao, Acta Phytotax. Geobot. 31: 59. 1980.

四苞马蓝 si bao ma lan

*Tetragoga cruciata* Bremekamp, Verh. Kon. Ned. Akad. Wetensch., Afd. Natuurk., Sect. 2, 41(1): 300. 1944; *T. nagensis* Bremekamp.

Subshrubs 1–2 m tall, anisophyllous. Stems 4-angled, sulcate, rust-colored hirsute or glabrous. Petiole 1–1.5 cm, pubescent; leaf blade ovate to ovate-lanceolate, 4–13  $\times$  1.5–5.5 cm, smaller of pair ca. 1/3 size of larger one, abaxially pale white tomentose especially along midvein, adaxially sparsely tomentose and brownish green when dry, secondary veins 7–9 on each side of midvein, base cuneate, margin serrate and ciliate,

apex acuminate. Inflorescences axillary or terminal, subcapitate; peduncle 0–2.5 cm, gland-tipped pilose; outer bracts leaf-like, petiolar base forming a rigid involucre around capitulum, 1–2  $\times$  0.5–1 cm, outside densely brownish gland-tipped pilose to subglabrous, inside glabrous, apical laminar portion ovate, 2–4  $\times$  2–3 cm, and erect; inner bracts linear-pandurate, 12–16  $\times$  3–5 mm, abaxially pilose and apically gland-tipped pubescent, adaxially glabrous, margin entire, apex acute; bracteoles narrowly linear, ca. 13  $\times$  1 mm. Calyx ca. 1.1 cm, outside pilose except glabrous toward base, inside apically silky villous, margin apically ciliate. Corolla white, ca. 2.5 cm, curved, outside glabrous, inside glabrous except for trichomes retaining style; tube basally cylindric and ca. 3 mm wide for ca. 1 mm then ventricose and gradually widened to ca. 1.2 cm at mouth; lobes ovate, ca. 4  $\times$  4 mm, apex obtuse. Stamens 4, included; shorter filament pair ca. 3 mm, glabrous; longer filament pair ca. 6 mm, hirsute; anther thecae oblong, ca.  $3 \times 1$  mm, erect, apiculate; connective shortly excurrent; pollen type 1. Ovary oblong, glabrous; style ca. 2.2 cm, gland-tipped pilose. Capsule fusiform, ca. 1.5 cm, glabrous, 4-seeded. Seeds brown, ovate in outline, ca. 4  $\times$  3 mm, densely appressed pubescent; areola small. Fl. Dec–Jul.

Dense moist mixed forests; 800–1500 m. Hainan, Xizang (Mêdog), Yunnan [India, Indonesia, Myanmar, Thailand].

*Strobilanthes cruciata* is a very distinct species with unique inflorescence structure and unusual pollen combined with the calyx sericeous inside.

**98. *Strobilanthes simonsii*** T. Anderson, J. Linn. Soc., Bot. 9: 474. 1867.

西蒙马蓝 xi meng ma lan

Subshrubs to 1 m tall, anisophyllous. Stems and branches 4-angled, sulcate, tomentose. Petiole 2–10 mm, sulcate, tomentose; leaf blade ovate-elliptic, smaller one 1.2–4  $\times$  0.6–1.4 cm and larger one 3.5–18  $\times$  1.6–6.5 cm, both surfaces tomentose, secondary veins 5–7 on each side of midvein, base cuneate and oblique, margin crenulate-serrate, apex acuminate and falcate. Inflorescences axillary, capitate, few flowered; peduncle 0.2–1 cm, pubescent; bracts variable in size and shape; outermost bracts leaflike, pandurate with a constricted middle and broad petiolar base, 3–4  $\times$  ca. 0.5 cm; inner bracts lanceolate, 13–20  $\times$  ca. 3 mm, abaxially tomentose, apex acute; bracteoles linear, ca. 2  $\times$  0.3 cm, abaxially apically pubescent. Calyx ca. 1.4 cm, subequally 5-lobed almost to base; lobes linear, outside apically pilose, apex acute. Corolla white, ca. 4 cm, straight, outside glabrous, inside glabrous except for trichomes retaining style; tube basally cylindric and ca. 2.5 mm wide for ca. 8 mm then gradually widened to ca. 1.8 cm at mouth; lobes oblong, ca. 6  $\times$  5 mm, apex rounded. Stamens 4, included; shorter filament pair ca. 3 mm, glabrous; longer filament pair ca. 1 cm, hirsute; anther thecae oblong, ca. 2  $\times$  1 mm, base divaricate, apex apiculate; connective shortly excurrent. Ovary glabrous; style ca. 3.2 cm, hirsute. Capsule clavate, 1.8–2 cm, glabrous, 4-seeded. Seeds ovate in outline, ca. 3  $\times$  2 mm, densely pubescent. Fl. Mar–Aug.

Forests; 1300–1700 m. Xizang (Mêdog) [Bhutan, India].

**99. *Strobilanthes echinata*** Nees in Wallich, Pl. Asiat. Rar. 3: 85. 1832.

长苞马蓝 chang bao ma lan

*Goldfussia echinata* (Nees) N. P. Balakrishnan; *Strobilanthes jugorum* Benoist; *Tetraglochidium jugorum* (Benoist) Bremekamp.

Herbs to 2 m tall, anisophyllous. Stems subterete to 4-angled, sulcate, pubescent with brownish trichomes or glabrescent. Leaves petiolate but apicalmost ones subsessile; petiole 0.5–4 cm, flat, slightly winged, pubescent or glabrous; leaf blade ovate, elliptic, or ovate-lanceolate, 4–20 × 1.5–7.5 cm, smaller of pair ca. 1/2 size of larger one, both surfaces pilose to subglabrous and with cystoliths, abaxially pale green, adaxially green; secondary veins 7–11 on each side of midvein, base cuneate and decurrent onto petiole, margin crenate-serrate, apex acuminate. Inflorescences capitate, 4–8-flowered, enveloped by bracts; peduncle short, usually simple; outer sterile bracts sessile, ovate, ovate-oblong, or oblong-ovate, 3–5 × 2–2.5 cm, equal or unequal, persistent, margin dentate, apex obtuse, rounded, or fimbriate; inner bracts fertile, obovate to spatulate, 2–3 × 0.7–0.8 cm, margin ciliate; bracteoles linear to oblanceolate, 13–23 × 1.5–3 mm, pubescent or glabrous, margin entire or sometimes dentate or fimbriate toward apex, apex acuminate. Calyx 1.5–2 cm, pubescent, 5-lobed almost to base; lobes linear, 12–19 × 1–2 mm, subequal, outside apically pubescent. Corolla violet, 4.5–5.5 cm, outside glabrous, inside glabrous except for trichomes retaining style; tube basally cylindric and ca. 2 mm wide for ca. 1.5 mm then ventricose and widened to ca. 1.5 cm at mouth; lobes ovate, 8–9 × 8–10 mm, apex rounded. Fertile stamens 4, included; shorter filament pair 3–5 mm, glabrous; longer filament pair 5–7 mm, pilose; anther thecae oblong, 2–3 × ca. 2 mm, apex apiculate; connective excurrent; staminode occasionally present, small or inconspicuous; pollen type 3. Ovary glabrous; style ca. 2.5 cm, hirsute. Capsule fusiform, 1.2–1.8 cm, glabrous, 4-seeded. Seeds brown, ovate in outline, 3–5 × 2.5–4 mm, pilose; areola small. Fl. May–Sep.

Moist forests; 100–2200 m. Guangdong, Guangxi, Yunnan [Bhutan, Cambodia, India, Indonesia, Laos, Malaysia, Myanmar, Thailand, Vietnam].

*Strobilanthes echinata* has been misidentified in the recent literature as *Tetraglochidium gigantodes* (Lindau) C. Y. Wu & C. C. Hu (*Strobilanthes gigantodes* Lindau) by D. Fang et al. (Guihaia 17: 38, 1997), C. C. Hu (FRPS 70: 157, 2002), and C. C. Hu and X. P. Fu (Higher Pl. China 10: 373, 2004).

楔叶马蓝 xie ye ma lan

*Dossifluga cuneata* Shakya, J. Jap. Bot. 50: 99. 1975.

Herbs to 30 cm tall, isophyllous. Stems 4-angled, glabrous. Petiole ca. 5 mm; leaf blade obovate to broadly elliptic, 4.5–7 × 2–3.5 cm, abaxially sparsely pilose along veins, adaxially glabrous and densely covered with cystoliths, secondary veins 6 or 7 on each side of midvein, base narrowly cuneate, margin serrate and ciliate, apex acuminate. Inflorescences axillary, subsessile clusters; bracts leaflike, obovate, 6–12 × 6–8 mm, cystoliths

prominent, margin dentate; bracteoles linear-oblanceolate, 2–4 mm. Calyx 1.2–1.5 cm, 5-lobed almost to base; lobes linear-lanceolate, 1–1.5 mm wide, subequal, margin ciliate. Corolla blue, campanulate, 3–4 cm, outside glabrous except for cilia along veins, inside glabrous except for trichomes retaining style; tube basally cylindric and ca. 2 mm wide for ca. 1.2 cm then gradually widened to ca. 1.4 cm at mouth; lobes orbicular, ca. 8 mm in diam. Stamens 4, included; filaments glabrous; shorter filament pair ca. 3 mm, equal, incurved; longer filament pair ca. 8 mm, unequal, incurved; anther thecae spherical, ca. 1.2 mm in diam., nodding; pollen type 3. Ovary glabrous; style 2.8–3.2 cm. Capsule obovoid, ca. 10 × 3 mm, glabrous, 4-seeded. Seeds suborbicular in outline, ca. 1.5 mm, long pilose; areole large. Fl. Aug.

Forests; ca. 2500 m. Xizang (Nyalam) [Nepal].

**101. *Strobilanthes glomerata*** (Nees) T. Anderson, J. Linn. Soc., Bot. 9: 475. 1867.

球序马蓝 qiu xu ma lan

*Goldfussia glomerata* Nees in Wallich, Pl. Asiat. Rar. 3: 88. 1832.

Subshrubs to 1 m tall, strongly anisophyllous. Stems and branches 4-angled to subterete, setose. Petiole 0.6–3 cm, densely pubescent; leaf blade elliptic, broadly elliptic, or narrowly ovate, 5.5–19 × 2.7–10 cm, smaller of pair ca. 1/5 size of larger one, both surfaces densely pubescent with purplish trichomes, secondary veins 5–7 on each side of midvein, base oblique, rounded, and decurrent onto petiole, margin serrate with shallow widely spaced teeth and ciliate with red multicellular trichomes, apex acuminate. Inflorescences capitate; bracts variable in size and shape; outer bracts sterile, lanceolate, ca. 3 × 0.6 cm, densely pubescent with purplish trichomes, margin serrate; inner bracts lanceolate, ca. 1.6 × 0.4 cm, margin entire and ciliate, apex acuminate; bracteoles lanceolate, 8–12 × ca. 2 mm, pubescent. Calyx ca. 1.5 cm, 5-lobed almost to base; lobes 10–13 × ca. 1.5 mm, slightly unequal, outside pubescent with purplish trichomes especially apically, inside glabrous. Corolla purple, 4–6 cm, subventricose, outside pubescent with gland-tipped trichomes, inside glabrous except for trichomes retaining style; tube basally cylindric and ca. 2 mm wide for 0.6–1.6 cm then bent to ca. 90° and gradually widened to ca. 1.7 cm at mouth; lobes ovate, ca. 4 × 7 mm, apex retuse. Stamens 4, included; filaments glabrous, shorter pair ca. 1.5 mm, longer pair 7–9 mm and unequal; anther thecae obliquely ellipsoid, ca. 1.5 mm; pollen type 3. Ovary glabrous; style ca. 3 cm, glabrous. Capsule fusiform, ca. 12 × 3 mm, glabrous, 4-seeded. Seeds ovate in outline, ca. 2 × 2 mm, densely pubescent; areola small. Fl. Aug–Oct.

Forests; 1000–1500 m. Xizang (Cona) [India].

*Strobilanthes glomerata* is introduced in Indonesia.

头花马蓝 tou hua ma lan

*Goldfussia capitata* Nees in Wallich, Pl. Asiat. Rar. 3: 88. 1832.

Subshrubs or perennial herbs, to 1 m tall, much branched, anisophyllous. Stems decumbent to ascending, pilose, glabrescent. Petiole 1–3 cm; leaf blade lanceolate, elliptic-ovate, or elliptic, 4–14 × 1.5–9 cm, abaxially pubescent along veins but often glabrescent, adaxially sparsely pilose and with numerous cystoliths, secondary veins 6 or 7 on each side of midvein, base attenuate and oblique, margin serrate, apex acuminate. Inflorescences axillary, pedunculate heads, ovoid to ellipsoid, 1.5–2 × 1–3 cm, 1–3 per axil, sometimes forming a panicle of heads with reduced leaves; peduncle 1–6 cm, glabrous or pubescent, simple or branched, sometimes with a sterile bract at branching point; outer floral bracts sterile, ovate, 1.5–2.3 cm, not overtopping capitula, concave, deciduous as flowers open, pubescent or glabrous, margin crenate, apex obtuse, acute, or acuminate; inner bracts oblong-elliptic, 1.3–1.6 cm, margin entire or with 1 or 2 teeth; bracteoles oblong-elliptic, 7–11 mm, caducous, pilose. Calyx pale green, ca. 1.2 cm, accrescent to ca. 2 cm in fruit, 5-lobed almost to base; lobes linear-oblongate, equal, outside pubescent, margin ciliate. Corolla blue, 4.3–5.5 cm, straight, outside thinly pilose, inside glabrous except for trichomes retaining style; tube basally cylindric and narrow for ca. 1.5 cm then gradually widened to ca. 1.5 cm at mouth; lobes oblong, ca. 5 × 4 mm. Stamens 4, included; filaments glabrous, shorter pair ca. 2 mm and nodding, longer pair 7–8 mm and unequal; anther thecae spherical, ca. 1.2 mm in diam., incurved; pollen type 3. Ovary gland-tipped pilose; style ca. 3.5 cm, thinly pilose. Capsule oblong, 1.4–2 cm, apical half gland-tipped pilose, 4-seeded. Seeds ovate in outline, ca. 3 × 2.5 mm, pubescent; areola small. Fl. Sep–Feb.

Forests; 900–1700 m. Xizang (Mainling, Nyalam) [Bhutan, India, Myanmar, Nepal].

**103. *Strobilanthes speciosa* Blume, Bijdr. 799. 1826.**

美丽马蓝 mei li ma lan

*Baphicacanthus multibractealatus* Hung T. Chang & H. Zhu; *Goldfussia speciosa* (Blume) Bremekamp.

Subshrubs or herbs, to 1.2 m tall, perennial, anisophyllous. Stems ascending, apically pubescent. Petiole 0.5–2 cm, hirsute; leaf blade of smaller pair ovate to suborbicular and ca. 3 × 1.6 cm and of larger pair ovate and 12.5–16.5 × 6–8 cm, both surfaces hirsute, adaxially with numerous prominent linear cystoliths, secondary veins 7–9 on each side of midvein, base oblique and decurrent onto petiole, margin irregularly crenate-dentate, apex acute to caudate. Inflorescences axillary, heads, narrowly ovoid, 1–2.5 × 1–1.5 cm, borne on simple or 3-furcate branches; peduncle 1–3 cm, simple or branched and sometimes with a sterile bract at branching point, hirsute; sterile bracts resembling small leaves; floral bracts lanceolate, 1.2–2.3 × 0.7–1 cm, overtopping capitula, abaxially brownish pubescent with gland-tipped trichomes, margin entire and ciliate, apex acuminate and falcate; bracteoles oblanceolate, 7–13 × ca. 2 mm, abaxially pilose, margin ciliate. Calyx outside hirsute, 5-lobed almost to base; lobes oblanceolate, 7–15 × ca. 0.2 mm, subequal, margin ciliate, apex acute. Corolla purplish blue, 3.5–5 cm, ventricose, outside gland-tipped pilose, inside glabrous; tube basally cylindric and ca. 2.5 mm wide for ca. 1 cm then gradually widened to ca. 1.5 cm at mouth; lobes ca. 5 × 4 mm,

apex rounded. Stamens 4, included; filaments glabrous, shorter pair 1–2 mm and nodding, longer pair 4–6 mm; anther thecae spherical, ca. 1.2 mm in diam., incurved; pollen type 3. Ovary comose; style ca. 3.7 cm; stigma unequally 2-lobed. Capsule fusiform, 1.5–1.8 × ca. 0.4 cm, apically with a few gland-tipped trichomes, 4-seeded. Seeds brown, ovate in outline, ca. 3 × 2.5 mm, appressed pilose. Fl. Sep–Dec, fr. Jan.

Forests; 500–1800 m. Yunnan [Cambodia, Indonesia, Laos, Malaysia, Thailand, Vietnam].

This species intergrades with *Strobilanthes capitata*, from which it differs in little more than the narrower heads overtopped by the floral bracts and may not be distinct.

*Strobilanthes speciosa* has been misidentified as *Goldfussia glomerata* Nees by C. C. Hu (FRPS 70: 164. 2002).

**104. *Strobilanthes kingdonii* J. R. I. Wood, Edinburgh J. Bot. 51: 244. 1994.**

合页草 he ye cao

Subshrubs 0.5–3 m tall, branched, slightly anisophyllous. Stems 4-angled, bifariously pilose, apically glabrescent. Petiole 0.5–2 cm, pubescent; leaf blade ovate, 5–12 × 1.5–5 cm, both surfaces pubescent, abaxially slightly paler, secondary veins 5–8 on each side of midvein, base long attenuate, margin crenate to serrate, apex acute to acuminate and slightly falcate. Inflorescences axillary, dense headlike spikes, borne on a short usually simple or (2 or) 3-furcate peduncle; peduncle 1–3 cm, pilose; rachis sparsely pilose; outer sterile bracts leaflike, lanceolate to narrowly oblong-elliptic, 1.3–2.7 × 0.3–0.8 cm, pubescent, margin dentate; floral bracts ovate, ovate-elliptic, or subrhomboidal, 7–10 × 2–4 mm, persistent, abaxially ciliate with long non-glandular white trichomes and scattered shorter white trichomes, apex obtuse; bracteoles linear-oblongate, 4–8 × 1.5–2 mm, persistent, margin ciliate with long white trichomes and sometimes stalked glands at apex, apex obtuse to acute. Calyx outside densely pilose with scattered long white trichomes mixed with numerous gland-tipped trichomes, inside glabrous, subequally 5-lobed to base, not accrescent; lobes narrowly oblong to lanceolate, 7–9 × ca. 1.5 mm, apex acute. Corolla purple, blue, or rose, 3.5–4.2 cm, straight, outside pilose, inside glabrous except for trichomes retaining style; tube basally cylindric and 1.5–2 mm wide for ca. 8 mm then ventricose and widened to ca. 1.2 cm at mouth; lobes broadly ovate, ca. 7 × 6 mm, apex rounded. Stamens 4, included; shorter filament pair 1.5–3.5 mm, glabrous; longer filament pair 6–8 mm, pilose; anther thecae shortly ellipsoid, ca. 1.2 mm, incurved; pollen type 3. Ovary apically gland-tipped pilose; style 1.7–1.9 mm, sparsely pilose. Capsule oblong, ca. 1 cm, gland-tipped pilose, 4-seeded. Seeds ca. 3 × 1.8 mm, pubescent. Fl. Mar, Jul, Nov.

● Evergreen broad-leaved forests by streams; 1500–2800 m. Xizang (Médog, Zayü), Yunnan (Fugong).

*Strobilanthes kingdonii* was mistakenly treated as *Sympagis monadelpha* (Nees) Bremekamp by C. C. Hu (FRPS 70: 176. 2002) and C. C. Hu and X. P. Fu (Higher Pl. China 10: 378. 2004) and also as *Sympagis petiolaris* (Nees) Bremekamp by C. C. Hu (FRPS 70: 178. 2002).

Herbs 30–60 cm tall, erect, much branched, isophyllous. Stems slender, decumbent and often rooting at nodes, bifariously pilose or glabrescent. Petiole 0–3 cm but apically leaves sessile, densely yellowish brown pilose; leaf blade elliptic, ovate, obovate, or ovate-lanceolate, 1–7(–11) × 1–4(–6) cm, abaxially glabrous or pilose, adaxially dark green and glabrous or sparsely pilose, secondary veins 4–7 on each side of midvein, base cuneate and often decurrent onto petiole, margin serrulate to crenulate, apex acute. Inflorescences terminal or axillary from apical leaf axils, spikes, 2–5 cm; peduncle 0–6 cm, pubescent; sterile bracts resembling reduced leaves; floral bracts imbricate, oblong to ovate-elliptic, 1.1–2.5 cm, concave, caducous or somewhat persistent after flowering, dull green, abaxially pubescent and covered with cystoliths, margin usually crenulate; bracteoles narrowly oblong-elliptic, 6–7 × 1–2 mm, scarious and caducous, abaxially puberulent. Calyx 0.8–1.4 cm, outside gland-tipped ciliate, 5-lobed almost to base; lobes linear-oblong with one distinctly longer than others, apex acute. Corolla purplish red to blue, 3.5–5 cm, ventricose, outside pubescent; tube basally cylindric and ca. 2 mm wide for ca. 1.2 cm then slightly curved and gradually widened to ca. 1.2 cm at mouth; lobes orbicular, 5–6 mm in diam. Stamens 4, included; filaments subglabrous, shorter pair ca. 2 mm and strongly reflexed, longer pair ca. 7 mm; anther thecae subspherical, ca. 1.2 mm; pollen type 3. Ovary comose; style 3.2–3.5 cm. Capsule fusiform, ca. 1.2 cm, glabrous except for few trichomes at tip, 4-seeded. Seeds light brown, ovate in outline, ca. 2.5 × 2 mm, densely pubescent; areola small, glabrous. Fl. Aug–Nov.

Dry grasslands and open *Pinus* forests; 1000–2600 m. Guizhou, Sichuan, SE Xizang, Yunnan [Bhutan, India, Nepal].

*Strobilanthes lamiifolia* was misidentified as *S. oligocephala* by Q. H. Chen (Fl. Guizhou. 10: 257. 2004).

**106. *Strobilanthes penstemonoides*** (Nees) T. Anderson, J. Linn. Soc., Bot. 9: 477. 1867 [*“pentstemonoides”*].

*Goldfussia ningmingensis* (D. Fang & H. S. Lo) C. Y. Wu ex C. C. Hu.

Herbs or subshrubs, to 40 cm tall, branched, anisophyllous. Stems 4-angled, sulcate, glabrous except for pubescent nodes. Petiole 3–7 cm; leaf blade ovate-elliptic, smaller of pair 1–1.7 × 0.7–1.2 cm and larger one 3–5.5 × 2–3 cm, both surfaces glabrous, abaxially cystoliths prominent, whitish, and dense along veins, adaxially with prominent linear cystoliths, secondary veins 4–6 on each side of midvein, base subrounded, margin serrulate, apex acute to acuminate. Inflorescences axillary or terminal, headlike simple spikes, 3- or 4-flowered; peduncle ca. 3 cm, apically thickened; bracts elliptic, 6–12 mm, caducous, abaxially densely covered with cystoliths, margin ciliate, apex acute; bracteoles linear, ca. 5 × 1 mm, caducous, abaxially sparsely hirsute. Calyx 5-lobed almost to base; lobes oblong-elliptic, 6–7 × ca. 1.5 mm, slightly unequal with one longer than others, outside glabrous, margin ciliate. Corolla purple, ca. 4 cm, ventricose, outside glabrous, inside glabrous except for trichomes retaining style; tube basally cylindric and ca. 2.5 mm wide for ca. 1.2 cm then gradually widened to ca. 1.3 cm at mouth; lobes orbicular, ca. 6 mm in diam., apex emarginate. Stamens 4, included; filaments glabrous; shorter filament pair ca. 3 mm, equal, incurved; longer filament pair 6–8 mm, unequal, erect; anther thecae subspherical, ca. 1.3 mm in diam., nodding. Ovary sparsely gland-tipped pilose at tip; style ca. 3 cm, sparsely gland-tipped pilose at base. Capsule not seen. Fl. Dec.

• Limestone hills; 200–300 m. Guangxi (Ningming).

Known only from the type, *Strobilanthes ningmingensis* is very close to, and may be conspecific with, the very variable *S. dimorphotricha*, differing only in the non-glandular calyx, which may be only a development stage.

**108. *Strobilanthes dimorphotricha*** Hance, J. Bot. 21: 355. 1883.

球花马蓝 qiu hua ma lan

Herbs 40–150 cm tall, perennial, much branched, isophyllous or anisophyllous. Stems apically somewhat zigzag, glabrous or yellowish pubescent. Petiole 0.5–1.5 cm, sparsely pubescent or glabrous; leaf blade elliptic, elliptic-lanceolate, ovate, oblong, or oblong-elliptic, 1.5–15 × 0.5–4.5 cm, smaller of pair 1/3–2/3 size of larger one, adaxially dark green, white appressed pubescent, and with slightly prominent cystoliths, abaxially glabrous or whitish pubescent along veins and with or without multicellular trichomes, secondary veins 5–7 on each side of midvein and sometimes forming a net near margin, base cuneate to attenuate, margin serrulate, apex acuminate, caudate, or acute. Inflorescences axillary or terminal, headlike spikes, subspherical, very compact, 2- or 3-flowered, usually 1–3 spikes forming a forked panicle; peduncle ca. 2.5 cm, glabrous or pubescent; bracts ovate-elliptic, 1–1.3 cm, caducous, glabrous, apex acute to acuminate; bracteoles lanceolate, ca. 5 mm, caducous. Calyx 7–9 mm, accrescent to 1.5–1.7 cm, 5-lobed almost to base; lobes lanceolate, gland-tipped pubescent, one lobe slightly longer than others. Corolla violet, 3–4 cm, slightly curved, outside subglabrous to sparsely pilose, inside glabrous except for trichomes retaining style; tube basally cylindric and ca. 2 mm wide for ca. 5 mm then ventricose and gradually widened to ca. 1.5 cm at mouth; lobes orbicular, 5–6 mm in diam., subequal, apex emarginate. Stamens 4, included; filaments glabrous; shorter filament pair ca. 2 mm, equal, incurved; longer filament pair 5–7 mm, unequal, erect; anther thecae spherical, ca. 1 mm in diam.; pollen type 3. Ovary pilose; style ca. 3.5 cm, pilose. Capsule oblong-clavate, 1.4–1.8 cm, gland-tipped pubescent, 4-seeded. Seeds ca. 2.5 × 2.5 mm, lenticular, pubescent. Fl. Aug–Feb(–Apr).

Thickets on limestone hills, streamsides, thickets by streams; 200–2200 m. Chongqing, Fujian, Guangdong, Guangxi, Guizhou, Hainan, Hubei, Hunan, Jiangxi, Sichuan, Taiwan, Yunnan, Zhejiang [India, Laos, Myanmar, Thailand, Vietnam].

*Strobilanthes dimorphotricha* has mistakenly been considered to be synonymous with *Goldfussia* (= *Strobilanthes*) *penstemonoides* by many authors.

卵苞马蓝 luan bao ma lan

*Goldfussia ovatibracteata* (H. S. Lo & D. Fang) C. Y. Wu ex C. C. Hu.

Herbs or subshrubs, 0.5–2 m tall, branched, anisophyllous. Stems 4-angled to subterete, sulcate, retrorsely pubescent. Petiole 3–10 mm, grooved, pubescent; leaf blade ovate-elliptic to rarely ovate, smaller of pair 1–4 × 0.5–2 cm and larger one 3–10.5 × 1.5–4.5 cm, glabrous, cystoliths prominent, whitish, and dense along veins, secondary veins 3–6 on each side of midvein, base attenuate and oblique, margin serrulate, apex acute. Inflorescences axillary, pedunculate heads, 3- or 4-flowered, sometimes forming small axillary panicles; peduncle 1–3 cm, simple or 3-furcate, pubescent, apically thickened; bracts broadly ovate to rarely obovate, 4–13 mm, caducous, abaxially subglabrous and densely covered with cystoliths, margin ciliate, apex acute; bracteoles linear, ca. 5 × 2 mm. Calyx 5-lobed almost to base; lobes linear to lanceolate, 6–7 mm, slightly unequal with one longer than others, pilose. Corolla purple, 3.5–4.3 cm, ventricose, outside pilose, inside glabrous except for trichomes retaining style; tube basally cylindric and ca. 2

mm wide for ca. 8 mm then gradually widened to ca. 1 cm at mouth; lobes ovate, ca. 4 mm, apex emarginate. Stamens 4, included; filaments glabrous; shorter filament pair ca. 2 mm, incurved; longer filament pair 7–8 mm, unequal, erect; anther thecae subspherical, ca. 1.3 mm in diam. Ovary gland-tipped pilose at tip; style 2.8–3.5 mm. Capsule 15–16 × 3–4 mm, oblong, apically gland-tipped pilose, 4-seeded. Seeds ovate in outline, ca. 2 × 2 mm, pubescent. Fl. Oct, fr. Dec.

- Forests; 300–900 m. Guangxi.

**112. *Strobilanthes hupehensis*** W. W. Smith, Notes Roy. Bot. Gard. Edinburgh 10: 193. 1918.

湖北马蓝 hu bei ma lan

Herbs 40–60 cm tall, isophyllous. Stems erect, glabrous. Petiole ca. 1 cm, glabrous; leaf blade lanceolate to ovate-lanceolate, 9–14 × 2.5–4 cm, glabrous, secondary veins 5–8 on each side of midvein, base cuneate, margin serrate, apex acuminate. Inflorescences axillary, headlike spikes, compact, simple; peduncle 1–11 cm, very slender; bracts ovate, ca. 5 × 3 mm, caducous, apex acute; bracteoles absent. Calyx 5–8 mm, outside gland-tipped pilose, 5-lobed almost to base; lobes linear-oblong with one much longer than others, apex acute. Corolla purplish blue, 2.5–3.5 cm, straight, outside pilose, inside glabrous except for trichomes retaining style; tube basally cylindric and ca. 2 mm wide for ca. 1 cm then gradually widened to ca. 1 cm at mouth; lobes oblong, ca. 4 × 4 mm, apex obtuse. Stamens 4, included; filaments glabrous; shorter filament pair ca. 3 mm, equal, incurved; longer filament pair 6–7 mm, unequal, erect; anther thecae spherical, ca. 1.2 mm in diam., nodding; pollen type 3. Ovary sparsely pilose; style ca. 2.6 cm. Capsule oblong, ca. 1 cm, 4-seeded. Seeds ovate in outline, ca. 3 × 3 mm, pubescent. Fl. Jul–Oct.

- Forests; 200–1800 m. Hubei, Hunan.

The very slender peduncles combined with the isophyllous habit make *Strobilanthes hupehensis* very distinctive.

**113. *Strobilanthes oxycalycina*** J. R. I. Wood, Edinburgh J. Bot. 51: 250. 1994.

尖萼马蓝 jian e ma lan

Subshrubs 1–2.5 m tall, forming small bushes, isophyllous or slightly anisophyllous. Stems rounded, somewhat sulcate, glabrous, apically densely covered with whitish cystoliths. Petiole 0.5–1.7 cm, glabrous; leaf blade broadly elliptic to oblong-elliptic, 5–14 × 2–7 cm, both surfaces glabrous with prominent cystoliths, secondary veins 6–9 on each side of midvein, base cuneate, margin serrate, apex acuminate. Inflorescences terminal, abbreviate to headlike spikes, simple or 3-furcate branched, often with a few flowers some distant below head; peduncle 2–4 cm, glabrous; bracts ovate, ca. 7 × 3 mm, herbaceous, caducous, thinly pubescent, apex shortly acuminate; bracteoles oblong-obovate, ca. 3 × 1–2 mm, apex acute. Calyx ca. 9 mm, accrescent to ca. 1.1 cm in fruit, 5-lobed almost to base; lobes linear to narrowly oblong-elliptic, equal, outside pubescent with gland-tipped trichomes, inside glabrous, apex acute. Corolla blue, 3–4 cm, straight or slightly curved, outside gland-tipped pubescent, inside glabrous except for trichomes retaining style;

tube basally cylindric and ca. 1 mm wide for ca. 1 cm then gradually widened to ca. 9 mm at mouth; lobes ovate, ca. 5 × 5 mm, apex obtuse. Stamens 4; filaments finely pubescent, shorter pair ca. 4 mm, longer pair 7–8 mm, unequal, and slightly exerted; anther thecae spherical, ca. 1.3 mm in diam., incurved; pollen type 3. Ovary gland-tipped pilose at tip; style ca. 2.5 cm, pilose. Capsule oblong, 1.1–1.3 cm, gland-tipped pubescent on apical half especially near tip, 4-seeded. Seeds ovate in outline, ca. 3 × 3 mm, densely covered with appressed trichomes. Fl. Dec–Feb.

● Forests; 600–1000 m. Xizang (Mêdog).

*Goldfussia discolor* Nees in A. Candolle, Prodr. 11: 172. 1847; *Difflugossa nagaensis* Bremekamp; *Strobilanthes discolor* var. *nudicalyx* C. B. Clarke.

Subshrubs to 1.8 m tall, strongly anisophyllous. Stems and branches 4-angled to subterete, sulcate, glabrous, apically somewhat zigzag. Petiole 0.5–2.5 cm, sulcate, glabrous; leaf blade elliptic to ovate-elliptic, 3–14 × 2–6.5 cm, glabrous, both surfaces with prominent cystoliths, abaxially whitish, adaxially dark green, secondary veins 6–8 on each side of midvein, base attenuate, shortly decurrent onto petiole, and often slightly oblique, margin serrate, apex acuminate to caudate and often falcate. Inflorescences axillary, pedunculate heads, often with secondary branching and becoming paniculate; floral bracts oblanceolate to spatulate, 3–5 × 1–2 mm, rapidly caducous, glabrous; bracteoles oblanceolate but often apparently absent. Calyx 5-lobed almost to base; lobes at anthesis linear-oblong, 5–7 × ca. 1 mm, subequal, apically pilose but otherwise glabrous, apex obtuse; lobes in fruit subspatulate, accrescent to ca. 1 cm, often gland-tipped pilose. Corolla violet, 3.2–3.8 cm, outside glabrous, inside glabrous except for trichomes retaining style; tube basally cylindric and ca. 2 mm wide for 8–10 mm then gradually widened to ca. 1 cm at mouth; lobes ovate, 5–6 × 6–7 mm, apex rounded. Stamens 4; shorter filament pair 1.5–2 mm, strongly reflexed, glabrous; longer filament pair 7–8 mm, glabrous or with a few trichomes; anther thecae obliquely ellipsoid, ca. 1.2 mm, incurved; pollen type 3. Ovary glabrous; style 2.3–2.8 cm, hirsute. Capsule narrowly obovoid, ca. 10 × 2.5 mm, glabrous except for a few apical glands, 4-seeded. Seeds ovate in outline, ca. 3 × 2 mm, pilose. Fl. Nov–Feb.  $2n = 22$ .

Forests. Xizang (Cona) [India].

**115. *Strobilanthes rhombifolia*** C. B. Clarke in J. D. Hooker, Fl. Brit. India 4: 461. 1884.

短柄马蓝 duan bing ma lan

*Goldfussia sessilis* Nees.

Herbs or subshrubs, strongly anisophyllous. Stems 4-angled, erect, glabrous. Petiole 0–10 mm but apical leaves sessile; leaf blade rhomboidal-elliptic, 2–15 × 1.5–10 cm, both surfaces green and with abundant cystoliths, secondary veins ca. 6 on each side of midvein, base cuneate and shortly decurrent onto petiole, margin serrate, apex acute. Inflorescences axillary, capi-

tula borne on simple or 2(or 3)-furcately branched peduncles, 2–10 cm; peduncle sulcate, bifariously pubescent with trichomes in sulci; sterile bracts leaflike, ovate, ca. 0.5 × 0.5 mm, relatively persistent; floral bracts obovate to oblong-obovate, ca. 6 × 1.5 mm, soon scarious and caducous; bracteoles not observed. Calyx subequally 5-lobed to base; lobes linear-elliptic, 7–12 × ca. 1.2 mm, pubescent and with sessile glands. Corolla blue, 4–4.5 cm, outside sparsely gland-tipped pilose but glabrescent, inside glabrous except for trichomes retaining style; tube basally cylindric and ca. 2 mm wide for ca. 1 cm then widened to 1.2–1.7 cm at mouth; lobes suborbicular, ca. 6 × 7 mm. Stamens 4, included; filaments glabrous, shorter pair ca. 2 mm, longer pair ca. 5 mm; anther thecae obliquely ovoid, ca. 1.5 × 1.2 mm, incurved. Ovary narrowly ovoid, apically gland-tipped; style ca. 2.7 cm, slender, glabrous apart from a few trichomes on basal part. Capsule not seen. Fl. Dec.

Forests. Xizang (Cona) [India].

**116. *Strobilanthes multidens*** C. B. Clarke in J. D. Hooker, Fl. Brit. India 4: 461. 1884.

*Goldfussia multidens* (C. B. Clarke) Bremekamp; *Pteracanthus agrestis* (C. B. Clarke) Bremekamp; *Strobilanthes agrestis* C. B. Clarke; *S. agrestis* var. *hemiotis* C. B. Clarke; *S. penstemonoides* (Nees) T. Anderson var. *multidens* (C. B. Clarke) Kuntze.

Subshrubs to 2 m tall, usually pubescent, strongly anisophyllous. Leaf blade ovate-elliptic, 2–20 × 1–9.5 cm, usually pubescent at least on veins, base attenuate and oblique, margin serrate, apex shortly acuminate and sometimes falcate. Inflorescences axillary, usually capitate, borne on 3-furcate axillary gland-tipped pilose peduncles, sometimes with scattered flower pairs below heads, rarely of branched spikes with flower pairs only; bracts ovate-suborbicular, 3–6 mm, concave, caducous, gland-tipped pilose, apex acute; bracteoles absent. Calyx 6–10 mm at anthesis, gland-tipped pubescent; lobes linear, accrescent to ca. 1.6 cm with one lobe 2–3 mm longer than others, apex acute. Corolla blue, 3.5–4.8 cm, outside glabrous, inside glabrous except for trichomes retaining style; tube basally cylindric and narrow then widened to ca. 1.5 cm at mouth. Stamens 4; shorter filament pair ca. 1 mm, recurved; longer filament pair 5–6 mm, slightly unequal, glabrous; anther thecae subspherical, ca. 1 mm, incurved; pollen type 3. Ovary gland-tipped; style ca. 2.5 cm, glabrous except for a few trichomes basally. Capsule oblong, 13–18 × ca. 3 mm, apically gland-tipped pilose, 4-seeded. Seeds ovate in outline, ca. 3 × 2 mm, appressed pubescent. Fl. Sep–Apr.

Streamsides; 1500–2000 m. Xizang (Cona) [Bhutan, India, Nepal].

**117. *Strobilanthes oligocephala*** T. Anderson ex C. B. Clarke in J. D. Hooker, Fl. Brit. India 4: 461. 1884.

*Difflugossa paupera* (C. B. Clarke) Bremekamp; *Goldfussia oligocephala* (T. Anderson ex C. B. Clarke) Bremekamp; *G. thomsonii* Hooker; *Strobilanthes oligocephala* var. *treutleri* C. B. Clarke; *S. paupera* C. B. Clarke.

Subshrubs 30–50 cm tall, much branched, anisophyllous. Stems decumbent and basally rooting at nodes but eventually erect, pubescent to subglabrous. Petiole 0.5–4 cm but apicalmost leaves sessile; leaf blade rhombic, elliptic, narrowly ovate, or apicalmost suborbicular, 4–12 × 1.5–6 cm, abaxially glaucous and glabrous or pilose along veins and margin, adaxially green, glabrous, and densely covered with prominent cystoliths, secondary veins 5–7 on each side of midvein, base attenuate and decurrent onto petiole, margin serrate, apex abruptly acuminate and falcate. Inflorescences terminal or arising from apical leaf axil, simple or branched, subcapitate with ca. 2 flower pairs to shortly spicate, 4–5 cm; peduncle 1–5 cm, glabrous or pubescent; bracts ovate to oblong, 0.8–1.5 × 0.7–1.3 cm, caducous, green when young but soon scarious, often becoming gland-tipped pilose, apex acute; bracteoles ca. 2 × 1 mm, caducous so often appearing absent. Calyx 1–1.8 cm, gland-tipped pilose, 5-lobed almost to base; lobes narrowly lanceolate with one slightly longer than others, apex acuminate. Corolla blue or white, 3.5–5 cm, ventricose, outside gland-tipped pubescent but sometimes only on lobes, inside glabrous except for trichomes retaining style; tube basally cylindric and ca. 2.5 mm wide for 1–1.5 cm then bent and widened to ca. 1 cm at mouth; lobes oblong, ca. 6 × 5 mm, apex obtuse. Stamens 4, included; filaments sparsely hirsute, shorter pair ca. 4 mm, longer pair ca. 7 mm; anther thecae oblong-ovoid, ca. 2 × 1.2 mm. Ovary comose; style 2.8–3.2 cm. Capsule ca. 1.4 cm, apically gland-tipped pilose, 4-seeded. Seeds ovate in outline, ca. 3 × 2.5 mm, densely pubescent. Fl. Jul–Nov.

Thickets on limestone hills; 2600–2800 m. Xizang (Cona) [Bhutan, India, Nepal].

墨脱马蓝 mo tuo ma lan

*Goldfussia medogensis* H. W. Li, Fl. Xizang. 4: 413. 1985.

Subshrubs 2–3 m tall, anisophyllous. Stems erect, slightly sulcate, bifariously puberulent. Petiole 0–5 mm with smaller leaves subsessile; leaf blade ovate, 3–13 × 2–5.5 cm, smaller of pair ca. 2/3 size of larger one, both surfaces glabrous, abaxially pale green, adaxially green and with numerous cystoliths, base rounded to subcordate, margin serrulate, apex acuminate and falcate. Inflorescences axillary, spikes, 3–6 cm, simple or 2-furcate; peduncle 2–5 cm; rachis bifariously pubescent; bracts obovate-oblancoate, 2.5–3 mm, herbaceous, caducous, glabrous; bracteoles similar to bracts but ca. 1.5 mm. Flowers 3–11 mm apart on rachis. Calyx ca. 1.2 cm in flower, 5-lobed to base; lobes narrowly oblong-elliptic, subequal, glabrous or gland-tipped pubescent, apex acuminate. Corolla yellowish white but dull purple on lobes, campanulate, ca. 2.5 cm, straight, outside glabrous, inside glabrous except for trichomes retaining style; tube basally cylindric and ca. 2 mm wide for ca. 1 cm then gradually widened to 1–1.5 cm at mouth; lobes broadly ovate, ca. 3 × 8 mm, apex rounded. Stamens 4, ± exserted; filaments basally pilose, apically glabrous, shorter pair 7–8 mm, longer pair 9–10 mm; anther thecae ca. 1 mm, incurved; pollen type 3. Ovary glabrous; style 2.7–2.8 cm, glabrous. Capsule not seen. Fl. Jul–Aug.

• Forests; 1900–2500 m. Xizang (Mêdog).

**119. *Strobilanthes thomsonii*** T. Anderson, J. Linn. Soc., Bot. 9: 478. 1867.

汤氏马蓝 tang shi ma lan

Subshrubs 1–2 m tall, pliestesial, anisophyllous. Stems and branches 4-angled, sulcate, glabrous or thinly pubescent. Petiole 2–14 mm or leaves sessile, glabrous; leaf blade ovate to narrowly ovate-elliptic, 12–20 × 4–7 cm, abaxially pale, adaxially glabrous with abundant cystoliths, secondary veins 5–7 on each side of midvein, base cuneate and decurrent onto petiole, margin serrate, apex long acuminate and usually falcate. Inflorescences axillary, simple or branched spikes, 3–9 cm; floral bracts variable in shape, ovate, elliptic, oblanceolate, or spatulate, 4–6 × 2–3 mm, caducous, glabrous or gland-tipped pubescent; bracteoles linear, ca. 2.5 × 0.8 mm, caducous. Flowers imbricate on rachis or to 1 cm apart. Calyx 5–9 mm, accrescent to ca. 1.3 cm in fruit, subequally 5-lobed almost to base; lobes linear, glabrous or pilose, apex acute. Corolla purple, funnel-shaped, 2.5–3.2 cm, curved, outside pubescent, inside glabrous except for trichomes retaining style; tube basally cylindric and ca. 2 mm wide for ca. 1 cm then curved and widened to 1–1.3 cm at mouth; lobes ovate, ca. 4 × 4 mm, apex rounded. Stamens 4; filaments glabrous, shorter pair ca. 2 mm and strongly incurved, longer pair 3.5–4 mm; anther thecae subspherical, ca. 1 mm, incurved; pollen type 3. Ovary pubescent; style 2.5–3 cm, basally thinly pilose, apically glabrous. Capsule narrowly obovoid, gland-tipped pubescent, 4-seeded. Seeds orbicular in outline, ca. 2 mm in diam., densely covered with appressed trichomes. Fl. Sep–Nov.

Dry forests; ca. 2500 m. Xizang (Cona) [Bhutan, India].

弄岗马蓝 nong gang ma lan

*Perilepta longgangensis* (D. Fang & H. S. Lo) C. Y. Wu & C. C. Hu.

Subshrubs to 40 cm tall, strongly anisophyllous. Petiole 2–14 mm; leaf blade narrowly elliptic to rarely ovate-elliptic, smaller of pair (1.5–)3–8.5 × 0.8–3 cm and larger one 6–11.5 × 2.5–4.5 cm, both surfaces glabrous with prominent cystoliths, abaxially paler, secondary veins 4–6 on each side of midvein, base narrowly cuneate and decurrent onto petiole, margin denticulate, apex acuminate. Inflorescences axillary, spikes, 2–4 cm, 1–5-flowered; peduncle ca. 8 mm; bracts narrowly triangular, 3–4 × 1–1.5 mm, persistent, apex acute; bracteoles oblong, 5–6 × ca. 1 mm, glabrous. Flowers distant on rachis, usually only 1 sterile per node. Calyx ca. 5 mm, 5-lobed to near base; lobes resembling bracteoles, glabrous. Corolla purple, campanulate, ca. 2.5 cm, outside glabrous, inside glabrous except for trichomes retaining style; tube basally cylindric and narrow for ca. 5 mm then gradually widened to ca. 1.5 cm at mouth; lobes oblong, ca. 4 mm, apex emarginate. Stamens 4, included; filaments sparsely pilose, shorter pair ca. 2 mm, longer pair 6–8 mm; anther thecae subspherical, ca. 1 mm, incurved. Ovary glabrous; style ca. 1.8 cm, hirsute. Capsule not seen. Fl. Nov.

- Limestone slopes; 300–600 m. Guangxi (Longzhou).

**121. *Strobilanthes secunda*** T. Anderson, J. Linn. Soc., Bot. 9: 480. 1867.

偏花马蓝 pian hua ma lan

Shrubs 0.6–1.5 m tall, strongly but variably anisophyllous. Stems and branches 4-angled, often zigzag, sulcate, glabrous on ridges but rufous scurfy pubescent in channels. Petiole 3–8 cm, appressed pubescent; leaf blade oblong-elliptic, 4–18 × 1.5–7.5 cm, abaxially glabrous except for pubescent midvein, adaxially glabrous, secondary veins 6–9 on each side of midvein, base narrowly cuneate, margin entire to sinuate, apex acuminate. Inflorescences axillary, spikes, 3–18 cm, lax; sterile bracts resembling reduced leaves; floral bracts and bracteoles caducous, presence only known from presence of scars. Flowers solitary or in opposite pairs, 1.5–3 cm apart on rachis. Pedicel ca. 1 mm. Calyx 1.6–2 cm, subequally lobed to 3–4 mm above base; lobes linear-lanceolate, 1.2–1.6 cm, glabrous, apex finely acuminate. Corolla yellow, 2.6–3 cm, curved and somewhat ventricose, outside pubescent, inside glabrous except for trichomes retaining style; tube basally cylindric and 2–3 mm wide for ca. 6 mm then gradually widened to ca. 1.5 cm at mouth; lobes broadly ovate, ca. 9 × 4 mm, apex rounded. Stamens 4, included; shorter filament pair ca. 3 mm, glabrous; longer filament pair ca. 5 mm, basally villous; anther thecae oblong, ca. 2 × 1 mm, erect; pollen type 3. Ovary clavate, comose; style ca. 2.6 cm, pilose. Capsule narrowly oblong, ca. 20 × 2–2.5 mm, very shortly pubescent, 4-seeded, apex acute. Seeds ovate in outline, ca. 3.5 × 2.5 mm, pilose; areola densely pilose. Fl. Dec–Jan, fr. Jan–Apr.

Forests. Xizang (Mêdog) [Myanmar].

**122. *Strobilanthes mastersii*** T. Anderson, J. Linn. Soc., Bot. 9: 481. 1867.

瑞丽叉花草 rui li cha hua cao

*Difflugossa scoriarum* (W. W. Smith) E. Hossain; *D. shweliensis* (W. W. Smith) E. Hossain; *Goldfussia scoriarum* (W. W. Smith) Bremekamp; *Strobilanthes aborensis* Dunn; *S. scoriarum* W. W. Smith; *S. shweliensis* W. W. Smith.

Herbs 1–1.5 m tall, anisophyllous. Stems 4-angled, erect, sulcate, glabrous to gland-tipped pilose. Petiole 0–2 cm with apical leaves sessile, subglabrous; leaf blade ovate to ovate-lanceolate, 10–15 × 4–7 cm, glabrous except for a few cilia in teeth sinus, secondary veins 5–10 on each side of midvein, base broadly cuneate on basal leaves and rounded on apical leaves, margin serrate, apex acuminate. Inflorescences terminal, panicles of spikes, narrowly ovoid, to 30 cm; peduncle and rachis glabrous when young, densely gland-tipped pilose at maturity; sterile bracts leaflike, lanceolate to ovate, 5–15 × 3–8 mm, tardily caducous, apex acuminate; floral bracts elliptic, 5–6 × 2–3 mm, caducous, apex obtuse; bracteoles oblong, ca. 3 × 1 mm, caducous, abaxially glabrous. Flowers in opposite pairs or solitary through abortion. Calyx 0.8–1.2 cm, subglabrous with sessile glands when young but becoming densely gland-tipped pilose and accrescent, 5-lobed almost to base; lobes lanceolate, with 3 lobes slightly longer than other 2, apex acuminate. Corolla purple, 2.5–3 cm, straight, ventricose, outside glabrous, inside glabrous except for trichomes retaining style; tube basally

cylindric and ca. 2 mm wide for 1–1.3 cm then widened to ca. 1 cm at mouth; lobes orbicular, ca. 5 mm in diam. Stamens 4, included; filaments glabrous, shorter pair ca. 3 mm, longer pair ca. 6 mm; anther thecae obliquely ellipsoid, ca. 0.8 × 1 mm, incurved; pollen type 3. Ovary slightly pilose at tip; style ca. 2.1 cm, slender, sparsely pilose on basal part. Capsule clavate, ca. 1.5 cm, apically gland-tipped pilose, 4-seeded. Seeds brown, ovate in outline, ca. 2.5 × 2 mm; areola small, verrucose. Fl. Sep–Jan.

Forests on mountain slopes; ca. 1500 m. Xizang (Mêdog), Yunnan [India].

*Strobilanthes mastersii*, like *S. hamiltoniana*, commonly has a glabrous inflorescence when it is young but becomes gland-tipped pilose as it matures.

**123. *Strobilanthes tenax*** Dunn, Bull. Misc. Inform. Kew 1920: 209. 1920.

结壮马蓝 jie zhuang ma lan

Subshrubs to 1 m tall. Stems 4-angled, sulcate, gland-tipped pubescent. Petiole 2–5 mm but apical leaves sessile; leaf blade lanceolate, 8–10 × 2.5–4 cm, glabrous, cystoliths numerous, linear, and prominent, secondary veins 4–6 on each side of midvein, base cuneate, margin serrate, apex acuminate. Inflorescences terminal, a panicle of branched spikes, 3–12 cm; rachis gland-tipped pilose; sterile bracts sessile, leaflike, oblong-lanceolate to ovate, 8–12 × 3–5 mm; floral bracts oblong-elliptic, 5–7 × ca. 2 mm, scarious and early caducous, sparsely gland-tipped pilose, apex obtuse; bracteoles apparently absent. Flowers sessile, with opposite pairs 1–2.5 cm apart on rachis. Calyx ca. 1 cm, outside gland-tipped pubescent, 5-lobed almost to base; lobes linear, apex acute. Corolla color unknown, ca. 3 cm, straight, outside glabrous, inside glabrous except for trichomes retaining style; tube basally cylindric and 1–2 mm wide for ca. 0.8 cm then abruptly widened to ca. 1 cm at mouth; lobes broadly ovate, 5–6 × ca. 3 mm, apex rounded. Stamens 4, included; filaments glabrous, shorter pair 1–2 mm, longer pair 3–4 mm; anther thecae obliquely ellipsoid, ca. 1.5 mm, incurved; pollen type 3. Ovary obovoid, ca. 2.5 mm, gland-tipped with a few apical trichomes; style ca. 1.9 cm, thinly pilose. Capsule narrowly obovoid, ca. 1.5 cm, gland-tipped pubescent, 4-seeded. Seeds immature. Fl. Mar.

- Forests; ca. 800 m. Xizang (Mêdog).

*Strobilanthes tenax* is only known from the type, and there are many errors in the protologue.

**124. *Strobilanthes hamiltoniana*** (Steudel) Bosser & Heine, Bull. Mus. Natl. Hist. Nat., B, Adansonia, Sér. 4, 10: 148. 1988.

叉花草 cha hua cao

*Ruellia hamiltoniana* Steudel, Nomencl. Bot., ed. 2, 2: 481. 1841, based on *Goldfussia colorata* Nees in Wallich, Pl. Asiat. Rar. 3: 89. 1832, not *Ruellia colorata* Blume (1826), nor Vellozo (1829); *Difflugossa colorata* (Nees) Bremekamp; *Strobilanthes colorata* (Nees) T. Anderson (1867), not Nees (1837).

Shrubs 0.5–1.5 m tall, much branched, anisophyllous. Stems 4-angled, sulcate, glabrous. Leaves petiolate or apical ones sessile or subsessile; petiole (0–)0.8–5(–8) cm, glabrous;

leaf blade lanceolate to ovate, smaller pair at least 2/3 size of larger one, 5–19 × 2–8.5 cm, glabrous, densely covered with linear cystoliths, secondary veins 4–7 on each side of midvein, base oblique to rarely slightly oblique and attenuate or on very large leaves subcordate, margin serrulate, apex acuminate. Inflorescences axillary or terminal, panicles, to 30 cm, much branched; rachis angled at ca. 60°, glabrous or rarely pubescent, gland-tipped in fruit; bracts green, broadly obovate, 3–5 × ca. 2 mm, concave, caducous, glabrous, becoming gland-tipped in fruit, margin entire, apex retuse; bracteoles green, oblanceolate to narrowly elliptic, 3–4 × ca. 1 mm, concave, caducous, glabrous, margin entire, apex retuse. Flowers solitary on each node, distant on rachis. Pedicel 1.5–5 mm, glabrous. Calyx 8–10 mm, accrescent to ca. 1.3 cm in fruit, glabrous, sometimes apically gland-tipped pubescent, becoming densely gland-tipped in fruit, 5-lobed almost to base; lobes narrowly elliptic with one longer than others, apex acute to sometimes retuse. Corolla white, lilac, or (in cultivated forms) deep pink with a white tube, 3.5–4 cm, subventricose, outside glabrous, inside glabrous except for trichomes retaining style; tube basally cylindric and ca. 2 mm wide for ca. 1.3 cm then slightly ventricose and gradually widened to 1.4–1.8 cm at mouth; lobes ovate, 4–5 × ca. 6 mm, apex rounded to retuse. Stamens 4, included; filaments glabrous; shorter filament pair ca. 1 mm, equal; longer filament pair 7–9 mm, unequal, erect; anther thecae white, spherical, ca. 1.2 mm in diam., partially recurved; pollen type 3. Ovary ca. 2.5 mm, glabrous; style ca. 3.8 cm, sparsely pubescent. Capsule green then dark purple, fusiform, 1–1.5 cm, glabrous or with gland-tipped trichomes, 4-seeded. Seeds ovate in outline, ca. 3 × 2 mm, with long trichomes; areola small. Fl. Dec–Jan.

Forests on mountain slopes; 800–2000 m. Xizang (Cona) [Bhutan, India, Myanmar, Nepal].

*Strobilanthes hamiltoniana* is an ornamental plant. It is widely cultivated in tropical countries and in conservatories in temperate climates. The species is sometimes naturalized, occasionally becoming an invasive weed as on the island of Réunion. Cultivated plants and plants of cultivated origin seem always to be glabrous, pink-flowered, and sterile with dispersal being by cuttings or shoots broken off by grazing animals.

"*Goldfussia tengyuehensis*" (C. Y. Wu, Index Fl. Yunnan. 2: 1675. 1984) belongs here but was not validly published.

**125. *Strobilanthes tenuiflora*** J. R. I. Wood, Kew Bull. 58: 691. 2003.

纤序马蓝 xian xu ma lan

Subshrubs to 1 m tall, anisophyllous. Stems 4-angled, sulcate, glabrous. Petiole 0.1–3.4 cm, usually very short on smaller leaves, often sulcate, glabrous; leaf blade ovate to ovate-elliptic, 1–13 × 0.5–8 cm, smaller of pair 1/4–1/3 size of larger one, glabrous except for multicellular trichomes in teeth sinuses, adaxially cystoliths prominent, secondary veins 5–7 on each side of midvein and abaxially prominent, base oblique and broadly cuneate, rounded, or slightly cordate, margin slightly serrate to subentire, apex acuminate. Inflorescences terminal, panicles, to 10 cm; peduncle to 3 cm, glabrous; rachis slender, glabrous, repeatedly 3-forked and bent to ca. 90°; bracts subulate, ca. 1 mm, caducous; bracteoles similar to bracts. Flowers 1 per node.

Calyx 4–6 mm, accrescent to ca. 8 mm in fruit, glabrous, 5-lobed almost to base; lobes oblong to oblong-lanceolate with one slightly longer than others, margin pale, apex emarginate. Corolla white, 3.2–4 cm, straight, outside glabrous, inside glabrous except for trichomes retaining style; tube basally cylindric and ca. 1.5 mm wide for 6–10 mm then slightly ventricose and gradually widened to ca. 1.5 cm at mouth; lobes ovate, ca. 5 × 5 mm, apex acute. Stamens 4, included; filaments glabrous, shorter pair ca. 0.5 mm, longer pair 4–5 mm; anther thecae spherical, ca. 1 mm in diam., partially recurved. Ovary glabrous; style 2.5–3.2 mm, glabrous. Capsule oblong, ca. 1.5 cm, glabrous, 4-seeded, apex acuminate. Seeds ovate in outline, ca. 2 × 1.5 mm, puberulent. Fl. Oct.

Forests; ca. 900 m. Yunnan (Cangyuan) [Thailand].

**126. *Strobilanthes euantha*** J. R. I. Wood, Kew Bull. 58: 697. 2003.

腾冲马蓝 teng chong ma lan

Herbs 0.5–1.5 m tall, perennial, slightly anisophyllous. Stems dark green, deeply sulcate and ridged, glabrous. Petiole 0–2.6 cm, glabrous; leaf blade ovate to ovate-elliptic, 4–20 × 3–12 cm, abaxially paler green and sparsely pilose along veins, adaxially dark green, pilose along margin, and with prominent cystoliths, secondary veins 5–8 on each side of midvein, base cordate to abruptly narrowed and often somewhat oblique, margin serrate, apex acuminate. Inflorescences terminal, open panicles, to 15 cm; peduncle ca. 3 cm, gland-tipped pilose; rachis gland-tipped pilose; bracts obovate, 1–2 mm, caducous before flowers open, apex rounded; bracteoles similar to bracts. Flowers distant on rachis, usually 1 per node. Pedicel ca. 3 mm, gland-tipped pilose. Calyx ca. 4 mm, accrescent to ca. 7 mm in fruit, glabrous, 5-lobed to ca. 1 mm from base; lobes oblong to oblanceolate, apex truncate to emarginate. Corolla pale lavender to pale pink, 2.2–3.5 cm, arcuate, glabrous; tube basally cylindric and narrow for 0.6–1.9 cm then ventricose and widened to 8–10 mm at mouth; lobes ovate, ca. 4 × 4 mm, apex acute. Stamens 4; filaments glabrous; shorter filament pair ca. 2 mm, incurved; longer filament pair 1–1.2 cm, erect, slightly exerted; anther thecae spherical, ca. 1 mm in diam. Ovary glabrous; style 2.2–2.7 cm, glabrous. Capsule narrowly oblong-obovoid, ca. 1.4 cm, glabrous, 4-seeded, apex acuminate. Seeds ovate-suborbicular in outline, ca. 2.5 × 2 mm, pubescent. Fl. Sep–Oct, fr. Dec.

Forests; 1500–2100 m. Yunnan (Gaoligong Shan) [Myanmar].

**127. *Strobilanthes parvifolia*** J. R. I. Wood, Kew Bull. 64: 25. 2009.

小叶马蓝 xiao ye ma lan

Herbs, perennial, anisophyllous. Stems somewhat sulcate with distinct small parallel ridges, glabrous, basally geniculate. Petiole 0–4 mm, glabrous; leaf blade lanceolate, ovate, or ovate-elliptic, 1–3.5 × 1–1.8 cm, smaller of pair ca. 1/3 size of larger one, both surfaces glabrous and with somewhat obscure cystoliths or rarely abaxially with a few gland-tipped trichomes on veins, base broadly to narrowly cuneate and somewhat decurrent onto petiole, margin undulate to slightly crenate, apex acute. Inflorescences leaflike with long few-flowered branches; branches strict, densely covered with short stalked glands,

sparingly 3-forked with subsessile flowers in opposite pairs (rarely solitary) in axils of leaflike bracts at tips of ultimate branches; basal sterile bracts variable in size and shape, sessile or nearly so, oblong-lanceolate to sometimes ovate, elliptic, or oblong, 0.5–3.5 × 0.3–1.5 cm, often very unequal at each pair, abaxially densely stalked gland-tipped pubescent toward base, base attenuate, margin undulate and sparsely covered with stalked glands, apex acute; floral bracts oblong, ca. 5 × 1 mm, caducous, gland-tipped pilose; bracteoles oblong, ca. 2 × 1 mm. Calyx ca. 1.1 cm at anthesis, accrescent to ca. 2 cm in fruit, 5-lobed almost to base; lobes narrowly oblong-lanceolate, 1–1.5 mm wide, subequal, densely covered with relatively short gland-tipped trichomes, apex obtuse. Corolla white flushed violet, 2.5–3 cm, outside glabrous, inside pubescent; tube basally cylindric and ca. 3 mm wide for ca. 1 cm then gradually widened to ca. 1.2 cm and bent to ca. 90° and then and widened to 1.2–1.5 cm at mouth; lobes broadly ovate, ca. 6 × 6 mm, apex obtuse. Stamens 4, included; filaments glabrous, shorter pair 1.5–2 mm, longer pair 5–6 mm; anther thecae oblong, ca. 2 × 0.5 mm; pollen type 16. Ovary glabrous; style ca. 1.5 cm, glabrous. Capsule narrowly clavate, ca. 2.2 cm, glabrous, 4-seeded. Mature seeds not seen. Fl. Sep, fr. Sep–Oct.

• Forest margins on hills; ca. 1600 m. Xizang (Mêdog).

**128. *Strobilanthes ferruginea*** D. Fang & H. S. Lo, *Guihaia* 17: 29. 1997.

锈背马蓝 xiu bei ma lan

*Perilepta ferruginea* (D. Fang & H. S. Lo) C. Y. Wu & C. C. Hu.

Shrubs to 4 m tall, almost glabrous throughout, anisophyllous. Stems 4-angled, sulcate. Petiole to 3 cm; leaf blade broadly elliptic, elliptic, or rarely ovate-elliptic, 4–18 × 2–8 cm, smaller of pair ca. 1/3 size of larger one, both surfaces densely covered with cystoliths, abaxially ferruginous when dry, adaxially dark green, secondary veins 7–11 on each side of midvein, base broadly cuneate, margin apically remotely crenate, apex acuminate to caudate. Inflorescences axillary or terminal, spikes, 1–2.5 cm, few flowered; bracts elliptic to oblong, 3.5–4 × ca. 2 mm, persistent, margin ciliate, apex truncate to rounded; bracteoles oblong to elliptic, ca. 7 × 2.5 mm. Flowers distant on rachis, usually only 1 fertile per node. Calyx ca. 9 mm; lobes oblong-oblongate, ca. 4 mm, margin ciliolate, apex obtuse. Corolla purple, 3–3.5 cm, ventricose, outside glabrous; tube basally cylindric and ca. 2 mm wide for ca. 6 mm then gradually widened to ca. 1.4 cm at mouth; lobes ca. 5 mm, apex emarginate. Stamens 4, included; filaments sparsely hirsute, shorter pair ca. 2 mm, longer pair ca. 8 mm; anther thecae oblong, ca. 2 mm. Ovary glabrous; style ca. 1.8 cm, densely hirsute. Capsule oblong, 1.7–2 cm, glabrous, 4-seeded. Seeds ovate in outline, ca. 3 mm, densely covered with appressed trichomes. Fl. Oct–Dec.

• Dense forests on rocky mountains; 400–800 m. Guangxi (Longzhou).

## 8. PHAULOPSIS Willdenow, Sp. Pl. 3: 4, 342. 1800 [*Phaylopsis*], nom. cons.

肾苞草属 shen bao cao shu

Hu Jiaqi (胡嘉琪 Hu Chia-chi), Deng Yunfei (邓云飞); Thomas F. Daniel

*Aetheilema* R. Brown; *Micranthus* J. C. Wendland; *Theileamea* Baillon.

Herbs, perennial [or annual], prostrate [to erect], with cystoliths, often anisophyllous. Leaves opposite, long petiolate; leaf blade margin entire or crenate. Inflorescences terminal [or axillary], second strobilate spikes; bracts subleaflike, orbicular or reniform, imbricate; bracteoles [present or] absent. Flowers sessile. Calyx 5-lobed almost to base; lobes unequal, posterior one largest. Corolla small; tube cylindric, slender; limb ± 2-lipped, lower lip 3-lobed, upper lip 2-lobed; lobes contorted in bud. Stamens 4, didynamous, included in corolla tube; filaments coherent at base; anthers 2-theous; thecae parallel, base minutely mucronate [or not mucronate]. Ovary with 2 ovules per locule; style hairy; stigma 2-lobed, lobes unequal. Capsule shortly stipitate, 4-seeded; retinacula present; septa with attached retinacula separating from inner wall of mature capsule. Seeds discoid, densely covered with hygroscopic trichomes.

Twenty-two species: tropical Africa, E, SE, and S Asia; one species in China.

**1. *Phaulopsis dorsiflora*** (Retzius) Santapau, *Kew Bull.* [3]: 276. 1948.

肾苞草 shen bao cao

*Ruellia dorsiflora* Retzius, *Observ. Bot.* 6: 31. 1791; *Aetheilema anisophyllum* (Jussieu) E. Meyer (1837), not R. Brown (1810); *A. parviflorum* Sprengel; *A. reniforme* Nees; *Blechnum anisophyllum* Jussieu; *Micranthus dorsiflorus* (Retzius) C. E. C. Fischer; *M. oppositifolius* J. C. Wendland; *Phaulopsis oppositifolia* (J. C. Wendland) Lindau; *P. parviflora* Willdenow, nom. illeg. superfl.

Herbs 30–50 cm tall, slightly anisophyllous. Stems as-

ending, 4-angled, brown retrorsely pubescent. Petiole 4–6 cm; leaf blade ovate to elliptic, 7.5–11 × 3.5–5 cm, papery, abaxially pubescent along veins, adaxially hirsute, secondary veins ca. 6 on each side of midvein, base cuneate to attenuate and slightly oblique, margin entire, apex acuminate. Spikes terminal, 3–6 cm; bracts orbicular to reniform, ca. 1 × 1.4 cm, gland-tipped pubescent. Calyx lobes outside gland-tipped pubescent; posterior lobe ovate-elliptic, 8–10 mm, bractlike, other lobes linear to subulate and 5–6 mm. Corolla white, ca. 6 mm; lower lip 3-lobed, lobes ovate-oblong and 1–2.4 × 0.6–1 mm; upper lip narrow, 2-lobed. Staminal filaments glabrous. Ovary apex sparsely gland-tipped pubescent; style pilose. Capsule ellipsoid, ca. 6

mm, apex gland-tipped pubescent. Seeds ca.  $2 \times 1.5$  mm. Fl. Nov–May, fr. Feb–Jul.  $2n = 56$ , ca. 64, 70.

Thickets, roadsides, along streams; 300–800 m. S and W Yunnan

[Bangladesh, Bhutan, India, Myanmar, Thailand, Vietnam; ?South Africa, Indian Ocean islands (Réunion), ?Madagascar].

Collections identified as *Phaulopsis dorsiflora* from South Africa and Madagascar remain questionable as to their source.

## 9. *HYGROPHILA* R. Brown, Prodr. 479. 1810.

水蓼衣属 shui suo yi shu

Hu Jiaqi (胡嘉琪 Hu Chia-chi), Deng Yunfei (邓云飞); Thomas F. Daniel

*Adenosma* Nees (1847), not R. Brown (1810); *Asteracantha* Nees; *Cardanthera* Buchanan-Hamilton ex Benth. & J. D. Hooker; *Hemidelphis* Nees; *Kita* A. Chevalier; *Nomaphila* Blume; *Physichilus* Nees; *Polyechma* Hochstetter; *Santapaua* N. P. Balakrishnan & K. Subramanyam; *Synnema* Benth.; *Tenoria* Dehnhardt & Giordano (1832), not Sprengel (1813).

Herbs, annual or perennial, often aquatic or hygrophilous, sometimes with axillary spines, cystoliths present. Leaves sessile or shortly petiolate; leaf blade margin entire, crenulate, or sometimes undulate. Flowers sessile, in terminal spikes or several in axillary clusters; bracteoles present or absent. Calyx 5-lobed. Corolla ventricose; limb 2-lipped, lower lip 3-lobed, upper lip apex shallowly dentate; lobes contorted in bud. Stamens 2 or 4, didynamous (posterior pair similar to anterior pair or smaller); anthers 2-theous; thecae equally inserted; staminodes 0 or 2. Ovary with 4 to many ovules per locule; stigma entire or 2-dentate. Capsule linear-ellipsoid to narrowly oblong, many seeded; retinacula present. Seeds discoid, covered with long mucilaginous trichomes.

About 100 species: widely distributed in tropical and subtropical regions; six species (one endemic) in China.

- 1a. Stamens 2 ..... 1. *H. polysperma*
- 1b. Stamens 4.
  - 2a. Flowers in terminal spikes ..... 2. *H. biplicata*

*Justicia polysperma* Roxburgh, Fl. Ind. 1: 120. 1820; *Adenosma polysperma* (Roxburgh) Sprengel; *Hemidelphis polysperma* (Roxburgh) Nees.

Annuals [or perennials] 10–20 cm tall. Stems often prostrate, 4-angled, slightly swollen above nodes, puberulent, soon glabrescent. Petiole to 5 mm; leaf blade oblong-lanceolate to ovate,  $2\text{--}3.5 \times 0.6\text{--}1.3$  cm, glabrous, base attenuate, margin entire, apex subobtus. Inflorescences terminal spikes, 1.3–5 cm; bracts imbricate, ovate, elliptic, or obovate,  $5\text{--}10 \times 1.5\text{--}3.5$  mm, both surfaces densely hirtellous, apex obtuse; bracteoles lanceolate,  $3.5\text{--}5 \times 0.5\text{--}1$  mm, margin ciliate. Calyx 3.5–6 mm; lobes lanceolate, 2.5–3 mm, unequal, pubescent, apex acuminate. Corolla white, ca. 6 mm; tube ca. 3.5 mm; lower lip ca. 2 mm, 3-lobed, lobes orbicular and subequal; upper lip oblong-ovate, ca. 1 mm, 2-lobed. Stamens 2, slightly exserted; filaments ca. 1 mm, coherent into a membrane near base; anther thecae subequal; staminodes 2, bristlelike, short. Capsule linear-oblong, 5.5–8 mm, pubescent with non-gland-tipped trichomes (also glabrous?), 20–30-seeded. Seeds ca.  $1 \times 0.5$  mm. Fl. Sep–Nov, fr. Oct–Jan.  $2n = 32$ .

Streamsides; below 600 m. Guangdong, Guangxi, Taiwan, Yunnan [Bhutan, India, Myanmar, Sri Lanka, Vietnam].

*Hygrophila polysperma* is a problematic (e.g., invasive) naturalized weed in some tropical and temperate regions outside of its native range.

2. *Hygrophila biplicata* (Nees) Sreemadhavan, Bull. Bot. Surv. India 10: 223. 1969.

连丝草 lian si cao

Annuals to 30 cm tall, ascending. Stems 4-angled, hirsute. Leaves sessile; leaf blade oblong,  $2.5\text{--}3.8 \times 1\text{--}1.8$  cm, white pubescent, secondary veins 3–5 on each side of midvein, base truncate to subcordate, margin crenulate, apex obtuse. Inflorescences terminal spikes, 2.5–10 cm; bracts narrowly elliptic, 6–8  $\times$  3–4 mm, margin crenulate or dentate; bracteoles linear, ca. 8  $\times$  3 mm. Calyx 8–9 mm, inside white hirsute; lobes linear, margin ciliate. Corolla purple, 1.2–1.6 cm, outside pilose; lower lip elliptic, ca. 8  $\times$  5 mm, 3-dentate, lobes triangular and ca. 1  $\times$  1 mm; upper lip oblong-ovate, ca. 6  $\times$  3 mm, 2-dentate. Stamens 4, slightly exserted; filaments with longer pair ca. 3 mm and shorter pair ca. 2 mm; anther thecae ca. 1 mm. Ovary ca. 3 mm, comose; style ca. 1 cm, hirsute. Capsule ca. 8 mm, pubescent. Fl. Dec, fr. Mar.

Paddy fields, wet places; 800–1000 m. Yunnan [Myanmar, Thailand].

**3. *Hygrophila ringens*** (Linnaeus) R. Brown ex Sprengel, Syst. Veg. 2: 828. 1825.

水蓼衣 shui suo yi

Perennials to 80 cm tall, branched. Stems erect or decumbent at base, 4-angled, striate, slightly pubescent. Petiole 0.5–1 cm, glabrous; leaf blade narrowly lanceolate to oblanceolate, 3–10 × 0.5–1.5 cm, both surfaces with numerous cystoliths and glabrous or slightly pubescent, secondary veins 8–11 on each side of midvein, base attenuate and decurrent onto petiole, margin entire or slightly undulate, apex acute to obtuse. Flowers (solitary or) 2–10 clustered in leaf axils, sessile; bracteoles narrowly ovate, 3–5 mm, margin pubescent, apex obtuse. Calyx narrowly campanulate, ca. 6 mm, 5-lobed to middle; lobes linear-lanceolate, grayish pubescent or fulvous strigose, apex acuminate. Corolla pale purple, 1–2.5 cm; tube ca. 7 mm, ca. 2 mm wide, glabrous; limb 2-lipped; lower lip obovate, ca. 3 mm, 3-lobed to middle, lobes ovate with an obtuse apex; upper lip elliptic, ca. 3 mm, shallowly 2-lobed, outside puberulent. Stamens 4, included; filaments glabrous, longer pair ca. 5 mm, shorter pair ca. 3 mm; anther thecae 1–2 mm. Ovary glabrous; style filiform, ca. 8 mm, included; stigma unequally 2-lobed. Capsule narrowly oblong, 0.8–2.2 cm, ca. 1.5 mm wide, glabrous, 12–18-seeded. Seeds ca. 1 mm, pubescent. Fl. Aug–Oct, fr. Dec–Feb.

Along streams, wet places; below 1000 m. Anhui, Chongqing, Fujian, Guangdong, Guangxi, Guizhou, Hainan, Henan, Hubei, Hunan, Jiangsu, Jiangxi, Sichuan, Taiwan, Yunnan, Zhejiang [Bhutan, Cambodia, India, Indonesia, Japan, Laos, Malaysia, Myanmar, Nepal, Pakistan, Philippines, Thailand, Vietnam].

Perennials to 1 m tall, erect. Stems 4-angled, brown strigose. Petiole 0–3 mm, hirsute; leaf blade elliptic, obovate, or oblong, 2–9 × 1–3 cm, papery, cystoliths dense, both surfaces hirsute, secondary veins 8–15 on each side of midvein, base

usually attenuate and decurrent onto petiole, margin entire or undulate, apex acute to sometimes obtuse. Flowers axillary, several clustered or in whorls upward; bracteoles linear-oblong, ca.  $5 \times 2$  mm, hirsute. Calyx ca. 1.1 cm, white hirsute, 5-lobed to middle; lobes linear. Corolla 1.8–2.2 cm, pubescent; lower lip oblong, sparsely pilose, 3-lobed; upper lip triangular, 2-lobed.

Stamens 4; filaments glabrous, longer pair ca. 5 mm, shorter pair ca. 3 mm; anther thecae ca. 2 mm. Ovary glabrous; style ca. 1.8 cm, pubescent. Capsule not seen.

Wet places; below 1200 m. Yunnan [Cambodia, India, Indonesia, Laos, Myanmar, Pakistan, Philippines, Thailand, Vietnam].

## 10. *ERANTHEMUM* Linnaeus, Sp. Pl. 1: 9. 1753.

可爱花属 ke ai hua shu

Hu Jiaqi (胡嘉琪 Hu Chia-chi), Deng Yunfei (邓云飞); Thomas F. Daniel

*Daedalacanthus* T. Anderson; *Pigafetta* Adanson; *Upudalia* Rafinesque.

Shrubs or perennial erect herbs with cystoliths. Leaves petiolate; leaf blade margin entire or crenate. Inflorescences terminal or rarely axillary, spikes, lax, sometimes several forming a panicle; bracts sometimes colored, subleafflike, large; bracteoles small, narrow. Calyx 5-lobed; lobes narrow, subequal. Corolla subsalverform; tube basally cylindric, long, slender, throat sometimes inconspicuous; limb 5-lobed; lobes obovate, subequal, contorted in bud. Stamens 2, inserted below throat; anthers 2-theous; thecae parallel, muticous; staminodes 2, clavate or filiform. Ovary with 2 ovules per locule; style filiform, glabrous or pubescent; stigma 2-lobed, lobes unequal. Capsule with a solid stalk at base, clavate, 4-seeded; retinacula present. Seeds discoid, compressed, pubescent with hygroscopic trichomes.

About 15 species: tropical and subtropical Asia; two species (one endemic) in China.

The Himalayan species *Eranthemum splendens* (T. Anderson) Bremekamp & Nannenga-Bremekamp reported from S Yunnan (FRPS 70: 60. 2002) is not treated here because no material has been seen by the authors. *Eranthemum pulchellum* Andrews is widely cultivated in S and SW China as an ornamental.

Hu Jiaqi (胡嘉琪 Hu Chia-chi), Deng Yunfei (邓云飞); Thomas F. Daniel

Shrubs or perennial herbs. Leaves opposite; leaf blade margin entire. Inflorescence axillary or terminal, branched cymes; bracts narrow to subleaflike; bracteoles inconspicuous or absent. Calyx often gland-tipped hairy, deeply 5-lobed; lobes equal or subequal. Corolla purple or yellow, funnel-shaped to campanulate; tube ventricose; limb 5-lobed; lobes subequal, contorted in bud. Stamens 4, didynamous; filaments connate at base into 2 pairs; anthers 2-theous; thecae parallel, hirsute, spurred at base. Ovary with 4–8 ovules per locule; stigma 2-lobed, one lobe reduced. Capsule linear-cylindric to linear-oblong, 8–16-seeded; retinacula present. Seeds subovate in outline, compressed, covered with hygroscopic trichomes.

Four species: Bhutan, China, India, Nepal, Vietnam; three species (two endemic) in China.

1a. Herbs to 20 cm tall ..... 1. *E. longipes*

1b. Subshrubs or shrubs more than 50 cm tall.

2a. Corolla purple, 2–2.5 cm, outside glabrous; anther thecae each with 2 basal spurs ..... 2. *E. longzhouensis*

2b. Corolla yellow, ca. 4 cm, outside pubescent; anther thecae each with 1 basal spur ..... 3. *E. lofouensis*

**1. *Echinacanthus longipes*** H. S. Lo & D. Fang, Acta Bot. Yunnan. 7: 138. 1985.

长柄恋岩花 *chang bing lian yan hua*

Herbs 5–20 cm tall, perennial, caulescent or acaulescent. Petiole 1.8–4.5(–5.5) cm, densely hirsute; leaf blade oblong to lanceolate-oblong, rarely ovate or oblanceolate, 3–7(–11) × 1.5–3(–4) cm, papery, both surfaces densely covered with cystoliths, abaxially pilose or sometimes only hairy along veins, adaxially dark grayish brown when dry and subglabrous, midvein raised on both surfaces, secondary veins 5–7 on each side of midvein and raised on both surfaces, base oblique and rounded to broadly cuneate, margin entire or slightly crenulate, apex acuminate to obtuse. Cymes axillary, (1 or)2–4(or 5)-flowered; peduncle 2–10 cm, densely hirsute; bracts subleaflike, ovate to ovate-elliptic, 8–10 × 4–7 mm. Calyx lobes linear, 1–1.2 cm but to 1.7 cm in fruit, white pilose. Corolla purple, ca. 4 cm, straight, outside subglabrous; tube cylindric and ca. 2.5 mm wide for 1.3–1.5 cm then gradually widened to ca. 1 cm at mouth; lobes oblong, 6–8 × 5–6 mm. Staminal filaments 5–6 mm; anther thecae ovoid, ca. 3 mm, subequal, ciliate, each with 1 spur at base. Ovary densely pilose; style ca. 3.2 cm, pilose; stigma 2-lobed, with one lobe longer. Capsule cylindric, ca. 1.1 cm, densely pilose, 12–16-seeded. Seeds elliptic in outline, ca. 1.5 mm, margin white. Fl. Apr–Jun, fr. Aug–Sep.

Limestone hills in forests; 500–2000 m. Guangxi, Yunnan [Vietnam].

**2. *Echinacanthus longzhouensis*** H. S. Lo, Acta Bot. Yunnan. 7: 140. 1985.

龙州恋岩花 *long zhou lian yan hua*

Shrubs to 3 m tall. Older stems grayish brown, subterete, lenticellate and tuberculate; young stems 4-angled, pilose. Peti-

ole 1–2(–3.5) cm, pubescent; leaf blade elliptic to ovate, 4.5–8.5 × 1.5–4.5 cm, leathery, both surfaces glabrous, secondary veins 6 or 7 on each side of midvein and slender, base broadly cuneate, margin entire, apex acute. Cymes axillary, 1–3-flowered; peduncle 1.5–3 cm, pubescent; bracts narrowly lanceolate, 10–15 × ca. 1 mm, pubescent. Calyx 1–1.2 cm, abaxially gland-tipped hirsute, adaxially hirsute; lobes linear, apex acuminate. Corolla purple, 2–2.5 cm, both surfaces glabrous; tube basally cylindric and ca. 1.5 mm wide for 5–8 mm then gradually widened to ca. 8 mm at mouth; lobes oblong, ca. 4 × 3 mm, apex retuse. Staminal filament longer pair ca. 1 cm and shorter pair ca. 0.6 cm, pilose; anther thecae with 2 spurs at base. Ovary pubescent; style ca. 1.4 cm, pubescent. Capsule linear-oblong, 1.3–1.4 cm, densely pubescent, usually 8-seeded. Seeds globose, ca. 3 × 3 mm. Fl. Aug.

• Limestone hills in forests; 300–400 m. Guangxi.

**3. *Echinacanthus lofouensis*** (H. Léveillé) J. R. I. Wood, Edinburgh J. Bot. 51: 186. 1994.

黄花恋岩花 *huang hua lian yan hua*

*Strobilanthes lofouensis* H. Léveillé, Repert. Spec. Nov. Regni Veg. 12: 99. 1913; *Echinacanthus flaviflorus* H. S. Lo & D. Fang.

Shrubs 1–3 m tall. Stems 4-angled, lenticellate, subglabrous. Petiole 0.5–2 cm, shortly hirsute; leaf blade ovate, lanceolate, or narrowly lanceolate, (2–)6–12 × (1–)1.5–3 cm, abaxially pubescent in vein axils, adaxially glabrous, midvein usually barbate, secondary veins 5 or 6 on each side of midvein, base broadly cuneate to subrounded, margin entire, apex acuminate. Cymes axillary, usually (1–)3-flowered; peduncle 1–2 cm, pubescent; bracts subleaflike, 1–1.5 × 0.5–1 cm, caducous. Calyx 1.2–1.4 cm but to 1.8 cm in fruit, both surfaces densely white pubescent; lobes linear, apex acuminate. Corolla yellow,

ca. 4 cm, outside pubescent; tube basally ca. 3 mm wide for ca. 1 cm then expanding to mouth; lobes semicircular, ca. 5 mm. Staminal filaments 1–1.3 cm, densely villous; anther thecae ovoid, ca. 3 mm, each with 1 spur at base. Ovary densely vil-

lous; style pilose. Capsule linear-oblong, ca. 1.5 cm, densely pubescent, 8–12-seeded. Fl. May–Oct.

● Limestone hills in forests; 500–1000 m. Guangxi, Guizhou.

## 12. *PARARUELLIA* Bremekamp & Nannega-Bremekamp, Verh. Kon. Ned. Akad. Wetensch., Afd. Natuurk., Sect. 2, 45(1): 25. 1948.

地皮消属 di pi xiao shu

Hu Jiaqi (胡嘉琪 Hu Chia-chi), Deng Yunfei (邓云飞); Thomas F. Daniel

Herbs, perennial. Stems short. Leaves opposite, rosulate, petiolate; leaf blade margin undulate, crenulate, or rarely subentire. Inflorescences terminal, spikes or thyrses; bracts usually subleaflike; bracteoles present. Flowers sessile. Calyx subequally to equally 5-lobed. Corolla white, bluish, or pink; tube basally cylindric and slender, apically expanded into a throat; limb 5-lobed; lobes subequal, contorted in bud, apex rounded or obtuse. Stamens 4, didynamous, inserted at base of throat; filaments glabrous; anthers 2-theous; thecae usually widely separated by a broad connective,  $\pm$  parallel; staminodes absent. Ovary glabrous, with 4–8 ovules per locule; style pubescent; stigma pubescent, 2-cleft, upper lobe very short or reduced. Capsule cylindric, not stipitate, 8–16-seeded; retinacula present. Seeds lenticular, pubescent with hygroscopic hairs.

About ten species: SE Asia, China; five species (all endemic) in China.

*Pararuellia* is purported to differ from *Ruellia* by its pollen, which has “minute prickles, papillae or granules (not a honey-combed pattern)” (C. B. Clarke, J. Asiat. Soc. Bengal, Pt. 2, Nat. Hist. 74: 649. 1908) or at least papillae on the muri of reticulations (C. C. Hu et al., Acta Phytotax. Sin. 43: 123–150. 2005). Because such structures are also known from some species of *Ruellia* (C. A. Furness & M. C. Grant, Grana 35: 231–239. 1996), the generic status of *Pararuellia* is questionable and deserves additional study.

- 1a. Bracts longer than rachis internodes, imbricate, homomorphic; spikes cylindric; flowers imbricate on rachis ..... 1. *P. glomerata*
- 1b. Bracts shorter than rachis internodes, distant, usually heteromorphic; spikes not cylindric; flowers distant on rachis.
- 2a. Spikes usually with 1 or 2(or 3) nodes ..... 5. *P. delavayana*
- 2b. Spikes with 4 to many nodes.
- 3a. Rachis usually zigzag, winged below nodes ..... 2. *P. alata*
- 3b. Rachis straight, wingless.
- 4a. Bracts oblong, elliptic, or ovate, usually subtending many flowers ..... 3. *P. cavaleriei*
- 4b. Bracts cordate to suborbicular, usually subtending only 1 flower ..... 4. *P. hainanensis*

1. *Pararuellia glomerata* Y. M. Shui & W. H. Chen, Bot. Stud. (Taipei) 50: 261. 2009.

云南地皮消 yun nan di pi xiao

Herbs to 20 cm tall, often rooting at nodes. Stems 1–2 cm, with 2–4 internodes; internodes constricted, 0.5–1.1 cm. Petiole 1.3–3.4 cm, densely hispid; leaf blade oblanceolate, obovate-oblong, or spatulate, 4–6.2  $\times$  1.8–3.2 cm, abaxially densely hispid, adaxially slightly hispid, secondary veins 6–9 on each side of midvein, base narrowly cuneate and decurrent onto petiole, margin erose to crenate, apex rounded to obtuse. Spikes cylindric, (0.6–)3.2–5.4 cm, several flowered; peduncle 0.7–5 cm and elongating to 13 cm in fruit, densely hispid; rachis (0.6–)3–5.5 cm and elongating in fruit, densely hispid, with (3 or)4–10 nodes; bracts imbricate, ovate to spatulate, 8–10  $\times$  6–9 mm, densely hispid, apex acute; bracteoles linear-lanceolate, 3–4  $\times$  ca. 1 mm, abaxially hispid especially apically, apex acuminate. Calyx ca. 5 mm; lobes linear, ca. 4  $\times$  0.7 mm and elongating to ca. 6 mm in fruit, subequal, outside hispid. Corolla light purple, bluish, or pink, 1.4–1.7 cm, outside slightly hispid, inside glabrous; lobes suborbicular, 7–8  $\times$  5–7 mm, equal, apex rounded to truncate. Stamen longer pair 1.5–3 mm, shorter pair ca. 0.5 mm; anther thecae ca. 1.1 mm. Ovary 2–2.5 mm, with 5 or 6 ovules per locule; style 0.8–1.4 cm. Capsule 1–1.5 cm, pu-

bescent, 10–12-seeded. Seeds broadly ovate to subcircular in outline, 1–1.5  $\times$  1–1.5 mm, covered with dense long white appressed trichomes. Fl. Apr–Jul, fr. Jun–Aug.

● Thickets on limestone hills in hot dry valleys; 200–500 m. SE Yunnan (Hong He valley).

2. *Pararuellia alata* H. P. Tsui, Novon 18: 33. 2008.

节翅地皮消 jie chi di pi xiao

Herbs to 27 cm tall. Stems hispid. Petiole 2.5–3.5 cm; leaf blade oblong-elliptic to oblanceolate-elliptic, 5–8.5  $\times$  1.5–3.5 cm, glabrous, secondary veins 7–10 on each side of midvein, base cuneate, margin entire, apex rounded to acute. Spikes 3–5 cm, with 4–6 nodes; rachis usually zigzag, winged for ca. 2 mm below nodes; bracts ovate to elliptic, 1.2–6  $\times$  0.8–3 cm, reduced in size apically on rachis, glabrous except for ciliate margin, base rounded, apex acute; bracteoles lanceolate, ca. 5  $\times$  2.5 mm, glabrous except for ciliate margin, margin serrate. Calyx ca. 7 mm, glabrous; lobes linear-triangular, ca. 6  $\times$  1.5 mm, equal. Corolla pink, ca. 1 cm, glabrous; tube basally cylindric and ca. 2 mm wide for ca. 5 mm; lobes oblong, ca. 2  $\times$  2 mm, equal, apex emarginate. Staminal filaments ca. 1 mm; anther thecae ca. 1 mm. Ovary ca. 2 mm; style ca. 7 mm. Capsule ca. 15  $\times$  2.7 mm, glabrous. Seeds broadly ovate to subcircular in outline, ca.

1.3 × 1.3 mm, covered with dense long white appressed trichomes. Fl. Aug–Oct, fr. Nov–Jan.

- Streamsides in forests; 700–800 m. Chongqing, Hubei, Yunnan.

**3. *Pararuellia cavaleriei*** (H. Léveillé) E. Hossain, Notes Roy. Bot. Gard. Edinburgh 32: 409. 1973.

罗甸地皮消 *luo dian di pi xiao*

*Ruellia cavaleriei* H. Léveillé, Repert. Spec. Nov. Regni Veg. 12: 21. 1913.

Herbs to 15 cm tall. Stems ca. 1.5 cm. Petiole 0.7–2.7 cm; leaf blade oblanceolate to spatulate, 4–12 × 1–3 cm, both surfaces sparsely strigose, secondary veins 4–6 on each side of midvein, base attenuate and decurrent onto petiole, margin undulate, apex rounded to acute. Spikes ca. 3 cm, with 4–6 nodes; rachis sparsely strigose; bracts ovate, 1–4 × 0.5–1.5 cm, reduced in size apically on rachis, glabrous, 4–6-veined, base broadly cuneate, apex acute; bracteoles triangular-lanceolate, ca. 3.5 × 1 mm, glabrous. Calyx ca. 5 mm, outside apically glandular pubescent; lobes triangular-lanceolate, ca. 3 × 0.7 mm, equal. Corolla purple, light blue, yellow, or white, ca. 1.5 cm, outside pubescent but soon glabrescent on limb and throat; tube basally cylindric and narrow for ca. 6 mm, throat ca. 4 mm; lobes oblong, ca. 6 × 6 mm, equal, apex emarginate. Stamen longer pair ca. 3 mm, shorter pair ca. 1.5 mm; anther thecae glabrous. Ovary ca. 3 mm; style ca. 1 cm. Capsule ca. 15 × 3 mm, glabrous, 8–12-seeded. Seeds broadly ovate in outline, ca. 1.4 × 1 mm, covered with dense appressed trichomes. Fl. Aug–Oct, fr. Nov–Jan.

- Thickets, forests; 100–1400 m. Guangxi, Guizhou, Yunnan.

**4. *Pararuellia hainanensis*** C. Y. Wu & H. S. Lo, Fl. Hainan. 3: 593. 1974.

海南地皮消 *hai nan di pi xiao*

Herbs. Petiole 0.5–1.5 cm; leaf blade obovate to oblanceolate, ca. 4.5 × 2.5–4.3 cm, abaxially pubescent, adaxially sparsely strigose, secondary veins ca. 6 on each side of midvein, base cuneate, margin entire, apex rounded, sometimes obtuse, or rarely acute. Spikes with 2–6 nodes; rachis pubescent; bracts cordate-ovate to orbicular, 0.5–3(–6.5) × 0.5–1.8(–6.5)

cm, abaxially strigose, adaxially glabrous; bracteoles lanceolate, 2.5–3 × ca. 0.6 mm. Calyx 5–6 mm, inside sparsely strigose; lobes linear-lanceolate, ca. 3 × 1 mm. Corolla white or blue, ca. 1.2 cm, outside pubescent, inside glabrous; tube basally cylindric and ca. 1 mm wide for ca. 7 mm, throat ca. 2.3 × 4 mm; lobes oblong, ca. 2.5 × 2 mm, subequal. Stamen longer pair ca. 1.9 mm, shorter pair ca. 1 mm; anther thecae ca. 1 mm, glabrous. Ovary ca. 3 mm; style ca. 1.6 cm, white comose. Capsule ca. 1.4 cm, glabrous. Seeds obovate in outline, ca. 1 × 1 mm, covered with dense appressed trichomes. Fl. Jun–Sep, fr. Dec–Mar.

- Rocks or wet places along streams, forests; 100–600 m. Guangxi, Hainan.

**5. *Pararuellia delavayana*** (Baillon) E. Hossain, Notes Roy. Bot. Gard. Edinburgh 32: 409. 1973.

地皮消 *di pi xiao*

*Ruellia delavayana* Baillon, Hist. Pl. 10: 408. 1891; *Hemigraphis drymophila* Diels; *Pararuellia drymophila* (Diels) C. Y. Wu & H. S. Lo; *R. arcuata* Lingelsheim & Borza; *R. drymophila* (Diels) Handel-Mazzetti; *R. esquirolii* H. Léveillé.

Herbs. Stems 1–2 cm. Petiole 0.5–2 cm; leaf blade oblong to oblong-elliptic, sometimes obovate, elliptic, or lanceolate, 4–12 × 2.5–4 cm, abaxially pubescent, adaxially strigose, secondary veins 7–9 on each side of midvein, base cuneate and decurrent onto petiole, margin undulate to crenate, apex acute, obtuse, or rounded. Spikes ca. 4 cm, with 1–3 nodes; bracts elliptic to ovate, 1–4.7 × 0.5–2.5 cm, reduced in size apically on rachis, both surfaces sparsely strigose, base rounded, margin ciliate, apex acute to obtuse; bracteoles linear, ca. 7 × 1 mm. Calyx ca. 8 mm; lobes triangular-lanceolate, ca. 7 × 1 mm, margin apically ciliate. Corolla white, light blue, or pink, ca. 1.3 cm; tube basally cylindric and narrow for ca. 4 mm, throat ca. 5 mm; lobes orbicular, ca. 4 × 4 mm, subequal, apex emarginate. Stamen longer pair ca. 3.5 mm, shorter pair ca. 1.5 mm; anther thecae oblong, ca. 1 mm. Ovary ellipsoid; style ca. 1.4 cm, white hirsute. Capsule to 2 cm, 16-seeded. Seeds ovate to sub-circular in outline, 1.1–1.4 × 1.1–1.4 mm, covered with dense appressed trichomes. Fl. Jul–Sep, fr. Nov–Feb.

- Forests, slopes; 700–3000 m. Guizhou, S Sichuan, Yunnan.

### 13. *RUELLIA* Linnaeus, Sp. Pl. 2: 634. 1753.

芦莉草属 *lu li cao shu*

Hu Jiaqi (胡嘉琪 *Hu Chia-chi*), Deng Yunfei (邓云飞); Thomas F. Daniel

*Blechnum* P. Browne; *Cryphiacanthus* Nees; *Dipteracanthus* Nees.

Herbs [or shrubs], perennial, prostrate to erect, with cystoliths. Leaves sessile or petiolate; leaf blade margin entire, crenulate, or dentate. Inflorescences axillary or terminal, reduced or expanded dichasia, sometimes forming dichasiate spikes, thyrses, or panicles, sometimes reduced to a solitary flower; bracts opposite, usually green, margin entire; bracteoles 2 [or absent]. Flowers [sessile or] subsessile to pedicellate. Calyx deeply 5-lobed; lobes equal or subequal. Corolla funnel-shaped; tube basally with a narrowly cylindric portion, usually expanded apically into a distinct throat; limb 5-lobed; lobes usually ovate to orbicular, equal to unequal in size, contorted in bud. Stamens 4, didynamous, usually included in corolla tube; filaments sometimes connate in pairs at base; anthers 2-thealous; thecae equal, parallel to subsagittate, muticous at base; staminode 1 or absent. Ovary with up to 10 ovules per locule; style usually included in corolla tube or slightly exserted; stigma 2-lobed, lobes equal or unequal. Capsule stipitate or not stipitate, [4–]12–26-seeded; retinacula present; septa with attached retinacula remaining attached (or separating in *Ruellia blechnum*) to inner wall of mature capsule. Seeds discoid, usually pubescent with hygroscopic trichomes.

About 250 species: tropical to temperate regions worldwide; four species (one endemic, two introduced) in China.

*Blechum* and *Dipteracanthus* are included in *Ruellia* based on morphological and molecular data (C. Ezcurra, Ann. Missouri Bot. Gard. 80: 787–845. 1993; E. Tripp, Syst. Bot. 32: 628–649. 2007; E. Tripp et al., Taxon 58: 893–906. 2009).

- 1a. Flowers in terminal dense 4-sided spikes; septa with retinacula separating from inner wall of mature capsule ..... 1. *R. blechum*  
 1b. Flowers otherwise; septa with retinacula remaining attached to inner wall of mature capsule.  
     2a. Creeping herbs; corolla white, 1.2–2 cm ..... 2. *R. repens*  
     2b. Erect herbs; corolla purplish, 2.2–5.5 cm.  
         3a. Roots lacking tuberlike swellings; flowers sessile ..... 3. *R. venusta*  
         3b. Roots with tuberlike swellings; flowers pedicellate ..... 4. *R. tuberosa*

**1. *Ruellia blechum*** Linnaeus, Syst. Nat., ed. 10, 2: 1120. 1759.

赛山蓝 sai shan lan

*Barleria pyramidata* Lamarck; *Blechum brownei* Jussieu;  
*B. pyramidatum* (Lamarck) Urban.

Herbs to 50 cm tall. Roots lacking tuberlike swellings. Stems slightly 4-angled, often prostrate and rooting at nodes, sparsely pubescent to subglabrous. Petiole 0.5–2.5 cm, strigose; leaf blade ovate, 3–6 × 2–4 cm, abaxially paler and subglabrous, adaxially green, sparsely strigose and densely pilose along veins, secondary veins 5–8 on each side of midvein, base obtuse to rounded and slightly decurrent onto petiole, margin entire, apex acute. Inflorescences terminal, dense spikes, 2–6 cm, subsessile to shortly pedunculate; rachis strigose; bracts subleaflike, ovate, ca. 1.5 × 1.3 cm, abaxially slightly pubescent, margin ciliate; bracteoles 2, lanceolate-ovate, 5–9 × 1.5–3 mm, margin ciliate. Calyx lobes linear to subulate, outside pilose. Corolla white to pale blue, ca. 1.5 cm (cleistogamous flowers sometimes present, these much smaller and budlike), outside puberulent on lobes; lobes ovate, ca. 3 × 2 mm. Stamens with longer pair ca. 4 mm and shorter pair ca. 3 mm; filaments glabrous; anther thecae ca. 1 mm. Ovary comose; style 6–10 mm, slightly hirsute; stigma usually with only 1 lobe evident. Capsule substipitate, ovoid to ellipsoid, ca. 6 mm, puberulent, 8–12-seeded; septa with attached retinacula separating from inner wall of mature capsule. Seeds ca. 1.5 mm in diam., margin with a conspicuous band of appressed hygroscopic trichomes. Fl. Nov, fr. Nov.  $2n = 34$ .

Disturbed sites, drainage ditches; sea level to below 100 m. Naturalized in Taiwan [native to tropical America].

*Ruellia blechum* is widely naturalized in tropical and subtropical areas.

**2. *Ruellia repens*** Linnaeus, Syst. Nat., ed. 12, 2: 424; Mant. Pl. 1: 89. 1767.

楠草 nan cao

*Dipteracanthus lanceolatus* Nees; *D. repens* (Linnaeus) Hasskarl.

Herbs 15–50 cm tall, perennial, creeping. Roots lacking tuberlike swellings. Stems almost 4-angled, finely pubescent or glabrescent. Petiole 3–5 mm; leaf blade ovate to linear-lanceolate, 1.4–4 × 0.8–2 cm, thinly papery, both surfaces sparsely strigose, secondary veins 4 or 5 on each side of midvein, base broadly cuneate to rounded, margin subentire, apex acuminate to acute. Flowers axillary, solitary [or clustered]; bracteoles subleaflike, ovate to ovate-oblong, 8–10 mm. Pedicel to 1 mm.

Calyx lobes lanceolate, ca. 5 mm, margin sparingly ciliate. Corolla white [or pink to light purple], 1.2–2 cm, outside pilose; tube basally ca. 2 mm wide for ca. 5 mm then ventricose and gradually widened to ca. 5 mm at mouth; lobes ovate, ca. 3 × 3 mm, apex obtuse. Stamens with longer pair ca. 5 mm and shorter pair ca. 2 mm; filaments glabrous; anther thecae ca. 1 mm. Ovary comose; style ca. 1 cm, hirsute; stigma lobes unequal. Capsule brownish yellow, stipitate, ca. 1.2 cm, slightly pilose, 12–16-seeded; septa with attached retinacula remaining attached to inner wall of mature capsule. Seeds discoid, ca. 3 mm in diam., margin with a conspicuous band of appressed hygroscopic trichomes. Fl. May–Aug, fr. Jul–Aug.  $2n = 24$ .

Grasslands, roadsides; 100–900 m. Guangdong, Guangxi, Hainan, Taiwan, Yunnan [Indonesia, Malaysia, Myanmar, Papua New Guinea, Philippines, Thailand, Vietnam].

**3. *Ruellia venusta*** Hance, J. Bot. 6: 92. 1868.

飞来蓝 fei lai lan

*Leptosiphonium venustum* (Hance) E. Hossain; *Ruellia seclusa* S. Moore.

Herbs to 70 cm tall, unbranched or rarely branched. Petiole 3–8 mm; leaf blade oblong-lanceolate, lanceolate, or oblanceolate, 4–14 × 1–3.5 cm, both surfaces glabrous, secondary veins 5–8 on each side of midvein, base cuneate to attenuate and decurrent onto petiole, margin slightly undulate to crenate, apex acute to acuminate. Flowers in axils of leaves or leaflike bracts, solitary or in dichasial clusters, sessile; bracteoles subleaflike, lanceolate to elliptic, 7–30 × 1.5–6.5 mm, abaxially glabrous. Calyx 7–8 mm; lobes lanceolate, outside sparsely pubescent with non-glandular trichomes, adaxially gland-tipped puberulent. Corolla purplish white, 4–5.5 cm; tube basally cylindric and ca. 2 mm wide for 2.2–3.5 cm; lobes 7–17 × 4–6 mm, subequal, apically undulate. Stamens with longer pair ca. 7 mm and shorter pair ca. 4 mm; filaments glabrous; anther thecae ca. 2 mm. Ovary glabrous; style sparsely villous. Capsule ca. 1.3 cm. Fl. Aug–Sep.

• Forests, along streams; 100–800 m. Anhui, Fujian, Guangdong, Guangxi, Hubei, Hunan, Jiangxi.

*Ruellia venusta* was treated under *Leptosiphonium* F. Mueller by C. C. Hu (FRPS 70: 56–58. 2002). *Leptosiphonium* is often treated as a section of *Ruellia*. The generic distinctions between *Leptosiphonium* and most *Ruellia* are based on floral form and color (white or yellowish corollas that are hypocrateriform in *Leptosiphonium*) and likely reflect different pollinators. It is doubtful that the genera are distinct, but the Chinese plants (with their purplish and funnel-form corollas) more closely resemble those of *Ruellia* than *Leptosiphonium*.

**4. *Ruellia tuberosa* Linnaeus, Sp. Pl. 2: 635. 1753.**

芦莉草 *lu li cao*

Herbs to 45 cm tall, perennial, erect. Roots with elongate tuberlike swellings. Stems slightly swollen above nodes, almost 4-angled, strigulose on angles. Petiole to 8 mm, glabrous; leaf blade oblong-obovate, 4–8 × 1.5–4.2 cm, both surfaces glabrous, veins abaxially somewhat prominent, base cuneate and tapering onto petiole, margin undulate to subentire, apex acute. Inflorescences axillary, lax dichotomous cymes; peduncle to 2.3 cm; bracts oblong-lanceolate, to 3–9 × 1–3 mm; bracteoles linear-oblong, to 1.5 mm. Pedicel 6–10 mm, minutely pilose. Calyx tube to 6 mm, outside tomentose; lobes linear-lanceolate, 0.9–2 cm. Corolla pale blue, 2.2–5.5 cm, outside hirtellous;

lobes suborbicular, ca. 1.6 × 1.5 cm. Stamens with longer pair ca. 8 mm and shorter pair ca. 4 mm; filaments glabrous; anther thecae white, hairy on dorsal side. Ovary glabrous except for a few gland-tipped trichomes at apex; style ca. 2.1 cm, sparsely hirsute; stigma 2-lamellate. Capsule not stipitate, linear-ellipsoid, 1.8–2.5 × 0.3–0.4 cm, glabrous except for a few gland-tipped trichomes at apex, 20–26-seeded; septa with attached retinacula remaining attached to inner wall of mature capsule. Seeds discoid, ca. 2 × 2 mm, covered with appressed hygroscopic trichomes. Fl. Dec–Jan, fr. May–Jul.  $2n = 32, 34$ .

Disturbed sites such as roadsides; below 100 m. Naturalized in Taiwan and Yunnan (Hekou) [native to tropical America].

*Ruellia tuberosa* is widely naturalized in tropical areas.

**14. *ASYSTASIA* Blume, Bijdr. 796. 1826.**

十万错属 *shi wan cuo shu*

Hu Jiaqi (胡嘉琪 *Hu Chia-chi*), Deng Yunfei (邓云飞); Thomas F. Daniel

*Intrusaria* Rafinesque.

Herbs or subshrubs, with cystoliths. Leaves petiolate; leaf blade margin entire to crenate. Inflorescences terminal or axillary, unilateral spikes or racemes, or panicles of these; bracts small, shorter than calyx; bracteoles similar to bracts or sometimes absent. Calyx 5-lobed; lobes equal to subequal. Corolla funnel-shaped; tube expanded distally into a throat; limb ± 2-lipped, often appearing subactinomorphic with 5 ± equal lobes; lobes ascending cochlear in bud. Stamens 4, included in or partially exerted from corolla tube; anthers 2-theous; thecae parallel to sagittate to subperpendicular, equally to unequally inserted, base mucous or with a small basal appendage; staminodes 0. Ovary with 2 ovules per locule; stigma capitate, 2-lobed or 2-dentate. Capsule with a solid stalk at base, clavate, up to 4-seeded; retinacula present. Seeds lenticular, lacking trichomes.

About 40 species: tropical and subtropical regions of Old World; four species (one introduced) in China.

- 1a. Corolla ± subsalverform with cylindric basal portion of tube at least 1.5 × as long as throat and limb combined .... 1. *A. neesiana*
- 1b. Corolla ± campanulate with cylindric basal portion of tube less than 1.5 × as long as throat and limb combined.
  - 2a. Leaf blade ovate to elliptic, base truncate to rounded; corolla yellow or white ..... 2. *A. gangetica*
  - 2b. Leaf blade lanceolate to ovate-lanceolate or narrowly ovate, base attenuate; corolla red or purplish red.
    - 3a. Leaf blade (1.2–)1.8–2.8 cm wide, margin entire; corolla 3.5–4 cm, lobes ca. 5 mm wide ..... 3. *A. salicifolia*
    - 3b. Leaf blade 3–5 cm wide, margin undulate-crenulate; corolla ca. 2.2 cm, lobes ca. 3.2 mm wide ..... 4. *A. nemorum*

**1. *Asystasia neesiana* (Wallich) Nees in Wallich, Pl. Asiat. Rar. 3: 89. 1832.**

白接骨 *bai jie gu*

*Ruellia neesiana* Wallich, Pl. Asiat. Rar. 1: 73. 1831; *Asystasia chinensis* S. Moore; *Asystasiella chinensis* (S. Moore) E. Hossain; *A. neesiana* (Wallich) Lindau.

Herbs to 1 m tall. Stems 4-angled, sulcate, 2-fariously puberulent to subglabrous. Petioles 0.5–5 cm, glabrous or sparsely pubescent; leaf blade lanceolate to ovate to elliptic to oblong or uppermost sometimes ovate-cordate, 4–25 × 2–11 cm, both surfaces glabrous or slightly pubescent, secondary veins 6–8, base attenuate and decurrent onto petiole (or cordate for uppermost leaves), margin entire to sinuate-crenate to subdentate, apex acuminate. Inflorescences terminal, spikes or racemes, unbranched or with one or more basal branches forming a panicle, 6–15 cm; rachis usually gland-tipped pubescent; bracts and bracteoles triangular, 1–2 × ca. 1 mm, minutely pubescent. Pedicel (0–)1–3 mm. Calyx 4–6.5 mm; lobes linear-lanceolate, usually gland-tipped pubescent. Corolla pink to purplish blue,

4–6 cm, outside gland-tipped pubescent; tube with cylindric basal portion narrow, elongate, 3–4 cm, at least 2 × as long as throat and limb combined; lobes of lower lip ovate, ca. 6 × 8 mm; lobes of upper lip suborbicular, ca. 7 × 7 mm. Stamens with longer pair ca. 5 mm, shorter pair ca. 2 mm; anther thecae subequally inserted. Style 3.6–5.2 cm, glabrous. Capsule 1.8–2.8 cm, gland-tipped pubescent, 4-seeded, basal stalk 1–1.5 cm. Seeds ovate in outline, ca. 4 × 3 mm, compressed. Fl. Jul–Sep, fr. Oct–Jan.

Evergreen broad-leaved forests, moist banks, streamsides, disturbed sites, ditches, trails; 100–1800 m. Anhui, Fujian, Guangdong, Guangxi, Guizhou, Hubei, Hunan, Jiangsu, Jiangxi, Sichuan, Taiwan, Yunnan, Zhejiang [India, Indonesia, Laos, Malaysia, Myanmar, Thailand, Vietnam].

*Asystasia neesiana* is sometimes treated in *Asystasiella* Lindau, a genus of two species with spheroidal, 4- or 5-porate, and spinulate (vs. prolate-spheroidal to subprolate, 3-colporate, and reticulate) pollen (see K. Ensermu et al., Kew Bull. 47: 669–675. 1992). The generic position of *Asystasia neesiana* s.l. and some of its relatives has yet to be thoroughly investigated.

This species is used medicinally.

**2. *Asystasia gangetica*** (Linnaeus) T. Anderson, Enum. Pl. Zeyl. 235. 1860.

宽叶十万错 kuan ye shi wan cuo

Herbs to 0.5 m tall, ascending. Stems 4-angled, pilose. Petiole 3–5 mm, pubescent; leaf blade ovate to elliptic, 3–12 × 1–5 cm, glabrous or sparsely pilose especially on veins, adaxially with numerous cystoliths, base truncate to rounded, margin entire or slightly crenulate, apex acuminate. Racemes axillary or terminal, to 16 cm; bracts triangular, ca. 5 mm, pilose; bracteoles linear-lanceolate, 1–2.5 mm, pilose. Pedicel 2–3 mm, pilose. Calyx ca. 7 mm; lobes linear-lanceolate, 5–7 × 1–1.2 mm, outside glandular pilose, margin ciliate. Corolla yellow or white, 1.2–3.5 cm, outside gland-tipped pilose, inside glabrous; tube basally cylindric and ca. 3 mm wide for ca. 8 mm then gradually widened to ca. 1 cm; lobes obovate to semicircular, 0.7–1.2 × 0.8–1 cm; middle lobe of lower lip with violet or maroon markings. Stamens included; filaments glabrous, longer pair ca. 5 mm, shorter pair ca. 3 mm; anther thecae ca. 3 × 1 mm. Ovary ellipsoid, ca. 3.5 mm; style ca. 1.8 cm, velutinous; stigma slightly capitate, 2-lobed. Capsule ca. 1.3 × 2 cm, pubescent. Seeds irregularly obovate in outline, 3–5 × 0.5–3 mm, tuberculate-rugose. Fl. Sep–Dec, fr. Dec–Mar.  $2n = 26, 52$ .

Forest margins, roadsides. Naturalized in Guangdong, Guangxi, Taiwan, and Yunnan [paleotropical; SW Asia].

Cultivated plants of *Asystasia gangetica* have corollas that vary from white to cream to lavender to purple.

- 1a. Corolla 3–3.5 cm, ca. 1 cm wide at mouth, lobes erect ..... 2a. subsp. *gangetica*
- 1b. Corolla 1.2–1.5 cm, ca. 0.5 cm wide at mouth, middle lobe of lower lip slightly reflexed ..... 2b. subsp. *micrantha*

**2a. *Asystasia gangetica* subsp. *gangetica***

宽叶十万错(原亚种) kuan ye shi wan cuo (yuan ya zhong)

*Justicia gangetica* Linnaeus, Cent. Pl. 2: 3. 1756; *Asystasia coromandeliana* Nees.

Corolla 3–3.5 cm, ca. 1 cm wide at mouth, lobes erect.

Forest margins. Naturalized in Guangdong, Guangxi, and Yunnan [tropical Asia; Pacific islands].

*Asystasia gangetica* subsp. *gangetica* occurs from India and Sri Lanka through SE Asia and Malesia to several Pacific islands. Exactly where the subspecies is native in E Asia and eastward is not confirmed.

**2b. *Asystasia gangetica* subsp. *micrantha*** (Nees) Ensermu in Seyani & Chikuni, Proc. XIII Plenary Meeting AETFAT 1: 343. 1994.

小花十万错 xiao hua shi wan cuo

*Asystasia coromandeliana* var. *micrantha* Nees in A. Can-dolle, Prodr. 11: 165. 1847; *A. micrantha* (Nees) Y. F. Deng & N. H. Xia.

Corolla 1.2–1.5 cm, ca. 0.5 cm wide at mouth, middle lobe of lower lip slightly reflexed.

Forest margins, roadsides. Naturalized in Guangdong and Taiwan [Africa, SW Asia, Indian Ocean islands, Madagascar].

**3. *Asystasia salicifolia*** Craib, Bull. Misc. Inform. Kew 1918: 367. 1918.

囊管花 nang guan hua

Herbs to 1 m tall. Stems 4-angled, pilose. Petiole ca. 5 mm, sparsely hirsute; leaf blade lanceolate, (5–)12–18 × (1.2–)1.8–2.8 cm, glabrous or hirsute along veins, secondary veins 6–9 on each side of midvein, base attenuate and decurrent onto petiole, margin entire, apex acuminate. Racemes terminal or rarely axillary, 5–10 cm; bracts triangular, 2–3 × ca. 1 mm, pilose with gland-tipped trichomes; bracteoles similar to bracts. Pedicel 1–3 mm, pilose. Calyx 5–6 mm, outside pilose with gland-tipped trichomes; lobes lanceolate. Corolla red to purplish red, 3.5–4 cm, outside gland-tipped pilose, inside pubescent in throat; lobes ovate, 5–6 × ca. 5 mm. Stamens included; filaments glabrous, longer pair ca. 1 cm, shorter pair ca. 0.8 cm; anther thecae oblong, ca. 3 mm. Ovary pilose; style ca. 2.8 cm, base pilose; stigma apically 2-cleft. Capsule and seeds not seen. Fl. Aug–Oct, fr. Nov–Jan.

Forests. Yunnan [India, Laos, Myanmar, Thailand].

Specimens identified as "*Asystasia henryi*" (C. Y. Wu, Index Fl. Yunnan. 2: 1669. 1984), which is not a validly published name, belong here.

Outside of China variation in *Asystasia salicifolia* also includes corollas pinkish to purplish (or rarely entirely white) and leaf blade margins entire to subsinuate.

**4. *Asystasia nemorum*** Nees in Wallich, Pl. Asiat. Rar. 3: 90. 1832.

十万错 shi wan cuo

Herbs to 1 m tall, perennial. Stems pilose. Leaf blade narrowly ovate to ovate-lanceolate, 6–12 × 3–5 cm, abaxially pilose along veins, adaxially glabrous or pilose along veins, secondary veins 6–9 on each side of midvein, base attenuate, margin undulate-crenulate, apex acuminate. Racemes terminal or axillary, 5–9 cm; bracts triangular, 2–3 × ca. 1 mm, pilose with gland-tipped trichomes; bracteoles similar to bracts. Pedicel 1–2 mm. Calyx 5–6 mm, outside pilose with gland-tipped trichomes; lobes lanceolate. Corolla red to purplish red, ca. 2.2 cm, outside pilose with gland-tipped trichomes, inside barbate in throat; lobes ovate, 4–5 × ca. 3.5 mm, unequal. Ovary and style pilose; stigma slightly 2-cleft. Capsule 1.8–2.2 cm. Seeds irregularly obovate in outline, 2–4 × ca. 2.5 mm, tuberculate-rugose. Fl. Aug–Oct, fr. Nov–Feb.

Paddy fields, streamsides, thickets. Guangdong, Guangxi, Yunnan [India, Laos, Myanmar, Thailand, Vietnam].

The plants misidentified as *Asystasia chelonoides* Nees by C. C. Hu (FRPS 70: 215. 2002) belong here.

*Asystasia salicifolia* can be difficult to distinguish from *A. nemorum*, and Chinese plants treated as these taxa might be conspecific. Indeed, according to R. Kiew and K. Vollesen (Kew Bull. 52: 965–971. 1997), *A. nemorum* has a compact inflorescence with flowers clustered toward the apex, a long and slender corolla tube, blue corollas, and is known only from Peninsular Malaysia (where cultivated) and Java (where native). It is possible that the plants treated here as *A. nemorum* are either not that species or represent cultivated plants of that species (which is used medicinally). *Asystasia* remains much in need of revisionary studies.

**15. PSEUDERANTHEMUM** Radlkofer, Sitzungsber. Math.-Phys. Cl. Königl. Bayer. Akad. Wiss. München 13: 282. 1883.

山壳骨属 shan ke gu shu

Hu Jiaqi (胡嘉琪 Hu Chia-chi), Deng Yunfei (邓云飞); Thomas F. Daniel

Herbs or shrubs, with cystoliths. Leaves sessile or petiolate; leaf blade margin entire or subentire [or lobed]. Flowers in axillary or terminal thyrses, racemes, or spikes; bracts and bracteoles present, mostly shorter than calyx. Calyx deeply 5-lobed; lobes equal to subequal. Corolla salverform; tube slender, not or scarcely apically enlarged; limb 5-lobed or 2-lipped; lobes  $\pm$  equal or 3 of lower lip slightly larger than 2 of upper lip, ascending cochlear in bud. Stamens 2, included in corolla tube or exerted from corolla mouth (some species heterostylous); anthers 2-theous; thecae equal to subequal, parallel, inserted at same height, mucous; staminodes 2 or absent. Style included or exerted; stigma 2-lobed, lobes equal. Capsule clavate with a long solid stalk, 4-seeded; retinacula present. Seeds lenticular, ornamented or smooth, lacking trichomes.

About 50 species; pantropical; seven species (two endemic) in China.

- 1a. Flowers in thyrses, imbricate on rachis.
  - 2a. Calyx lobes pubescent with gland-tipped trichomes ..... 1. *P. polyanthum*
  - 2b. Calyx lobes pubescent with non-glandular trichomes.
    - 3a. Bracts ca. 7 mm; ovary pubescent; leaf blade 5–15 cm ..... 2. *P. crenulatum*
    - 3b. Bracts ca. 3 mm; ovary glabrous; leaf blade 2.5–5.5 cm ..... 3. *P. shweliense*
- 1b. Flowers in racemes (thyrses in *P. coudercii*), distant on rachis.
  - 4a. Racemes terminal or axillary ..... 4. *P. teysmannii*
  - 4b. Racemes terminal only (or terminal and also rarely in apical leaf axils in *P. haikangense*).
    - 5a. Leaf blade lanceolate, length greater than  $4 \times$  width; filaments of fertile and sterile stamens connate at base ..... 5. *P. coudercii*
    - 5b. Leaf blade elliptic-ovate or elliptic, length less than  $3.5 \times$  width; filaments of fertile and sterile stamens distinct at base. ~
      - 6a. Stems terete, glabrous; bracts and bracteoles 1–3 mm; corolla ca. 4 cm ..... 6. *P. haikangense*
      - 6b. Stems 4-angled, pubescent; bracts and bracteoles 4–6 mm; corolla 2–3 mm ..... 7. *P. latifolium*

**1. *Pseuderanthemum polyanthum*** (C. B. Clarke ex Oliver) Merrill, Brittonia 4: 175. 1941.

多花山壳骨 duo hua shan ke gu

*Eranthemum polyanthum* C. B. Clarke ex Oliver, Hooker's Icon. Pl. 20: t. 2000. 1891.

Herbs. Stems grayish, subterete, glabrescent. Petiole ca. 2.5 cm; leaf blade broadly ovate to oblong,  $7\text{--}17 \times (3\text{--})4\text{--}9$  cm, both surfaces glabrous, secondary veins 7–9 on each side of midvein, base cuneate and decurrent onto petiole, margin entire, apex acute. Thyrses 5–12 cm; bracts triangular,  $3.5\text{--}4 \times$  ca. 1.5 mm; bracteoles ca.  $2 \times 0.5$  mm. Pedicel 1.5–2.5 mm. Calyx ca. 1 cm; lobes lanceolate. Corolla bluish purple; tube 3–3.5 cm; lower lip 3-lobed, lobes oblong and ca.  $1.5 \times 0.6$  cm; upper lip 2-lobed, lobes ca.  $11 \times 3$  mm. Staminal filaments short, distinct, inserted at throat. Ovary pilose; style basally pilose; stigma spherical. Capsule clavate, ca. 2.5 cm, pubescent. Seeds ovate in outline, ca.  $3 \times 3$  mm, verrucose, glabrous. Fl. Apr–Jun, fr. Aug.

Forests, thickets; 300–1600 m. Guangxi, Yunnan [India, Malaysia, Myanmar, Thailand, Vietnam].

Plants misidentified as *Rhinacanthus calcaratus* (Wallich) Nees by C. C. Hu (FRPS 70: 268. 2002) belong here.

**2. *Pseuderanthemum crenulatum*** (Wallich ex Lindley) Radlkofer, Sitzungsber. Math.-Phys. Cl. Königl. Bayer. Akad. Wiss. München 13: 286. 1883.

云南山壳骨 yun nan shan ke gu

*Eranthemum crenulatum* Wallich ex Lindley, Bot. Reg. 11: t. 879. 1825; *E. graciliflorum* Nees; *E. malaccense* C. B. Clarke; *Pseuderanthemum graciliflorum* (Nees) Ridley; *P. malaccense* (C. B. Clarke) Lindau.

Subshrubs or shrubs, to 3 m tall. Stems blackish brown, subterete, pubescent. Petiole 1–4 cm, puberulent; leaf blade ovate-elliptic to oblong-lanceolate,  $5\text{--}15 \times 3\text{--}5.5$  cm, abaxially light green and pubescent along veins, adaxially slightly pubescent, secondary veins ca. 7 on each side of midvein, base cuneate to broadly cuneate, margin entire, apex acute to acuminate. Thyrses 3–10 cm, densely flowered; bracts triangular, ca.  $7 \times 3$  mm, brown tomentose; bracteoles subulate,  $3\text{--}4 \times$  ca. 1.5 mm, brown tomentose. Pedicel 1–3 mm, pubescent. Calyx 4–5 mm; lobes linear-lanceolate, densely pubescent with non-glandular trichomes. Corolla white or light purplish,  $3.5\text{--}4.5$  cm, outside finely and sparingly pubescent with gland-tipped trichomes; tube 2.5–3.5 cm; lower lip 3-lobed, lobes oblong and ca. 1 cm; upper lip 2-lobed to middle. Stamens slightly exerted; filaments ca. 3 mm, glabrous; anther thecae ovoid. Ovary pilose; style basally white pilose; stigma spherical. Capsule clavate, ca. 2.5 cm. Seeds subcircular in outline, ca. 3.5 mm in diam., verrucose, glabrous. Fl. Apr–Jun, fr. Aug.

Forests, thickets; 200–1700 m. Guangxi, Guizhou, Yunnan [India, Laos, Malaysia, Thailand, Vietnam].

**3. *Pseuderanthemum shweliense*** (W. W. Smith) C. Y. Wu & C. C. Hu, Fl. Reipubl. Popularis Sin. 70: 226. 2002.

瑞丽山壳骨 rui li shan ke gu

*Eranthemum shweliense* W. W. Smith, Notes Roy. Bot. Gard. Edinburgh 10: 176. 1918.

Shrubs 1–2 m tall. Stems woody, grayish, hispid when young. Petiole 3–5 mm, densely brownish hirsute; leaf blade lanceolate, ovate-lanceolate, or elliptic, 2.5–5.5 × 1–2 cm, abaxially sparsely pilose or glabrous but densely brown hairy along veins, adaxially sparsely pilose along veins, base cuneate and decurrent onto petiole, margin entire, apex obtuse to acute. Inflorescences terminal, 7–15 cm; rachis densely yellowish pilose, with flowers fascicled at each node; bracts linear to linear-lanceolate, ca. 3 mm, pilose; bracteoles subulate, ca. 2 mm. Pedicel ca. 2 mm, pilose. Calyx ca. 5 mm; lobes linear-oblong, pilose, apex acute. Corolla white with violet spot on 2 lobes; tube ca. 2.2 cm, outside and inside pilose; lobes 5, ovate, 1.8–1.9 cm. Stamens exserted. Ovary glabrous; style basally sparsely pilose; stigma slightly 2-cleft. Capsule clavate, ca. 2.5 cm. Seeds ovate in outline, ca. 3 mm, verrucose, glabrous. Fl. Feb–May, fr. Jun–Aug.

● Thickets, forest margins; 1200–1800 m. Yunnan.

**4. *Pseuderanthemum teysmannii*** (Miquel) Ridley, Fl. Malay. Penin. 2: 592. 1923 [*“teysmanni”*].

红河山壳骨 hong he shan ke gu

*Strobilanthes teysmannii* Miquel, Fl. Ned. Ind. 2: 799. 1858 [*“teysmanni”*].

Shrubs. Stems reddish brown, 4-angled, glabrous. Petiole to 2.5 cm; leaf blade ovate, 3.5–9.5 × 1.5–4.5 cm, abaxially pubescent along veins, adaxially sparsely pubescent along midvein, secondary veins 8–10 on each side of midvein, base broadly cuneate and decurrent onto petiole, margin subentire, apex acuminate. Racemes terminal or axillary; rachis with flowers 0.5–1.5 cm apart, yellowish brown pubescent; bracts triangular, 2–3 mm, margin ciliate; bracteoles similar to bracts. Pedicel 0–4 mm, pilose. Calyx ca. 5 mm, pubescent; lobes linear, slightly unequal. Corolla pale purple, ca. 3.5 cm; tube ca. 2.5 cm; limb 5-lobed, slightly 2-lipped. Stamens inserted at corolla throat; anthers as long as filaments. Ovary pilose; style ca. 2 cm, slightly white villous; stigma 2-cleft. Capsule clavate, ca. 2.3 cm, sparsely pubescent. Seeds ovate in outline, ca. 3 × 3 mm, verrucose, glabrous. Fl. Apr–Jun, fr. Aug.

Thickets; 100–300 m. Yunnan [Indonesia, S Thailand].

**5. *Pseuderanthemum coudercii*** Benoist, Notul. Syst. (Paris) 5: 111. 1936 [*“couderci”*].

狭叶钩粉草 xia ye gou fen cao

Subshrubs or perennial herbs, 30–50 cm tall. Stems subterete to 4-angled, pubescent, glabrescent. Petiole ca. 5 mm; leaf blade oblong, lanceolate, or linear, 3–11 × 0.2–2.5 mm, both surfaces glabrous, secondary veins 6–12 on each side of midvein, base cuneate, margin entire or slightly undulate, apex acuminate to rarely acute. Thyrses terminal, to 20 cm; rachis pubescent; dichasia 1–4-flowered; basal bracts 1–3, large, leaflike, longer than calyx; apical bracts linear, shorter than calyx, villous; bracteoles linear, villous. Calyx 5–6 mm; lobes linear, vil-

lous. Corolla light purplish red, slightly pubescent; tube ca. 3 cm; lower lip ca. 1.2 cm, lobes ovate to ovate-elliptic; upper lip 2-lobed, lobes oblong. Stamens 2; filaments connate at base; staminodes 2, smaller than stamens. Capsule ca. 1.8 cm, sparsely pubescent. Seeds obovate in outline, ca. 3.5 mm, tuberculate-punctate, glabrous. Fl. Jun–Aug, fr. Sep.

Forests, streamsides; 100–400 m. Hainan [Cambodia].

**6. *Pseuderanthemum haikangense*** C. Y. Wu & H. S. Lo, Fl. Hainan. 3: 595. 1974.

海康钩粉草 hai kang gou fen cao

Shrubs 40–100 cm tall. Stems terete, glabrous; bark straw-yellow. Petiole 0.5–1.5 cm; leaf blade elliptic-orbicular, oblong, ovate, or rarely lanceolate-elliptic, 5–11.5 × 2–3.5 cm, both surfaces glabrous, secondary veins 5–7 on each side of midvein, base broadly cuneate to rounded, margin entire or inconspicuously undulate, apex shortly acuminate to caudate. Racemes terminal or rarely in apical leaf axils, to 30 cm; bracts narrowly triangular, 2–3 mm; bracteoles 1–2 mm. Pedicel 0–3 mm. Calyx ca. 5 mm; lobes linear-lanceolate, apex acuminate. Corolla white or pink and with red spots on lobes of lower lips, ca. 4 cm, pilose; tube basally ca. 1.5 mm wide for ca. 3 cm; lower lip 3-lobed, lobes narrowly elliptic, ca. 10 × 4 mm, and apex obtuse; upper lip 2-lobed, lobes elliptic, ca. 10 × 6 mm, and apex obtuse. Stamens 2; filaments ca. 2 mm; anther thecae oblong, ca. 1.5 mm; staminodes ca. 1.3 mm. Ovary pilose; style ca. 3 cm, slightly pubescent; stigma slightly 2-cleft. Capsule clavate, 1.9–2 cm, pubescent. Seeds broadly ovate in outline, ca. 3.5 mm, tuberculate-punctate. Fl. Jun–Aug, fr. Sep.

● Forests; 200–900 m. Guangdong, Hainan, Yunnan.

**7. *Pseuderanthemum latifolium*** (Vahl) B. Hansen, Nordic J. Bot. 9: 213. 1989.

山壳骨 shan ke gu

*Justicia latifolia* Vahl, Symb. Bot. 2: 4. 1791; *Antheliacanthus micranthus* Ridley; *Eranthemum palatiferum* (Wallich) Nees; *J. palatifera* Wallich; *Pseuderanthemum palatiferum* (Wallich) Radlkofer.

Herbs to 1 m tall, perennial. Stems 4-angled, pubescent. Petiole 1–2.5 mm; leaf blade elliptic, 11.5–12 × 3.5–6 cm, abaxially glabrous except villous on midvein, adaxially glabrous, secondary veins 5 or 6 on each side of midvein, base cuneate, margin subentire to slightly undulate-crenulate, apex acuminate. Racemes to 30 cm; rachis pubescent, usually with 3-flowered clusters at nodes; bracts triangular, 4–6 × ca. 2 mm, pubescent; bracteoles similar to bracts. Pedicel 0.5–2 mm. Calyx 5–6 mm, outside pubescent; lobes linear, 4.5–5.5 × ca. 1 mm. Corolla light purple with purple dots on lower lip, 2–3 cm; tube linear, 1.5–2.5 cm; lobes 3–4 × ca. 3 mm. Style basally pubescent. Capsule ca. 2.5 cm, pubescent. Seeds ovate in outline, ca. 4 × 4 mm, rugose. Fl. Apr–Jun, fr. Aug–Sep.

Forests; 100–1600 m. Guangdong, Guangxi, Hainan, Yunnan [Cambodia, India, Laos, Malaysia, Myanmar, Thailand, Vietnam].

# 16. **MACKAYA** Harvey, Thes. Cap. 1: 8. 1859, nom. cons., not Arnott (1838), nor *Mackaia* Gray (1821).

太平爵床属 *tai ping jue chuang shu*

Hu Jiaqi (胡嘉琪 Hu Chia-chi), Deng Yunfei (邓云飞); Thomas F. Daniel

Herbs, perennial, with cystoliths. Leaves petiolate. Inflorescences axillary or terminal, secund racemes; bracts linear-lanceolate [or narrowly deltoid]; bracteoles 2, borne at base of pedicel. Calyx much shorter than corolla tube, 5-lobed almost to base; lobes linear-lanceolate. Corolla subactinomorphic; tube basally cylindric, campanulate toward apex; limb 2-lipped, lower lip 3-lobed, upper lip 2-lobed; lobes suborbicular [ovate or oblong], ascending cochlear in bud. Stamens 2, inserted at base of campanulate portion of corolla tube, subincluded; anthers 2-theous; thecae oblong, dorsally pubescent; staminodes 2, lacking anthers. Disk obsolete. Ovary subellipsoid, with ovules 2 per locule; style subglabrous or pubescent near base; stigma 2-lobed. Capsule (not seen for *Mackaya tappingensis*) stipitate, 2- or 4-seeded; retinacula present. Seeds (not seen for *M. tappingensis*) somewhat rugose.

Three species: disjunctly distributed in Himalayan region and South Africa; one species in China.

**1. *Mackaya tappingensis*** (W. W. Smith) Y. F. Deng & C. Y. Wu, Novon 19: 308. 2009.

太平爵床 *tai ping jue chuang*

*Eranthemum tappingense* W. W. Smith, Notes Roy. Bot. Gard. Edinburgh 10: 177. 1918; *Pseuderanthemum tappingense* (W. W. Smith) C. Y. Hu & H. S. Lo.

Herbs to 1 m tall, perennial. Stems subterete, glabrous or subglabrous. Petiole 2–3.5 cm, sparsely puberulent or glabrescent; leaf blade lanceolate to oblong-lanceolate, 12–17 × 3–5(–7) cm, membranous, both surfaces glabrous or glabrescent, abaxially paler, adaxially dark green, secondary veins 8–12 on

each side of midvein, base cuneate, margin entire to undulate, apex acuminate. Inflorescences axillary or terminal, racemes, 7–20 cm; peduncle sparsely pilose or glabrescent; bracts linear-lanceolate, 2–3 mm, pilose or glabrescent; bracteoles linear, ca. 1 mm. Pedicel 2–3 mm. Calyx 6–8 mm; lobes linear-lanceolate, 3–4 × 1.5–2 mm, glabrous, apex acuminate. Corolla rose, 3–4 cm, outside glabrous; tube basally cylindric for ca. 1 cm; lobes suborbicular, 7–12 mm, subequal, margin dentate. Staminal filaments 6–12 mm, pilose; anther thecae 4–5 mm, muticous at base; staminodes 1–4 mm. Ovary glabrous; style ca. 1.8 cm, pubescent. Capsule not seen. Fl. Oct–Jan.

Forests; 600–1800 m. Yunnan [Myanmar].

# 17. **ISOGLOSSA** Oersted, Vidensk. Meddel. Dansk Naturhist. Foren. Kjøbenhavn 1854: 155. 1854, nom. cons.

叉序草属 *cha xu cao shu*

Hu Jiaqi (胡嘉琪 Hu Chia-chi), Deng Yunfei (邓云飞); Thomas F. Daniel

*Chingiacanthus* Handel-Mazzetti; *Ecteinanthus* T. Anderson; *Leda* C. B. Clarke (1908), not Bory (1822) [Algae]; *Rhytiglossa* Nees; *Strophacanthus* Lindau.

Shrubs or herbs, with cystoliths, isophyllous or slightly anisophyllous. Leaves petiolate. Inflorescences terminal and/or sometimes axillary, open panicles or thyrses; bracts small, shorter than calyx. Calyx deeply 5-lobed, lobes similar. Corolla funnel-shaped, 2-lipped; lower lip 3-lobed; upper lip shortly 2-lobed, lacking a stylar furrow (i.e., erugulate); lobes ascending cochlear in bud. Stamens 2; anthers 2-theous; thecae equal or unequal, parallel (to perpendicular), subequally to unequally inserted, base muticous; staminodes absent; pollen 2-porate [elsewhere also 3-colporate and 6-pseudocolporate]. Ovary with 2 ovules per locule. Capsule clavate with a solid sterile basal stalk, 4-seeded; retinacula present; septa with attached retinacula remaining attached to inner wall of mature capsule. Seeds subdiscoid.

About 50 species: tropical Africa and Asia; two species (one endemic) in China.

- 1a. Calyx lobes subulate, widest at base; inflorescence long branched, widely paniculate ..... 1. *I. collina*  
1b. Calyx lobes spatulate-oblongate, widest above middle; inflorescence shortly branched, narrowly paniculate or  
thyrsoid ..... 2. *I. glabra*

Herbs 40–100 cm tall. Stems prostrate and rooting at base

but apically erect, terete, slender, slightly puberulent when young, later glabrescent. Petiole 1–3 cm, brownish pubescent; leaf blade ovate to ovate-elliptic, 3.5–11 × 2–4.8 cm, abaxially sparsely puberulent especially along veins, adaxially glabrous, secondary veins 5–7 on each side of midvein, base cuneate or on uppermost leaves rounded, margin ± entire, apex acuminate. Inflorescences terminal or axillary from upper leaf axils, panicles, 5–18 × 3–10 cm; rachis gland-tipped puberulent or subglabrous.

brous with few sessile glands; branches slightly flattened; bracts lanceolate,  $1.5\text{--}2 \times \text{ca. } 0.5$  mm, glabrous or slightly gland-tipped pubescent. Calyx  $5\text{--}8$  mm; lobes subulate, glabrous or gland-tipped puberulent. Corolla white with purplish dots,  $1.7\text{--}4.5$  cm, outside glabrous; tube basally cylindric for ca.  $1/3$  of its length then gradually widening into a funnel-shaped throat; lips  $8\text{--}10$  mm; lobes of lower lip oblong-elliptic,  $3\text{--}6$  mm, unequal with lateral 2 narrower. Staminal filaments  $4\text{--}10$  mm, glabrous; anther thecae to  $4.5$  mm, equal, parallel, overlapping for ca.  $1/2$  their length or more. Ovary glabrous; style glabrous. Capsule  $1\text{--}1.4$  cm, glabrous. Seeds coarsely corrugated with irregular ridges and often with minute acute protuberances. Fl. Aug–Nov.

Evergreen broad-leaved forests, wetlands by streams;  $300\text{--}2200$  m. Guangdong, Guangxi, Hunan, Jiangxi, Xizang, Yunnan [Bhutan, India, Thailand].

**2. *Isoglossa glabra*** (Handel-Mazzetti) B. Hansen, *Nordic J. Bot.* 5: 12. 1985.

光叉序草 *guang cha xu cao*

*Chingiacanthus glaber* Handel-Mazzetti, *Sinensia* 5: 12. 1934.

Herbs  $40\text{--}100$  cm tall, erect. Stems terete, glabrous. Petiole  $0.8\text{--}1.5$  cm, minutely puberulent; leaf blade ovate-elliptic,  $5.8\text{--}7.5 \times 3\text{--}3.5$  cm, glabrous except puberulent on margin and midvein, secondary veins 6 or 7 on each side of midvein, base rounded to constricted cuneate, apex attenuate. Inflorescences terminal, interrupted panicles composed of cymes, ca.  $10 \times 2$  cm; rachis glabrous; bracts triangular, ca.  $1.2 \times 1$  mm, glabrous. Calyx ca.  $4.5$  mm; lobes spatulate-ob lanceolate, glabrous, apex acute. Corolla to  $3.5$  cm, outside glabrous, inside pubescent; tube basally cylindric for ca.  $1/3$  of its length then gradually widening into a funnel-shaped throat; lobes of lower lip  $3\text{--}5$  mm. Staminal filaments  $4\text{--}6$  mm, glabrous; anther thecae to  $2.5$  mm,  $\pm$  equal or with lower theca smaller,  $\pm$  parallel, slightly or not overlapping. Ovary glabrous; style glabrous. Capsule not seen. Fl. Aug–Sep.

• Forests; ca.  $1000$  m. Guangxi.

## 18. CLINACANTHUS Nees in A. Candolle, *Prodr.* 11: 511. 1847.

鳄嘴花属 *e zui hua shu*

Hu Jiaqi (胡嘉琪 *Hu Chia-chi*), Deng Yunfei (邓云飞); Thomas F. Daniel

Shrubs or perennial herbs, with cystoliths. Leaves petiolate; leaf blade margin entire or sinuate-crenate. Inflorescences axillary or terminal, thyrsoid racemes; bracts and bracteoles narrow. Calyx deeply 5-lobed, lobes narrow. Corolla putatively resupinate (apparently by geniculation rather than torsion); tube long, geniculate, apically widened; limb 2-lipped; lower lip slightly recurved, much broader than upper lip, 3-lobed; upper lip shortly 2-lobed; lobes ascending cochlear in bud. Stamens 2; anthers 1-theous, base muticous; staminodes absent. Stigma shortly 2-cleft. Capsule oblong, with a short basal stalk, 4-seeded; retinacula present.

Three species: tropical Asia; one species in China.

**1. *Clinacanthus nutans*** (N. L. Burman) Lindau, *Bot. Jahrb. Syst.* 18: 63. 1893.

鳄嘴花 *e zui hua*

*Justicia nutans* N. L. Burman, *Fl. Indica*, 10. 1768; *Clinacanthus burmanni* Nees, nom. illeg. superfl.; *C. nutans* var. *robinsonii* Benoist.

Shrubs to  $1$  m tall. Stems terete, striate, glabrescent. Petiole  $0.3\text{--}2$  cm, sulcate, bifariously pubescent; leaf blade lanceolate-ovate, lanceolate, or linear-lanceolate,  $7\text{--}12 \times 1\text{--}4$  cm, both surfaces pubescent when young then glabrescent except abaxially pilose along veins, secondary veins  $4\text{--}6$  on each side of midvein and abaxially elevated, base cuneate to rounded, margin subentire to sinuate-crenate, apex acuminate. Racemes 1 to several at or near shoot apex, usually 3 to several forming a terminal panicle; rachis gland-tipped pubescent; bracts and

bracteoles linear, ca.  $8 \times 2$  mm, abaxially gland-tipped pilose, apex acute. Calyx  $0.9\text{--}1.3$  cm; lobes linear, outside gland-tipped pilose, apex acute. Corolla dull red with a green base,  $3\text{--}4.2$  cm, outside gland-tipped pilose, inside glabrous except for a ring of trichomes ca.  $5$  mm above base; tube basally cylindric for ca.  $5$  mm and ca.  $3$  mm wide then gradually widened to ca.  $6$  mm at mouth; lower lip  $1\text{--}2 \times \text{ca. } 1$  cm, with yellow streaks; upper lip triangular,  $1\text{--}2 \times \text{ca. } 0.5$  cm, erect, apex emarginate; lobes ovate,  $3\text{--}5 \times 1\text{--}2$  mm. Stamens exserted from mouth of corolla; filaments  $1\text{--}1.5$  cm, glabrous; anthers ovate-linear,  $4\text{--}5 \times \text{ca. } 1$  mm, muticous. Style  $3\text{--}3.7$  cm, base sparsely pubescent. Capsule ca.  $2$  cm, pilose. Seeds ca.  $2$  mm in diam. Fl. Oct–Jan, fr. Mar.

Thickets; below  $700$  m. Guangdong, Guangxi, Hainan, Yunnan [Indonesia, Malaysia, Thailand, Vietnam].

This species is used medicinally.

## 19. KUDOACANTHUS Hosokawa, *Trans. Nat. Hist. Soc. Formosa* 23: 94. 1933.

银脉爵床属 *yin mai jue chuang shu*

Hu Jiaqi (胡嘉琪 *Hu Chia-chi*), Deng Yunfei (邓云飞); Thomas F. Daniel

Herbs, decumbent, often rooting at basal nodes. Leaves petiolate. Inflorescences terminal, spikes or sometimes in panicles with spicate branches, bracteate; bracteoles 2. Calyx 5-lobed. Corolla tube short, distally slightly enlarged into a throat; limb 2-lipped; lower lip 3-lobed, lobes subequal; upper lip 2-cleft, lacking a stylar furrow (so far as known); lobes ascending cochlear in bud.

Stamens 2, inserted slightly above throat; anthers 2-theous; thecae equally to subequally inserted, parallel, subequal, base mucous; staminodes absent. Disk without an annulus. Capsule unknown.

- One species: China (Taiwan).

*Kudoacanthus* was recently shown to pertain to the “*Tetramerium* lineage” of Justiceae (L. McDade et al., Amer. J. Bot. 95: 1136–1152. 2008). Whether *K. albonervosa* is generically distinct remains to be determined; it appears very similar to *Leptostachya wallichii*.

**1. *Kudoacanthus albonervosa*** Hosokawa, Trans. Nat. Hist. Soc. Formosa 23: 95. 1933.

银脉爵床 yin mai jue chuang

*Codonacanthus albonervosa* (Hosokawa) Yuen P. Yang.

Herbs to 40 cm tall. Stems hirsute. Petiole 3–15 mm; leaf blade ovate to orbicular-ovate, 0.7–4.5 × 0.7–2.5 cm, membranous, both surfaces pilose, abaxially slightly paler, adaxially green, secondary veins 3–5 pairs on each side of midvein, prominent, and white, base broadly cuneate, margin remotely undulate to entire, apex obtuse to acuminate. Spikes to 4 cm, simple or branched into a panicle, few flowered; rachis gland-tipped pilose; bracts linear to oblanceolate, 2–3 × ca. 1 mm, abaxially gland-tipped pilose, adaxially glandular punctate. Flowers sessile; bracteoles linear, ca. 2 × 0.8 mm, abaxially gland-tipped pilose, adaxially glandular punctate. Calyx ca. 4

mm, outside gland-tipped pilose, inside glandular punctate, 5-lobed almost to base; lobes linear, outside pubescent, margin ciliate. Corolla white, ca. 5 mm, outside glabrous, inside slightly puberulent on throat; tube basally cylindric for 2.5–3 mm then slightly enlarged into a throat; lobes of lower lip obovate-elliptic, spreading, apex obtuse; lobes of upper lip erect, concave. Staminal filaments ca. 1 mm, glabrous; anther thecae ca. 0.8 mm. Ovary oblong-ellipsoid, ca. 1.5 mm, glabrous, with 2 ovules per locule; style filiform, ca. 4 mm, glabrous; stigma minutely 2-cleft. Capsule and seeds unknown. Fl. Apr, Aug.

- Evergreen broad-leaved forests; 600–700 m. Taiwan.

*Kudoacanthus albonervosa* is known from few collections (but collected as recently as 2002) and remains poorly characterized. Its pollen is described as 3-porate (C. F. Hsieh & T. C. Huang, Fl. Taiwan, ed. 2, 4: 669. 1998).

## 20. *RUNGIA* Nees in Wallich, Pl. Asiat. Rar. 3: 77, 109. 1832.

孩儿草属 hai er cao shu

Hu Jiaqi (胡嘉琪 Hu Chia-chi), Deng Yunfei (邓云飞); Thomas F. Daniel

Herbs, decumbent to erect, with cystoliths. Leaves petiolate; leaf blade margin entire. Inflorescences axillary or terminal spikes, secund or 4-sided, sometimes reduced to a single flower; bracts 2- or 4-ranked but usually only 2 ranks fertile, homomorphic or heteromorphic, usually imbricate, margin usually scarious or hyaline; bracteoles similar to bracts or narrower. Calyx deeply 5-lobed; lobes equal or subequal. Corolla small; tube basally cylindric, distally ± expanded; limb 2-lipped; lower lip spreading, 3-lobed; upper lip erect, rugula (stylar furrow) present, margin entire to emarginate; lobes ascending cochlear in bud. Stamens 2, inserted in corolla throat; anthers 2-theous; thecae subequal in size, superposed, lower one white spurred at base. Ovary with 2 ovules per locule; stigma entire or slightly 2-cleft. Capsule shortly stalked, ovoid or oblong, 4-seeded; retinacula present; septa (with attached retinacula) separating from inner wall of mature capsule. Seeds compressed, verrucose, lacking trichomes.

About 50 species: Old World tropics and subtropics; 16 species (12 endemic) in China.

- 1a. Flowers solitary in apical leaf axils or in 2-sided spikes; bracts 2- or 4-ranked, all fertile.
  - 2a. Flowers solitary in apical leaf axils ..... 1. *R. axilliflora*
  - 2b. Flowers in axillary or terminal spikes.
    - 3a. Plants 6–10 cm tall; spikes globose or ovoid, 0.5–1 cm ..... 2. *R. mina*
    - 3b. Plants more than 20 cm tall; spikes cylindric, 1–7 cm.
      - 4a. Bracts without hyaline margin ..... 3. *R. densiflora*
      - 4b. Bracts with hyaline margin.
        - 5a. Bracteoles elliptic, ca. 1/2 as long as bracts ..... 4. *R. chinensis*
        - 5b. Bracteoles ovate-lanceolate, as long as bracts ..... 5. *R. stolonifera*
  - 1b. Spikes 1-sided; bracts 4-ranked, each 2 fertile or sterile.
    - 6a. Bract margins not ciliate.
      - 7a. Sterile and fertile bracts different in shape; fertile bracts oblong, ca. 0.7 cm, apex rounded ..... 6. *R. guangxiensis*
      - 7b. Sterile and fertile bracts similar in shape; fertile bracts oblong to elliptic-oblong, ca. 1.5 cm, apex acute ..... 7. *R. pinpiensis*
    - 6b. Bract margins ciliate.
      - 8a. Fertile bracts circular, obovate, elliptic, obovate-elliptic, or spenoid, apex rounded, obtuse, or emarginate.
        - 9a. Fertile bracts circular to obovate, apex rounded to obtuse to emarginate and mucronate ..... 8. *R. pectinata*
        - 9b. Fertile bracts spenoid, elliptic, obovate, or obovate-elliptic, apex rounded and not mucronate.
          - 10a. Fertile bracts spenoid ..... 9. *R. monetaria*

- 10b. Fertile bracts elliptic, obovate-elliptic, or obovate.  
 11a. Fertile bracts elliptic to obovate-elliptic ..... 10. *R. longipes*  
 11b. Fertile bracts obovate ..... 11. *R. bisaccata*  
 8b. Fertile bracts lanceolate-linear, oblong-lanceolate, lanceolate, ovate, or elliptic, apex acute, acuminate, or cuspidate.  
 12a. Bracts abaxially gland-tipped pubescent ..... 12. *R. pungens*  
 12b. Bracts glabrous or non-glandular pubescent.  
 13a. Fertile bracts elliptic, broader at middle.  
 14a. Leaf blade pubescent abaxially ..... 13. *R. napoensis*  
 14b. Leaf blade glabrous on both surfaces ..... 14. *R. yunnanensis*  
 13b. Fertile bracts ovate to ovate-lanceolate to lanceolate-linear, broader at base.  
 15a. Leaf blade glabrous ..... 15. *R. taiwanensis*  
 15b. Leaf blade pubescent along veins and ciliate on margin ..... 16. *R. hirpex*

**1. *Rungia axilliflora*** H. S. Lo, Acta Phytotax. Sin. 16(4): 92. 1978.

腋花孩儿草 ye hua hai er cao

Herbs 10–20 cm tall. Branches slender, bifariously retrorsely pubescent. Petiole 2–7 mm, pubescent; leaf blade ovate to broadly ovate, 5–20 × 4–14 mm, secondary veins ca. 4 on each side of midvein, base cuneate to rounded, margin entire or slightly undulate, apex obtuse to rounded. Flowers solitary in apical leaf axils, sessile; bracteoles 2, broadly ovate, 4–4.5 × ca. 2.5 mm, margin yellow, 0.1–0.2 mm broad, membranous, and ciliate. Calyx 3–3.5 mm; lobes lanceolate, glabrous, apex acuminate. Corolla light bluish, 1.1–1.2 cm, outside glabrous; tube ca. 6 mm, straight; lower lip ca. 6 mm, patent, apex 3-lobed, lobes orbicular and ca. 1.5 mm in diam.; upper lip triangular, erect, apex emarginate. Staminal filaments ca. 5 mm; anther thecae ovoid. Ovary glabrous; style 8.5–9 mm; stigma 2-lobed. Capsule not seen. Fl. Sep–Nov.

• Streamsides; 400–700 m. Guangxi, Guizhou.

**2. *Rungia mina*** H. S. Lo, Acta Phytotax. Sin. 16(4): 93. 1978.

矮孩儿草 ai hai er cao

Herbs 6–10 cm tall. Stems ca. 1 mm in diam., erect, usually unbranched, white retrorsely gland-tipped pubescent. Petiole 2–5 mm, densely pubescent; leaf blade ovate or broadly ovate, 5–20 × 4–10 mm, both surfaces sparsely pubescent, secondary veins 2 or 3 on each side of midvein, base broadly cuneate, margin entire, apex obtuse. Spikes terminal or axillary, sessile, globose to ovoid, 5–10 mm, 2-sided, contracted; bracts all fertile, obovate to spatulate-obovate, ca. 4 × 3 mm, abaxially pilose, margin hyaline and ciliate, apex obtuse to sometimes acute; bracteoles boat-shaped, ca. 3 × 2 mm, concave, margin ciliate. Calyx 5-lobed almost to base; lobes linear-lanceolate, 1.5–1.7 mm, apex acuminate. Corolla purple, ca. 3.8 mm; tube ca. 2 mm; lower lip ca. 1.8 mm, patent, 3-lobed, lobes suborbicular, ca. 0.5 mm in diam., and outside slightly pubescent on central one; upper lip broadly triangular, ca. 1.5 mm, erect, apex emarginate. Staminal filaments ca. 1.5 mm; anther thecae ovoid. Ovary glabrous; style ca. 4 mm, glabrous. Capsule ca. 2.7 mm, glabrous. Fl. Sep.

• Wet places in forests; ca. 1400 m. Yunnan.

**3. *Rungia densiflora*** H. S. Lo, Acta Phytotax. Sin. 16(4): 94. 1978.

密花孩儿草 mi hua hai er cao

Herbs to 50 cm tall. Stems stout, bifariously retrorsely pubescent. Petiole 0.5–2 cm, pubescent; leaf blade elliptic-ovate, ovate, or ovate-lanceolate, 2–8.5 × 1–3 cm, papery, both surfaces glabrous or minutely hirsute, secondary veins 6–8 on each side of midvein, base cuneate and slightly decurrent onto petiole, margin entire, apex acuminate to slightly obtuse. Spikes terminal or axillary, sessile, to 3 cm; bracts 4-ranked, all fertile, homomorphic, usually spatulate to sometimes obovate, 7–11 × 1.5–3 mm, 3-veined, margin not hyaline but ciliate and densely so apically, apex rounded to obtuse; bracteoles 2, obovate, ca. 6 × 2–3 mm, margin hyaline. Calyx ca. 4 mm; lobes linear-lanceolate. Corolla 1.1–1.7 cm, outside pilose; tube basally cylindric for 6–9 mm; lower lip oblong, 5–8 mm, apex 3-lobed, central lobe smaller; upper lip triangular-ovate, erect, shortly 2-lobed. Staminal filaments 5–7 mm, glabrous; anther thecae ovoid. Capsule ca. 6 mm. Fl. Sep–Oct, fr. Nov–Dec.

• Forests, streamsides; 400–800 m. Anhui, Guangdong, Jiangxi, Zhejiang.

**4. *Rungia chinensis*** Benth, Fl. Hongk. 166. 1861.

中华孩儿草 zhong hua hai er cao

Herbs to 70 cm tall, spreading to erect. Stems slender, 4-angled, sulcate, slightly puberulent, usually rooting at basal nodes. Petiole 0.5–3 cm, pubescent; leaf blade ovate to oblong-lanceolate, 2.5–9 × 1.8–3 cm, membranous, glabrous except sparsely hirsute along veins, secondary veins 5 or 6 on each side of midvein, base cuneate to attenuate, margin entire or slightly undulate, apex acute to obtuse. Spikes terminal or axillary, 1–7 cm, 2-sided; bracts 4-ranked, all fertile, elliptic, 7–8 × 2–4 mm, margin sparsely ciliate, apex acute; bracteoles elliptic, 4–5 × ca. 2.5 mm, margin membranous and sparsely ciliate, apex mucronate. Calyx deeply 5-lobed; lobes linear-lanceolate, ca. 5 mm. Corolla bluish, 6–8 mm, outside slightly pilose and glandular punctate; lower lip 3-lobed, lobes ca. 7 mm; upper lip shallowly dentate. Ovary subglabrous; style ca. 1 cm, glabrous; stigma obtuse. Capsule ovoid, ca. 6 mm, 4-seeded. Seeds lenticular, ca. 1.5 mm wide, minutely tuberculate. Fl. Sep–Oct, fr. Nov–Dec.

Grasslands; 300–1200 m. Anhui, Fujian, Guangdong, Guangxi, Jiangxi, Taiwan, Zhejiang [Vietnam].

This species is used medicinally.

**5. *Rungia stolonifera*** C. B. Clarke in J. D. Hooker, Fl. Brit. India 4: 547. 1885.

匍匐鼠尾黄 pu fu shu wei huang

*Justicia stolonifera* (C. B. Clarke) B. Hansen.

Herbs 30–60 cm tall, erect, branched, rooting at basal nodes. Stems 4-angled, sulcate, pubescent along groove. Petiole 5–10 mm; leaf blade ovate, 2.5–7.5 × 1.8–3.8 cm, subglabrous except for some pubescence on margin, secondary veins ca. 5 on each side of midvein, base broadly cuneate, margin entire or undulate, apex acute. Spikes terminal or axillary; bracts obovate to spatulate, ca. 4 × 3 mm, minutely pubescent, margin hyaline, apex rounded; bracteoles ovate-lanceolate, similar to bracts. Calyx ca. 1.3 cm, glabrous; lobes lanceolate, margin hyaline. Corolla 1.2–1.6 cm; tube basally cylindric, 2–3 mm in diam., and straight for ca. 8 mm; limb ca. 4 mm; lower lip 3-lobed, pendent, lobes oblong and ca. 1 × 1 mm; upper lip triangular, erect, subentire. Staminal filaments white, glabrous; anther thecae purplish black. Ovary sparsely hirsute; style 1.5–1.8 cm, exserted; stigma orbicular. Capsule 3–4 mm, subglabrous. Seeds ovate in outline, ca. 2 × 1.5 mm, minutely gland-tipped papillose. Fl. Sep–Oct, fr. Nov–Dec.

Forests, trailsides; 200–2300 m. Yunnan [Bangladesh, India].

**6. *Rungia guangxiensis*** H. S. Lo & D. Fang, Guihaia 17: 46. 1997.

广西孩儿草 guang xi hai er cao

Herbs to 70 cm tall, erect. Stems subterete, subglabrous or pubescent when young. Petiole 0.5–2.5 cm, bifariously pubescent; leaf blade elliptic to ovate, 9–17 × 2.5–4 cm, abaxially puberulent, adaxially glabrous, secondary veins ca. 7 on each side of midvein, base cuneate, margin entire, apex shortly acuminate. Spikes terminal, 1-sided; peduncle absent or less than 3 mm; bracts 4-ranked; fertile bracts oblong, ca. 7 × 3.5 mm; sterile bracts broadly obovate, 7–8 × 4–5 mm, glabrous, apex rounded. Calyx ca. 2.5 mm, 5-lobed. Corolla red, ca. 1.7 cm, outside glabrous; tube basally cylindric and ca. 1.5 mm in diam.; lower lip 3-lobed, patent; upper lip ovate-triangular, apex obtuse. Stamens slightly exserted; anther thecae ovoid, lower thecae spurred. Capsule not seen. Fl. Jan–Apr.

• Dense forests; 500–600 m. Guangxi.

**7. *Rungia pinpienensis*** H. S. Lo, Acta Phytotax. Sin. 16(4): 91. 1978.

屏边孩儿草 ping bian hai er cao

Herbs to 1 m tall, erect. Stems 4-angled when young then subterete, subglabrous. Petiole 2–5 cm, subglabrous; leaf blade elliptic to broadly elliptic, 13–15 × 6–8 cm, cystoliths white, abaxially glabrous or puberulent along veins, adaxially glabrous, secondary veins 9 or 10 on each side of midvein and netted near margin, base broadly cuneate, margin slightly undulate, apex cuspidate. Spikes terminal, ca. 9 cm, 1-sided; peduncle ca. 1 cm; bracts 4-ranked, each 2 sterile or fertile, oblong to elliptic-oblong, ca. 15 × 4–5 mm, homomorphic, glabrous, margin narrowly hyaline, apex acute. Calyx ca. 5 mm; lobes linear.

Corolla not seen. Capsule ca. 1.2 cm, glabrous. Seeds blackish brown, ovate in outline, densely verrucose. Fr. Apr–Jun.

• Streamsides; 900–1900 m. Yunnan.

**8. *Rungia pectinata*** (Linnaeus) Nees in A. Candolle, Prodr. 11: 470. 1847.

孩儿草 hai er cao

*Justicia pectinata* Linnaeus, Amoen. Acad. 4: 299. 1760; *Rungia parviflora* Nees subsp. *pectinata* (Linnaeus) L. H. Cramer; *R. parviflora* var. *pectinata* (Linnaeus) C. B. Clarke; *R. pectinata* var. *clarkeana* Handel-Mazzetti.

Herbs 20–50 cm tall, annual or perennial. Stem basally prostrate and rooting at nodes then erect, minutely pubescent. Petiole 0–7 mm; leaf blade oblong-elliptic, 1–4 × 0.4–1.4 cm, glabrous except for a few trichomes along veins, secondary veins ca. 4 on each side of midvein, base cuneate and decurrent onto petiole, margin entire, apex acute. Spikes axillary or terminal, 0.5–2 cm, 1-sided, solitary or sometimes 2 or 3 compound; bracts dimorphic; sterile bracts green, elliptic, ca. 4 × 0.7 mm, glabrous, apex acute; fertile bracts circular to obovate, 4–5 × ca. 2 mm, pubescent, margin broadly hyaline, apex obtuse to rounded to emarginate and mucronulate; bracteoles elliptic, 2–3 mm, margin ciliate, apex 2-cleft and subacute. Calyx colorless, pubescent; lobes linear-lanceolate, ca. 3 × 0.5 mm, margin narrowly hyaline, apex mucronulate. Corolla blue or white, ca. 5 mm, outside pubescent; lower lip 3-lobed, lobes triangular; upper lip ovate, 1–2 mm, apex emarginate. Staminal filaments glabrous. Ovary glabrous. Capsule ellipsoid, ca. 2.5 mm, glabrous, 2–4-seeded, apex apiculate. Seeds orbicular in outline, ca. 1 mm in diam., minutely verrucose. Fl. Nov–Jan, fr. Jan–Apr. *2n* = 26, 52.

Wastelands. Guangdong, Guangxi, Hainan, Yunnan [Bangladesh, Bhutan, India, Laos, Myanmar, Nepal, Sri Lanka, Thailand, Vietnam].

*Rungia pectinata* is a common weed in disturbed habitats.

This species is used medicinally.

**9. *Rungia monetaria*** (Benoist) B. Hansen, Nordic J. Bot. 9: 211. 1989.

中越孩儿草 zhong yue hai er cao

*Justicia monetaria* Benoist, Bull. Soc. Bot. France 81: 605. 1934.

Herbs to 1.5 m tall, perennial. Stems sulcate, glabrescent. Petiole 1–2.5 cm; leaf blade elliptic to ovate-elliptic, 6–17 × 3–8.5 cm, both surfaces densely covered with prominent cystoliths and glabrous, secondary veins 4–7 on each side of midvein, base cuneate and to decurrent and asymmetric or symmetric, margin entire, apex acute to acuminate. Spikes terminal or borne from leafless lateral branches, (2–)5–8(–19) cm; peduncle ca. 1 cm, glabrous; rachis glabrous; bracts 4-ranked; sterile bracts yellowish green, circular, rhombic, or obovate, 1.2–1.6 × 1.1–1.6 cm, glabrous, base rounded to cuneate, margin entire or apically serrate, apex rounded to acute; fertile bracts yellowish brown, sphenoid, 1.2–1.4 × 0.8–1.1 cm, glabrous, base cuneate, margin entire, apex rounded; bracteoles yellowish brown, narrowly lanceolate, 9–11 × ca. 2 mm, mem-

branous, abaxially glabrous, margin ciliate. Calyx yellowish brown, 6–7 mm, glabrous, 5-lobed almost to base; lobes 5–6 × ca. 1 mm. Corolla white with purple dotted stripe in throat, ca. 1.5 cm; tube ca. 6 × 3 mm; lower lip oblong, ca. 7 × 6 mm, 3-lobed, middle lobe ca. 3 × 2 mm, lateral lobes ca. 2 × 1 mm; upper lip triangular, ca. 5 × 6 mm, apex emarginate. Stamens 2, inserted at base of throat; filaments ca. 3 mm, glabrous; anther thecae ovoid. Ovary ca. 1.5 × 1 mm, glabrous; style ca. 8 mm, glabrous. Capsule obovoid-ellipsoid, ca. 10 × 3 mm, glabrous, 2-seeded. Seeds orbicular in outline, ca. 3 mm in diam., glabrous. Fl. Sep–Oct, fr. Nov–Jan.

Streamsides; 300–900 m. Yunnan [Vietnam].

**10. *Rungia longipes*** D. Fang & H. S. Lo, Guihaia 17: 49. 1997.

长柄孩儿草 chang bing hai er cao

Herbs to 50 cm tall. Stems subterete, bifariously pubescent. Petiole (1–)4–4.5 cm, pubescent; leaf blade ovate to elliptic, 10–17 × 4–8.5 cm, thinly papery to papery, abaxially pubescent along veins, adaxially densely covered with white linear cystoliths and glabrous, secondary veins 6 or 7 on each side of midvein, base broadly cuneate and slightly oblique, margin undulate-denticulate, apex acuminate. Spikes axillary, 2.5–11 cm, 1-sided; bracts 4-ranked, heteromorphic; sterile bracts elliptic to ovate-elliptic, (6–)10–12 × 3–4 mm, abaxially subglabrous, hyaline margin ca. 0.5 mm and ciliate, apex obtuse; fertile bracts elliptic to obovate-elliptic, ca. 12 × 5 mm, abaxially puberulent, margin slightly ciliate, apex rounded; bracteoles obovate-elliptic, ca. 7 × 3 mm, apex obtuse. Calyx 6–10 mm; lobes subulate, margin ciliate. Corolla not seen. Capsule ca. 1 cm, pubescent. Seeds ovate in outline, ca. 2 × 2 mm, verrucose. Fr. Apr–Jun.

• Forests in valleys. Guangxi.

**11. *Rungia bisaccata*** D. Fang & H. S. Lo, Guihaia 17: 48. 1997.

囊花孩儿草 nang hua hai er cao

Herbs 20–40 cm tall. Stems subterete when young then 4-angled, 2-sulcate, pubescent along furrow. Petiole 0.8–2.5 cm, pubescent; leaf blade ovate-elliptic, 5–13 × 2.3–5.7 cm, papery, abaxially subglabrous or puberulent along veins, adaxially glabrous, secondary veins 5–7 on each side of midvein, base broadly cuneate to attenuate, margin slightly undulate, apex acuminate to obtuse. Spikes axillary, 1-sided; bracts 4-ranked, sterile and fertile ones similar, obovate, 7–11 × 4–8 mm, abaxially glabrous, margin slightly ciliate, apex rounded; bracteoles oblong-elliptic, ca. 10 × 4 mm, margin hyaline and ciliate. Calyx ca. 7 mm; lobes subulate, margin ciliate. Corolla white with rose dots, ca. 1.8 cm, outside and inside slightly gland-tipped puberulent; tube cylindric and ca. 2.5 mm in diam. for ca. 9 mm, inside with a saccate papilla; lower lip ca. 6 × 3 mm, patent, 3-lobed, central lobe larger; upper lip ca. 5 mm, erect, 2-lobed. Staminal filaments ca. 5 mm, glabrous; anther thecae ca. 2 mm. Ovary glabrous; style ca. 1.3 cm, glabrous. Capsule not seen. Fl. Jan–Feb.

• Rocky mountains. Guangxi.

**12. *Rungia pungens*** D. Fang & H. S. Lo, Guihaia 17: 47. 1997.

尖苞孩儿草 jian bao hai er cao

Herbs 0.5–1.5 m tall, isophyllous. Stems erect or basal portion prostrate and rooting at nodes, 4-angled, glabrous or bifariously pubescent. Petiole 0.4–5.5 cm, glabrous; leaf blade elliptic to ovate-elliptic, 2.5–16 × 0.9–5.5 cm, densely covered with linear cystoliths, glabrous, secondary veins 4–9 on each side of midvein, base broadly cuneate, margin slightly undulate, apex acuminate. Spikes terminal or axillary, 2–5 cm, 1-sided; peduncle 1–9 cm; rachis pubescent or gland-tipped pubescent; bracts 4-ranked, heteromorphic; sterile bracts elliptic, 7.5–8 × 4–6 mm, abaxially gland-tipped puberulent, hyaline margin 0.8–1.5 mm broad and ciliate, apex cuspidate; fertile bracts lanceolate, 6.5–7.5 × ca. 4 mm, abaxially gland-tipped puberulent, hyaline margin ca. 1 mm wide and ciliate, apex cuspidate; bracteoles elliptic, ca. 6 × 4 mm, abaxially scabrid, adaxially glabrous. Calyx 6–7 mm; lobes linear, unequal, scabrid. Corolla light yellowish green outside and white with purple dots inside, ca. 1.5 cm, gland-tipped pubescent and pubescent; tube ca. 7 mm; lower lip 3-lobed, middle lobe larger; upper lip ca. 6 mm, apex emarginate. Staminal filaments ca. 5 mm, glabrous; anther thecae ca. 1.5 mm. Ovary hirsute; style ca. 1 cm, basal portion hirsute. Capsule ca. 8 mm, gland-tipped puberulent or puberulent. Seeds ovate in outline, ca. 2 × 1.5 mm, verrucose. Fl. Dec–Feb, fr. Apr–May.

• Limestone hills, forests; 600–1000 m. Guangxi, Yunnan.

**13. *Rungia napoensis*** D. Fang & H. S. Lo, Guihaia 17: 46. 1997.

那坡孩儿草 na po hai er cao

Herbs 70–90 cm tall. Stems 4-angled when young then subterete, sulcate, bifariously pubescent. Petiole 0.5–2.5 cm, bifariously pubescent; leaf blade narrowly elliptic to lanceolate, 3–10 × 1–4 cm, papery, both surfaces densely covered with linear cystoliths, abaxially pubescent along veins, adaxially glabrous, secondary veins 4–7 on each side of midvein, base cuneate, margin subentire, apex acuminate. Spikes axillary or terminal, 1–5 cm, 1-sided; peduncle 3–5 mm, pubescent; bracts 4-ranked; sterile bracts lanceolate-elliptic, ca. 4 × 1–2 mm, abaxially glabrous, margin hyaline and ciliate, apex acute; fertile bracts purplish, elliptic, ca. 9 × 4 mm, covered with cystoliths, abaxially glabrous, hyaline margin ca. 0.5 mm broad and ciliate, apex acute; bracteoles purple at tip, elliptic, ca. 9 × 5 mm, abaxially puberulent. Calyx ca. 6 mm; lobes linear. Corolla white, ca. 1.6 cm, outside sparsely pubescent; tube ca. 7 × 2 mm; lower lip ca. 7 mm, 3-lobed, central lobe larger; upper lip triangular, ca. 6 mm, apex emarginate. Staminal filaments ca. 3 mm, glabrous; anther thecae ca. 1.5 mm. Ovary glabrous; style ca. 1.2 cm, subglabrous. Capsule not seen. Fl. Dec–Mar.

• Limestone hills, streamsides; 200–500 m. Guangxi.

**14. *Rungia yunnanensis*** H. S. Lo, Acta Phytotax. Sin. 16(4): 92. 1978.

云南孩儿草 yun nan hai er cao

Herbs. Stems stout, subterete, sulcate, bifariously re-

trorsely pubescent. Petiole 1.5–2 cm, pubescent; leaf blade ovate, 6–10 × 2.5–3.5 cm, papery, both surfaces glabrous, secondary veins 10–12 on each side of midvein and netted near margin, base attenuate and slightly decurrent onto petiole, margin entire, apex acuminate. Spikes terminal or axillary, to 8 cm, 1-sided; bracts 4-ranked; sterile bracts ovate, 10–12 × 5–6 mm, hyaline margin broad, apex acuminate; bracts fertile, elliptic, ca. 9 × 3 mm, margin hyaline; bracteoles elliptic, ca. 6.5 × 3 mm. Calyx ca. 7 mm; lobes linear, slightly scabrid, apex acuminate. Corolla ca. 1 cm, outside pilose. Staminal filaments glabrous; anther thecae ovoid. Ovary hirsute; style glabrous. Capsule ca. 9 mm, tomentose. Fl. Nov–Dec, fr. Jan–Mar.

- Thickets, valleys, streamsides; 400–1000 m. Yunnan.

**15. *Rungia taiwanensis*** T. Yamazaki, J. Jap. Bot. 43: 61. 1968.

台湾明萼草 tai wān míng ē cǎo

Herbs 30–50 cm tall. Stems prostrate and rooting at nodes on basal portion, bifariously hirsute. Petiole 1–3 cm, pubescent; leaf blade ovate-oblong to oblong-lanceolate, 2.5–8 × 2.1–3.5 cm, membranous, glabrous, secondary veins 4–7 on each side of midvein, base cuneate to attenuate, margin entire or slightly undulate, apex acuminate. Spikes terminal or axillary, to 4 cm, often solitary; peduncle 1–2 cm; bracts 4-ranked; sterile bracts oblong-lanceolate, 8–9 × 2–3 mm, hyaline margin narrow and ciliate; fertile bracts ovate to ovate-lanceolate, hyaline margin broad and ciliate; bracteoles ovate, ca. 6 × 3.5 mm. Calyx ca. 5 mm, 5-lobed almost to base; lobes lanceolate. Corolla blue, ca.

1.5 cm, outside slightly gland-tipped pubescent; throat ca. 3 mm; lower lip 3-lobed; upper lip broad. Stamens exserted; filaments ca. 5 mm, glabrous. Ovary glabrous; style ca. 1 cm, glabrous. Capsule ovoid, ca. 6 mm. Seeds suborbicular, ca. 1.5 × 1.5 mm, minutely tuberculate.

- Thickets, streamsides; 1000–1500 m. Taiwan.

**16. *Rungia hircex*** Benoist, Bull. Mus. Natl. Hist. Nat., sér. 2, 2: 149. 1930.

金沙鼠尾黄 jin sha shu wei huang

Herbs to 60 cm tall. Stems 4-angled, sulcate, bifariously pubescent along sulcae. Petiole 1–3 cm, pubescent; leaf blade ovate to oblong, 2.5–9 × 1.5–4.5 cm, slightly pubescent along veins, secondary veins 3–5 on each side of midvein and inconspicuous, base cuneate and decurrent onto petiole, margin entire and ciliate, apex acuminate. Spikes terminal, 3–5 cm; bracts homomorphic but sterile ones slightly larger than fertile ones, lanceolate-linear, 10–14 × 2–2.5 mm, abaxially pubescent, margin ciliate, apex acute; bracteoles oblong-lanceolate, ca. 6 × 2 mm, margin ciliate, apex acuminate. Calyx 5-lobed almost to base; lobes linear, ca. 5 × 2 mm, glabrous, apex acute. Corolla ca. 1.4 cm; tube cylindric; lower lip ca. 2 × 3 mm, 3-lobed, lobes ovate and apex rounded; upper lip 2-lobed. Stamens white, ca. 4 mm, glabrous. Ovary glabrous. Capsule 7–8 mm, glabrous. Seeds ovate in outline, ca. 1 mm in diam. Fl. Aug–Oct, fr. Oct–Dec.

- Streamsides; 500–600 m. Yunnan.

**21. *LEPTOSTACHYA*** Nees in Wallich, Pl. Asiat. Rar. 3: 76, 105. 1832, nom. cons. prop., not *Leptostachia* Adanson (1763).

纤穗爵床属 xian sui jue chuāng shu

Hu Jiaqi (胡嘉琪 Hu Chia-chi), Deng Yunfei (邓云飞); Thomas F. Daniel

Herbs, perennial with cystoliths. Leaves petiolate. Inflorescences a panicle of spikes, usually reduced to a single terminal spike; bracts mostly shorter than calyx; bracteoles linear, minute. Calyx deeply 5-lobed, lobes similar (or posterior lobe shorter). Corolla tube cylindric, short; limb 2-lipped; lower lip 3-lobed; upper lip emarginate and galeate, lacking a stylar furrow; lobes ascending cochlear in bud. Stamens 2; anthers 2-theous; thecae equally to subequally inserted, parallel, muticous at base; staminodes 0. Pollen 3–5-aperturate. Ovary with 2 ovules per locule. Capsule clavate with a solid sterile stalk at base, 4-seeded; retinacula present, not rising from base. Seeds lenticular.

One species: tropical Asia.

The genus is similar to *Justicia* but differs from it by the combination of its muticous anthers, galeate upper lip of the corolla, and lack of a stylar furrow (rugula) on the upper lip. B. Hansen (Nordic J. Bot. 5: 469–473. 1985) discussed typification, taxonomy, and morphological/geographic variation of this genus.

**1. *Leptostachya wallichii*** Nees in Wallich, Pl. Asiat. Rar. 3: 105. 1832.

纤穗爵床 xian sui jue chuāng

*Codonacanthus spicatus* Handel-Mazzetti; *Dianthera leptostachya* C. B. Clarke; *Justicia wallichii* (Nees) T. Anderson; *Odontonemella leptostachya* (C. B. Clarke) Lindau; *Ptyssiglottis leptostachya* (C. B. Clarke) S. Moore.

Herbs 30–100 cm tall. Stems prostrate at base then ascending. Branches subterete, striate, bifariously pubescent then glabrescent. Petiole 1.5–4 cm, puberulent; leaf blade ovate, lan-

ceolate, or elliptic, 2–11(–17) × 1–5 cm, abaxially subglabrous except sparsely pubescent on margin and veins, adaxially glabrous or with few scattered trichomes, secondary veins 4–7 on each side of midvein, base rounded to broadly cuneate, margin entire, apex acute. Inflorescences with 1–3 spikes, 4–12 cm; rachis gland-tipped pubescent; bracts oblong-lanceolate, oblanceolate, or obovate, 1.2–2.5 mm; bracteoles lanceolate, 1–3 mm, apex acute. Calyx 2.5–3 mm; lobes subulate, outside gland-tipped pubescent. Corolla white, 5–8 mm, outside pilose; tube basal portion narrowly cylindric, 4–5 × ca. 0.5 mm; lobes of lower lip triangular-ovate, subequal. Stamens inserted in co-

rolla throat; filaments 1.5–4 mm, glabrous or puberulent; anther thecae 1–1.5 mm. Ovary glabrous or apically hirsute; style glabrous or hirsute at basal portion; stigma 2-cleft. Capsule 1–1.5 cm, finely pubescent. Seeds ca.  $2 \times 2$  mm, with concentric

ridges of short linear warts. Fl. Jun–Sep.

Moist forests; 900–1600 m. Guangdong, Guangxi, Hainan [Bhutan, India, Indonesia, Laos, Malaysia, Myanmar, Thailand, Vietnam].

## 22. CODONACANTHUS Nees in A. Candolle, Prodr. 11: 103. 1847.

钟花草属 zhong hua cao shu

Hu Jiaqi (胡嘉琪 Hu Chia-chi), Deng Yunfei (邓云飞); Thomas F. Daniel

Herbs, small, erect, perennial, with cystoliths. Leaves petiolate; leaf blade margin entire to subsinuate. Inflorescences of axillary or terminal racemes, loose, when terminal sometimes branched and forming a panicle, pedicellate; bracts and bracteoles minute. Flowers 1(–3 or more) in only 1 axil per node. Calyx deeply 5-lobed; lobes subequal. Corolla white with colored markings on lower lip, broadly campanulate; tube short; limb slightly 2-lipped; lower lip 3-lobed; upper lip 2-lobed; lobes ascending cochlear in bud. Stamens 2, included in to slightly emergent from corolla tube; anthers 2-theous; thecae unequal, subparallel,  $\pm$  equally to subequally inserted; staminodes 2, short. Ovary with 2 ovules per locule; stigma capitate to shallowly 2-lobed. Capsule with a solid stalk at base, fertile region ellipsoid, usually with a medial constriction, up to 4-seeded; retinacula present. Seeds  $\pm$  discoid, surfaces and margin smooth to  $\pm$  rugose, lacking trichomes.

Two species: E and S Asia; one species in China.

**1. Codonacanthus pauciflorus** (Nees) Nees in A. Candolle, Prodr. 11: 103. 1847.

钟花草 zhong hua cao

*Asystasia pauciflora* Nees in Wallich, Pl. Asiat. Rar. 3: 90. 1832; *Codonacanthus acuminatus* Nees; *Leptostachya repanda* Q. H. Chen.

Herbs 20–60 cm tall, much branched or unbranched. Stems 4-angled, sulcate, 2-fariously pubescent. Petiole 3–15 mm, puberulent or glabrous; leaf blade elliptic, ovate, or lanceolate, (2–)4–12  $\times$  (0.5–)1.5–4.5 cm, thin, abaxially pale green and glabrous or sparsely pubescent on major veins, adaxially green, glabrous or with few large-celled hairs, and with numerous cystoliths, secondary veins 5–7 on each side of midvein, base rounded, cuneate, or attenuate and decurrent onto petiole, apex

acute or acuminate. Racemes simple or terminal ones usually forming a panicle up to 15 cm; rachis puberulent; bracts lanceolate to linear, 1–2.5 mm, puberulent; bracteoles lanceolate, 1–2 mm, puberulent. Pedicel 1–7 mm, puberulent. Calyx 2.5–4 mm; lobes lanceolate, puberulent. Corolla white with purple spots at base of lower lip, 6.5–10 mm, glabrous; tube basally cylindric for 1–2 mm and 1–1.5 mm wide then abruptly widened to 3.5–6.5 mm at mouth; lobes of lower lip 3.5–5.5  $\times$  2–3.5 mm. Staminal filaments ca. 2.5 mm, glabrous; anther thecae 1.2–1.4 mm. Ovary glabrous; style 4–6.5 mm. Capsule 1–1.9 cm, glabrous. Seeds 2–3 mm. Fl. and fr. Aug–Apr.

Evergreen broad-leaved forests, wet places in ravines; below 100–1500 m. Fujian, Guangdong, Guangxi, Guizhou, Hainan, Jiangxi, Taiwan, Yunnan [Bhutan, Cambodia, India, Japan, Myanmar, Thailand, Vietnam].

## 23. COSMIANTHEMUM Bremekamp, Blumea 10: 166. 1960.

秋英爵床属 qiu ying jue chuang shu

Hu Jiaqi (胡嘉琪 Hu Chia-chi), Deng Yunfei (邓云飞); Thomas F. Daniel

Herbs, often prostrate then ascending, rarely erect, with cystoliths, isophyllous. Leaves petiolate or subsessile; leaf blade margin entire. Inflorescences terminal thyrsoid racemes or thyrses, sometimes with many-flowered cymes proximally and 1–3-flowered cymes distally; bracts small; bracteoles smaller than bracts. Calyx usually deeply 5-lobed; lobes subequal or slightly unequal, posterior or one sometimes shorter. Corolla white, greenish, or yellowish; tube straight or curved, sometimes with a dorsal pouch; throat short or absent; limb 2-lipped; lower lip 3-lobed; upper lip emarginate or 2-lobed [or entire]; lobes ascending cochlear in bud. Stamens 2, inserted at throat; anthers 2-theous; thecae equal or subequal, parallel, muticous at base; staminodes 2, inserted at base of upper lip. Stigma 2-cleft. Capsule stalked, 4-seeded; retinacula present.

About ten species: SE Asia, especially Borneo; three species (two endemic) in China.

*Cosmianthemum* resembles *Pseuderanthemum* in fruit and androecium but differs by the generally smaller corolla being distinctly 2-lipped (the upper lip only shallowly lobed) and lacking an elongate, narrow, cylindric tube; see B. Hansen (Nordic J. Bot. 5: 195–197. 1985) and B. L. Burt and R. M. Smith (Notes Roy. Bot. Gard. Edinburgh 26: 365–381. 1965).

- 1a. Leaf blade ovate to broadly ovate, 4–9 cm wide ..... 1. *C. viriduliflorum*
- 1b. Leaf blade elliptic-lanceolate, ovate-elliptic, or oblong-lanceolate, 1.4–7.3 cm wide.
  - 2a. Bracts abaxially gland-tipped pubescent; calyx outside gland-tipped pubescent ..... 2. *C. knoxiifolium*

海南秋英爵床 *hai nan qiu ying jue chuang*

*Graptophyllum viriduliflorum* C. Y. Wu & H. S. Lo, *Fl. Hainan*. 3: 594. 1974.

Herbs to 60 cm tall, erect, perennial. Stems terete, glabrous; branches yellowish brown, pubescent. Petiole 1–2.5 cm, pubescent; leaf blade ovate to broadly ovate, 7–15 × 4–9 cm, both surfaces glabrous, abaxially light green, adaxially dark green and lustrous, secondary veins 5–7 on each side of midvein and netted near margin, base broadly cuneate to subrounded, margin entire or inconspicuously undulate, apex acuminate, caudate, or sometimes acute. Thyrses terminal, 4–10 cm; peduncle 1–4 cm; rachis pubescent; bracts linear, 1–1.5 × ca. 0.5 mm; bracteoles linear, ca. 1 × 0.5 mm. Pedicel 2–2.5 mm. Calyx ca. 5 mm, gland-tipped pubescent; lobes linear-lanceolate, apex acuminate. Corolla light greenish yellow, ca. 1.2 cm, outside and inside pubescent; lobes of lower lip oblong-lanceolate, ca. 3 × 0.6 mm, subacute at apex; upper lip erect, apex 2-cleft to emarginate. Staminal filaments ca. 4 mm, pubescent; anther thecae ca. 2 mm; staminodes ca. 2 mm, sparsely pubescent. Ovary glabrous; style ca. 6 mm, sparsely pubescent. Capsule ca. 2 cm. Seeds not seen. Fl. Jul–Oct.

• Forests; 700–1000 m. Hainan.

**2. *Cosmianthemum knoxiifolium*** (C. B. Clarke) B. Hansen, *Nordic J. Bot.* 5: 195. 1985.

秋英爵床 *qiu ying jue chuang*

*Gymnostachyum knoxiifolium* C. B. Clarke, *J. Asiatic Soc. Bengal*, Pt. 2, Nat. Hist. 74: 663. 1908; *Pseuderanthemum parviflorum* Ridley; *Ptyssiglottis parviflora* (Ridley) Ridley; *Sphinctacanthus malayanus* Ridley.

Shrubs to 50 cm tall or more. Stems terete, puberulent. Petiole 1–1.5 cm, glabrous; leaf blade elliptic-lanceolate, 8–20 × 1.8–7.3 cm, leathery, abaxially puberulent along veins and margin, adaxially glabrous, secondary veins 8–10 on each side of midvein, base cuneate, margin remotely serrate or suben-

tire, apex acuminate to attenuate. Thyrses terminal, (5.5–)10–30(–60) cm; rachis brownish pubescent with few gland-tipped trichomes; bracts lanceolate, 2–3 × 0.5–1 mm, gland-tipped pubescent; bracteoles subulate, 1–2 × ca. 0.5 mm. Pedicels 1–3 mm, pubescent. Calyx 2.5–5 mm, outside gland-tipped pubescent; lobes lanceolate, outside scaly hairy. Corolla white to pale yellow with purple spots on lower lip, ca. 1.5 cm, outside pubescent; tube ca. 5 mm; upper lip erect, apically 2-lobed to emarginate. Staminal filaments 6–7 mm, glabrous; staminodes ca. 1 mm, pubescent. Ovary gland-tipped pubescent; style pubescent. Capsule 2–2.7 cm, puberulent. Seeds ovate in outline, ca. 2 × 2 mm, flattened, irregularly ridged or warty, lacking trichomes. Fl. May–Sep, fr. Sep–Dec.

Dense montane forests; 400–500 m. Hainan [Malaysia, Thailand, Vietnam].

**3. *Cosmianthemum guangxiense*** H. S. Lo & D. Fang, *Guihaia* 17: 42. 1997.

广西秋英爵床 *guang xi qiu ying jue chuang*

*Cosmianthemum longiflorum* D. Fang & H. S. Lo.

Herbs to 70 cm tall, branched or unbranched. Stems 4-angled to subterete, sulcate, sparsely pubescent. Petiole 0.5–1 cm, grooved, pilose; leaf blade ovate-elliptic to oblong-lanceolate, 2–13.5 × 1.4–4 cm, abaxially glabrous, adaxially pilose toward base or along veins, secondary veins 5–7 on each side of midvein, base rounded to cuneate, margin entire, apex acuminate. Thyrses terminal, 3–10 cm; rachis pilose; peduncle (0.5–)1–3 cm, pubescent; cymes 1–6-flowered; bracts triangular-subulate, ca. 1.5 × 0.5 mm, pilose; bracteoles similar to bracts. Pedicel 1–3 mm. Calyx 3–4 mm, outside pilose; lobes linear, apex acute. Corolla white or yellowish green, 1–1.5 cm, outside sparsely pubescent to subglabrous, inside glabrous; tube ca. 1.5 mm wide for 4–5 mm; lower lip 6–7 × 3.5–5 mm, lobes ovate and ca. 1 × 1 mm; upper lip ovate, 5–6 × ca. 5 mm. Staminal filaments 4–5 mm, glabrous; thecae ca. 2 mm. Ovary glabrous; style 0.9–1.1 cm, sparsely hirsute to subglabrous. Capsule and seeds not seen. Fl. Oct.

• Forests; ca. 400 m. Guangxi.

## 24. JUSTICIA Linnaeus, Sp. Pl. 1: 15. 1753.

爵床属 *jue chuang shu*

Hu Jiaqi (胡嘉琪 Hu Chia-chi), Deng Yunfei (邓云飞); Thomas F. Daniel

*Adatoda* Adanson; *Adhatoda* Miller; *Calophanoides* Ridley; *Ecbolium* Kuntze (1891), not Kurz (1871); *Gendarussa* Nees; *Mananthes* Bremekamp; *Rhaphidospora* Nees; *Rostellaria* Nees (1832), not C. F. Gaertner (1807); *Rostellularia* Reichenbach.

Herbs, subshrubs, or shrubs, cystoliths present. Leaves sessile or petiolate; leaf blade margin usually entire but sometimes sinuate or slightly serrate. Inflorescences dichasia (sometimes reduced to a single flower) in leaf axils or axillary or terminal spikes, racemes, or thyrses, sometimes branched and becoming panicles; bracts variable in shape, sometimes prominent and/or brightly colored; bracteoles 2, similar to or smaller than bracts. Calyx deeply 4- or 5-lobed; lobes equal or subequal. Corolla tubular or funnel-shaped; limb strongly 2-lipped; lower lip 3-lobed; upper lip entire to 2-lobed, internally rugulate (i.e., with a stylar furrow); lobes ascending cochlear in bud. Stamens 2; anthers 2-theous; thecae equally or unequally inserted, parallel to perpendicular, one or both spurred at base or sometimes lacking basal appendages; staminodes absent. Ovary with 2 ovules per locule; stigma slightly 2-lobed. Capsule with a sterile basal stalk and a fertile head (i.e., ± clavate), 2–4-seeded; retinacula present. Seeds compressed [to spheric].

About 700 species: tropical and temperate regions worldwide; 43 species (26 endemic, three introduced) in China.

*Justicia betonica* Linnaeus, *J. brandegeana* Wasshausen & L. B. Smith, and *J. carnea* Lindley are only cultivated in China so are not treated here.

- 1a. Calyx equally 4-lobed or unequally 5-lobed (i.e., with one lobe conspicuously smaller than others).
  - 2a. Leaves sessile.
    - 3a. Plants diffuse, to 8 cm tall; leaf blade lanceolate to narrowly lanceolate, glabrous ..... 1. *J. demissa*
    - 3b. Plants usually erect, to 100 cm tall; leaf blade oblong to broadly ovate, pubescent ..... 2. *J. mollissima*
  - 2b. Leaves petiolate.
    - 4a. Leaf blade linear, to 5 mm wide ..... 3. *J. neolinearifolia*
    - 4b. Leaf blade ovate to elliptic to subcircular, usually wider than 5 mm.
      - 5a. Bracts obovate-elliptic, broadest at or above middle, 2–3 mm wide ..... 6. *J. hayatae*
      - 5b. Bracts ovate to elliptic-lanceolate to oblong-lanceolate, mostly broadest near base, 0.6–1.3 mm wide.
        - 6a. Spikes dense and cylindric,  $\pm$  densely pubescent ..... 4. *J. procumbens*
        - 6b. Spikes neither dense nor cylindric, sparsely pubescent ..... 5. *J. diffusa*
- 1b. Calyx equally 5-lobed.
  - 7a. Flowers in axillary abbreviated spikes, spikes ca. 1 cm, usually solitary or several clustered.
    - 8a. Leaf blade glabrous.
      - 9a. Leaf blade linear to linear-lanceolate ..... 7. *J. neesiana*
      - 9b. Leaf blade ovate to broadly elliptic (rarely lanceolate).
        - 10a. Bracts subcircular ..... 8. *J. kwangsiensis*
        - 10b. Bracts lanceolate ..... 9. *J. albovidis*
    - 8b. Leaf blade  $\pm$  pubescent (sometimes glabrous or only pubescent along veins in *J. quadrifaria*).
      - 11a. Corolla ca. 2 cm ..... 10. *J. wardii*
      - 11b. Corolla less than 1.5 cm.
        - 12a. Bracts linear, lanceolate, or ovate, broadest at base, 1-veined.
          - 13a. Bracts 2–3 mm ..... 20. *J. siccanca*
          - 13b. Bracts 5–6 mm ..... 21. *J. xantholeuca*
        - 12b. Bracts ovate to circular to elliptic to obovate to spatulate-obovate, broadest above base, pinnately veined.
          - 14a. Leaf blade (2–)5.5–11.5 cm.
            - 15a. Bracts ovate to obovate, with 3–4 mm petiole, apex obtuse; calyx 5–6 mm ..... 17. *J. quadrifaria*
            - 15b. Bracts obovate to circular, with 1–2 mm petiole, apex retuse or rounded; calyx ca. 1 cm ..... 18. *J. kouytcheensis*
          - 14b. Leaf blade 0.8–7(–10.5) cm.
            - 16a. Leaf blade adaxially glabrous ..... 13. *J. xylopoda*
            - 16b. Leaf blade adaxially pubescent at least when young.
              - 17a. Leaf blade sparsely pubescent, soon glabrescent or abaxially pilose along midvein ..... 11. *J. championii*
              - 17b. Leaf blade hispid, or densely grayish or white or yellowish pubescent.
                - 18a. Bracts circular to subcircular ..... 16. *J. hainanensis*
                - 18b. Bracts not circular (sometimes subcircular in *J. xerobatica* and *J. xerophila*).
                  - 19a. Corolla white.
                    - 20a. Stems yellow pilose; leaf blade 3–5 mm wide ..... 12. *J. xerophila*
                    - 20b. Stems minutely white sericeous; leaf blade 5–8 mm wide ..... 19. *J. xerobatica*
                  - 19b. Corolla whitish yellow, yellow, or yellowish green.
                    - 21a. Stems villous ..... 14. *J. albovelata*
                    - 21b. Stems sericeous ..... 15. *J. yunnanensis*
      - 7b. Flowers in terminal or axillary elongated spikes (or racemes or panicles), or in axillary cymes, or in thyrses of 3-flowered cymes.
        - 22a. Flowers in terminal thyrses of 3-flowered cymes; both anther thecae spurred at base ..... 22. *J. grossa*
        - 22b. Flowers in spikes or axillary cymes; only lower anther theca spurred at base.
          - 23a. Corolla 2.5–3 cm ..... 23. *J. adhatoda*
          - 23b. Corolla 2.2 cm or less.
            - 24a. Flowers in axillary cymes ..... 24. *J. vagabunda*
            - 24b. Flowers in terminal or axillary spikes (or panicles of spikes), or sometimes in racemes.
              - 25a. Bracts (at least lower ones) longer than calyx.
                - 26a. Bracts 1–1.5 cm ..... 25. *J. ventricosa*
                - 26b. Bracts to 1 cm.
                  - 27a. Leaf blade narrowly lanceolate, to 1.5 cm wide; basal bracts longer than calyx then gradually smaller with apicalmost ones shorter than calyx ..... 26. *J. gendarussa*
                  - 27b. Leaf blade lanceolate to ovate to elliptic to subcircular, often wider than 1.5 cm; all bracts longer than calyx.

- 28a. Spikes interrupted; flowers distant on rachis; corolla yellow with purplish spots ..... 27. *J. pseudospicata*  
 28b. Spikes continuous; flowers dense on rachis; corolla pale white or yellowish green with purplish red dots or stripes.  
 29a. Leaf blade margin entire; bracts ovate to elliptic, basally pale green and purplish red above middle, apex acuminate ..... 28. *J. latiflora*  
 29b. Leaf blade margin entire or crenate; bracts broadly obovate or flabellate, green, apex acuminate to obtuse and mucronate with 1–3 teeth ..... 29. *J. austrosinensis*  
 25b. Bracts equaling or shorter than calyx.  
 30a. Leaves sessile.  
 31a. Leaf blade oblanceolate to rarely lanceolate, 8–17 × 2.5–6.5 cm, abaxially rust-colored when dry ..... 30. *J. ferruginea*  
 31b. Leaf blade obovate, 15–26 × 7.5–15 cm, abaxially dark green when dry ..... 31. *J. panduriformis*  
 30b. Leaves petiolate.  
 32a. Leaf blade base cordate to truncate.  
 33a. Flowers usually 1 per rachis node; stems 4-angled; calyx ca. 4 mm; calyx and corolla pubescent with gland-tipped trichomes outside ..... 32. *J. lianshanica*  
 33b. Flowers usually 2–5 per rachis node; stems terete; calyx ca. 2 mm; calyx and corolla pubescent with non-glandular trichomes outside ..... 33. *J. cardiophylla*  
 32b. Leaf blade base (rounded to) cuneate to attenuate.  
 34a. Stems short; leaves in a basal rosette ..... 34. *J. austroguangxiensis*  
 34b. Stems elongated; leaves cauline.  
 35a. Flowers more than 1 per rachis node.  
 36a. Shrubs to 2 m tall; leaf blade (2–)3–5.5 × 1.5–2.5 cm; inflorescences unbranched spikes ..... 36. *J. microdonta*  
 36b. Herbs to 1 m tall; leaf blade 4–12.5(–18) × 2.5–6.5(–8) cm; inflorescences unbranched or branched.  
 37a. Leaf blade 10.5–12.5(–18) × 5–6.5(–8) cm; flowers in spikes ..... 35. *J. leptostachya*  
 37b. Leaf blade 4–9 × 2.5–4.5 cm; flowers in spiciform racemes (pedicel ca. 1 mm) ..... 37. *J. damingensis*  
 35b. Flowers 1 per rachis node.  
 38a. Calyx lobes elliptic-lanceolate, apex obtuse or rounded ..... 38. *J. amblyosepala*  
 38b. Calyx lobes linear to lanceolate or narrowly triangular, apex acute.  
 39a. Stems sharply 4-angled, slightly winged along angles ..... 39. *J. acutangula*  
 39b. Stems subterete to 4-angled, wingless.  
 40a. Corolla tube 2–3 × as long as limb ..... 40. *J. patentiflora*  
 40b. Corolla tube less than 2 × as long as limb.  
 41a. Calyx puberulent on both surfaces ..... 41. *J. poilanei*  
 41b. Calyx glabrous adaxially.  
 42a. Leaf blade lanceolate, broadest below middle, 4.3–5 cm wide; bracts ca. 1.5 mm ..... 42. *J. kamptiana*  
 42b. Leaf blade elliptic to obovate-elliptic, broadest at or above middle, 1.2–4.2 cm wide; bracts 3–4 mm ..... 43. *J. caudatifolia*

**1. *Justicia demissa*** N. H. Xia & Y. F. Deng, J. Trop. Subtrop. Bot. 13: 534. 2005.

矮爵床 ai jue chuang

*Rostellaria humilis* H. S. Lo, Fl. Hainan. 3: 598. 1974, not *Justicia humilis* Michaux (1803).

Herbs 6–8 cm tall, diffuse, annual. Stems 4-angled, glabrous. Leaves sessile; leaf blade lanceolate to narrowly lanceolate, 1–2 × ca. 0.3 cm, glabrous, cystoliths inconspicuous, base cuneate, margin entire, apex obtuse. Spikes terminal, 2–4.5 cm, glabrous; bracts linear-lanceolate, ca. 3 mm, glabrous, margin membranous; bracteoles similar to bracts. Calyx ca. 5 mm, glabrous, 4-lobed to base; lobes linear, margin membranous, apex obtuse. Corolla not seen. Capsule ca. 6 mm, glabrous.

• Hainan.

**2. *Justicia mollissima*** (Nees) Y. F. Deng & T. F. Daniel, **comb. nov.**

喀西爵床 ka xi jue chuang

Basionym: *Rostellaria mollissima* Nees in Wallich, Pl. Asiat. Rar. 3: 101. 1832; *Justicia khasiana* C. B. Clarke; *J. procumbens* Linnaeus var. *latispica* C. B. Clarke; *Rostellaria khasiana* (C. B. Clarke) J. L. Ellis; *R. khasiana* var. *latispica* (C. B. Clarke) C. Y. Wu ex C. C. Hu; *R. mollissima* (Nees) Nees.

Herbs 60–100 cm tall. Stems 4-angled, erect, hispid. Leaves sessile; leaf blade oblong to broadly ovate, 3–4.5 × 0.3–0.5 cm, both surfaces hispid, secondary veins 4–6 on each side of midvein, base broadly cuneate, margin entire, apex acute to obtuse. Spikes 2.5–4 cm, hispid; bracts linear-oblong, ca. 8 × 2–3 mm, hispid; bracteoles linear, ca. 6 mm. Calyx ca. 8 mm, out-

side hispid, 4-lobed almost to base; lobes linear, margin ciliate. Corolla purplish red, 0.8–1.2 cm; lower lip spreading, 3-lobed; upper lip erect, apex emarginate. Staminal filaments ca. 6 mm, sparsely hirsute; anther thecae superposed, lower one white spurred at base. Ovary hirsute at tip; style ca. 8 mm, basal portion hirsute. Capsule ellipsoid, ca. 8 mm, pubescent. Seeds minutely reticulate.  $2n = 18$ .

Trailsides; 2100–2700 m. Yunnan [India].

"*Justicia mollissima*" was published as a nomen nudum (Wallich, Numer. List, no. 2445. 1830). The earliest name for this species is *Rostellaria mollissima*, dating from 1832. Nees' name has not been transferred previously to *Justicia*.

**3. *Justicia neolinearifolia*** N. H. Xia & Y. F. Deng, J. Trop. Subtrop. Bot. 13: 534. 2005.

大叶杜根藤 *da ye du gen teng*

*Calophanoides albobiridis* (Benoist) C. Y. Wu & H. S. Lo.

Herbs to 50 cm tall, perennial. Stems basally slightly decumbent then erect; young branches 4-angled, sulcate and striate, bifariously pubescent, glabrescent. Petiole 3–8 mm; leaf blade ovate to rarely lanceolate, (1–)3–9 × (0.5–)1.5–4 cm, papery, both surfaces glabrous, secondary veins 4 or 5 on each side of midvein, base slightly oblique and cuneate to subrounded, margin subentire, apex shortly acuminate. Spikes axillary, ca. 1 cm, (1–)3–5-flowered; bracts lanceolate, 1–3 mm, glabrous; bracteoles linear, ca. 1.5 mm. Calyx ca. 4 mm, 5-lobed; lobes lanceolate, outside glabrous except pubescent along midvein. Corolla white or greenish white, 8–9 mm, outside pubescent; lower lip elliptic, 3-lobed, lobes ovate with an obtuse apex; upper lip narrowly triangular, 2-lobed. Ovary slightly hirsute at tip; style basally hirsute. Capsule ca. 7 cm, glabrous. Seed light yellow, papillate. Fl. Aug–Sep, fr. Nov–Jan.

Wet places, streamsides; 200–600 m. Hainan [Vietnam].

**10. *Justicia wardii*** W. W. Smith, Notes Roy. Bot. Gard. Edinburgh 10: 184. 1918.

高山杜根藤 *gao shan du gen teng*

*Calophanoides wardii* (W. W. Smith) C. Y. Wu ex C. C. Hu.

Shrubs to 60 cm tall, diffuse. Stems straw-colored, much branched, flexuous, densely grayish tomentose, soon glabrescent. Petiole ca. 5 mm, gray pilose; leaf blade elliptic, elliptic-lanceolate, oblanceolate, or sometimes obovate, to 4.5 × 2 cm, papery, both surfaces first white tomentose then sparsely pilose, base cuneate, margin slightly undulate, apex shortly acuminate, acute, or rarely retuse. Spikes axillary, ca. 1 cm, (1–)3–5-flowered; peduncles 0–3 mm; bracts linear-lanceolate, ca. 5 mm, densely white villous; bracteoles linear, ca. 2 mm. Calyx to 8 mm, 5-lobed almost to base; lobes oblanceolate, outside densely villous, apex acute. Corolla ca. 2 cm, outside white villous; tube longer than limb; lower lip 3-lobed to middle, lobes oblong; upper lip 7–8 mm, shallowly 2-lobed. Staminal filaments glabrous, basally whitish; anther thecae superposed, lower one spurred at base. Ovary glabrous; style white villous. Capsule not seen. Fl. May.

- On rocks, thickets; ca. 1000 m. Yunnan.

**11. *Justicia championii*** T. Anderson in Benth. Fl. Hongk. 264. 1861.

圆苞杜根藤 yuan bao du gen teng

*Adhatoda chinensis* Benth. Hooker's J. Bot. Kew Gard. Misc. 5: 134. 1853; *Calophanoides chinensis* (Benth.) C. Y. Wu & H. S. Lo; *Dicliptera cyclostegia* Handel-Mazzetti; *Justicia chinensis* (Benth.) Druce (1917), not Linnaeus (1753).

Herbs to 50 cm tall. Stems 4-angled, sulcate, retrorsely pubescent. Petiole (0–)0.5–1.5 cm, sulcate, pubescent; leaf blade elliptic, oblong-elliptic, ovate, or lanceolate, 1–7(–10.5) × 0.5–2(–3.5) cm, sparsely pubescent when young, soon glabrescent or abaxially pilose along midvein, cystoliths adaxially numerous, secondary veins 3–6 on each side of midvein, base cuneate to attenuate, margin entire, apex acute to obtuse. Spikes axillary, usually 3-flowered, several clustered; peduncle 2–4 mm, sparsely pubescent; bracts petiolate, subleaflike, circular to obovate-spatulate or sometimes elliptic, 5–11 × 2–6 mm, glabrous or adaxially sparsely pilose, veins 1–3 on each side of midvein, apex rounded to obtuse; bracteoles subulate to triangular, ca. 1 mm, glabrous or sparsely yellow puberulent, apex acute. Calyx 5-lobed almost to base; lobes yellowish white except for green along veins, linear-lanceolate, 6–7 mm, 1- or 2-veined, margin ciliate. Corolla white with 2 purplish red streaks, 7–10 mm, outside puberulent; lower lip ovate, ca. 4 × 3 mm, 3-lobed, middle lobe semicircular and ca. 0.8 × 1.3 mm, lateral lobes ovate and ca. 1.2 × 1 mm; upper lip lanceolate, ca. 3.5 × 1.5 mm, apex emarginate. Stamens exserted; filaments ca. 4 mm, glabrous; anther thecae superposed, lower one spurred at base, upper one muticous. Ovary glabrous; style ca. 6 mm, sparsely pubescent toward base; stigma capitate. Capsule 8–9 mm, glabrous, 4-seeded. Seeds oblong, ca. 2 × 1.5 mm, verrucose. Fl. and fr. Aug–Oct.

- Thickets, forests; 400–2000 m. Anhui, Fujian, Guangdong, Guangxi, Guizhou, Hainan, Hubei, Hunan, Jiangxi, Yunnan, Zhejiang.

Inflorescences of *Justicia championii* appear to be axillary clusters of flowers but are much-reduced spikes or racemes with a very short rachis.

**12. *Justicia xerophila*** W. W. Smith, Notes Roy. Bot. Gard. Edinburgh 11: 214. 1919.

干地杜根藤 gan di du gen teng

*Calophanoides xerophila* (W. W. Smith) C. Y. Wu ex C. C. Hu.

Herbs to 10 cm tall. Stems basally semi-woody, slender and flexuous, yellow pilose. Petiole 1–3 mm, pilose; leaf blade lanceolate to oblanceolate, 0.8–1.5 × 0.3–0.5 cm, papery, both surfaces slightly pilose along veins, secondary veins ca. 3 on each side of midvein, base cuneate, margin ciliate and entire or apically 2 or 3 repandly toothed, apex acute to obtuse. Spikes axillary, ca. 1 cm, 1–3-flowered; bracts leaflike, broadly obovate to subcircular, 3–5 mm; bracteoles linear, ca. 2 mm. Calyx green, ca. 5 mm, outside slightly pilose to subglabrous, 5-lobed almost to base; lobes linear, apex acuminate. Corolla white, 7–8

mm, outside sparsely pilose; lower lip 3-lobed; upper lip emarginate. Staminal filaments ca. 4 mm, pilose; anther thecae superposed, lower one spurred at base. Ovary glabrous; style ca. 6 mm, subglabrous. Capsule ca. 5 mm, glabrous. Seeds ovate in outline, ca. 1 × 1 mm, tuberculate.

- Thickets on dry slopes. Yunnan.

**13. *Justicia xylopoda*** W. W. Smith, Notes Roy. Bot. Gard. Edinburgh 11: 214. 1919.

木柄杜根藤 mu bing du gen teng

*Calophanoides xylopoda* (W. W. Smith) C. Y. Wu ex H. P. Tsui.

Shrubs 10–13 cm tall. Stems very short, much branched; branches basally often cylindric, erect or decumbent, apically ascending, grayish or whitish pubescent, internodes sulcate. Petiole 1–3 cm, white pubescent; leaf blade ovate to narrowly ovate, 1–2.4 × 0.7–1.2 cm, papery, abaxially minutely and sparsely pilose on veins, adaxially glabrous, secondary veins 3 on each side of midvein, base cuneate and decurrent onto petiole, margin entire, apex ± obtuse. Spikes axillary, ca. 1 cm, usually 3-flowered; bracts ovate, ca. 1 cm, pubescent like leaves; bracteoles sublinear, ca. 1.5 mm. Calyx green, ca. 6 mm, 5-lobed to base; lobes linear-lanceolate, membranous, subequal, margin white, apex acuminate. Corolla yellow with purplish spots, ca. 1 cm, outside white pilose; lower lip broad, 3-lobed with center one larger; upper lip triangular, 2-lobed. Stamens inserted at apical part of corolla tube; filaments pilose around insertion; anther thecae superposed, lower one with a white spur at base. Ovary glabrous. Capsule not seen.

- Thickets on mountain slopes; 2300–2400 m. Sichuan, Yunnan.

**14. *Justicia albovelata*** W. W. Smith, Notes Roy. Bot. Gard. Edinburgh 10: 182. 1918.

绵毛杜根藤 mian mao du gen teng

*Calophanoides albovelata* (W. W. Smith) C. Y. Wu ex H. P. Tsui.

Herbs 20–50 cm tall, perennial, much branched. Stems basally decumbent then erect and zigzag; young branchlets densely white villous. Petiole 3–5 mm, pubescent; leaf blade lanceolate, 3.5–4.5 × 0.8–1.5 cm, membranous, abaxially villous, adaxially densely white villous, secondary veins 4 or 5 on each side of midvein, base cuneate, margin entire, apex obtuse. Spikes axillary, ca. 1 cm, usually 3(or 4)-flowered; bracts spatulate-circular to obovate, 5–10 × 3–7 mm; bracteoles oblanceolate to linear. Pedicels ca. 2 mm. Calyx grayish green, 5–6 mm, 5-lobed almost to base; lobes linear-lanceolate, with dense white trichomes along veins, apex acuminate. Corolla whitish yellow to yellow, ca. 9 mm; tube slightly longer than limb, outside pilose; lower lip 3-lobed; upper lip short, 2-lobed. Staminal filaments basally hirsute; anther thecae superposed, lower one larger and with a white spur at base. Ovary glabrous. Capsule clavate, ca. 8 mm, glabrous, 4-seeded. Seeds ovate in outline, ca. 1.5 × 1.5 mm, verrucose. Fl. Sep.

- Thickets, streamsides; ca. 2700 m. Yunnan.

**15. *Justicia yunnanensis*** W. W. Smith, Notes Roy. Bot. Gard. Edinburgh 11: 215. 1919.

滇杜根藤 dian du gen teng

*Calophanoides yunnanensis* (W. W. Smith) C. Y. Wu ex H. P. Tsui.

Shrubs to 45 cm tall. Stems basally unbranched, suberect, apically ascending, whitish sericeous. Petiole 2–5(–7) mm, pilose; leaf blade lanceolate to oblanceolate, ca.  $2.5 \times 1$  cm, papery, both surfaces pilose, base narrowly cuneate and decurrent onto petiole, margin entire, apex  $\pm$  obtuse. Spikes axillary, ca. 1 cm, usually 3–5-flowered; bracts surrounded by leaves, circular-spatulate to obovate, 5–10 mm; bracteoles linear to oblanceolate. Pedicel short. Calyx light grayish green, ca. 5 mm, 5-lobed to base; lobes linear-lanceolate, midvein pale whitish yellow, apex acuminate. Corolla light whitish yellow, ca. 8 mm, outside minutely pilose; lower lip broad, 3-lobed with center one larger; upper lip triangular, 2-lobed. Stamens inserted at apical part of corolla tube, pilose around insertion; anther thecae superposed, lower one with a white spur at base. Capsule glabrous, 4-seeded. Seeds verrucose. Fl. Sep.

● Limestone slopes; ca. 1600 m. Yunnan.

Based on the known characters, *Justicia yunnanensis* appears remarkably similar to *J. albovelata*, if it is indeed distinct. We have refrained from making taxonomic alterations because no specimens of *J. yunnanensis* were studied.

**16. *Justicia hainanensis*** (C. Y. Wu & H. S. Lo) N. H. Xia & Y. F. Deng, J. Trop. Subtrop. Bot. 13: 533. 2005.

海南爵床 hai nan jue chuang

*Calophanoides hainanensis* C. Y. Wu & H. S. Lo, Fl. Hainan. 3: 597. 1974.

Herbs to 1 m tall. Stems 4-angled, sulcate, pubescent. Petiole 2–5 mm; leaf blade ovate to lanceolate-ovate, (0.5–)1.5–3  $\times$  (0.3–)0.5–1.8 cm, thickly papery, both surfaces hispid, secondary veins 3–5 on each side of midvein, base broadly cuneate to subrounded, margin entire, apex acute. Spikes axillary, ca. 1 cm, (1–)3–5-flowered; bracts shortly petiolate, circular to subcircular, 2–5 mm in diam.; bracteoles small or absent. Calyx ca. 4.5 mm, hispid, 5-lobed almost to base; lobes linear-lanceolate. Corolla white, ca. 6 mm, outside densely pubescent; tube slightly enlarged; lower lip spreading, apex 3-lobed; upper lip erect, triangular and concave, apex emarginate. Staminal filaments ca. 2.5 mm; anther thecae superposed, lower one spurred at base. Ovary glabrous; style ca. 3 mm, glabrous. Capsule obovoid, ca. 6 mm, glabrous, 4-seeded. Seeds broadly ovate in outline, ca.  $0.6 \times 0.6$  mm, compressed, verrucose. Fl. Jul–Nov, fr. Oct–Jan.

● Forests; 200–1100 m. Guangdong, Hainan.

**17. *Justicia quadrifaria*** (Nees) T. Anderson, J. Linn. Soc., Bot. 9: 514. 1867.

杜根藤 du gen teng

*Gendarussa quadrifaria* Nees in Wallich, Pl. Asiat. Rar. 3: 105. 1832; *Adhatoda quadrifaria* (Nees) Nees; *A. zollingeriana* Nees; *Calophanoides quadrifaria* (Nees) Ridley.

Herbs. Stems 4-angled, basally decumbent and usually rooting at nodes then erect, sulcate, bifariously pubescent, soon glabrescent. Petiole 0.4–2.5 cm, sparsely pubescent; leaf blade oblong, lanceolate, to rarely orbicular, (2–)6–8  $\times$  (1–)2–3.5 cm, both surfaces glabrous or only pubescent along veins, secondary veins 5–7 on each side of midvein, base narrowly cuneate and decurrent onto petiole, margin entire or slightly serrate, apex acute. Spikes axillary, ca. 1 cm, usually 3-flowered, solitary or several in a cluster; bracts with a 3–4 mm petiole, ovate to obovate, 3–8  $\times$  3–5 mm, sparsely pubescent, pinnately veined, apex obtuse; bracteoles linear, ca. 1 mm, glabrous. Calyx 5–6 mm, outside puberulent, 5-lobed almost to base; lobes linear-lanceolate. Corolla white with purple spots on lower lip, ca. 8 mm, outside pubescent; lower lip ca.  $4 \times 3$  mm, patent, apex 3-lobed; upper lip oblong, erect, apex 2-lobed. Anthers with thecae superposed, lower ones spurred at base. Ovary glabrous; style ca. 6 mm, sparsely hirsute. Capsule ca. 8 mm, glabrous. Seeds ovate in outline, ca.  $1.5 \times 1$  mm, verrucose, glabrous.

On rock in forested valleys; 800–1600 m. Chongqing, Guangdong, Guangxi, Guizhou, Hainan, Hubei, Hunan, Sichuan, Yunnan [India, Indonesia, Laos, Myanmar, Thailand, Vietnam].

**18. *Justicia kouytcheensis*** (H. Léveillé) E. Hossain, Notes Roy. Bot. Gard. Edinburgh 32: 407. 1973.

贵州杜根藤 gui zhou du gen teng

*Ruellia repens* Linnaeus var. *kouytcheensis* H. Léveillé, Repert. Spec. Nov. Regni Veg. 13: 175. 1914; *Calophanoides kouytcheensis* (H. Léveillé) H. S. Lo.

Herbs to 40 cm tall. Stems basally decumbent and rooting at nodes. Petiole 1–2.5 cm; leaf blade oblong to rhombic, 5.5–11.5  $\times$  3.5–5.5 cm, membranous, both surfaces pubescent especially along veins, secondary veins 6 or 7 on each side of midvein, base cuneate and decurrent onto petiole, margin entire or sometimes apically undulate-serrate, apex acuminate to subcaudate. Spikes axillary, ca. 1 cm, 1–3(–5)-flowered; bracts with a 1–2 mm petiole, obovate to circular, 7–8  $\times$  4–5 mm, veins ca. 3 on each side of midvein, base broadly cuneate, apex retuse or rounded; bracteoles subulate, 1–2 mm. Calyx ca. 1 cm, 5-lobed almost to base; lobes lanceolate, subequal, outside white laterally, green along midvein, and pubescent. Corolla white, ca. 1.4 cm; lower lip patently 3-lobed; upper lip erect, 2-lobed. Staminal filaments ca. 5 mm, glabrous; anther thecae oblong, superposed, lower one smaller and with a white spur at base. Ovary glabrous; style ca. 9 mm, glabrous; stigma capitate, slightly enlarged. Capsule and seeds not seen. Fl. Aug–Oct.

● Limestone hills, thickets; 800–1300 m. Guizhou, Yunnan.

*Justicia kouytcheensis* is very similar to *J. quadrifaria*, and the putative distinctions between them require additional studies.

**19. *Justicia xerobatica*** W. W. Smith, Notes Roy. Bot. Gard. Edinburgh 11: 213. 1919.

滇东杜根藤 dian dong du gen teng

*Calophanoides xerobatica* (W. W. Smith) H. P. Tsui.

Subshrubs to 30 cm tall, prostrate. Stems basally woody, slender, flexuous, and often rooting at nodes, apically as-

ending, minutely white sericeous. Petiole 2–3 cm, pilose; leaf blade subcircular, broadly obovate, or rarely narrowly lanceolate,  $1-2 \times 0.5-0.8$  cm, softly membranous, both surfaces pilose on veins, base cuneate, margin entire, apex rounded to obtuse. Spikes axillary, ca. 1 cm, 1–3-flowered; bracts surrounded by leaves, leaflike, broadly obovate to subcircular, 3–4 mm; bracteoles ovate to nearly subulate-lanceolate, small. Calyx green, ca. 5 mm, 5-lobed almost to base; lobes linear-lanceolate, midrib pilose, margins scarious, apex acuminate. Corolla white (reportedly), ca. 9 mm, outside sparsely pilose. Mature capsule not seen. Fl. Sep.

- Limestone areas; 1200–1400 m. Sichuan, Yunnan.

*Justicia xerobatica* is very similar to *J. xerophila*. Further studies of both will be necessary to determine whether they should be treated as distinct from one another.

**20. *Justicia siccanca*** W. W. Smith, Notes Roy. Bot. Gard. Edinburgh 10: 43. 1917.

旱杜根藤 han du gen teng

*Calophanoides siccanca* (W. W. Smith) C. Y. Wu ex C. C. Hu.

Shrubs to 60 cm tall, prostrate. Stems woody, flexuous, grayish tomentose, soon glabrescent. Petiole 3–8 cm, villous; leaf blade ovate to lanceolate,  $1.5-4 \times 1-2$  cm, both surfaces sparsely pilose, secondary veins ca. 4 on each side of midvein, base cuneate, margin entire, apex rounded to acute. Spikes axillary, ca. 1 cm, 1–3-flowered; peduncle ca. 3 mm, grayish pubescent; bracts linear, 2–3 mm, abaxially grayish pubescent; bracteoles similar to bracts. Calyx ca. 7 mm, outside pubescent, 5-lobed to base; lobes linear. Corolla white tinged with red, ca. 1.3 cm, outside pubescent; lower lip very short, 3-lobed, lobes circular; upper lip shorter, apex emarginate. Staminal filaments ca. 4 mm, basal portion whitish villous; anther thecae superposed, lower one spurred at base. Ovary glabrous; style ca. 8 mm, white villous. Capsule ca. 7 mm, glabrous. Seeds ovate in outline, ca.  $1 \times 1$  mm. Fl. Sep.

- On rocks by trailsides, open slopes; 2000–2200 m. Sichuan, Yunnan.

**21. *Justicia xantholeuca*** W. W. Smith, Notes Roy. Bot. Gard. Edinburgh 11: 212. 1919.

黄白杜根藤 huang bai du gen teng

*Calophanoides xantholeuca* (W. W. Smith) C. Y. Wu ex C. C. Hu.

Shrubs to 30 cm tall. Stems 4-angled, much branched, sulcate, pilose then glabrescent. Petiole 2–5 mm, pilose; leaf blade lanceolate,  $2-3 \times 0.7-1$  cm, papery, both surfaces pilose along veins, secondary veins ca. 3 on each side of midvein, base cuneate, margin entire, apex acute. Spikes axillary, 3–5-flowered; bracts lanceolate or ovate, 5–6 mm; bracteoles subulate, narrowly lanceolate, or ovate, smaller than bracts. Calyx grayish white, ca. 5 mm, white pilose along midvein, 5-lobed almost to base; lobes linear-lanceolate. Corolla white, ca. 8 mm, outside sparsely pilose; lower lip 3-lobed; upper lip emarginate. Staminal filaments ca. 5 mm, sparsely hirsute; anther thecae superposed, lower one spurred at base. Ovary glabrous; style ca. 6

mm, subglabrous. Capsule ca. 5 mm, glabrous. Seeds ovate in outline, ca.  $1 \times 1$  mm, tuberculate-verrucose. Fl. Nov–Jan.

- Thickets on dry slopes; 400–800 m. Yunnan.

**22. *Justicia grossa*** C. B. Clarke in J. D. Hooker, Fl. Brit. India 4: 535. 1885.

大爵床 da jue chuang

Shrubs 50–100 cm tall. Stems subterete, puberulent when young then glabrescent. Petiole 1.3–4 cm, glabrous or puberulent; leaf blade elliptic to lanceolate,  $16-30 \times 5-9.5$  cm, abaxially glabrous or puberulent along veins; adaxially glabrous, secondary veins 5–8 on each side of midvein, base broadly rounded to cuneate, margin crenulate, apex acuminate to attenuate and with an obtuse tip. Inflorescences terminal, thyrsoid of 3-flowered cymes, usually 3 or more branched,  $5-15 \times 2-3$  cm; peduncle 1–3.5 cm; rachis hirsute; bracts ovate, elliptic, or lanceolate,  $2-8 \times 1-5$  mm, abaxially puberulent; bracteoles lanceolate to rarely triangular,  $1.5-3 \times 0.5-1$  mm, abaxially puberulent. Pedicel 1–5 mm, hirsute. Calyx ca. 6 mm, both surfaces gland-tipped pubescent, 5-lobed to base; lobes linear. Corolla greenish white with pale purple dots on lower lip, 1.2–1.5 cm, outside pubescent; tube 6–7 mm; limb 6–7 mm; lower lip 3-lobed, lobes ovate and ca.  $2 \times 1.5-2$  mm; upper lip emarginate. Staminal filaments 4–6 mm, basal portion densely pubescent; anther thecae 1.5–2 mm, both spurred at base. Ovary pubescent; style pubescent. Capsule ca. 1.6 cm, densely pubescent. Seeds elliptic to circular in outline, ca.  $3.5 \times 3.5$  mm, wrinkly verrucose.

Forests; 400–800 m. Hainan [Laos, Malaysia, Myanmar, Thailand, Vietnam].

**23. *Justicia adhatoda*** Linnaeus, Sp. Pl. 1: 15. 1753.

鸭嘴花 ya zui hua

*Adhatoda vasica* Nees.

Shrubs to 4 m tall. Branches thickened,  $\pm$  4-angled, lenticellate, pubescent when young but soon glabrescent. Petiole 0.8–3 cm, puberulent; leaf blade ovate to elliptic-ovate,  $7-18 \times 2-7$  cm, abaxially puberulent, adaxially densely tomentose when young but glabrescent except tomentose along veins, secondary veins 9–12 on each side of midvein and meeting near margin, base broadly cuneate, margin entire, apex acuminate and sometimes slightly falcate. Spikes terminal or axillary, ovoid to broadly ovoid, 3–7 cm; peduncle 3–7 cm; bracts imbricate, ovate-oblong,  $1-2 \times 0.5-1.5$  cm, puberulent, 3–7-veined, margin ciliate, apex acute; bracteoles linear-lanceolate,  $1-1.4 \times$  ca. 0.4 cm, puberulent, 3–5-veined, margin ciliate, apex acute. Calyx 5-lobed; lobes linear-oblong, ca.  $10 \times 3$  mm, margin narrowly scarious and ciliate. Corolla white or pink with purplish or pinkish stripes outside, broadly tubular, 2.5–3 cm, outside pilose; tube basally cylindric and ca. 5 mm wide for ca. 5 mm and then slightly inflated and bent upward; upper lip ovate-oblong, ca. 1.8 cm, erect, shallowly 2-lobed; lower lip oblong-circular, spreading, 3-lobed, middle lobe subcircular and ca.  $9 \times 5$  mm, lateral lobes ovate and ca.  $8 \times 4.5$  mm. Stamens exserted; filaments ca. 1.5 cm, declinate, glabrous except basally sericeous; anther thecae ellipsoid, ca. 3.5 mm, equal,

superposed, lower one spurred at base. Ovary pubescent especially at tip; style ca. 2.5 cm, recurved, basal part pubescent; stigma simple. Capsule obovoid, 2.5–4 × ca. 0.5 cm. Seeds circular in outline. Fl. Jan–Mar, fr. Jun–Jul.  $2n = 34$ .

Roadsides, thickets. Naturalized or cultivated in Guangdong, Guangxi, Hainan, and Yunnan [probably native to India, Indonesia, Malaysia, Nepal, Pakistan, and Sri Lanka, but widely cultivated and naturalized in tropics, obscuring native distribution].

*Justicia adhatoda* is widely cultivated beyond its native range.

This species is used medicinally.

**24. *Justicia vagabunda*** Benoist, Notul. Syst. (Paris) 5: 114. 1936.

针子草 zhen zi cao

*Raphidospora vagabunda* (Benoist) C. Y. Wu ex C. C. Hu.

Shrubs to 1.3 m tall. Stems terete, zigzag, glabrous. Petiole 7–12 mm; leaf blade oblong-lanceolate, 6–14 × 2–5 cm, glabrous or sometimes pilose along midvein, base obliquely cuneate, margin entire or slightly undulate, apex acute to falcate. Cymes axillary, ca. 2 cm; peduncle 4–6 mm, pubescent; bracts subulate, 1–2 mm, pilose; bracteoles 2–5 mm, pilose. Calyx ca. 3.5 mm, outside pubescent; lobes 5, oblong-lanceolate. Corolla white with blue lines, 1–1.1 cm, outside pubescent; tube as long as limb; lower lip 3-lobed; upper lip triangular, apex emarginate. Staminal filaments ca. 4 mm, glabrous; anther thecae superposed, lower one spurred at base. Ovary pubescent at tip; style basal portion hirsute. Capsule not seen.

Forests, thickets, streamsides; 500–800 m. Yunnan [Cambodia, Vietnam].

**25. *Justicia ventricosa*** Wallich ex Hooker, Bot. Mag. 54: t. 2766. 1827.

黑叶小驳骨 hei ye xiao bo gu

*Adhatoda ventricosa* (Wallich ex Hooker) Nees; *Gendarussa ventricosa* (Wallich ex Hooker) Nees.

Subshrubs or perennial herbs, to 1 m tall. Stems subterete, glabrous. Winter buds ovoid, ca. 2 mm, pubescent. Petiole 0.5–1.5 cm, sulcate, glabrous; leaf blade elliptic to obovate, 6–17 × 2–6 cm, glabrous, midvein abaxially prominent and adaxially impressed, secondary veins 6–8 on each side of midvein, prominent on both surfaces, and meeting near margin, base attenuate, margin entire or slightly undulate, apex shortly acuminate to acute. Spikes terminal, 5–10 cm, densely flowered, usually with 1–3 flowers on each inflorescence node; peduncle ca. 1 cm; bracts leaflike, green to maroon, imbricate, broadly ovate to subcircular, 1–1.5 × 0.8–1 cm, abaxially pilose to subglabrous, pinnately veined, margin ciliate, apex acute; bracteoles linear, 3–5 × 1–2 mm, margin ciliate. Calyx 5-lobed; lobes linear-lanceolate, ca. 3 mm, margin ciliate. Corolla creamy white with purplish pink stripes on lips, 1.5–1.8 cm, outside pilose, inside pubescent; tube basally cylindric and ca. 1.7 mm wide for ca. 1 cm; lower lip 3-lobed, lobes ovate, ca. 2 × 1 mm, and apex rounded; upper lip oblong-ovate, 2-lobed. Stamens exserted; filaments ca. 6 mm, glabrous; anther thecae ovoid, subequal, superposed, lower one with a white appendage at base. Ovary comose; style ca. 1.6 cm, base pilose. Cap-

sule ca. 8 mm, pubescent, 4-seeded. Fl. Nov–Jan, fr. Apr–May.  $2n = 30$ .

Sparse forests, thickets. Naturalized or cultivated in Guangdong, Guangxi, Hainan, and Yunnan [native to Cambodia, Laos, Myanmar, N Thailand, and Vietnam].

This species is used medicinally.

**26. *Justicia gendarussa*** N. L. Burman, Fl. Indica, 10. 1768.

小驳骨 xiao bo gu

*Gendarussa vulgaris* Nees.

Subshrubs 0.7–1.5 cm tall, much branched. Stems subterete, swollen at nodes, glabrous. Petiole 3–10 mm; leaf blade narrowly lanceolate, 6–10 × 1–1.5 cm, glabrous, secondary veins 5–8 on each side of midvein, base cuneate to attenuate, margin subsinuate, apex acute to shortly acuminate. Spikes terminal or axillary, 3–12 cm, interrupted, usually in a leafy panicle; peduncle 0.5–1.5 cm; bracts triangular, 2–6 × 1–2.5 mm, basal ones longer than calyx then gradually smaller with apicalmost ones shorter than calyx, margin ciliate, apex acute; bracteoles elliptic to linear-lanceolate, ca. 3 × 1 mm, margin ciliate, apex acute. Calyx ca. 5 mm, 5-lobed; lobes linear-lanceolate, 3–4 × ca. 0.5 mm, subequal, apex acuminate. Corolla creamy white, 1.2–1.5 cm; tube basally cylindric and ca. 2 mm wide for 8–9 mm; lower lip violet dotted basally, cuneate-obovate, 6–10 mm broad, 3-lobed, lobes oblanceolate and 3–5 × ca. 3.5 mm; upper lip violet blotched, triangular, ca. 7 × 3.5 mm, 2-cleft. Stamens exserted; filaments 3–6 mm, glabrous; anther thecae oblong, ca. 1.2 mm, superposed, lower one spurred at base, upper one mucicous. Ovary glabrous; style ca. 1 cm, glabrous; stigma capitate, shortly 2-lobed. Capsule clavate, ca. 1.2 cm. Fl. Jan–Apr.  $2n = 28, 30$ .

Roadsides, thickets. Naturalized or cultivated in Guangdong, Guangxi, Hainan, Taiwan, and Yunnan [native to or naturalized in Cambodia, India, Indonesia, Laos, Malaysia, Myanmar, Papua New Guinea, Philippines, Sri Lanka, Thailand, and Vietnam; widely cultivated].

*Justicia gendarussa* is native to S and SE Asia but is widely cultivated and naturalized. Its actual native distribution is not certain because it is often not clear whether particular collections are native.

**27. *Justicia pseudospicata*** H. S. Lo & D. Fang, Guihaia 17: 52. 1997.

黄花爵床 huang hua jue chuang

*Mananthes pseudospicata* (H. S. Lo & D. Fang) C. Y. Wu & C. C. Hu.

Herbs to 30 cm tall, perennial. Stems 4-angled, basally usually rooting at nodes, sulcate, bifariously pubescent. Petiole 3–13 mm, pubescent; leaf blade ovate, (0.8–)1.5–6.5 × (0.4–)1–4 cm, thickly papery, abaxially glabrous, adaxially glabrous or pilose on veins, secondary veins 4 or 5 on each side of midvein, base cuspidate to rounded, margin subundulate, apex acute. Spikes often terminal or rarely axillary in apicalmost leaf axil, 1.5–3 cm, interrupted; peduncle 1–2.5 cm; rachis bifariously pubescent; bracts broadly obovate to sometimes circular or ovate, 3–5 × 2–4 mm, abaxially sparsely gland-tipped puberulent, apex cuspidate; bracteoles narrowly triangular, ca. 2 × 1 mm, abaxially pubescent, margin ciliate, apex acute. Calyx 2–3

mm, 5-lobed almost to base; lobes linear. Corolla yellow with purplish spots, 1.2–1.4 cm, outside pubescent; lower lip palate 3-lobed, lobes triangular and 1–2 mm; upper lip 4–5.5 mm, apex emarginate. Staminal filaments 2.5–3 mm, glabrous; anther thecae ca. 1.5 mm, lower one spurred at base. Ovary glabrous; style 5–8 mm, subglabrous. Capsule not seen. Fl. Sep–Dec.

- On rocks in forests; 1300–1700 m. Guangxi.

*Mananthes latiflora* (Hemsley) C. Y. Wu & C. C. Hu.

Herbs or shrubs 50–100 cm tall, erect. Stems 4-angled, sulcate, sparsely pubescent. Petiole 1–3.5 cm, pubescent; leaf blade lanceolate, ovate, or subcircular, 6–10 × 2–3.5 cm, both surfaces hispid along veins, secondary veins 8–10 on each side of midvein, base cuneate to sometimes attenuate, margin entire, apex acuminate. Spikes terminal, 3.5–5.5 cm, densely flowered; bracts basally pale green and purplish red above middle, ovate to elliptic, 7–10 × 3–4 mm, abaxially puberulent, apex acuminate; bracteoles linear, 5–7 × ca. 1.5 mm, abaxially puberulent. Calyx 5–8 mm, outside puberulent, 5-lobed almost to base; lobes linear, apex acute. Corolla pale white with purplish red dots or stripes on lobes, ca. 1.5 cm, outside pubescent; tube ca. 1 cm; lower lip patent, broadly 3-lobed, lobes circular and ca. 1 mm in diam.; upper lip ca. 0.5 mm, broadly rounded and concave, apex emarginate. Staminal filaments glabrous; anther thecae superposed, lower one minutely spurred at base. Ovary glabrous; style glabrous. Capsule obovoid-clavate, 1–1.2 cm, glabrous. Seeds ovate in outline, ca. 4 × 3.5 mm, rugose. Fl. Feb–Apr, fr. May–Jun.

- Forests, streamsides; 600–1800 m. Chongqing, Guizhou, Hubei, Hunan.

**29. *Justicia austrosinensis*** H. S. Lo, Guihaia 17: 52. 1997.

华南爵床 *hua nan jue chuang*

*Mananthes austrosinensis* (H. S. Lo) C. Y. Wu & C. C. Hu.

Herbs 40–70 cm tall. Stems 4-angled, sulcate, glabrous. Petiole 0.5–3 cm, bifariously pubescent or glabrescent; leaf blade broadly ovate to ovate-elliptic, 7–15 × 2.5–7 cm, glabrous, abaxially pale green, adaxially green and with numerous cystoliths especially on veins, secondary veins 5–8 on each side of midvein, base cuneate and decurrent onto petiole, margin crenate or entire, apex shortly acuminate to acute. Spikes mostly terminal or rarely axillary, 5–7 cm; peduncle 1–3 cm, with numerous cystoliths, glabrous; bracts green, usually subtending 1 or 2 flowers, flabellate or broadly obovate, 5–8 × 7–9 mm, margin ciliate, apex acuminate to obtuse and mucronate, with 1–3 teeth; bracteoles subulate, ca. 3 mm, margin ciliate, apex acuminate. Calyx 5-lobed almost to base; lobes lanceolate, ca. 4 mm, margin ciliate, apex acuminate. Corolla yellowish green with purplish red dots on lobes, ca. 1.3 cm, outside pilose, inside glabrous except for trichomes retaining style; lip ca. 1/2

as long as corolla; lower lip 3-lobed, lobes ovate, ca. 2 × 2 mm, and apex rounded; upper lip ovate-triangular, ca. 6 × 3 mm, erect, apex emarginate. Stamens exserted; filaments ca. 4 mm, glabrous; anther thecae ca. 2 mm, unequal, superposed, lower one spurred at base, upper one mucous. Ovary glabrous; style ca. 1 mm, pilose. Capsule clavate, ca. 1.2 cm, pubescent, 4-seeded. Seeds ovate in outline, ca. 2 mm, rugose. Fl. Jul–Oct.

- Thickets in ravines. Guangdong, Guangxi, Guizhou, Jiangxi, Yunnan.

Herbs to 1 m tall. Stems 4-angled, basally prostrate and rooting at nodes, sulcate, glabrous. Petiole 2–15 mm, glabrous; leaf blade elliptic to obovate-elliptic, 3–10  $\times$  1.2–4.2 cm, apical half broadest, papery, glabrous, secondary veins 5 or 6 on each side of midvein, base cuneate, margin subentire, apex caudate. Spikes axillary, 1–3 cm, interrupted; peduncle 0.5–1.5 cm; rachis sulcate, puberulent, 1-flowered per node; bracts linear-triangular, 3–4 mm, abaxially puberulent, margin ciliate; bracteoles ovate, 2.5–3 mm, margin ciliate. Calyx ca. 4 mm, 5-lobed almost to base; lobes narrowly triangular, outside glabrescent, inside glabrous. Corolla white, ca. 1.1 cm, outside slightly retrorsely pubescent; tube as long as limb; lower lip 3-lobed, lobes ca. 2.5 mm and apex rounded; upper lip ca. 5 mm, apex emarginate. Staminal filaments ca. 3 mm, glabrous; anther thecae superposed, lower one minutely spurred at base. Ovary glabrous; style ca. 5 mm, glabrous. Capsule not seen. Fl. Oct.

● On rocks in forests on limestone hills. Guangxi.

## 25. RHINACANTHUS Nees in Wallich, Pl. Asiat. Rar. 3: 76, 108. 1832.

灵枝草属 ling zhi cao shu

Hu Jiaqi (胡嘉琪 Hu Chia-chi), Deng Yunfei (邓云飞); Thomas F. Daniel

Shrubs, subshrubs, or herbs, with cystoliths. Leaves opposite, petiolate or subsessile; leaf blade margin entire or slightly undulate. Inflorescences axillary or terminal, spikes or racemes, sometimes branched into panicles; bracts and bracteoles shorter than calyx. Calyx deeply 5-lobed; lobes subequal. Corolla white or greenish [or purple]; tube cylindric, elongate, narrow; limb 2-lipped; lower lip 3-lobed, lobes ascending cochlear in bud; upper lip entire or 2-cleft, inside rugulose. Stamens 2, exerted from mouth of corolla; anthers 2-theous; thecae unequally inserted to superposed, lower theca with or without a basal appendage; staminodes absent. Capsule with a solid stalk, clavate, 4-seeded; retinacula present. Seeds discoid, variously ornamented, lacking trichomes.

About 25 species: tropical and subtropical regions of Africa and Asia; two species (one endemic) in China.

*Rhinacanthus calcaratus* (Wallich) Nees was reported from Yunnan by C. C. Hu (FRPS 70: 268. 2002) based on a misidentification of *Pseuderanthemum polyanthum*.

- 1a. Leaf blade narrowly obovate to oblanceolate, 20–24  $\times$  6–8 cm, abaxially glabrous, secondary veins 8–10 on each side of midvein; corolla tube ca. 4 cm, lobes of lower lip 2–2.5 cm ..... 1. *R. beesianus*  
 1b. Leaf blade elliptic, ovate-elliptic, or rarely lanceolate, 2–7(–11)  $\times$  0.8–3 cm, abaxially pubescent, secondary veins 5 or 6 on each side of midvein; corolla tube 1.5–1.8 cm, lobes of lower lip 2–4 mm ..... 2. *R. nasutus*

**1. *Rhinacanthus beesianus*** Diels, Notes Roy. Bot. Gard. Edinburgh 5: 164. 1912.

滇灵枝草 dian ling zhi cao

Shrubs to 1.5 m tall. Stems 4-angled, subglabrous. Petiole 0–4 mm; leaf blade narrowly obovate to oblanceolate, 20–24 × 6–8 cm, abaxially glabrous, adaxially slightly pubescent, secondary veins 8–10 on each side of midvein, base attenuate and decurrent onto petiole, margin slightly undulate to subentire, apex acute. Panicles terminal, 12–15 × 8–9 cm; bracts leaflike, lanceolate, 0.8–1.2 × 0.3–0.4 cm. Flowers pedicellate. Calyx lobes linear, ca. 10 × 1.5 mm, pubescent, 1-veined, apex acute. Corolla white, fragrant, outside gland-tipped pubescent; tube ca. 4 cm; lower lip lobes elliptic, 2–2.5 cm; upper lip ca. 2 cm, apex 2-cleft. Stamens ca. 1 cm. Fl. Aug–Sep.

● Open dry situations on mountain slopes; 2100–2400 m. Yunnan.

**2. *Rhinacanthus nasutus*** (Linnaeus) Kurz, J. Asiat. Soc. Bengal, Pt. 2, Nat. Hist. 39: 79. 1870.

灵枝草 ling zhi cao

*Justicia nasuta* Linnaeus, Sp. Pl. 1: 16. 1753; *Rhinacanthus communis* Nees.

Subshrubs or perennial herbs, to 1.5 m tall. Stems stout, ± 4-angled, faintly striate, densely pubescent when young then glabrescent. Petiole 0.5–1.5 cm; leaf blade elliptic, ovate-elliptic, or rarely lanceolate, 2–7(–11) × 0.8–3 cm, abaxially densely pubescent, adaxially sparsely pubescent to subglabrous, secondary veins 5 or 6 on each side of midvein, base cuneate, margin entire or slightly undulate, apex shortly acuminate to acute. Panicles terminal or axillary, to 50 cm; rachis densely pubescent; bracts lanceolate, to 2 × 0.5 mm; bracteoles ca. 1 mm. Flowers sessile to subsessile. Calyx ca. 5 mm, both surfaces pubescent; lobes lanceolate, ca. 4 × 0.7 mm. Corolla greenish white, 2.1–2.7 cm, outside pubescent with gland-tipped and non-glandular trichomes; tube 1.5–1.8 cm; lower lip 0.75–1.2 cm, lobes 2–4 mm and subequal; upper lip linear-lanceolate, 6–7.5 mm, erect. Staminal filaments glabrous. Style sparsely pubescent. Capsule ca. 2 × 0.3 cm, pubescent with gland-tipped trichomes. Seeds ca. 2.5 × 2.2 mm, papillose. Fl. Oct–Dec. *2n* = 30.

Thickets, forests, cultivated around villages; below 700 m. Guangdong, Hainan, Yunnan [Cambodia, India, Indonesia, Laos, Malaysia, Myanmar, Philippines, Sri Lanka, Thailand, Vietnam; Madagascar].

## 26. DICLIPTERA Jussieu, Ann. Mus. Natl. Hist. Nat. 9: 267. 1807, nom. cons.

狗肝菜属 gou gan cai shu

Hu Jiaqi (胡嘉琪 Hu Chia-chi), Deng Yunfei (邓云飞); Thomas F. Daniel

*Diapedium* K. D. Koenig.

Herbs, diffuse, annual, biennial, or perennial [or sometimes shrubs], with cystoliths; young stems ± 6-angled in cross-section. Leaves petiolate; leaf blade margin entire or subsinuate. Inflorescences of cymes in leaf axils or in terminal spikelike thyrses or panicles of thyrses. Flowers subtended by an involucre of several pairs of bracteoles (= cymule); outermost pair equal or unequal in size, usually concealing inner pair(s), calyx, and base of corolla. Calyx deeply 5-lobed; lobes narrow, equal, apex acute. Corolla pink, resupinate 180° by torsion of tube; tube slender, widened apically, limb 2-lipped; lower lip (in upper position) 3-lobed, lobes ascending cochlear in bud; upper lip (in lower position) entire or emarginate. Stamens 2, exserted from mouth of corolla; anthers 2-theccous; thecae unequally inserted to superposed, base mucinous; staminodes absent. Stigma 2-cleft. Capsule substipitate or stipitate, 2–4-seeded; retinacula present; placenta with retinacula separating elastically and rising from inner capsule wall at dehiscence. Seeds lenticular, papillate, lacking trichomes.

About 100 species: tropical and temperate regions worldwide; four species (two endemic) in China.

1a. Outer bracteoles oblong-lanceolate to oblanceolate, greater than 2 × as long as wide.

2a. Outer bracteoles oblong-lanceolate, 5–7 mm, sparsely covered with white or grayish trichomes or glabrescent; corolla ca. 0.5 cm ..... 1. *D. bupleuroides*

2b. Outer bracteoles oblanceolate, 10–14 mm, densely covered with yellow trichomes; corolla ca. 1.5 cm ..... 2. *D. induta*

1b. Outer bracteoles elliptic, subcircular, or obovate, less than 2 × as long as wide.

3a. Corolla pale purple, 1–1.2 cm; outer bracteoles 0.5–1.3 × 0.3–0.8 cm ..... 3. *D. chinensis*

3b. Corolla pinkish red, ca. 1.8 cm; outer bracteoles 1.5–2 × 1–1.5 cm ..... 4. *D. elegans*

**1. *Dicliptera bupleuroides*** Nees in Wallich, Pl. Asiat. Rar. 3: 111. 1832.

印度狗肝菜 yin du gou gan cai

*Dicliptera roxburghiana* Nees var. *bupleuroides* (Nees) C. B. Clarke.

Herbs to 50 cm tall. Stems sulcate, pubescent. Petiole 5–10 mm; leaf blade ovate, 3.5–7 × 1.8–2.8 cm, glabrous or with 2-celled trichomes, secondary veins 4 or 5 on each side of midvein, base cuneate, margin subentire, apex acuminate. Inflores-

cences axillary and subsessile or sometimes terminal and shortly pedunculate, cymes, many flowered; peduncle 3–5 mm; bracts lanceolate, 2–3 mm; outer bracteoles green, oblong-lanceolate, 5–7 × ca. 2 mm, abaxially pubescent, base cuneate, margin entire and ciliate, apex mucronate; inner bracteoles green with yellowish margin, lanceolate, ca. 4 × 1.5 mm. Calyx ca. 3 mm; lobes subulate, pubescent. Corolla ca. 5 mm, outside pubescent; lip in lower position orbicular, ca. 1.5 × 1.5 mm; lip in upper position oblong, ca. 2 × 1 mm, 3-lobed, lobes ovate and ca. 0.3 × 0.3 mm. Staminal filaments ca. 2 mm; anther thecae spheri-

cal. Ovary pilose at tip; style ca. 3 mm. Capsule ca. 3 mm, pilose at tip. Seeds ovate in outline, ca. 1 mm, papillate. Fl. Nov–May, fr. Dec–Jun.  $2n = 26$ .

Roadsides, forests, shady places; 800–1900 m. Guizhou, Sichuan, Yunnan [Cambodia, India, Laos, Myanmar, Thailand, Vietnam].

**2. *Dicliptera induta*** W. W. Smith, Notes Roy. Bot. Gard. Edinburgh 10: 175. 1918.

毛狗肝菜 mao gou gan cai

Herbs to 60 cm tall. Stems sulcate, densely yellow hirsute especially along sulcae. Petiole 5–12 mm, yellow tomentose; leaf blade ovate, 3–4 × 1.5–2.5 cm, both surfaces yellow tomentose especially along veins, secondary veins 3–5 on each side of midvein, base broadly cuneate to subrounded, margin entire, apex acute. Inflorescences axillary, each of 1 or 2 cymes; peduncle 2–3 mm, yellow hirsute; bracts linear-subulate, ca. 5 mm, tomentose; outer bracteoles dark green, oblanceolate, 10–14 × 2–4 mm, unequal, rigid, both surfaces tomentose especially toward base, base cuneate, apex acute and shortly mucronate; inner bracteoles linear-lanceolate, 8–10 mm, pilose, apex acuminate. Pedicel ca. 1 mm. Calyx ca. 5 mm; lobes linear, pilose, apex acute. Corolla pink, ca. 1.5 cm, pilose; tube basally slender, white pilose; lip in lower position ca. 4 mm, 2-lobed; lip in upper position ca. 3 mm, 3-lobed, lobes ovate. Staminal filaments ca. 6 mm, glabrous; anther thecae spherical, ca. 1 mm. Ovary minutely pilose; style ca. 1.2 cm, minutely pilose. Capsule ca. 4 mm, pilose. Seeds ovate in outline, ca. 2 mm, papillate. Fl. Aug–Sep, fr. Oct–Nov.

• Wastelands; 400–700 m. Yunnan.

**3. *Dicliptera chinensis*** (Linnaeus) Jussieu, Ann. Mus. Natl. Hist. Nat. 9: 268. 1807.

狗肝菜 gou gan cai

*Justicia chinensis* Linnaeus, Sp. Pl. 1: 16. 1753; *Diapedium chinense* (Linnaeus) K. D. Koenig & Sims; *Dicliptera burmanni* Nees; *D. roxburghiana* Nees.

Herbs 30–80 cm tall, annual or biennial. Stems ridged, basally diffuse, apically erect, glabrous except for pubescence on young branches and nodes. Petiole to 0.5–3 cm, puberulent; leaf blade ovate-elliptic, 2–8 × 1.5–4 cm, abaxially sparsely puberulent along veins, adaxially glabrous, secondary veins 4 or 5 on each side of midvein and abaxially slightly prominent, base cuneate to attenuate and decurrent onto petiole, margin entire or slightly sinuate, apex shortly acuminate to acute. Inflorescences each of (1–)3 or 4 pedunculate cymes from upper leaf axils, 1–4 cm; inflorescence bracts subulate to linear to oblanceolate to obovate, 3–7.5 × 0.3–1 mm; peduncle 2–5 mm; cymules usually 3 or 4 per cyme; outer bracteoles elliptic to obovate, 5–13 × 3–8 mm, unequal, abaxially puberulent, 3-veined, margin cili-

ate, apex acute and mucronate; inner bracteoles linear, ca. 5 mm, abaxially hirsute, apex acuminate. Pedicel 0.5–3 mm, puberulent. Calyx ca. 5 mm; lobes linear, equal, margin hirsute, apex acuminate. Corolla pale purple, 1–1.2 cm, outside puberulent; tube slender, ca. 6 mm, ca. 1.5 mm wide; limb 2-lipped; lip in lower position ovate, ca. 5 × 3 mm, apex entire; lip in upper position oblong, ca. 4 × 1.5 mm, shallowly 3-lobed. Stamens inserted near apex of corolla tube; filaments ca. 4 mm, glabrous; thecae spherical, ca. 1.2 mm in diam., parallel. Ovary pilose at tip; style ca. 1.4 cm. Capsule broadly ellipsoid, ca. 6 mm, puberulent, 4-seeded, apex apiculate. Seeds circular in outline, ca. 2 mm in diam., covered with apically barbed papillae. Fl. Sep–Jan, fr. Nov–Feb.  $2n = 26$ .

Streamsides, trailsides; below 1800 m. Fujian, Guangdong, Guangxi, Guizhou, Hainan, Sichuan, Taiwan, Yunnan [Bangladesh, India, Vietnam].

This species is used medicinally.

优雅狗肝菜 you ya gou gan cai

*Dicliptera mairei* Benoist.

Herbs 60–120 cm tall. Stems erect, branched, slender, sulcate, sparsely pubescent. Petiole 0.5–1.5 cm, sulcate, pubescent; leaf blade ovate to ovate-lanceolate, 4–8 × 2–5 cm, abaxially pale gray and sparsely pubescent, adaxially green, densely covered with cystoliths, and densely brownish pilose on midveins but otherwise sparsely pubescent with few large-celled white trichomes, secondary veins 4–6 on each side of midvein, base broadly cuneate and decurrent onto petiole, margin entire or sinuate, apex acuminate. Inflorescences axillary, each of 2 or 3 cymes; peduncle to 7 cm, white tomentose; inflorescence bracts linear, 7–10 × 1–2 mm, puberulent; cymules 3–6 per cyme; outer bracteoles subcircular to obovate, 1.5–2 × 1–1.5 cm, unequal, abaxially with cystoliths and pilose, palmately 3- or 5-veined, base rounded, apex mucronate; inner bracteoles linear-lanceolate, 5–7 × ca. 1 mm, abaxially puberulent, apex acuminate. Pedicel 0.5–2 mm. Calyx 6–7 mm; lobes linear-lanceolate, outside puberulent, apex acuminate. Corolla pinkish red, ca. 1.8 cm, outside pubescent; tube slender; limb 2-lipped. Staminal filaments ca. 5 mm, glabrous; anther thecae spherical, ca. 1 mm, inserted at slightly different levels. Ovary slightly pilose. Capsule ca. 6 mm, light yellow pilose. Seeds light brown, circular in outline, ca. 1.5 × 1.5 mm, compressed, yellowish papillate. Fl. Aug–Oct, fr. Oct–Dec.

• Forest margins, thickets, roadsides; 600–2000 m. Sichuan, Yunnan.

*Dicliptera mairei* was incorrectly reduced to *D. induta* by C. C. Hu (FRPS 70: 238. 2002).

## 27. PERISTROPHE Nees in Wallich, Pl. Asiat. Rar. 3: 77, 112. 1832.

观音草属 guan yin cao shu

Hu Jiaqi (胡嘉琪 Hu Chia-chi), Deng Yunfei (邓云飞); Thomas F. Daniel

Herbs or shrubs, with cystoliths. Leaf blade margin entire or slightly toothed. Inflorescences in axillary or terminal cymes, these

sometimes aggregated into a leafy panicle-like complex; cymes consisting of (1 or) 2–4 (or more) involucre; involucre of usually 1–3 flowers enclosed by 2 (or more) pairs of bracteoles that conceal calyx and corolla tube. Outer pair of bracteoles equal to unequal in size and larger than inner pair(s). Calyx small, 5-lobed; lobes equal. Corolla white to pink or purple, usually large, resupinate 180°; tube slender, twisted, apically ± widened into throat; limb 2-lipped; upper lip (in lower position) entire to 2-cleft; lower lip (in upper position) 3-lobed; lobes ascending cochlear in bud. Stamens 2, inserted at corolla throat, exerted from corolla tube; anthers 2-theccous; thecae unequally inserted or superposed (contiguous or separated by gap), base muticous; staminodes absent. Ovary with 2 ovules per locule; stigma slightly enlarged or 2-cleft. Capsule with a solid stalk, 4-seeded; retinacula present; placenta not rising elastically from base of valves. Seeds discoid, smooth to tuberculate, lacking trichomes.

About 40 species: tropical and subtropical Africa, Asia, and Madagascar, with one species possibly extending to Australia (see R. M. Barker, J. Adelaide Bot. Gard. 9: 192. 1986); ten species (three endemic) in China.

- 1a. Outer involucre bracteoles abaxially pubescent with gland-tipped trichomes.
  - 2a. Corolla ca. 4.5 cm, pubescent with gland-tipped and non-glandular trichomes ..... 1. *P. lanceolaria*
  - 2b. Corolla ca. 1 cm, outside pubescent with non-glandular trichomes ..... 2. *P. paniculata*
- 1b. Outer involucre bracteoles abaxially glabrous or pubescent with non-glandular trichomes.
  - 3a. Anther thecae superposed (i.e., one entirely above other and with a gap between them).
    - 4a. Corolla ca. 1 cm; outer involucre bracteoles subulate to lanceolate to linear, less than 3 mm wide; capsule pubescent with non-glandular trichomes ..... 2. *P. paniculata*
    - 4b. Corolla 3–3.4 cm; outer involucre bracteoles ovate to elliptic, more than 5 mm wide; capsule pubescent with gland-tipped and non-glandular trichomes ..... 10. *P. japonica*
  - 3b. Anther thecae inserted at same level or at different levels but overlapping.
    - 5a. Anther thecae inserted at same level ..... 3. *P. yunnanensis*
    - 5b. Anther thecae inserted at different levels.
      - 6a. Outer involucre bracteoles less than 2 × as long as calyx.
        - 7a. Leaf blade subglabrous ..... 4. *P. tianmuensis*
        - 7b. Leaf blade densely pubescent ..... 5. *P. strigosa*
      - 6b. Outer involucre bracteoles more than 2 × as long as calyx.
        - 8a. Corolla and capsule glabrous ..... 6. *P. montana*
        - 8b. Corolla and capsule pubescent.
          - 9a. Leaf blade adaxially puberulent (especially along midvein) or becoming subglabrescent; corolla 3–5.7 cm ..... 7. *P. bivalvis*
          - 9b. Leaf blade adaxially sparsely pubescent; corolla 2–4 cm.
            - 10a. Outer involucre bracteoles narrowly ovate to lanceolate, more than 4 × as long as wide ..... 8. *P. floribunda*
            - 10b. Outer involucre bracteoles ovate to oblong to elliptic, less than 3 × as long as wide.
              - 11a. Outer involucre bracteoles ovate to oblong, abaxially slightly villous, base subcordate ..... 9. *P. fera*
              - 11b. Outer involucre bracteoles ovate to elliptic, abaxially subglabrous to puberulent, base cuneate to truncate ..... 10. *P. japonica*

**1. *Peristrophe lanceolaria*** (Roxburgh) Nees in Wallich, Pl. Asiat. Rar. 3: 114. 1832.

五指山蓝 wu zhi shan lan

*Justicia lanceolaria* Roxburgh, Fl. Ind. 1: 122. 1820.

Herbs to 1 m tall, erect. Branches stout, densely covered with white retrorse trichomes or sometimes glabrescent. Petiole (0.5–)1.5–3.5 cm; leaf blade lanceolate to ovate-lanceolate, (6–)10–17 × (1–)3–6 cm, abaxially sparsely pubescent or glabrescent, adaxially glabrescent except for a few trichomes along midvein toward base, secondary veins 5–7 on each side of midvein, base narrowly cuneate and slightly oblique, margin entire, apex acuminate. Inflorescences of axillary pedunculate cymes of (1–)3 involucre with cymes sometimes in axils of distal bracts and collectively forming a terminal panicle-like complex 5–7 cm; outer involucre bracteoles linear-lanceolate, 10–18 × 1.5–3 mm, gland-tipped pubescent; inner involucre bracteoles similar to outer ones except smaller. Calyx ca. 9 mm; lobes linear, ca. 1 mm broad. Corolla pink, ca. 4.5 cm, outside pubes-

cent with gland-tipped and non-glandular trichomes; tube base ca. 1.5 mm wide for ca. 2.5 cm; lip in lower position obovate, ca. 2 × 0.8 cm, slightly 2-lobed; lip in upper position oblong, ca. 2 × 0.6 cm, 3-lobed, lobes ovate and ca. 1 × 1 mm. Staminal filaments ca. 1.8 cm, glabrous; anther thecae oblong, ca. 3 × 0.6 mm, superposed. Capsule 1.4–1.8 cm, pubescent with gland-tipped trichomes. Seeds ca. 3 × 2 mm, smooth. Fl. Dec–Mar, fr. Mar–Jun.

Wet places; 500–700 m. Hainan, Yunnan [India, Laos, Myanmar, Thailand, Vietnam].

**2. *Peristrophe paniculata*** (Forsskål) Brummitt, Kew Bull. 38: 451. 1983.

双萼观音草 shuang e guan yin cao

*Dianthera paniculata* Forsskål, Fl. Aegypt.-Arab. 7. 1775; *D. bicalyculata* Retzius; *Dicliptera paniculata* (Forsskål) I. Darbyshire; *Justicia bicalyculata* (Retzius) Vahl; *Peristrophe bicalyculata* (Retzius) Nees.

Herbs to 1.2 m tall, erect, perennial. Stems hirsute, usually 4- or 6-angled. Petiole 3–12 mm; leaf blade ovate to lanceolate, (1–)3–4.5 × (0.5–)1.5–2 cm, abaxially scabrid, adaxially slightly scabrid, base attenuate to broadly cuneate, margin remotely serrulate and slightly ciliate, apex acuminate, acute, or sometimes rounded. Inflorescences of axillary pedunculate cymes with (1–)4(or more) involucre (cymes sometimes branching internally) in axils of leaves or bracts and collectively often forming a terminal leafy panicle-like complex; rachis and inflorescence branches pubescent; outer involucre bracteoles unequal, abaxially pubescent with gland-tipped (sometimes absent) and non-glandular trichomes, larger outer involucre bracteole ± linear, ca. 10 × 2 mm, 1-veined, and apex acute and mucronate, shorter outer involucre bracteole subulate to lanceolate, ca. 6 × 0.1 mm; inner involucre bracteoles narrowly linear to subulate, unequal in length. Calyx lobes lanceolate, ca. 3 mm, outside sparsely pubescent with non-glandular trichomes, inside sparsely pubescent with sessile gland-tipped trichomes, margin membranous at base, apex long acuminate. Corolla light to dark purple, ca. 1 cm, outside pubescent with non-glandular trichomes; tube basally cylindric for ca. 5 mm; lip in lower position narrowly elliptic, 5–7 × 1–2 mm, apex emarginate; lip in upper position elliptic, 3–7 × 2–3 mm, 3-lobed. Staminal filaments ca. 5 mm, white hairy; anther thecae ovoid, superposed, not touching. Ovary ovoid, pubescent and glandular; style glabrous; stigma 2-lobed. Capsule 0.9–1.3 cm, pubescent with non-glandular trichomes. Seeds 2.2–2.5 mm, rough and tuberculate. Fl. Aug–Dec, fr. Oct–Feb.

Weedy areas, roadsides; 600–2200 m. Guangxi, Sichuan, Yunnan [Cambodia, India, Indonesia, Malaysia, Myanmar, Nepal, Pakistan, Philippines, Thailand, Vietnam; tropical Africa, Australia].

**3. *Peristrophe yunnanensis*** W. W. Smith, Notes Roy. Bot. Gard. Edinburgh 10: 187. 1918.

滇观音草 dian guan yin cao

Herbs 1–2 m tall. Stems sulcate, densely grayish pubescent when young, later glabrescent. Petiole 1–10 mm; leaf blade lanceolate to ovate, 2.5–3 × ca. 1 cm, abaxially pubescent, adaxially sparsely puberulent especially on veins or glabrescent, base cuneate, margin entire, apex acuminate. Outer involucre bracteoles linear, ca. 3 mm; inner involucre bracteoles 2.5–6 mm. Calyx 5–7 mm; lobes linear, glabrous or subglabrous, apex acute. Corolla pink to violet, ca. 1.8 cm, outside slightly pubescent. Staminal filaments basally pubescent; anther thecae oblong, ca. 2 mm, parallel, inserted at same level, touching each other. Capsule not seen. Fl. Apr, Aug.

• Thickets; 1900–2200 m. Sichuan, Yunnan.

**4. *Peristrophe tianmuensis*** H. S. Lo, Bull. Bot. Res., Harbin 8(1): 4. 1988.

天目山蓝 tian mu shan lan

Herbs 30–35 cm tall. Stems 6-angled, pubescent. Petiole 3–10 mm; leaf blade broadly ovate, 1.5–6 × 1–4 cm, both surfaces subglabrous, secondary veins 3–6 on each side of midvein, base broadly cuneate to subrounded, margin entire, apex cuspidate to acute. Cymes terminal or pseudo-axillary; outer involucre bracteoles narrowly lanceolate, 3.5–6 mm, pubes-

cent; inner involucre bracteoles similar to outer involucre bracteoles. Calyx ca. 3 mm; lobes linear, pubescent. Corolla light purple, ca. 2 cm; tube slender; lip in lower position oblong-elliptic, ca. 1 cm, apex emarginate; lip in upper position oblong-spatulate, minutely 3-lobed. Staminal filaments 7.5–8 cm, pubescent; anther thecae linear, parallel, inserted at different levels, touching each other for 2/3 of length. Ovary pubescent; style ca. 2 cm, glabrous. Capsule 8–9 mm, pubescent. Seeds ca. 1.2 × 1.2 mm. Fl. Aug, fr. Oct.

• Thickets. Zhejiang (Tianmu Shan).

**5. *Peristrophe strigosa*** C. Y. Wu & H. S. Lo, Fl. Hainan. 3: 596. 1974.

糙叶山蓝 cao ye shan lan

Herbs 40–100 cm tall, annual. Stems 6-angled, pubescent. Petiole 1.5–2.5 cm; leaf blade ovate to lanceolate-ovate, 7–13 × 3–5.5 cm, both surfaces densely pubescent, secondary veins 6–8 on each side of midvein, base broadly cuneate, margin entire, apex acuminate to shortly caudate. Cymes terminal or axillary, 3(or 5)-branched, with 3–5 involucre; peduncle ca. 4 mm; outer involucre bracteoles ovate, ca. 5 × 2 mm, concave, apex aristate; inner involucre bracteoles subulate, ca. 2.5 mm. Calyx ca. 5 mm; lobes linear-lanceolate, apex acuminate. Corolla purple, ca. 4.2 cm, outside pubescent; tube basally cylindric for ca. 2.4 cm; lip in lower position elliptic-obovate, ca. 1.6 × 0.6 cm, apex obtuse to retuse; lip in upper position oblong, ca. 1.6 × 0.5 cm, slightly narrowed at tip, 3-lobed, lobes suboblong and ca. 1 × 1 mm. Staminal filaments ca. 1 cm, pubescent; anther thecae linear, parallel, inserted at different levels. Ovary oblong, ca. 2 mm, pubescent; style ca. 3.5 cm, glabrous. Capsule clavate, ca. 1.7 cm, densely strigose-pubescent. Seeds ca. 2.5 × 2 mm, tuberculate-punctate. Fl. Nov–Jan, fr. Jan–Mar.

• Dense forests. Hainan.

**6. *Peristrophe montana*** Nees in Wallich, Pl. Asiat. Rar. 3: 113. 1832.

岩观音草 yan guan yin cao

Herbs to 1 m tall, erect, glabrous. Petiole 1.5–4.5 cm; leaf blade narrowly oblong, lanceolate, or rarely ovate, 4–9(–20) × 3–5 cm, both surfaces glabrous, secondary veins 6–8 on each side of midvein, base rounded, margin entire, apex acute. Cymes terminal or axillary; peduncle 1.5–1.7 cm; outer involucre bracteoles various, broadly ovate to linear-lanceolate, 1–1.8 × 0.2–1 cm, pinnately veined, base rounded to truncate, margin entire, apex obtuse; inner cymule bracteoles linear, 3–4 mm. Calyx ca. 5 mm; lobes linear. Corolla pink, 4.5–6 cm, outside glabrous; lip in lower position elliptic, apex emarginate; lip in upper position oblong, 3-lobed. Filaments pubescent; anther thecae linear. Ovary glabrous; style glabrous. Capsule ca. 2 cm, shiny, glabrous. Seeds ca. 3 × 2.6 mm. Fl. Oct–Dec, fr. Dec–Feb.

Wet shady cliffs. Hainan [India, Sri Lanka].

**7. *Peristrophe bivalvis*** (Linnaeus) Merrill, Interpr. Herb. Amboin. 476. 1917.

观音草 guan yin cao

*Justicia bivalvis* Linnaeus, Syst. Nat., ed. 10, 2: 850. 1759; *Hypoestes bodinieri* H. Léveillé; *J. baphica* Sprengel; *J. roxburghiana* Roemer & Schultes; *J. tinctoria* Roxburgh; *Peristrophe baphica* (Sprengel) Bremekamp; *P. roxburghiana* (Roemer & Schultes) Bremekamp; *P. tinctoria* (Roxburgh) Nees.

Herbs to 1 m tall, perennial. Stems 5- or 6-angled, much branched, sulcate, pubescent. Petiole to 3.5 cm; leaf blade ovate to lanceolate-ovate, 3–14.5 × 1.5–5.3 cm, both surfaces puberulent (especially along midvein) or becoming subglabrescent, secondary veins 5 or 6 on each side of midvein, base broadly cuneate to subrounded, margin entire to sinuate, apex acuminate to acute. Cymes axillary or terminal, pedunculate, often consisting of 1–3 (or more) pedunculate involucre terminating branches; peduncle 0.3–2.3 cm; outer involucral bracteoles broadly ovate, ovate, or elliptic, unequal in size, puberulent to subglabrous, base rounded to cuneate, apex acute; larger outer involucral bracteole (1.8–)2.3–3.3 × 0.8–1.5 cm; smaller outer involucral bracteole 0.71–0.85 × as long as larger one; inner cymule bracteoles triangular-subulate, 1–2 mm. Calyx 4.5–5 mm, pubescent; lobes lanceolate. Corolla pink, 3.5–5.7 cm, outside pubescent with non-glandular trichomes; tube ca. 1.5 mm in diam.; lip in lower position broadly ovate-elliptic, 2.2–2.6 × ca. 1.8 cm, apex emarginate; lip in upper position oblong, 2–2.5 × ca. 0.9 cm, 3-lobed. Staminal filaments ca. 1.3 cm, puberulent; anther thecae linear, subequally to unequally inserted (overlapping for most of their length), 3.2–4 mm. Ovary pubescent; style glabrous; stigma 2-cleft. Capsule ca. 1.5 cm, pubescent. Seeds ca. 1.5 × 1.5 mm. Fl. Aug–Mar.

Forests; 500–1000 m. Fujian, Guangdong, Guangxi, Guizhou, Hainan, Hunan, Jiangxi, Taiwan, Yunnan [Cambodia, India, Indonesia, Laos, Malaysia, Thailand, Vietnam].

**8. *Peristrophe floribunda*** (Hemsley) C. Y. Wu & H. S. Lo, Fl. Hainan. 3: 561. 1974.

海南山蓝 hai nan shan lan

*Dicliptera crinita* (Thunberg) Nees var. *floribunda* Hemsley, J. Linn. Soc., Bot. 26: 248. 1890.

Herbs, erect, perennial. Stems stout, 4-angled, sulcate, pubescent. Petiole 0.5–2 cm; leaf blade ovate to lanceolate, 2–9 × 1.5–3.5 cm, both surfaces pubescent along veins, secondary veins 4–6 on each side of midvein, base broadly cuneate to subrounded, margin entire, apex acuminate to acute-acuminate. Cymes terminal or axillary; outer involucral bracteoles narrowly ovate to lanceolate, unequal in size, both surfaces pubescent, base cuneate, rounded, or sometimes cordate, margin entire and ciliate, apex acuminate; larger outer involucral bracteoles 1.5–2 × 0.3–0.5 cm; smaller outer involucral bracteoles 4/5–5/6 size of larger ones; inner involucral bracteoles shorter than calyx. Calyx ca. 4.5 mm, pubescent; lobes ca. 3.5 mm. Corolla light purple to pink, outside pubescent; tube slender, ca. 1 mm in diam.; lip in lower position ovate-elliptic, apex slightly emarginate; lip in upper position oblong, 3-lobed. Staminal filaments ca. 1 cm, pubescent; anther thecae linear, parallel, slightly unequally inserted. Ovary hirsute; style basally hirsute. Capsule 1.2–1.3 mm, densely pubescent. Seeds ca. 2.5 mm in diam. Fl. Jun–Sep.

Valleys, forests. Fujian, Guangdong, Guizhou, Hainan, Hunan, Sichuan, Yunnan [India].

**9. *Peristrophe fera*** C. B. Clarke in J. D. Hooker, Fl. Brit. India 4: 556. 1885.

野山蓝 ye shan lan

*Peristrophe fera* var. *intermedia* C. B. Clarke; *P. jalapifolia* Nees.

Herbs to 1 m tall, erect. Stems 4-angled, sulcate, pubescent. Petiole 5–10(–20) mm; leaf blade ovate to ovate-lanceolate, 5–10 × 2–4.3 cm, both surfaces pubescent, secondary veins 3–5 on each side of midvein, base broadly cuneate, margin subentire or apically obscurely dentate, apex acuminate. Cymes terminal or axillary in apical leaf axils, densely pubescent; outer involucral bracteoles ovate to oblong, unequal in size, slightly villous, base subcordate, margin ciliate, apex acuminate; larger outer involucral bracteoles ca. 1.5 × 0.8–1 cm; smaller outer involucral bracteoles 4/5–5/6 size of larger ones; inner involucral bracteoles 2.2–2.5 mm. Calyx 4–5 mm, pubescent; lobes linear, apex acuminate. Corolla 3–4 cm, outside pubescent; tube ca. 1.5 mm in diam.; lip in lower position broadly elliptic, apex emarginate; lip in upper position narrowly oblong, apex 3-lobed. Staminal filaments ca. 1.5 cm, villous; anther thecae linear, parallel, slightly unequally inserted. Ovary pubescent; style basally hirsute. Capsule ca. 1.4 cm, pubescent. Seeds ca. 1.5 × 1.5 mm. Fl. Jul–Aug.

Dense forests. Guizhou, Hainan, Yunnan [India].

**10. *Peristrophe japonica*** (Thunberg) Bremekamp, Boissiera 7: 194. 1943.

九头狮子草 jiu tou shi zi cao

*Dianthera japonica* Thunberg in Murray, Syst. Veg., ed. 14, 64. 1784; *Dicliptera buergeriana* Miquel; *D. crinita* (Thunberg) Nees; *D. japonica* (Thunberg) Makino; *D. uraiensis* Hayata; *Justicia crinita* Thunberg; *Peristrophe chinensis* Nees; *P. guangxiensis* H. S. Lo & D. Fang.

Herbs 20–80 cm, perennial. Stems 4-angled, basally prostrate and rooting at nodes, bifariously pubescent. Petiole 0.5–1.5 cm; leaf blade lanceolate to ovate-oblong, (3–)5–13 × (1–)2.5–4.5 cm, both surfaces sparsely pubescent (especially along midvein), secondary veins 3–5 on each side of midvein, base obtuse to cuneate, margin entire or slightly sinuate, apex acuminate to caudate. Inflorescences terminal or axillary pedunculate cymes from axils of distal leaves, cymes consisting of 1–4 (or more) pedunculate involucre; involucre bearing 1–3 flowers; peduncle 0.7–5.5 cm; outer involucral bracteoles ovate to elliptic, subequal to unequal in size, abaxially subglabrous to puberulent, base cuneate to truncate, margin entire, apex acute to obtuse; larger outer involucral bracteoles 1.1–2.5 × 0.5–1.8 cm; smaller outer involucral bracteoles 8–17 × 3–9 mm; inner involucral bracteoles linear, 2–3 mm, abaxially puberulent, apex acuminate. Calyx ca. 4 mm; lobes subulate, pubescent. Corolla white to pale pink to light purple and with pink specks or dark lines on limb, 2–3.4 cm, outside pubescent with non-glandular trichomes; tube basally ca. 1 mm wide for ca. 1.5 cm; lip in lower position elliptic to subcircular, 8–15 × 3–11 mm, entire or slightly emarginate; lip in upper position oblong, 9–15 × 4–7

mm, 3-lobed. Staminal filaments ca. 7 mm, pubescent; anther thecae linear, ca. 1.2 mm, parallel, unequally inserted to superposed. Ovary pilose; style ca. 2 cm; stigma 2-cleft. Capsule 0.8–1.2 cm, pubescent with gland-tipped and non-glandular trichomes. Seeds ca. 2 mm in diam., tuberculate. Fl. Jul–Feb, fr. Jul–Oct.  $2n = 48$ .

Roadsides, grasslands, streamsides, montane slopes, trailsides, evergreen broad-leaved forests, *Machilus-Castanopsis* forests; below 1500 m. Anhui, Chongqing, Fujian, Guangdong, Guangxi, Guizhou, Hainan, Henan, Hubei, Hunan, Jiangsu, Jiangxi, Sichuan, Taiwan, Yunnan, Zhejiang [Japan].

This species is used medicinally.

## 28. *HYPOESTES* Solander ex R. Brown, Prodr. 474. 1810.

枪刀药属 qiang dao yao shu

Hu Jiaqi (胡嘉琪 Hu Chia-chi), Deng Yunfei (邓云飞); Thomas F. Daniel

Shrubs or perennial herbs, decumbent to erect, with cystoliths. Leaves opposite, petiolate; leaf blade margin entire or dentate. Inflorescences of axillary or terminal bracteate spikes to panicles of spikes or of variously disposed cymes (these sometimes clustered in leaf axils); bracteoles usually 4, in 2 to rarely more pairs, distinct or connate, inner pair sometimes partially adnate to outer pair, forming an involucre enclosing 1 or sometimes more flowers. Calyx small, usually obscured by bracteoles, scarious or membranous, 5-lobed; lobes equal or subequal in length. Corolla rose-pink, purplish, or whitish, resupinate 180° by torsion of tube; tube subcylindric to expanded distally into a narrow throat; limb 2-lipped; lower lip (in upper position) shallowly 3-lobed; upper lip (in lower position) subentire or shallowly 2-lobed; lobes ascending cochlear in bud. Stamens 2, inserted near apex of corolla tube, exerted from mouth of corolla; anthers 1-theous; theca muticous. Ovary with 2 ovules per locule; style exerted from mouth of corolla; stigma 2-lobed, lobes equal or unequal. Capsule stalked, 2–4-seeded; retinacula present. Seeds smooth or ornamented.

About 150 species: Old World; three species in China.

- 1a. Outer bracteoles connate for more than half their length, forming a conspicuous tube; capsule glabrous ..... 1. *H. purpurea*
- 1b. Outer bracteoles inconspicuously connate only at base if at all, not forming a conspicuous tube; capsule pubescent.
- 2a. Outer bracteoles 2.5–4 mm, lanceolate-subulate to linear ..... 2. *H. cumingiana*
- 2b. Outer bracteoles 7–17 mm, elliptic to obovate to oblanceolate ..... 3. *H. triflora*

### 1. *Hypoestes purpurea* (Linnaeus) R. Brown, Prodr. 474. 1810.

红丝线 hong si xian

*Justicia purpurea* Linnaeus, Sp. Pl. 1: 16. 1753; *Hypoestes sinica* Miquel; *Peristrophe purpurea* (Linnaeus) Hochreutiner.

Shrubs or perennial herbs, to 1.5 m tall, spreading to erect. Stems  $\pm$  4-angled when young, sulcate, slightly puberulent. Petiole 1–3.5 cm, sparsely pubescent; leaf blade ovate to ovate-elliptic, 5–13  $\times$  1.5–7 cm, abaxially pale green and glabrous, adaxially green and sparsely pubescent or glabrous except for pubescent along veins and on margin, secondary veins 5–8 on each side of midvein, base narrowed and cuneate, margin entire, subundulate, or sinuate-crenate, apex acuminate to acute. Inflorescences of terminal or axillary spikes, 1–3 cm, often arranged in large panicles forming a many-flowered thyse to 7 cm or of dense cymose clusters in axils of leaves or subleaflike bracts; outer bracteoles connate for more than half their length, forming a 5–8 mm obconic involucre, abaxially glabrous or pubescent; inner bracteoles smaller than and partially adnate to outer pair. Calyx ca. 5 mm, 5-lobed  $\pm$  halfway to base; lobes equal, margin ciliate. Corolla reddish purple to purple, 2–2.7 cm, outside puberulent; lip in lower position lanceolate, subentire; lip in upper position triangularly obovate. Staminal filaments to 1.2 cm, glabrous. Style glabrous; stigma equally 2-lobed. Capsule oblong-ovoid, 0.7–1 cm, glabrous. Seeds elliptic-ovate in outline, tuberculate. Fl. Sep–Oct, fr. Oct.

Thickets, along trails and roads, evergreen broad-leaved forests, rocky shores; near sea level to 1200 m. Guangdong, Guangxi, Hainan, Taiwan [Laos, Philippines].

*Hypoestes purpurea* is a medicinal and ornamental plant.

### 2. *Hypoestes cumingiana* (Nees) Benth & J. D. Hooker, Gen. Pl. 2: 1122. 1876.

枪刀菜 qiang dao cai

*Peristrophe cumingiana* Nees in A. Candolle, Prodr. 11: 498. 1847.

Herbs to 1 m tall, suffrutescent. Stems subterete, ascending to decumbent, distally minutely pubescent. Petiole to 2 cm; leaf blade ovate-oblong to linear-lanceolate, 4–14  $\times$  1–4 cm, both surfaces glabrous, secondary veins 3–6 on each side of midvein, base truncate to cuneate, margin slightly undulate, apex acuminate to acute. Panicles terminal or axillary, to 40 cm, lax; branches of panicle usually subtended by subleaflike inflorescence bracts; floral bracts lanceolate, ca. 4.5  $\times$  1 mm; bracteoles lanceolate-subulate to linear, outer pair 2.5–4 mm, puberulent, inner pair smaller. Flowers single or paired, crowded at tips of branches. Calyx 5-lobed nearly to base, lobes subulate, outside puberulent with non-glandular and gland-tipped trichomes. Corolla white to light purple with darker purple markings, 1.6–2 cm, outside puberulent; tube basally cylindrical and ca. 1 mm wide for 5–8 mm; lip in lower position elliptic, 8–1.2  $\times$  7–8 mm, apex rounded; lip in upper position ca. 10  $\times$  4 mm. Staminal filaments ca. 8 mm. Style 1.4–2 cm, sparsely strigose; stigma 2-lobed. Capsule oblong-ovoid, ca. 1.3 cm, densely puberulent. Seeds blackish brown, ovate in outline, ca. 3  $\times$  3 mm, verrucose. Fl. Nov–Mar, fr. Mar–Jun.

Trailside slopes, along streams; 100–500 m. Taiwan [Philippines].

**3. *Hypoestes triflora*** (Forsskål) Roemer & Schultes, Syst. Veg. 1: 141. 1817.

三花枪刀药 san hua qiang dao yao

*Justicia triflora* Forsskål, Fl. Aegypt.-Arab. 4. 1775; *Dicliptera riparia* Nees var. *yunnanensis* Handel-Mazzetti.

Herbs to 1 m tall, decumbent, much branched. Stems 4-angled, sulcate, strigose. Petiole 1–3 cm, pubescent; leaf blade ovate, ovate-elliptic, or oblong, (1.3–)3–10 × (1–)2–4 cm, both surfaces sparsely pubescent, secondary veins 4–7 on each side of midvein, base cuneate and decurrent onto petiole, margin minutely crenate to denticulate, apex acuminate. Cymes pedunculate in leaf axils and/or in axils of subleaflike bracts distally or in a terminal cluster, (1–)3(–5)-flowered; outer pair of bracte-

oles elliptic to obovate to oblanceolate, 0.7–1.7 × 0.4–0.6 cm, green toward apex, abaxially pilose, base cuneate, apex rounded to acute; inner pair of bracteoles linear-lanceolate to oblanceolate, smaller, basally connate, apex acute. Calyx ca. 6 mm, 5-lobed almost to base; lobes linear-lanceolate, ca. 5 mm. Corolla white to pink with maroon markings, ca. 1.5 cm, outside pubescent; tube basally cylindric and ca. 1 mm wide for ca. 1 cm; lip in lower position lanceolate, ca. 5 × 1.5 mm, apex slightly 2-lobed; lip in upper position oblong, ca. 5 × 3 mm. Ovary pubescent; style ca. 1.4 cm, glabrous; stigma unequally 2-lobed. Capsule ca. 9 mm, pubescent (at least distally). Seeds black, ovate in outline, ca. 2 × 2 mm, verrucose. Fl. Jul–Sep, fr. Sep–Jan.  $2n = 30$ .

Trailsides, forests; 300–2400 m. Yunnan [Bhutan, India, Myanmar, Nepal; Africa].

## 29. *BARLERIA* Linnaeus, Sp. Pl. 2: 636. 1753.

假杜鹃属 jia du juan shu

Hu Jiaqi (胡嘉琪 Hu Chia-chi), Deng Yunfei (邓云飞); Thomas F. Daniel

Shrubs, subshrubs, or perennial herbs, with cystoliths, usually spiny. Leaves opposite, petiolate. Inflorescences axillary cymes (sometimes secund or reduced to dense clusters), terminal spikes, or flowers solitary; bracts present or absent; bracteoles 2, sometimes becoming spinose. Calyx deeply 4-lobed; outer 2 lobes larger [anterior lobe sometimes 2-cleft]; inner 2 lobes smaller. Corolla funnel-shaped, usually large; limb 5-lobed (usually with upper lip appearing 4-lobed); lobes subequal, quincuncial in bud. Stamens [2 or] 4 and didynamous, one pair usually greatly reduced and/or sterile; anthers 2-theous; thecae ± equal in size, equally inserted, lacking basal appendages; staminodes 1 or 3, sometimes bearing very small anthers. Ovary with 2 ovules per locule; stigma 2-cleft or entire. Capsule substipitate or lacking a distinct basal stalk, subellipsoid to ovoid, 2–4-seeded; retinacula present. Seeds discoid, pubescent with appressed hygroscopic trichomes.

About 80–120 species: tropical regions of Africa and Asia, one species in tropical America; four species (one endemic) in China.

*Barleria procumbens* Loureiro (Fl. Cochinch. 2: 377. 1790) is not treated here because no material was available for study. *Barleria lupulina* Lindley is cultivated only in China and not treated here.

1a. Margin of calyx lobes (at least outer lobes) serrate or spiny.

2a. Flowers in dense, shortly pedunculate cymes from leaf axils; bracteoles linear to linear-lanceolate, 2.4–6.5 cm ..... 1. *B. cristata*

2b. Flowers in axillary and terminal dense spikes; bracteoles elliptic, ca. 1.2 cm ..... 3. *B. strigosa*

1b. Margin of calyx lobes entire (apex spine-tipped in *B. prionitis*).

3a. Plants with spines in at least some leaf axils; calyx lobes apically spinose; corolla yellowish to orange ..... 2. *B. prionitis*

3b. Plants without spines; calyx lobes not apically spinose; corolla not yellowish to orange.

4a. Flowers in dense spikes; calyx purple; narrow basal portion of corolla tube ca. 3 × as long as throat; bracteoles ca. 1/2 as long as calyx; seeds 4 per capsule ..... 3. *B. strigosa*

4b. Flowers solitary in leaf axils; calyx green; narrow basal portion of corolla tube shorter than throat; bracteoles equaling or longer than calyx; seeds 2 per capsule ..... 4. *B. integrisepala*

**1. *Barleria cristata*** Linnaeus, Sp. Pl. 2: 636. 1753.

假杜鹃 jia du juan

*Barleria cavaleriei* H. Léveillé; *B. ciliata* Roxburgh; *B. cristata* var. *mairei* H. Léveillé; *B. dichotoma* Roxburgh; *B. laciniata* Nees; *B. napalensis* Nees.

Subshrubs to 2 m tall. Stems terete, branched, covered with soft trichomes. Petiole (0–)0.3–1 cm; leaf blade elliptic to oblong to ovate, 2–10 × 1–4 cm, both surfaces villous especially along veins, secondary veins 4–7 on each side of midvein, base cuneate and decurrent onto petiole, apex acute to sometimes acuminate. Inflorescences axillary short and dense cymes, shortly pedunculate; bracts absent; bracteoles variable,

linear to linear-lanceolate, 2.4–6.5 × 0.5–1.5 cm, 3–7-veined, base cuneate, margin usually spiny but sometimes bristly pilose and becoming spinescent with age, apex acuminate. Outer calyx lobes ovate to narrowly elliptic to lanceolate, 1.2–2.5 × 0.5–1.3 cm, pilose, reticulately veined, margin spiny, apex mucronate; inner calyx lobes linear to lanceolate, 6–12 mm, 1-veined, margin scarious. Corolla purplish blue, 4.5–6.5 cm, outside pilose; tube basally narrowly cylindric then gradually widened; lobes oblong-elliptic, ca. 1.5 cm, equal. Stamens 4, didynamous; filaments pilose especially toward base; staminode 1, filament sparsely pilose. Ovary oblong-ellipsoid, glabrous; style linear, ca. 2.5 cm, glabrous; stigma slightly inflated. Capsule 1.2–1.8 cm, glabrous, 4-seeded. Seeds subglobose to ovoid, 4–5 × ca. 4 mm. Fl. May, Aug–Dec, fr. May, Oct.  $2n = 40$ .

Roadsides, slopes, along streams, in xeric vegetation; below 100–2600 m. Fujian, Guangdong, Guangxi, Guizhou, Hainan, Sichuan, Taiwan, ?Xizang, Yunnan [Bhutan, Cambodia, India, Indonesia, Laos, Myanmar, Nepal, Pakistan, Philippines, Singapore, Sri Lanka, Thailand, Vietnam].

*Barleria cristata* is a medicinal and ornamental plant.

**2. *Barleria prionitis* Linnaeus, Sp. Pl. 2: 636. 1753.**

黄花假杜鹃 huang hua jia du juan

Shrubs to 1.8 m tall with spines in lower leaf axils, branched. Stems and branches terete, smooth, lenticellate, glabrous. Petiole 1–2.5 cm; leaf blade elliptic to ovate, 4–10.5 × 1.8–5.5 cm, both surfaces pubescent when young but soon glabrescent, sparsely strigose along midvein, base attenuate and decurrent onto petiole, margin entire, apex acute. Flowers clustered in axils of upper leaves and/or bracts; bracts linear-oblong, 1.2–2.2 × 0.2–0.8 cm, margin ciliate, apex abruptly acuminate; bracteoles linear-lanceolate, to 1.4 × 0.2 cm, spine-tipped. Outer calyx lobes ovate-oblong, ca. 1.5 × 0.4 cm, apex mucronate; inner calyx lobes linear-lanceolate, ca. 1.3 × 0.2 cm, apex mucronate. Corolla yellow to orange, 2.4–4 cm, outside pilose; tube with narrow basal portion slightly shorter than throat; lobes ovate-oblong to orbicular, 8–10 × 6–7 mm, recurved. Stamens 4, longer pair ca. 1.1 cm with anthers ca. 3.2 mm, shorter pair ca. 1.5 mm with anthers ca. 1 mm. Ovary ovoid; stigma slightly enlarged, 2-cleft, exserted. Capsule ovoid, ca. 1.8 cm, contracted gradually at tip forming a beak, 2-seeded. Seeds ovate in outline, ca. 7 × 5 mm. Fl. Oct–Dec, fr. Dec–Feb.  $2n = 40$ .

Roadsides, thickets, dry places in evergreen broad-leaved forests; ca. 600 m. Yunnan [India, Laos, Myanmar, Sri Lanka, Thailand, Vietnam; Africa, Madagascar].

This species is used medicinally.

The distribution of *Barleria prionitis* is commonly given as throughout tropical Africa and Asia, where it is often introduced; its native distribution is not known with certainty.

**3. *Barleria strigosa* Willdenow, Sp. Pl. 3: 379. 1800.**

紫萼假杜鹃 zi e jia du juan

*Barleria purpureosepala* H. P. Tsui.

Subshrubs to 80 cm tall, branched. Stems subterete, coarsely fulvous strigose. Petiole 0.7–2.5 cm, brownish yellowish strigose; leaf blade elliptic to ovate, 5.5–15 × 2.2–5.5 cm, both surfaces fulvous strigose especially along veins, secondary veins ca. 7 on each side of midvein, base cuneate and decurrent onto petiole, apex acute. Flowers in axillary and terminal dense spikes to 5 cm; bracts oblong to elliptic-oblong, abaxially shortly strigose along veins, apex sharply acute; bracteoles elliptic, ca. 1.2 cm, 1-veined, margin ciliate, apex acute. Outer calyx lobes purple, ovate, ca. 3.2 × 1.8 cm, base rounded, margin subentire to dentate, apex acute; inner calyx lobes yellowish brown, lanceolate, ca. 1.5 × 0.2 cm, both surfaces strigose, apex acute. Corolla purplish red, 5–6 cm; tube basally cylindric for ca. 3.7 cm, throat ca. 1.2 cm; lobes ovate-oblong, ca. 2 × 1–1.5 cm, subequal. Stamens 4; filaments basally pilose, longer pair ca. 1.3 cm with anthers ca. 5 mm, shorter pair ca. 3 mm with anthers ca. 1.5 mm; staminode 1. Ovary ovoid, ca. 3 mm; style ca. 2.5 cm. Capsule ellipsoid, 1.4–1.8 × ca. 0.5 cm, glabrous, shining, 4-seeded. Fl. Nov, fr. Feb.  $2n = 40$ .

Dense forests; ca. 900 m. Yunnan [Bhutan, Cambodia, India, Indonesia, Malaysia, Myanmar, Nepal, Sri Lanka, Thailand, Vietnam].

**4. *Barleria integriseppala* H. P. Tsui, Acta Bot. Yunnan. 12: 269. 1990.**

全缘萼假杜鹃 quan yuan e jia du juan

Shrubs to 1 m tall, evergreen. Stems sparsely lenticellate, strigose, soon glabrescent. Leaves clustered at shoot apices; petiole 3–5 cm, strigose; leaf blade ovate, narrowly ovate, or lanceolate, 3–4.5 × 0.7–1.8 cm, both surfaces pilose and strigose along veins, secondary veins 4–6 on each side of midvein, base cuneate and decurrent onto petiole, apex acute. Flowers axillary, solitary; bracteoles linear, ca. 14 × 1 mm, sparsely pilose. Pedicel short. Outer calyx lobes elliptic, ca. 1.3 × 0.7 cm, outside sparsely strigose, inside pilose, base cuneate, margin ciliate, apex acute; inner calyx lobes lanceolate, ca. 5 × 1 mm, margin ciliate, apex acuminate. Corolla bluish purple, funnel-shaped, ca. 3.5 cm; tube basally cylindric for ca. 7 mm, throat ca. 1.5 cm; lobes suborbicular, ca. 1.4 × 1.4 cm, subequal. Stamens 4; filaments basally pilose, longer pair ca. 1.7 cm with anthers ca. 4 mm, shorter pair ca. 4 mm with anthers ca. 1.5 mm; staminode 1, filament ca. 4 mm. Ovary subellipsoid, ca. 4 mm, glabrous; stigma enlarged. Capsule ellipsoid, ca. 1.7 cm, contracted at tip forming a beak, 4-seeded. Seeds ovate in outline, ca. 5 × 5 mm. Fl. Aug–Sep, fr. Nov–Dec.

• Thickets along streams; 1900–2000 m. Sichuan (Muli).

**30. LEPIDAGATHIS Willdenow, Sp. Pl. 3: 400. 1800.**

鳞花草属 lin hua cao shu

Hu Jiaqi (胡嘉琪 Hu Chia-chi), Deng Yunfei (邓云飞); Thomas F. Daniel

Herbs [or shrubs], perennial, with cystoliths, often anisophyllous. Leaves opposite; leaf blade margin entire or crenate-serrate. Inflorescences dense spikes or cymes condensed into globose heads, sometimes clustered; bracts and bracteoles present. Calyx 5-lobed; lobes heteromorphic; posterior lobe usually largest; lateral 2 lobes smallest; anterior 2 lobes usually connate to a greater degree than other lobes. Corolla small; tube usually expanded into a distinct throat near middle; limb 2-lipped; lower lip 3-lobed, patent, usually spotted, lobes subequal or middle one slightly larger; upper lip erect or slightly patent, entire to 2-lobed; lobes quincuncial in bud. Stamens 4, didynamous [or with one pair reduced or absent], usually included in corolla tube; filaments short; anthers 2-theous [or with one pair of anthers sometimes 1-theous]; thecae oblong, parallel or one lower and somewhat divergent,

base muticous or spurred. Ovary with 2 ovules per locule; stigma subcapitate, entire or slightly 2-cleft. Capsule subellipsoid to oblong to linear-conical, lacking a stalk, to 4-seeded; retinacula present. Seeds discoid, pubescent with hygroscopic trichomes.

About 100 species: tropical to subtropical regions worldwide (mostly paleotropical); seven species (three endemic) in China.

- 1a. Inflorescences globose or ovoid heads to 1 cm; leaves sessile to subsessile; leaf blade usually less than 2 cm, base truncate to subcordate ..... 6. *L. secunda*
- 1b. Inflorescences  $\pm$  elongate and secund spikes to 5.5 cm; leaves usually petiolate; leaf blade to 14.5 cm, base cuneate to attenuate and usually decurrent onto petiole (in *L. inaequalis* abruptly truncate to rounded and decurrent onto petiole).
  - 2a. Leaf blade linear to linear-lanceolate, (4.6–)6.5–16  $\times$  as long as wide ..... 7. *L. stenophylla*
  - 2b. Leaf blade ovate to elliptic to subcircular to obovate, 1.6–4.5(–5.6)  $\times$  as long as wide (in *L. fasciculata*, sometimes only distalmost 1 or 2 nodes with leaf blade linear to linear-lanceolate and 6–9.5  $\times$  as long as wide and others ovate to elliptic and 1.7–3  $\times$  as long as wide).
    - 3a. Anterior calyx lobes connate at base for 10%–25% of their length; bracts (1 or)3(or 5)-veined.
      - 4a. Corolla pinkish; bracts broadly ovate to ovate-oblong, 2.5–4.4 mm wide; posterior calyx lobe 3-veined; distinct segments of anterior calyx lobe oblanceolate to linear, 6–6.5 mm; capsule 4.5–5 mm, pubescent distally ..... 1. *L. fasciculata*
      - 4b. Corolla white; bracts narrowly lanceolate, 1–1.5 mm wide; posterior calyx lobe 5-veined; distinct segments of anterior calyx lobe narrowly lanceolate, 9–10 mm; capsule 6–6.5 mm, pubescent throughout ..... 3. *L. hainanensis*
    - 3b. Anterior calyx lobes connate at base for 30%–60% of their length; bracts 1(or 3)-veined.
      - 5a. Leaf blade 1–4(–6) cm, 1.6–2  $\times$  as long as wide, base abruptly rounded to truncate and decurrent onto petiole; plants decumbent, not conspicuously woody at base ..... 4. *L. inaequalis*
      - 5b. Leaf blade to 14.5 cm, usually more than 2  $\times$  as long as wide, base cuneate to long attenuate and decurrent onto petiole; plants not decumbent, conspicuously woody at base.
        - 6a. Calyx 5–6 mm ..... 2. *L. formosensis*
        - 6b. Calyx 8–10 mm ..... 5. *L. incurva*

**1. *Lepidagathis fasciculata*** (Retzius) Nees in Wallich, Pl. Asiat. Rar. 3: 95. 1832.

齿叶鳞花草 chi ye lin hua cao

*Ruellia fasciculata* Retzius, Observ. Bot. 4: 28. 1786.

Herbs to 40 cm tall, erect to spreading, isophyllous to anisophyllous. Stems 4-angled to 4-angled and sulcate, pubescent or glabrate. Petiole 1.5–3.5 cm; leaf blade ovate to elliptic (distalmost 1 or 2 nodes with leaves sometimes linear to linear-lanceolate), 1.3–12.5  $\times$  0.7–5(–7) cm, 1.7–3 (6–9.5 in distalmost linear leaves when present)  $\times$  as long as wide, both surfaces pubescent but trichomes sometimes sparse or restricted to midvein, secondary veins 4 or 8 or more on each side of midvein, base attenuate and decurrent onto petiole, margin entire to crenate-serrate, apex acuminate. Spikes elongate, 2–4 cm; bracts broadly ovate to ovate-oblong, 7–10  $\times$  2.5–4.4 mm, abaxially pubescent, 1- or 3-veined, veins prominent, margin ciliate with gland-tipped and non-glandular trichomes, apex aristate; bracteoles ovate-elliptic, abaxially pubescent, margin ciliate with glandular and non-glandular trichomes. Calyx ca. 8 mm, pubescent with gland-tipped and non-glandular trichomes; posterior lobe narrowly elliptic to oblong-lanceolate, ca. 8  $\times$  1.5–1.7 mm, 3-veined; lateral lobes lanceolate, ca. 6.5 mm; anterior lobes connate at base for 17%–25% of their length, distinct segments oblanceolate to linear and 6–6.5 mm. Corolla pinkish, 0.8–1.5 cm, outside pubescent; lower lip 2.5–4 mm, lobes ca. 1  $\times$  0.7–1 mm. Capsule 4.5–5 mm, distally pubescent. Seeds subcircular in outline, 0.8–1.2 mm in diam. Fl. Nov–Mar, fr. Jan–May. *2n* = 20.

Thickets, roadsides, streamsides. Hainan, Yunnan [Bangladesh, Laos, Malaysia, Myanmar, N Thailand].

**2. *Lepidagathis formosensis*** C. B. Clarke ex Hayata, J. Coll. Sci. Imp. Univ. Tokyo 30(1): 213. 1911.

台湾鳞花草 tai wan lin hua cao

Herbs to 45(–90) cm tall, suffrutescent, erect, isophyllous to conspicuously anisophyllous. Stems 4-angled to 4-angled and sulcate, glabrous or slightly pubescent. Petiole 0.5–2 cm; leaf blade ovate to narrowly elliptic to broadly elliptic to obovate, 2.5–14.5  $\times$  (0.8–)1–6 cm, 2–3.8(–5.6)  $\times$  as long as wide, abaxially sparsely pubescent along veins, adaxially glabrous, secondary veins 4–7 on each side of midvein, base long attenuate and decurrent onto petiole, margin entire to sinuate, apex acuminate. Spikes elongate, 1–5.5 cm, secund; bracts ovate to lanceolate, 3.5–5  $\times$  1–2 mm, 1(or 3)-veined, abaxially and marginally pubescent with non-glandular and sometimes gland-tipped trichomes, apex aristate; bracteoles similar to bracts or narrower. Calyx 5–6 mm, pubescent with non-glandular and sometimes gland-tipped trichomes; posterior lobe ovate to oblong-lanceolate, 5–5.9  $\times$  1.2–1.8 mm, 3-veined; lateral lobes lanceolate to oblong-lanceolate, 4.5–5.8  $\times$  0.7–0.9 mm; anterior lobes connate at base for 50%–60% of their length, distinct segments lanceolate-subulate and 2.5–3 mm. Corolla white with purple markings on limb, 6.5–9 mm, outside pubescent; lower lip 2.3–3.1 mm, lobes 1–2  $\times$  1–2 mm. Capsule 5–7 mm, distally pubescent. Seeds subcircular to broadly ovate in outline, 1.3–1.8 mm in diam. Fl. Sep–May, fr. Jan–Apr.

• Secondary evergreen broad-leaved forests, along streams, ditches, slopes; 100–2300 m. Guangdong, Taiwan.

*Lepidagathis formosensis* is similar to *L. incurva*, if it is indeed distinct. On most plants from Taiwan the bracts and calyx are pubescent with only non-glandular trichomes. On some, however (e.g., *B. Bar-*

*tholomew & D. E. Boufford 6193* at CAS), conspicuous gland-tipped trichomes are present on these structures. In other respects, such plants agree with non-glandular specimens of *L. formosensis*.

**3. *Lepidagathis hainanensis*** H. S. Lo, Fl. Hainan. 3: 598. 1974.

海南鳞花草 hai nan lin hua cao

Herbs to 30 cm tall, erect, anisophyllous. Stems 4-angled, subglabrous to slightly pubescent. Petiole (0–)0.5–1.5 cm; leaf blade ovate to elliptic, 1–12 × 0.5–3.5 cm, 1.8–3.5 × as long as wide, abaxial surface sparsely and inconspicuously puberulent especially along midvein, adaxial surface glabrous, secondary veins 4–6 on each side of midvein, base narrowly cuneate and decurrent onto petiole, margin entire to irregularly subsinuate, apex obtuse to rounded to acute. Spikes elongate, 2–6 cm, secund; bracts narrowly lanceolate, 8–10 × 1–1.5 mm, abaxially and marginally pubescent with gland-tipped and non-glandular trichomes, 3(or 5)-veined, apex aristate; bracteoles similar to bracts. Calyx 0.9–1.2 cm, pubescent with gland-tipped and non-glandular trichomes; posterior lobe lanceolate, 8.5–11 × 1.5–2 mm, 5-veined; lateral lobes lanceolate-subulate, ca. 7 × 1 mm; anterior lobes connate at base for ca. 10% of their length, distinct segments narrowly lanceolate and 9–10 mm. Corolla white, 9–10 mm, outside pubescent; lower lip not seen. Capsule 6–6.5 mm, pubescent throughout. Seeds not seen. Fl. Feb–Apr, fr. Feb–Apr.

• Forests. Guangxi, Hainan.

**4. *Lepidagathis inaequalis*** C. B. Clarke ex Elmer, Leaflet. Philipp. Bot. 5: 1695. 1913.

卵叶鳞花草 luan ye lin hua cao

Herbs 10–20 cm tall, decumbent, not conspicuously woody, isophyllous. Stems 4-angled, sulcate, glabrous or 2-fariously pubescent. Petiole 3–15 mm; leaf blade broadly ovate to subcircular, 1–4(–6) × 0.65–2.5(–3) cm, 1.6–2 × as long as wide, sparsely pubescent especially along midvein, secondary veins 3–5 on each side of midvein, base abruptly rounded to truncate and decurrent onto petiole, margin entire or shallowly sinuate, apex acute to acuminate. Spikes elongate, 1.2–2 cm, secund; bracts lanceolate, 3–5 × 1–1.4 mm, abaxially and marginally pubescent with gland-tipped trichomes (glands sometimes restricted to distal portion of margin), 1(or 3)-veined, apex aristate; bracteoles similar to bracts or smaller. Calyx ca. 6 mm, pubescent with gland-tipped and non-glandular trichomes; posterior lobe oblong-lanceolate, ca. 6.2 × 1.1 mm, 3-veined; lateral lobes lanceolate, ca. 5.8 × 0.7 mm; anterior lobes connate at base for ca. 50% of their length, distinct segments lanceolate and ca. 3.2 mm. Corolla white, ca. 8 mm, outside pubescent; lower lip ca. 3 mm, lobes ca. 2 × 2 mm. Capsule ca. 5 mm, distally pubescent. Seeds not seen. Fl. and fr. Sep.

Evergreen broad-leaved forests, shaded roadsides; below 100 m. Taiwan [Japan, Philippines].

Corollas of *Lepidagathis inaequalis* have been reported as 4–5 mm and glabrous outside (e.g., C. F. Hsieh & T. C. Huang, Fl. Taiwan, ed. 2, 4: 671. 1998). Those of *Kao 704* (CAS) are ca. 8 mm and pubescent outside.

*Lepidagathis inaequalis* is similar to *L. formosensis*, if they are indeed distinct. Some plants from Taiwan with glandular bracts and calyces (e.g., *Hsieh 787* at CAS) appear somewhat intermediate between them in leaf shape. Plants treated as *L. inaequalis* have glandular bracts and calyces, decumbent stems, and usually smaller leaf blades that are broadly ovate to subcircular and abruptly constricted basally (truncate to rounded). In *L. formosensis*, bracts and calyces are often non-glandular, stems are erect, and leaf blades are usually larger, ovate to elliptic to obovate, and gradually attenuate-tapered at the base. Among the limited specimens studied, those of *L. inaequalis* are isophyllous, whereas most of those of *L. formosensis* are anisophyllous.

**5. *Lepidagathis incurva*** Buchanan-Hamilton ex D. Don, Prodr. Fl. Nepal. 119. 1825.

鳞花草 lin hua cao

*Lepidagathis hyalina* Nees.

Herbs 30–100 cm tall, base often conspicuously woody, often ± anisophyllous. Stems 4-angled, sulcate, pubescent or soon glabrescent. Petiole 0.5–3.5 cm; leaf blade ovate to elliptic to narrowly elliptic, 2.5–11 × 1–4.5 cm, 1.7–4.5 × as long as wide, both surfaces pubescent but soon glabrescent with few trichomes or sparsely pubescent along veins, secondary veins (4–)7–9 on each side of midvein, base cuneate and conspicuously decurrent onto petiole, margin entire and slightly sinuate, apex acute to shortly acuminate. Spikes elongate, (0.5–)1–3.8 cm, secund; bracts oblong-lanceolate, 6–10 × 1.5–2 mm, abaxially and marginally pubescent with gland-tipped (sometimes absent) and non-glandular trichomes, 1-veined, apex long acuminate; bracteoles similar to bracts except usually smaller. Calyx 8–10 mm, pubescent with gland-tipped (sometimes absent) and non-glandular trichomes or glabrescent; posterior lobe oblong-lanceolate, 8–9 × 1.5–1.7 mm, 3-veined; lateral lobes lanceolate, 6–7.5 × 0.7–0.8 mm; anterior lobes connate at base for 30%–55% of their length, distinct segments lanceolate and 4.8–6 mm. Corolla white streaked with purple, 8–10 mm, outside sparsely pubescent; lower lip 2.5–3 mm, lobes 1.5–3 × 1.3–1.8 mm. Stamens not seen. Ovary not seen; style not seen; stigma not seen. Capsule 5–6 mm, distally pubescent. Seeds subcircular in outline, 1.5–1.8 mm in diam. Fl. and fr. Oct–Mar.  $2n = 20, 44, 84$ .

Grasslands, thickets, roadsides, hedgerows, streamsides; 100–2200 m. Guangdong, Guangxi, Hainan, Yunnan [Bangladesh, India, Myanmar, Thailand, Vietnam].

This species is used medicinally.

**6. *Lepidagathis secunda*** Nees in A. Candolle, Prodr. 11: 259. 1847.

小琉球鳞花草 xiao liu qiu lin hua cao

*Ruellia secunda* Blanco, Fl. Filip. 495. 1837, not Vahl (1794).

Herbs to 30 cm tall, erect or spreading. Stems 4-angled, subglabrous. Leaves sessile to subsessile; leaf blade ovate to ovate-lanceolate, 1.5–2 × 0.7–1 cm, both surfaces pubescent, base truncate to subcordate, margin entire, apex acute to shortly acuminate. Spikes globose to ovoid, to 1 cm; bracts oblong-lanceolate. Corolla to 6 mm, outside pubescent. Stamens included

in corolla tube; thecae ca. 1 mm, pilose at tip. Ovary oblong; style sparingly hirsute. Capsule ca. 4 mm. Seeds subcircular in outline.

Taiwan [Philippines].

No specimens of *Lepidagathis secunda* have been seen, and published descriptions are inadequate to evaluate the status of either this species or its occurrence in Taiwan. Information above is based entirely on that provided by C. F. Hsieh and T. C. Huang (Fl. Taiwan, ed. 2, 4: 673. 1998).

**7. *Lepidagathis stenophylla*** C. B. Clarke ex Hayata, J. Coll. Sci. Imp. Univ. Tokyo 30(1): 214. 1911.

柳叶鳞花草 liu ye lin hua cao

Herbs to 40 cm tall, suffrutescent, often  $\pm$  anisophyllous. Stems 4-angled to 4-angled and sulcate, subglabrous or evenly to  $\pm$  bifariously pubescent. Petiole (1–)5–12 mm; leaf blade

linear to linear-lanceolate, 3.5–11  $\times$  0.3–1.9 cm, (4.6–)6.5–16  $\times$  as long as wide, both surfaces subglabrous or pubescent, secondary veins 4 or 5 on each side of midvein, base narrowed and decurrent onto petiole, margin shallowly sinuate, apex acute to acuminate. Spikes elongate, 1.3–3.8 cm, secund; bracts lanceolate to lanceolate-ovate, ca. 5  $\times$  1–1.5 mm, abaxially and marginally pubescent with non-glandular trichomes, 1-veined, apex aristate; bracteoles similar to bracts except usually smaller and narrower. Calyx 5.5–8.2 mm, pubescent with non-glandular trichomes; posterior lobe ovate to oblong-lanceolate, 5–7.5  $\times$  1.1–1.3 mm, 3-veined; lateral lobes lanceolate, 4.5–5.7  $\times$  0.7–0.8 mm; anterior lobes connate at base for 20%–55% of their length, distinct segments narrowly lanceolate and 3–6 mm. Corolla white, ca. 5 mm, outside pubescent; lower lip 2–2.3 mm, lobes 1.5–1.6  $\times$  0.6–0.8 mm. Capsule 4.5–5.5 mm, pubescent  $\pm$  throughout or only distally. Seeds subcircular in outline, 1–1.8 mm in diam. Fl. and fr. Dec.

• Forest trails; 200–400 m. Hong Kong, Taiwan.

### 31. *CHROESTHES* Benoist, Bull. Mus. Natl. Hist. Nat. 33: 107. 1927.

色萼花属 se e hua shu

Hu Jiaqi (胡嘉琪 Hu Chia-chi), Deng Yunfei (邓云飞); Thomas F. Daniel

Shrubs, subisophyllous or anisophyllous. Leaves opposite, petiolate; leaf blade margin entire. Inflorescences terminal thyrses; bracts and bracteoles greenish. Calyx unequally 5-lobed; posterior lobe largest, 2 lateral lobes smaller than 2 anterior lobes. Corolla tube basally cylindric and expanded distally into a throat; limb 2-lipped, lower lip 3-lobed, upper lip 2-lobed; lobes quincuncial in bud. Stamens 4, not connate, posterior pair shorter than anterior pair, inserted at base of throat; anthers 2-theccous; thecae parallel, inserted at different heights, dorsally pubescent, base spurred. Ovary with 2 ovules per locule; style basally sparsely pubescent. Capsule stipe absent or barely present; retinacula present. Seeds compressed, brownish pubescent.

Three species: China, Laos, Malaysia, Myanmar, Thailand, Vietnam; one species in China.

**1. *Chroesthes lanceolata*** (T. Anderson) B. Hansen, Nordic J. Bot. 3: 209. 1983.

色萼花 se e hua

*Asystasia lanceolata* T. Anderson, J. Linn. Soc., Bot. 9: 524. 1867; *A. kerrii* Craib; *A. silvicola* W. W. Smith; *Chroesthes pubiflora* Benoist; *C. racemiflora* Bremekamp; *C. racemiflora* var. *glabrior* Bremekamp; *C. silvicola* (W. W. Smith) E. Hossain.

Shrubs 0.5–3 m tall, anisophyllous. Stems terete, slender, rarely branched, glabrous. Petiole 1–2.5 cm; leaf blade elliptic to oblanceolate to lanceolate, 10–16  $\times$  3–7 cm, both surfaces glabrous, secondary veins 6–9 on each side of midvein, base cuneate, margin entire or subsinuate, apex acuminate. Thyrses 3–7 cm; cymes sessile, 1–3-flowered; bracts elliptic to broadly

lanceolate, 3–9  $\times$  1–3 mm, gland-tipped pubescent, apex acute; bracteoles narrowly elliptic to broadly lanceolate, 4–9  $\times$  0.7–1.2 mm. Pedicel 1–5 mm. Calyx 1–1.6 cm, outside gland-tipped pubescent; posterior lobe lanceolate, ovate, or subelliptic; lateral lobes linear-lanceolate; anterior lobes connate to 2/3 their length. Corolla white with pink or purple spots, ca. 2.5 cm, outside pubescent; tube basal portion ca. 9 mm, throat ca. 1.5 cm; lower lip 3-lobed; upper lip 2-lobed. Stamens included in throat; filaments 1–1.2 cm, glabrous; anther thecae 2.1–2.3 mm, pubescent at apex and along sides, basal spur pointed. Ovary apex pubescent; style ca. 2.5 cm. Capsule subellipsoid to obovoid, 1.2–1.6 cm, glabrous or only at apex pubescent, 4-seeded. Seeds subcircular in outline. Fl. Feb–Mar, fr. May–Jul.

Forests; (200–)800–1400 m. Guangxi, S Yunnan [Laos, Myanmar, Thailand, Vietnam].

### 32. *GYMNOSTACHYUM* Nees in Wallich, Pl. Asiat. Rar. 3: 76, 106. 1832.

裸柱草属 luo zhu cao shu

Hu Jiaqi (胡嘉琪 Hu Chia-chi), Deng Yunfei (邓云飞); Thomas F. Daniel

*Cryptophragmium* Nees; *Sarcanthera* Rafinesque.

Herbs, perennial [or shrubs], with cystoliths. Leaves cauline or subradical, opposite; leaf blade margin usually entire. Inflorescences axillary or terminal, spikes, racemes, or panicles, often secund; bracts and bracteoles shorter than calyx. Calyx 5-lobed nearly to base; lobes subequal. Corolla tube longer than limb, basal portion narrowly cylindric,  $\pm$  expanded distally into a throat; limb 2-lipped, lower lip 3-lobed, upper lip emarginate to 2-lobed; lobes ascending cochlear in bud. Stamens 2, included in or slightly

exserted from corolla tube; anther thecae 2, equal or subequal in size, parallel, one or both mucronate at base; staminodes absent. Ovary with 3 to many ovules per locule; stigma 2-lobed, lobes compressed. Capsule without a stipe, linear, 4-angled, many seeded; retinacula present. Seeds compressed, covered with hygroscopic trichomes.

About 30 species: tropical Asia; three species (two endemic) in China.

- 1a. Stems very short; leaves in a basal rosette ..... 1. *G. subrosulatum*  
 1b. Stems elongate; leaves cauline.  
     2a. Inflorescences axillary ..... 2. *G. listeri*  
     2b. Inflorescences terminal ..... 3. *G. sinense*

**1. *Gymnostachyum subrosulatum*** H. S. Lo, Acta Phytotax. Sin. 17(4): 86. 1979.

矮裸柱草 ai luo zhu cao

*Gymnostachyum kwangsiense* H. S. Lo.

Herbs 20–40 cm tall. Stems short, hirsute. Leaves in a basal rosette; petiole 2–9(–14) cm; leaf blade suborbicular to broadly ovate, 5–16 × 3.5–11 cm, papery, abaxially subglabrous but midvein and secondary veins hirsute, adaxially slightly scabrous, secondary veins 7–9 on each side of midvein, base slightly cordate to rounded, margin entire or slightly sinuate, apex rounded to acute. Thyrses 10–35 cm, with 1–4 flowers per cyme; peduncle 8–19 cm; bracts subulate, ca. 2.5 mm, pilose, apex acute; bracteoles similar to bracts. Calyx 2.5–3 mm; lobes subulate, pilose. Corolla ca. 1.5 cm; lower lip patent, 3-lobed, lobes oblong-ovate and ca. 3 × 2 mm; upper lip triangular, ca. 5 mm, erect, 2-dentate. Stamens exserted; filaments 7–8 mm; anther thecae linear, parallel. Ovary 2-locular, with 4 ovules per locule; style 1.3–1.9 cm. Capsule linear, 1.3–1.6 cm, 8-seeded. Seeds ovate in outline, ca. 1 × 0.8 mm. Fl. Apr–May, fr. Jun–Sep.

• Limestone hills; 200–600 m. Guangxi.

**2. *Gymnostachyum listeri*** Prain, J. Asiatic Soc. Bengal, Pt. 2, Nat. Hist. 69: 171. 1900.

云南裸柱草 yun nan luo zhu cao

*Cryptophragmium tonkinense* Benoist; *Parajusticia petelotii* Benoist.

Herbs to 50 cm tall, caulescent, isophyllous. Stems branched, 4-angled, pubescent. Leaves cauline; petiole 5–12 mm, pubescent; leaf blade elliptic to obovate-elliptic, (4.5–)6–13(–17) × 2.1–5.5 cm, abaxially white pubescent, adaxially glabrous except for trichomes along midvein, secondary veins 11–14 on each side of midvein and abaxially prominently curved, tertiary veins inconspicuous, base asymmetric or symmetric and ± decurrent onto petiole, margin entire or obscurely sinuate, apex acute to acuminate. Spikes 2–6 cm, secund; peduncle 0.5–

1.5 cm; rachis pubescent and gland-tipped pilose; bracts linear, ca. 3 × 0.3 mm, pubescent; bracteoles linear-triangular, ca. 1.5 × 0.5 mm, pubescent. Calyx 0.1–1.1 cm; lobes linear, 8–10 × ca. 0.5 mm, outside pubescent, inside glabrous, margin gland-tipped pilose. Corolla purple, 1.6–2 cm, pubescent; tube basally cylindric and ca. 2.5 cm wide for ca. 8 mm, throat abruptly bending and widening to 5 mm; lower lip 4–5 mm, 3-lobed, lobes oblong and ca. 3 × 1.5 mm; upper lip 3–4 mm, 2-lobed, lobes broadly ovate and ca. 2 × 2 mm. Staminal filaments ca. 4 mm, glabrous; anther thecae oblong, ca. 5 × 1 mm, pilose, spurred at base. Ovary ca. 3 × 1 mm, glabrous; style ca. 1.5 cm, villous. Capsule not seen. Fl. Apr–May.

Limestone hills; 200–600 m. Guangxi, Yunnan [Bangladesh, Vietnam].

**3. *Gymnostachyum sinense*** (H. S. Lo) H. Chu, Bull. Bot. Res., Harbin 11(1): 48. 1991.

华裸柱草 hua luo zhu cao

*Andrographis sinensis* H. S. Lo, Bull. Bot. Res., Harbin 1(4): 103. 1981.

Herbs to 1 m tall. Stems purplish black, terete, glabrous; young shoots 4-angled, pubescent at nodes. Petiole 2–4 mm; leaf blade ovate to broadly ovate, 1.5–4 × 1–1.8 cm, thickly paper, both surfaces glabrous, secondary veins ca. 6 on each side of midvein, base cuneate, margin entire or subentire, apex acute to sometimes caudate. Spikes terminal, few flowered; peduncle ca. 1 cm, subglabrous; bracts linear to linear-lanceolate, 1.5–2 mm; bracteoles similar to bracts. Calyx ca. 7 mm, glabrous; lobes lanceolate-linear, apex acuminate. Corolla white, ca. 1 cm; lower lip ca. 4 mm, 3-lobed, lobes ovate and ca. 0.5 × 0.5 mm; upper lip subtriangular, ca. 3.5 mm, 2-lobed. Staminal filaments ca. 2.5 mm, glabrous; anther thecae linear, ca. 3 mm, spurred at base. Ovary ellipsoid, ca. 3 mm, glabrous, ovules 5 or 6 per locule; style ca. 7 mm. Capsule narrowly cylindric, 1–1.5 mm, glabrous. Seeds subglobose, ca. 1 × 1 mm, pubescent. Fl. Aug.

• Limestone hills. Guangxi.

### 33. *ANDROGRAPHIS* Wallich ex Nees in Wallich, Pl. Asiat. Rar. 3: 77, 116. 1832.

穿心莲属 chuan xin lian shu

Hu Jiaqi (胡嘉琪 Hu Chia-chi), Deng Yunfei (邓云飞); Thomas F. Daniel

*Haplanthoides* H. W. Li; *Haplanthus* Nees.

Herbs or subshrubs, with cystoliths. Leaf blade margin entire. Inflorescences terminal or axillary, panicles, racemes, or sometimes spikes or dense clusters; bracts present; bracteoles small [or absent]. Calyx deeply 5-lobed; lobes narrow, equal or subequal. Corolla tubular to funnelform at base; limb 2-lipped; lower lip 3-lobed; upper lip entire or 2-lobed; lobes ascending cochlear in bud.

Stamens 2, exserted from or included in corolla tube; filaments sometimes pubescent; anthers 2-theous; thecae parallel, equal or subequal, base mucous and conspicuously pubescent. Capsule linear-oblong or ellipsoid, compressed perpendicular to septum, [6–]12–20-seeded; retinacula present. Seeds subglobose,  $\pm$  blocky, or  $\pm$  compressed, surfaces smooth or ornamented, lacking trichomes.

About 20 species: tropical and subtropical Asia; two species (one introduced) in China.

- 1a. Leaf blade lanceolate to oblong-lanceolate; corolla deeply and prominently 2-lipped, lips divergent (i.e., upper lip  $\pm$  perpendicular or oblique to tube and lower lip); stamens exserted from corolla tube ..... 1. *A. paniculata*  
 1b. Leaf blade ovate; corolla shallowly and inconspicuously 2-lipped, lips not divergent (i.e., lips  $\pm$  parallel to one another); stamens included in corolla tube ..... 2. *A. laxiflora*

**1. *Andrographis paniculata*** (N. L. Burman) Wallich ex Nees in Wallich, Pl. Asiat. Rar. 3: 116. 1832.

穿心莲 chuan xin lian

*Justicia paniculata* N. L. Burman, Fl. Indica, 9. 1768.

Herbs to 50 cm tall, annual, much branched. Stems 4-angled, glabrous. Petiole 0.3–1 cm; leaf blade ovate-lanceolate, lanceolate, or narrowly elliptic, 1.5–7  $\times$  1–2.5 cm, both surfaces glabrous, abaxially pale green, adaxially green, secondary veins 3–5 on each side of midvein, base attenuate and decurrent onto petiole, margin entire, apex acute to shortly acuminate. Inflorescences terminal, leafy panicles of secund racemes; rachis glabrous to sparsely pubescent; bracts triangular to subulate, 1–1.5 mm; bracteoles linear to subulate, 1–1.5 mm. Pedicel 2–9 mm, sparsely pubescent with gland-tipped and non-glandular trichomes (gland-tipped pubescent). Calyx 2.5–3 mm, outside glabrous or gland-tipped pubescent, lobes subulate. Corolla white, 0.9–1.5 cm, outside gland-tipped pubescent; tube basally funnelform for 4–8 mm; lower lip with purple dots, 5–7 mm, erect, lobes ca. 3 mm; upper lip 5–7 mm, reflexed, 2-lobed, lobes ca. 1 mm. Stamens exserted from corolla tube. Style 6–10 mm, sparsely pilose toward base. Capsule ellipsoid-compressed, 1.5–2  $\times$  0.3–0.4 cm, glabrous or sparsely pubescent with gland-tipped trichomes, ca. 12-seeded. Seeds ca. 2  $\times$  1.5 mm, rugose. Fl. and fr. throughout year.  $2n = 50$ .

Cultivated or naturalized in Anhui, Fujian, Guangdong, Guangxi, Hainan, Hubei, Hunan, Jiangsu, Jiangxi, Yunnan, and Zhejiang [native to India and Sri Lanka; cultivated or naturalized in Cambodia, Indonesia, Laos, Malaysia, Myanmar, Thailand, Vietnam, and Caribbean].

This species is used medicinally.

**2. *Andrographis laxiflora*** (Blume) Lindau in Engler & Prantl, Nat. Pflanzenfam. 4(3b): 323. 1895.

疏花穿心莲 shu hua chuan xin lian

*Justicia laxiflora* Blume, Bijdr. 789. 1826; *Andrographis glomeruliflora* Bremekamp; *A. laxiflora* var. *glomeruliflora* (Bremekamp) H. Zhu; *A. monglunensis* Hung T. Chang & H. Zhu; *A. tenera* (Nees) Kuntze; *A. tenuiflora* T. Anderson, nom. illeg. superfl.; *Haplanthoides yunnanensis* H. W. Li; *Haplanthus tener* Nees.

Herbs to 50 cm tall, isophyllous or anisophyllous. Stems erect or procumbent, 4-angled, glabrous or pubescent. Petiole 3–10 mm; leaf blade ovate, 1.5–9  $\times$  1.5–3(–5.5) cm, both surfaces glabrous, secondary veins 5 or 6 pairs on each side of midvein, base slightly attenuate and decurrent onto petiole, margin entire, apex acuminate to shortly acuminate. Inflorescences axillary or terminal, racemes or panicles of racemes, these sometimes reduced and flowers appearing as clusters in leaf axils or at ends of long peduncles; rachis glabrous or pubescent (trichomes non-gland-tipped or gland-tipped); bracts linear, subulate, or lanceolate, 1–3 mm, glabrous or pubescent; bracteoles subulate, glabrous or pubescent. Pedicel 0.5–2 mm, glabrous or pubescent. Calyx 2–4 mm, outside glabrous or pubescent, lobes subulate. Corolla white with purplish or pinkish coloration on lips, 0.8–1.2 cm, outside pubescent with gland-tipped trichomes; tube 6–9 mm, base curved, dorsally  $\pm$  gibbous; lower lip 1.5–4 mm, lobes 0.5–2 mm; upper lip 1.5–4 mm, erect ( $\pm$  parallel to lower lip), entire to 2-lobed. Stamens included in corolla tube. Capsule linear-cylindric, 10–20  $\times$  ca. 2 mm, glabrous or pubescent with gland-tipped trichomes, 16–20-seeded. Seeds ca. 1  $\times$  0.7 mm, rugose. Fl. Aug–Nov, fr. Nov–Mar.

Thickets, bamboo forests; 200–1500 m. Guangxi, Guizhou, Hainan, Yunnan [Cambodia, India, Indonesia, Laos, Malaysia, Myanmar, Thailand, Vietnam].

Specimens misidentified as *Gymnostachyum sanguinolentum* (Vahl) T. Anderson (C. Y. Wu, Index Fl. Yunnan. 2: 1676. 1984; C. C. Hu, FRPS 70: 75. 2002) belong here.

Variation is evident in the pubescence of rachises, pedicels, bracts, bracteoles, and calyces among plants of *Andrographis laxiflora*. These structures may be glabrous, have non-glandular trichomes only, have gland-tipped trichomes only, or have a mixture of gland-tipped and non-glandular trichomes. Capsule may be glabrous or pubescent with gland-tipped trichomes only. Plants with gland-tipped trichomes on the calyces and capsules have been treated as *A. laxiflora* var. *glomeruliflora* (C. C. Hu, FRPS 70: 205. 2002). Because varying degrees of pubescence are evident on calyces and capsules among specimens from within and outside of China, and because these same differences are not taxonomically recognized for plants of *A. paniculata* that show the very same variations, var. *glomeruliflora* is not recognized here (in keeping with B. Hansen, Nordic J. Bot. 5: 353–356. 1985, who did not recognize it as distinct).

### 34. PHLOGACANTHUS Nees in Wallich, Pl. Asiat. Rar. 3: 76, 99. 1832.

火焰花属 huó yán huā shù

Hu Jiaqi (胡嘉琪 Hu Chia-chi), Deng Yunfei (邓云飞); Thomas F. Daniel

Herbs, shrubs, or small trees, with cystoliths. Leaves opposite; leaf blade large, margin entire or obscurely crenate. Inflores-

cences in terminal thyrses or axillary cymes, pedunculate; bracts small; bracteoles small or absent. Calyx deeply 5-lobed; lobes equal to unequal. Corolla tubular, slightly curved (arched); limb subequally 5-lobed or 2-lipped; lower lip 3-lobed, lobes ascending cochlear in bud; upper lip 2-cleft. Stamens 2, inserted at middle or basal portion of tube, included or sometimes slightly exerted beyond corolla lip; anthers 2-theous; thecae equal, base divaricate and mucous; staminodes 2, small. Ovary usually glabrous; stigma subentire. Capsule linear, 4-angled, basal portion solid but lacking a conspicuous basal stalk; retinacula present, 8–16-seeded. Seeds lenticular, glabrous or pubescent.

About 15 species: mainland Asia; two species in China.

- 1a. Inflorescences terminal thyrses, 14–18 cm; corolla purplish red, 4.5–5 cm; anthers not extending beyond corolla lips; capsule 3.5–5 cm ..... 1. *P. curviflorus*  
 1b. Inflorescences axillary cymes, ca. 4 cm; corolla orange, ca. 1.8 cm; anthers extending beyond corolla lips; capsule 2.5–3 cm ..... 2. *P. pubinervius*

**1. *Phlogacanthus curviflorus*** (Wallich) Nees in Wallich, Pl. Asiat. Rar. 3: 99. 1832.

火焰花 huó yān huā

*Justicia curviflora* Wallich, Pl. Asiat. Rar. 2: 9. 1831.

Shrubs 3–6 m tall. Petiole 1.5–5 cm; leaf blade elliptic to oblong, 12–35 × 9–18 cm, abaxially puberulent along veins, adaxially glabrous, secondary veins 12–17 on each side of midvein, base broadly cuneate and decurrent onto petiole, margin entire to subcrenate, apex acute to acuminate. Thyrses terminal, 14–18 × 6–8 cm; cymes (1–)3–5-flowered. Pedicel 5–12 mm, densely tomentose; bracts subulate to lanceolate, 3–7 mm; bracteoles subulate 2–3 mm. Calyx 6–11 mm; lobes subulate to lanceolate, subequal, outside sparsely pubescent, inside densely brown tomentose. Corolla purplish red, 4.5–5 cm, outside densely brownish pubescent and sometimes including gland-tipped trichomes; tube ca. 4.2 cm; lower lip 3-lobed, lobes oblong and ca. 2 × 1.5 mm; upper lip 2-cleft. Stamens slightly exerted; filaments glabrous; anther thecae ellipsoid, 5–5.5 mm, not extending beyond corolla lips; staminodes 2, small. Ovary and style glabrous. Capsule 3.5–5 cm, 8–10-seeded. Seeds 5.5–6.3 × 4.2–4.5 mm, pubescent. Fl. Oct–Feb, fr. Feb–May.

Thickets, forest margins, ravines; 400–1600 m. Xizang, Yunnan [Bhutan, India, Laos, Myanmar, Thailand, Vietnam].

**2. *Phlogacanthus pubinervius*** T. Anderson, J. Linn. Soc., Bot. 9: 508. 1867.

毛脉火焰花 mǎo mài huó yān huā

*Aeschynanthus dunnii* H. Léveillé; *Lonicera menelii* H. Léveillé.

Shrubs or small trees, to 5 m tall, much branched. Petiole 0.5–2 cm; leaf blade elliptic-oblong to oblong, (5–)8–18 × (1–)3.5–5 cm, abaxially puberulent along veins, adaxially scabrous, secondary veins 5–7 on each side of midvein, base attenuate, margin undulate, apex acuminate to long acuminate. Cymes axillary, 1–4-flowered; peduncle 0.8–1.6 cm, 4-angled, pubescent; bracts small, caducous; bracteoles subulate, ca. 3 × 1 mm, caducous. Pedicel 0.8–1.5 cm. Calyx 7–8 mm; lobes linear-lanceolate, unequal, outside pubescent, inside gray tomentose. Corolla orange, ca. 1.8 cm, outside pubescent; tube ca. 1.3 cm, slightly curved; lower lip deeply 3-lobed, lobes ovate; upper lip 2-cleft. Stamens much exerted; filaments ca. 2.5 cm, glabrous; anther thecae oblong, parallel, extending beyond corolla lips; staminodes 2, small. Ovary glabrous; style ca. 2 cm, glabrous. Capsule 2.5–3 cm, glabrous, 8-seeded.

Forests, thickets; 700–1500 m. Guangxi, Guizhou, Yunnan [Bhutan, India, Myanmar].

### 35. CYSTACANTHUS T. Anderson, J. Linn. Soc., Bot. 9: 457. 1867.

鳔冠花属 biāo guān huā shù

Hu Jiaqi (胡嘉琪 Hu Chia-chi), Deng Yunfei (邓云飞); Thomas F. Daniel

Shrubs or perennial herbs, with cystoliths. Leaf blade margin entire or obscurely crenate. Inflorescences thyrses or rarely axillary cymes or racemes; bracteoles 2, small. Calyx deeply 5-lobed; lobes usually covered with gland-tipped trichomes. Corolla orange or pink, funnel-shaped, usually bent ca. 90° and abruptly inflated near middle; limb 2-lipped; lower lip 3-lobed, lobes orbicular or ovate and equal; upper lip 2-lobed; lobes ascending cochlear in bud. Stamens 2, included; anthers 2-theous; thecae parallel, equal, hirsute, mucous at base; staminodes 2. Ovary ovoid, long hirsute; style filiform; stigma 2-cleft. Capsule cylindric, 8–12-seeded; retinacula present. Seeds ovate in outline, compressed, tomentose.

About 15 species: mainland Asia; eight species (three endemic) in China.

Five of the Chinese species treated here in *Cystacanthus* have also been treated in *Phlogacanthus*. In addition to the macromorphological characteristics (geniculate corolla with an inflated throat in *Cystacanthus*) distinguishing *Cystacanthus* and *Phlogacanthus*, R. W. Scotland (Rev. Palaeobot. Palynol. 72: 229–243. 1992) discussed palynological differences between them in ornamentation of the aperture margins (i.e., aperture margins with spines ± restricted to a single row in *Phlogacanthus* and with the spines throughout the aperture margin in *Cystacanthus*). A thorough reevaluation of taxa treated in these two genera will be necessary to determine whether both genera are worthy of recognition and if so, to which genus each species pertains.

- 1a. Corolla outside pubescent with gland-tipped trichomes.  
 2a. Thyrses to 2.5 cm, 3- or 4-flowered ..... 1. *C. affinis*  
 2b. Thyrses longer than 5 cm, many flowered.  
 3a. Corolla purple; leaf blade oblong to oblong-lanceolate ..... 2. *C. paniculatus*  
 3b. Corolla blue, red, white, or purplish blue; leaf blade ovate to ovate-lanceolate.  
 4a. Young stems pubescent but not densely whitish or yellowish brown villous ..... 3. *C. yangtsekiangensis*  
 4b. Young stems densely whitish to yellowish brown villous ..... 4. *C. yunnanensis*  
 1b. Corolla outside glabrous or non-glandular pubescent.  
 5a. Bracts leaflike, much longer than calyx; corolla glabrous outside ..... 5. *C. pyramidalis*  
 5b. Bracts small and not leaflike, subequal to calyx; corolla pubescent outside.  
 6a. Leaf blade secondary veins ca. 6 on each side of midvein ..... 6. *C. abbreviatus*  
 6b. Leaf blade secondary veins 9–17 on each side of midvein.  
 7a. Leaf blade secondary veins 9–11 on each side of midvein; inflorescences spikelike thyrses; rachis with 1 flower per node; calyx ca. 6 mm; corolla densely pubescent outside ..... 7. *C. vitellinus*  
 7b. Leaf blade secondary veins 12–17 on each side of midvein; inflorescences paniculate thyrses; rachis with several flowers per node; calyx ca. 3 mm; corolla sparsely pubescent outside ..... 8. *C. colaniae*

**1. *Cystacanthus affinis*** W. W. Smith, Notes Roy. Bot. Gard. Edinburgh 9: 103. 1916.

丽江鳔冠花 *li jiang biao guan hua*

Shrubs to 2 m tall. Stems terete. Petiole 5–10 mm; leaf blade oblong to ovate, 2.5–6 × 1.5–3 cm, both surfaces pubescent, secondary veins 5 or 6 on each side of midvein, base cuneate, margin entire, apex acuminate. Thyrses terminal, to 2.5 cm, 3- or 4-flowered; bracts oblong-lanceolate, shorter than calyx, gland-tipped pubescent, caducous; bracteoles similar to bracts. Pedicel ca. 3 mm, gland-tipped pubescent. Calyx 1.5–2 cm, outside pubescent with gland-tipped trichomes; lobes linear, ca. 1 mm wide, apex acute. Corolla yellow outside and light yellow inside with purplish striae, 3.5–4 cm; lobes ovate, to 1.5 cm. Stamens slightly exerted; filaments barbate; anther thecae to 1 mm, connective barbate; staminodes ca. 2 mm. Ovary ca. 5 mm; style ca. 2 cm, glabrous; stigma slightly 2-cleft. Capsule light yellow, ca. 2 cm, glabrous, 6-seeded. Seeds ovate in outline, ca. 3 × 3 mm.

• Thickets, streamsides, trailsides; 1700–2200 m. Sichuan, Xizang, Yunnan.

**2. *Cystacanthus paniculatus*** T. Anderson, J. Linn. Soc., Bot. 9: 458. 1867.

鳔冠花 *biao guan hua*

*Phlogacanthus paniculatus* (T. Anderson) J. B. Imlay.

Shrubs to 2 m tall. Stems 4-angled, glabrous; young branches winged. Petiole 1–1.5 cm; leaf blade oblong to oblong-lanceolate, 10–12 × 2.5–4 cm, abaxially pubescent along veins, adaxially glabrous, base attenuate and decurrent onto petiole, margin undulate to crenulate, apex acuminate. Thyrses terminal, to 18 cm, many flowered; rachis densely villous with gland-tipped trichomes; bracts oblong-lanceolate, shorter than calyx, gland-tipped pubescent, caducous; bracteoles similar to bracts. Pedicel 2–4 mm, gland-tipped pubescent. Calyx 1.2–1.4 cm, gland-tipped pubescent; lobes lanceolate. Corolla light purple, 2–2.4 cm, ventricose, outside gland-tipped pubescent, inside glabrous; lower lip with lobes orbicular, subequal, patent. Stamens included; filaments barbate; anther thecae ca. 1 mm,

connective barbate; staminodes very small. Ovary pubescent, with 4 ovules per locule; style 1.6–2 cm, glabrous; stigma slightly 2-cleft. Capsule grayish brown, clavate, ca. 2.3 cm, pubescent, 8-seeded. Seeds ovate in outline, ca. 3.5 × 3.5 mm.

Forests; 300–2100 m. Yunnan [Myanmar].

**3. *Cystacanthus yangtsekiangensis*** (H. Léveillé) Rehder, J. Arnold Arbor. 16: 315. 1935.

金江鳔冠花 *jin jiang biao guan hua*

*Strobilanthes yangtsekiangensis* H. Léveillé, Cat. Pl. Yunnan, 6. 1915.

Shrubs to 1 m tall. Stems subterete, striate, pubescent. Petiole 3–7 mm, pubescent; leaf blade ovate, ca. 3.5 × 1.5 cm, both surfaces pubescent and glaucous, secondary veins 10–12 on each side of midvein, base cuneate, margin entire, apex acute. Thyrses terminal or axillary, racemose, secund, to 7 cm; bracts linear-lanceolate, 5–8 mm, densely gland-tipped villous; bracteoles similar to bracts. Pedicel 2–4 mm, gland-tipped pubescent. Calyx 7–10 mm; lobes linear, densely yellowish pubescent. Corolla blue or red, campanulate, ca. 2.5 × 1.2–1.3 cm, ventricose and curved; tube basally ca. 5 mm wide and short; lobes broadly triangular, apex obtuse. Stamens included; filaments barbate; anther thecae ovoid, connective barbate with yellowish brown trichomes; staminodes ca. 2 mm. Ovary pubescent; style ca. 2 cm, glabrous; stigma slightly 2-cleft. Capsule and seeds not seen.

• 400–500 m. Yunnan.

**4. *Cystacanthus yunnanensis*** W. W. Smith, Notes Roy. Bot. Gard. Edinburgh 9: 104. 1916.

滇鳔冠花 *dian biao guan hua*

Shrubs 1–1.5 m tall, erect. Stems subterete or slightly 4-angled, densely whitish or yellowish brown villous. Petiole 0.5–1.5 cm; leaf blade ovate to ovate-lanceolate, 5–10 × 3–4 cm, abaxially white villous, adaxially densely yellowish villous, secondary veins ca. 6 on each side of midvein, base attenuate, margin entire, apex acuminate to acute. Thyrses paniculate, to 15 cm; bracts linear-lanceolate, 5–10 mm, densely gland-tipped

villous; bracteoles similar to bracts. Pedicel 1–2 mm, gland-tipped villous. Calyx ca. 1.5 cm, outside densely gland-tipped villous, inside slightly villous; lobes linear, ca.  $13 \times 2$  mm, subequal, apex acute. Corolla white or purplish blue and with a whitish base, 3–3.5 cm, ventricose, incurved, outside gland-tipped pubescent; tube basally ca. 1.5 mm wide and very short then wide at middle; lobes orbicular, ca.  $10 \times 7$  mm, unequal with anterior one longer. Stamens 2; filaments ca. 1.5 cm, basally pilose; anther thecae oblong, ca. 6 mm, connective barbate; staminodes filiform, ca. 2 mm. Ovary ca. 4 mm, villous, with 6 ovules per locule; style ca. 2 mm, sparsely villous; stigma minutely 2-dentate. Capsule ca. 3.5 cm, ca. 5 mm wide, gland-tipped villous. Seeds disciform,  $2-3 \times 2-3$  mm, puberulent.

• Forests; 800–1600 m. Yunnan.

**5. *Cystacanthus pyramidalis*** Benoist, Bull. Soc. Bot. France 74: 907. 1928.

金塔火焰花 jin ta huo yan hua

*Phlogacanthus pyramidalis* (Benoist) Benoist.

Herbs to 1 m tall, perennial. Stems 4-angled, glabrous. Petiole ca. 2.5 cm; leaf blade elliptic to elliptic-ovate,  $9-23 \times 5.5-10$  cm, abaxially glabrous or pubescent along veins, adaxially glabrous, secondary veins 8–10 on each side of midvein, base cuneate and decurrent onto petiole, margin entire, apex acute to shortly acuminate. Thyrses terminal, to 26 cm; cymes 3-flowered; peduncle 1–3 mm, pubescent; bracts leaflike, ovate to lanceolate,  $0.6-3 \times 0.3-1.2$  cm, diminished in size apically on inflorescence, pubescent; bracteoles subulate, ca. 1 mm. Pedicel 3–5 mm. Calyx ca. 3.5 mm, glabrous or sparsely pubescent; lobes equal, linear, apex acuminate to acute. Corolla light purplish red, ca. 1 cm, bent to  $90^\circ$  and abruptly inflated at middle, glabrous; lobes ovate, ca.  $2 \times 1.5$  mm. Stamens 2; filaments ca. 0.8 cm, glabrous; anther thecae ovoid, ca. 1.5 mm, connective hirsute; staminodes ca. 2 mm. Ovary glabrous; style ca. 1 cm, glabrous; stigma slightly 2-cleft. Capsule clavate, ca. 2.2 cm, 4-angled, 8-seeded. Seeds ca.  $2 \times 2$  mm, compressed.

Forests. Hainan [Vietnam].

**6. *Cystacanthus abbreviatus*** Craib, Bull. Misc. Inform. Kew 1911: 438. 1911.

缩序火焰花 suo xu huo yan hua

*Phlogacanthus abbreviatus* (Craib) Benoist.

Shrubs to 1 m tall. Stems green, terete or 4-angled, slightly pubescent. Petiole 1.5–3.5 cm; leaf blade oblanceolate to ovate-lanceolate, ca.  $15 \times 5$  cm, abaxially slightly pubescent along veins, adaxially glabrous, secondary veins ca. 6 on each side of midvein, base narrowly attenuate, margin entire, apex shortly acuminate. Thyrses terminal, 8–12 cm; bracts minute, caducous; bracteoles subulate. Pedicel ca. 3 mm. Calyx ca. 8 mm; lobes linear-lanceolate, outside appressed strigose, margin sparsely gland-tipped ciliate, apex obtuse. Corolla purple, ca. 1.5 cm, bent to  $90^\circ$  and abruptly inflated at middle. Stamens included; filaments ca. 1.2 cm, hirsute at base; anther thecae ob-

long, connective gland-tipped hirsute; staminodes 2. Ovary ca. 2 mm, glabrous; style ca. 1 cm, glabrous; stigma slightly 2-cleft. Capsule and seeds not seen.

Yunnan [Vietnam].

**7. *Cystacanthus vitellinus*** (Roxburgh) Y. F. Deng, **comb. nov.**

糙叶火焰花 cao ye huo yan hua

Basionym: *Justicia vitellina* Roxburgh, Fl. Ind. 1: 117. 1820; *Endopogon vitellinus* (Roxburgh) Nees; *J. asperula* (Nees) G. Loddiges; *Phlogacanthus asperulus* Nees; *P. vitellinus* (Roxburgh) T. Anderson; *Sphinctacanthus siamensis* C. B. Clarke.

Shrubs to 1.5 m tall. Stems terete, glabrous. Petiole 1–5 cm; leaf blade broadly ovate to oblong-lanceolate,  $10-30 \times 6-11$  cm, abaxially slightly pubescent or glabrescent, adaxially glabrous or slightly pubescent, secondary veins 9–11 on each side of midvein, base attenuate and decurrent onto petiole, margin slightly undulate, apex acute to acuminate. Thyrses 10–20 cm; bracts minute; bracteoles linear, ca.  $1.5 \times 0.5$  mm, pubescent. Pedicel 1–3 mm. Calyx ca. 6 mm, pubescent; lobes linear-lanceolate. Corolla purplish red or white, 1.2–1.8 cm, bent to  $90^\circ$  and abruptly inflated at middle, outside pubescent. Stamens ca. 1 cm; filaments hirsute at base; anther thecae oblong, ca. 2 mm, connective glabrous; staminodes very small. Ovary glabrous; style 1–1.5 cm, glabrous; stigma slightly 2-cleft. Capsule clavate, ca. 2 cm, 8-seeded. Seeds ovate in outline, ca.  $2.5 \times 2$  mm.

Forests; 200–1100 m. Yunnan [Bhutan, India, Myanmar].

**8. *Cystacanthus colaniae*** (Benoist) Y. F. Deng, **comb. nov.**

广西火焰花 guang xi huo yan hua

Basionym: *Phlogacanthus colaniae* Benoist, Notul. Syst. (Paris) 5: 109. 1936.

Shrubs to 1 m tall. Stems terete, pubescent, soon glabrescent. Petiole 1–5 cm, puberulent; leaf blade ovate to ovate-lanceolate,  $(5-12-30 \times (2-5)-12$  cm, abaxially slightly pubescent, adaxially glabrous or puberulent along veins, secondary veins 8–17 on each side of midvein, base shortly attenuate, margin entire or slightly crenate, apex shortly acuminate. Thyrses 10–20 cm; cymes few flowered; bracts triangular,  $1.5-2 \times 0.7-1$  mm, pubescent; bracteoles linear, ca.  $1 \times 0.5$  mm, pubescent. Pedicel 1–2 mm, pubescent. Calyx ca. 3 mm, pubescent; lobes linear. Corolla ca. 1.2 cm, ventricose, bent to  $90^\circ$  and abruptly inflated at middle, outside slightly grayish white pubescent, inside pubescent on lobes; lobes oblong-ovate, ca.  $5 \times 3$  mm, unequal, apex acute. Stamens 2; filaments hirsute at base, ca. 6 mm; anther thecae oblong, ca. 2 mm, connective black and glabrous; staminodes filiform, very short, hirsute. Ovary oblong, ca. 2 mm, glabrous; style ca. 8 mm, glabrous; stigma slightly 2-cleft. Capsule 1.8–2 cm, glabrous. Seeds ovate in outline, ca.  $2.5 \times 2$  mm.

Limestone hills; 200–500 m. Guangxi, Hainan, Yunnan [Vietnam].

## CARLEMANNIACEAE

香茜科 xiang qian ke

Chen Tao (陈涛)<sup>1</sup>; Anthony R. Brach<sup>2</sup>

Perennial herbs, shrubs, or subshrubs, often somewhat fleshy; stems with interpetiolar line. Leaves opposite, petiolate, simple, estipulate, ± asymmetric, dentate or crenate-serrate. Flowers bisexual, slightly zygomorphic, in terminal or axillary cymes or corymbs, sometimes heterostylous. Calyx tube adnate to ovary, 4- or 5-lobed; lobes ± unequal. Corolla 4- or 5-lobed; lobes imbricate or induplicate-valvate. Stamens 2, inserted at middle of corolla tube; filaments short; anthers linear-oblong, opening laterally by slits, connivent around style. Disk well developed, conical or cylindrical. Ovary inferior, 2-loculed, each locule with ovules many (30–100) in axile to basal placentation. Fruit a 2-loculed, dry or fleshy capsule, 2- or 5-valvate; calyx lobes persistent. Seeds many (30–100), ovoid, smooth, with endosperm ± fleshy.

Two genera and five species: tropical Asia; two genera and three species in China.

Although previously treated in FRPS within the Rubiaceae, the Carlemanniaceae is treated separately here (see APG, Ann. Missouri Bot. Gard. 85: 531–553. 1998; M. Thiv in Kubitzki, Fam. Gen. Vasc. Pl. 7: 57–59. 2004). It has also been included by various authors in the Caprifoliaceae.

Herein, the term “calyx tube” refers to the ovary plus the tubular free portion of the calyx limb, but not including the calyx lobes when these are present.

Lo Hsienshui. 1999. *Carlemannia* and *Silvianthus*. In: Lo Hsienshui, ed., Fl. Reipubl. Popularis Sin. 71(1): 175–179.

- 1a. Herbs; leaves distinctly crenate-serrate; flowers 4-merous, arranged in loose corymbose inflorescences; calyx lobes imbricate; fruit a 2-valved dry capsule ..... 1. *Carlemannia*  
1b. Shrubs; leaves often slightly irregular and shallowly dentate; flowers 4- or 5-merous, congested in dense subglobose inflorescence; calyx lobes induplicate-valvate; fruit a 5-valved fleshy capsule ..... 2. *Silvianthus*

### 1. CARLEMANNIA Benthams, Hooker's J. Bot. Kew Gard. Misc. 5: 308. 1853.

香茜属 xiang qian shu

Herbs perennial. Leaf margin crenate-serrate. Inflorescence corymbose, lax, terminal, long pedunculate. Flowers 4-merous, minute. Calyx tube subglobose; lobes spreading, small. Corolla narrowly funnelform; lobes imbricate. Anthers linear-oblong; pollen grains 5- or 6-colpate. Ovary with placentas ascending from inner base of each locule; style prolonged; stigma clavate or fusiform, 2-lobed. Fruit a 2-valved dry capsule.

Three species: China, E Himalaya, NE India, Indonesia (Sumatra), Myanmar, N Thailand, Vietnam; one species in China.

1. *Carlemannia tetragona* J. D. Hooker, Fl. Brit. India 3: 85. 1880.

香茜 xiang qian

*Carlemannia henryi* H. Léveillé.

Plants 0.5–1.5 m tall, fragrant when dry. Stems often with lower part prostrate and rooting at nodes; young branches quadrangular, sulcate, pubescent or subglabrous; old branches terete, glabrous. Petiole 2–4 cm or slightly longer, puberulent; leaf blade elliptic or ovate, often inequilateral, 3–10(–15) × 2–5(–8) cm, drying thinly papery or membranous, lateral veins 4–

7 pairs, slender, both surfaces sparsely pilose, base shortly decurrent, margin distinctly serrate, apex often caudate. Cymes corymbose, 2–4 cm, pubescent; peduncles and branches slender; bracts linear, 2–2.5 mm, apex obtuse. Pedicel 1–2.5 mm. Calyx lobes linear, 1–2 mm. Corolla white except yellow speckled in throat, shorter than 1 cm, outside pilose, inside villous. Capsule broadly pyramidal, 3.5–4.5 mm in diam., wider than long, base truncate, apex contracted, stellate-dehiscent into 4 valves; valves with linear persistent calyx lobes. Seeds reticular striate. Fl. Jun–Sep, fr. Oct–Dec.

Dense forests especially in moist ravines; 600–1500 m. Xizang, Yunnan [NE India, Indonesia (Sumatra), Myanmar, N Thailand].

### 2. SILVIANTHUS J. D. Hooker, Hooker's Icon. Pl. 11: 36. 1868.

蜘蛛花属 zhi zhu hua shu

*Quiducia* Gagnepain.

Shrubs or subshrubs; stems hollow. Leaf margin shallowly dentate. Inflorescence a cyme, usually axillary, many flowered, dense, compact, headlike, shortly pedunculate or sessile. Flowers heterostylous. Corolla broadly funnelform, (4 or) 5-lobed; lobes

<sup>1</sup> Fairy Lake Botanical Garden, 160 Xianhu Road, Liantang, Shenzhen, Guangdong 518004, People's Republic of China.

<sup>2</sup> Missouri Botanical Garden, c/o Harvard University Herbaria, 22 Divinity Avenue, Cambridge, Massachusetts 02138-2094, U.S.A.

induplicate-valvate. Anthers dorsifixed near base, oblong; pollen grains 3-colpate. Disk ridged. Ovary with placentas at middle of septum; style prolonged; stigma oblong-fusiform. Fruit a 5-valved, slightly fleshy capsule. Seeds ovoid-oblong, slightly curved; testa spongy, longitudinally striate.

Two species: China, NE India, Laos, Myanmar, N Thailand, N Vietnam; two species in China.

- 1a. Calyx lobes relatively large, oblong to spatulate; corolla white; leaf blade drying membranous ..... 1. *S. bracteatus*  
 1b. Calyx lobes relatively smaller, linear; corolla yellow or red; leaf blade drying papery ..... 2. *S. tonkinensis*

**1. *Silvianthus bracteatus*** J. D. Hooker, Hooker's Icon. Pl. 11: 36. 1868.

蜘蛛花 zhi zhu hua

Shrubs, 0.5–1 m tall. Stems brown, subterete, slightly stout, ca. 3 mm in diam., herbaceous, glabrous. Petiole 2–7 cm, slender, flattened, glabrous; leaf blade abaxially pale green, adaxially green, elliptic, 17–25 × 7.5–10.5 cm, drying membranous, midvein slender, prominent on both surfaces, lateral veins ca. 10 pairs, arcuate-ascending, distinct on both surfaces, both surfaces glabrous, base cuneate, decurrent to petiole, margin irregular, shallowly wavy-dentate, apex shortly acuminate. Cymes axillary or terminal, shortly pedunculate or sessile, glabrous or papillose-puberulent; bracts oblong, ca. 5 × 3 cm, apex obtuse. Pedicel ca. 2 mm, puberulent. Calyx tube obconical, 2–3 mm in length and width; lobes subequal, oblong to spatulate, 7–10 × (2.5–)3(–6) mm, apex acute. Corolla white, funnelform-campanulate, ca. 1.2 cm, throat slightly expanded; lobes suborbicular, valvate. Stamens included. Style long, included. Capsule pinkish, subglobose, 6–7 × 6–7 mm, subfleshy, dehiscing down from calyx lobes into 5 valves. Seeds many. Fl. spring, fr. autumn.

Forests; 700–900 m. Yunnan [NE India, Myanmar].

**2. *Silvianthus tonkinensis*** (Gagnepain) Ridsdale, Blumea 24: 42. 1978.

线萼蜘蛛花 xian e zhi zhu hua

*Quiducia tonkinensis* Gagnepain, Bull. Soc. Bot. France

95: 33. 1948; *Silvianthus bracteatus* J. D. Hooker subsp. *clerodendroides* (Airy Shaw) H. W. Li; *S. bracteatus* subsp. *tonkinensis* (Gagnepain) H. W. Li; *S. clerodendroides* Airy Shaw.

Subshrubs, 1–2(–4) m tall, glabrous. Stems terete. Petiole 1–4(–7) mm, rugose when dry; leaf blade elliptic, ovate-elliptic, or sometimes broadly elliptic, large, (10–)15–25(–30) × 5–20 cm, drying papery, lateral veins (9 or)10(–16) pairs, joining in an intramarginal vein, slightly prominent on both surfaces when dry, base usually broadly cuneate, rarely slightly obtuse, or slightly decurrent, margin often shallowly dentate-incised, apex acute to shortly acuminate. Cymes 1–4 cm in diam.; peduncles usually shorter than 1 cm, sometimes to 5 cm; bracts linear, 4–6 mm. Flowers heterostylous. Pedicel ca. 3 mm. Calyx tube obconical, 2–3 mm; lobes linear, 9–11 × 1–1.5 mm, longitudinally veined, often obtuse. Corolla usually yellow or pale red, occasionally purplish red (based on literature); tube 1.2–1.3 cm, throat slightly expanded, outside glabrous, inside with soft hairs; lobes orbicular, 5–6 mm, inside papillose. Stamens inserted near middle of corolla tube; anthers ca. 4.5 mm. Style ca. 1.1 cm. Capsule purple at maturity, obconical, 6–9 mm in diam. Seeds black, 3–3.5 mm, white aciculate striate-rugose. Fl. Mar–Jul, fr. Oct–Dec.

Forests in valleys, stream-sides in evergreen hillside forests; 900–1500 m. Yunnan [Laos, N Thailand, N Vietnam].

This species was confused with *Silvianthus bracteatus* by some authors.

## LENTIBULARIACEAE

狸藻科 li zao ke

Li Zhenyu (李振宇)<sup>1</sup>; Martin R. Cheek<sup>2</sup>

Herbs, perennial or annual, carnivorous, terrestrial, epiphytic, or aquatic. Roots present or absent. Stems often (*Utricularia*) modified into rhizoids, stolons, or rhizomes, rarely developed. Traps (bladders) on rhizoids, stolons, or leaves present in *Utricularia* but absent in *Pinguicula*. Stipules absent. Leaves alternate or in a basal rosette, simple or variously divided. Inflorescences usually racemes or reduced to a solitary flower; peduncle erect to twining. Flowers  $\pm$  zygomorphic. Calyx 2–5-lobed or -parted; lobes imbricate, persistent. Corolla gamopetalous, tube short, limb 2-lipped or equally 5-lobed; lower lip entire or 2- or 3(–6)-lobed, lobes imbricate; upper lip entire or 2- or 3-lobed; spur subulate, cylindric, conic, or saccate. Stamens 2, inserted at base of corolla tube, included; filaments linear, short, curved or straight; anthers dorsifixed, ellipsoid; thecae 2, divaricate, confluent or (in *Utricularia*) sometimes distinct and  $\pm$  separated by a connective; staminodes absent. Disk absent. Carpels 2, connate; ovary superior, 1-locular; placenta free-central or basal; ovules 2 to numerous, anatropous, somewhat sunken into placenta; style 1 or absent; stigma 2-lipped, upper lip reduced or obsolete. Fruit usually a capsule, loculicidal, circumscissile, or rarely indehiscent. Seeds few, numerous, or rarely 1 per capsule, minute, without endosperm.

Three genera and ca. 290 species: cosmopolitan but mostly in tropical regions; two genera and 27 species (four endemic) in China.

Li Zhenyu. 1990. Lentibulariaceae. In: Wang Wentsai, ed., Fl. Reipubl. Popularis Sin. 69: 582–605.

- 1a. Leaves with margin usually involute, adaxially with viscid glands; traps absent; calyx 5-parted; corolla open at throat ..... 1. *Pinguicula*  
1b. Leaves with margin not involute, adaxially without viscid glands; traps present; calyx 2(–4)-parted; corolla with variously raised palate at throat ..... 2. *Utricularia*

### 1. PINGUICULA Linnaeus, Sp. Pl. 1: 17. 1753.

捕虫堇属 bu chong jin shu

Herbs, perennial [or annual], terrestrial [epilithic or epiphytic], rhizomatous, without rhizoids, stolons, or traps. Roots fibrous. Leaves in a basal rosette, simple, petiolate or sessile, soft and fleshy; leaf blade adaxially usually with numerous viscid glands, veins pinnate, margin entire and usually involute. Inflorescences with a solitary flower, rarely a 2- or 3-flowered raceme, without scales, bracts, or bracteoles. Calyx 2-lipped; lower lip 2-lobed; upper lip 3-lobed. Corolla open at throat, palate of lower lip not raised; lower lip larger than upper lip, spurred, 3-lobed, middle lobe larger; upper lip 2-lobed. Capsule loculicidal, opening by 2 valves. Seeds many per capsule.

About 55 species; N temperate regions, most diverse in Central America, extending S to Patagonia; two species in China.

- 1a. Roots 0.4–1 mm thick; leaf blade 1–4 cm; pedicel and calyx glabrous; corolla 9–20 mm, white but spur yellowish .... 1. *P. alpina*  
1b. Roots 0.1–0.2 mm thick; leaf blade 0.5–1 cm; pedicel and calyx glandular pilose; corolla 6–9 mm, pale violet including spur ..... 2. *P. villosa*

#### 1. *Pinguicula alpina* Linnaeus, Sp. Pl. 1: 17. 1753.

高山捕虫堇 gao shan bu chong jin

Herbs, perennial, overwintering by a resting bud; bud ovoid, ca. 1 cm. Roots numerous, 0.4–1 mm thick. Leaves shortly petiolate; leaf blade pale green, elliptic-oblong to lanceolate-oblong, 1–4.5  $\times$  0.5–1.7 cm, abaxially glabrous, secondary veins 5–7 on each side of midvein, base broadly cuneate, margin involute, apex obtuse to rounded. Flowers 1–5, from generative (spring) rosette. Pedicel 2.5–13 cm  $\times$  0.4–1.2 mm, glabrous, apical part enlarged in fruit. Calyx parted from base into 2 lips, glabrous; lower lip 1–2.5 mm, 2-lobed, lobes obovate; upper lip 2–4 mm, 3-lobed, lobes triangular-ovate. Corolla mostly white with 1 or more yellow spots on palate, 0.9–2 cm; tube shortly funnelform-tubular, 3–7 mm, outside glabrous, inside puberulent; spur yellowish, cylindric, straight,

$\pm$  as long as corolla tube, apex rounded; lobes of lower lip circular to broadly ovate, apex rounded to obtuse; lobes of upper lip broadly ovate to suborbicular, apex obtuse. Filaments curved, 1.4–1.6 mm; anther thecae confluent. Ovary globose, ca. 1.5 mm in diam.; style short but distinct; stigma lower lip circular and ciliate, upper lip deltoid. Capsule ovoid-oblong, 5–7 mm, glabrous. Seeds narrowly ellipsoid, 0.6–0.8 mm; seed coat with small prominent elongate reticulations. Fl. May–Jul, fr. Jul–Sep.  $2n = 32$ .

Bogs and wet places on mountains; 1800–4500 m. Chongqing, Gansu, NE Guizhou, W Hubei, E Qinghai, S Shaanxi, Sichuan, S and SE Xizang, NW Yunnan [Bhutan, N India, Kashmir, Mongolia, N Myanmar, Nepal, Russia; Europe].

The report of *Pinguicula vulgaris* Linnaeus from Shaanxi (Iconogr. Cormophyt. Sin. 4: 148. 1975) is in fact *P. alpina*.

**2. *Pinguicula villosa* Linnaeus, Sp. Pl. 1: 17. 1753.**北捕虫堇 *bei bu chong jin*

Herbs, perennial, overwintering by a resting bud. Roots numerous, 0.1–0.2 mm thick. Leaves shortly petiolate; leaf blade pale green, elliptic to broadly elliptic, 5–10(–15) × 4–8 mm, abaxially glabrous, secondary veins 4 or 5 on each side of midvein, base broadly cuneate, margin strongly involute, apex rounded. Flowers 1 or 2, from generative rosette. Pedicel 2.5–8 × 0.4–1 mm, glandular pilose. Calyx parted from base into 2 lips, outside glandular pilose, inside glabrous; lower lip 2-lobed, 0.5–1 mm, lobes ovate-lanceolate; upper lip 3-lobed, 1–2 mm, lobes ovate-lanceolate. Corolla pale violet with yellow

stripes in throat, 6–9 mm; tube shortly funnellform-tubular, 2.5–3 mm, outside glabrous, inside sparsely puberulent; spur cylindrical-conic, straight, longer than corolla tube, apex rounded; lobes of lower lip oblong, apex obtuse to truncate; lobes of upper lip oblong, apex obtuse. Filaments curved, 1–1.2 mm; anther thecae confluent. Ovary globose, 1.2–1.5 mm in diam.; style short; stigma lower lip semicircular and ciliate, upper lip obtuse. Capsule obovoid, 5–6 mm, glabrous. Seeds narrowly ellipsoid; seed coat with small prominent elongate reticulations. Fl. Jun–Aug, fr. Aug–Oct.  $2n = 16$ .

Sphagnum bogs. NE Nei Mongol [Japan, Russia (Far East, Siberia); N Europe, North America].

**2. *UTRICULARIA* Linnaeus, Sp. Pl. 1: 18. 1753.**狸藻属 *li zao shu*

*Calpidisca* Barnhart; *Diurospermum* Edgeworth; *Lentibularia* Séguier; *Megozipa* Rafinesque; *Meloneura* Rafinesque; *Nelipus* Rafinesque; *Vesiculina* Rafinesque; *Xananthes* Rafinesque.

Herbs, perennial or annual, terrestrial, epiphytic, or aquatic, without true roots. Stems modified into rhizoids and stolons, rarely developed. Traps on rhizoids, stolons, and/or leaves, small, bladderlike. Leaves alternate or in a basal rosette, simple to many × divided, veins 1–3, unbranched, dichotomously branched, or pinnately branched. Inflorescences racemose or flowers solitary, pedunculate, usually simple, seldom branched, erect to twining, bracteate; bracts and bracteole often present, scalelike, sometimes basiolute (with base extending below point of insertion). Calyx parted from base into 2 equal or unequal lobes, lobes sometimes apically 2-parted. Corolla lower lip larger than upper lip; lower lip entire or 2- or 3(–6)-lobed, spurred, palate variously raised; upper lip entire or 2- or 3-lobed. Anther thecae confluent or distinct. Capsule adaxially loculicidal, both abaxially and adaxially loculicidal, or circumscissile, rarely indehiscent. Seeds few, many, or rarely 1 per capsule, variously appendaged.

About 220 species: cosmopolitan but mostly in tropical regions, a few in N temperate regions; 25 species (four endemic) in China.

This account is based largely on the work of P. Taylor (Kew Bull., Addit. Ser. 14: [i]–xi, 1–724. 1989), which should be consulted for a complete synonymy.

- 1a. Leaves divided into narrowly linear to capillary segments, ultimate segments (except *U. limosa*) bearing apical and often lateral solitary or fasciculate setulae; bracteoles absent; capsule globose or ellipsoid, not dorsiventrally compressed; seeds globose, lenticular, or prismatic.
- 2a. Scales not present on peduncle; persistent style often equaling or exceeding capsule ..... 25. *U. aurea*
- 2b. Scales present on peduncle; persistent style much less than 1/2 as long as capsule.
- 3a. Scales and bracts basiolute; corolla lilac, violet, or white.
- 4a. Lower corolla lip 2-lobed to ca. 1/2 its length; seeds globose, not winged; rhizoids present and capillary ..... 18. *U. limosa*
- 4b. Lower corolla lip rounded to retuse; seeds lenticular, with a broad dentate wing; rhizoids apparently absent ..... 19. *U. punctata*
- 3b. Scales and bracts basifixed; corolla yellow.
- 5a. Turions (overwintering buds) absent; corolla with a few short stipitate glands; capsule laterally 2-valvate; seeds lenticular, with a broadly irregular wing ..... 20. *U. gibba*
- 5b. Turions usually present; corolla without external stipitate glands; capsule circumscissile; seeds prismatic, (4 or) 5- or 6-angled (unknown for *U. intermedia*).
- 6a. Stolons all with green, many × divided leaves with traps, leaf segment capillary or slightly flattened.
- 7a. Margins of lower corolla lip deflexed; palate hairy; bracts ovate ..... 21. *U. vulgaris*
- 7b. Margins of lower corolla lip spreading; palate glabrous; bracts orbicular ..... 22. *U. australis*
- 6b. Stolons dimorphic, bearing either green leaves with narrowly linear segments with few or no traps or bearing colorless much reduced leaves with traps.
- 8a. Palate of lower corolla lip with a prominent rounded basal swelling; spur subulate, slightly shorter than lower corolla lip; rhizoids present and filiform ..... 23. *U. intermedia*
- 8b. Palate of lower corolla lip without a prominent rounded swelling but much elongate with a raised marginal rim; spur saccate to obtusely broadly conic, ca. 1/2 as long as lower corolla lip; rhizoids absent ..... 24. *U. minor*

- 1b. Leaves simple, orbicular to linear, glabrous, margin entire or rarely divided into broader lobes; bracteoles present; capsule globose, ovoid, or ellipsoid, often dorsiventrally compressed; seeds ovoid, obovoid, or ellipsoid, rarely globose.
- 9a. Bracts and bracteoles basifixed, attached just above to below middle.
- 10a. Leaves linear to narrowly obovate, vein 1; scales numerous; calyx lobes  $\pm$  equal in size, upper lobe shorter than upper corolla lip.
- 11a. Corolla violet, pink, or white, marked with yellow at throat, palate without hooked processes ..... 3. *U. caerulea*
- 11b. Corolla pale bluish purple, palate with hooked processes ..... 4. *U. warburgii*
- 10b. Leaves reniform, orbicular, or obovate, veins dichotomously branched; scales absent (seldom few in *U. striatula*); calyx lobes very unequal in size, upper lobe much longer than upper corolla lip.
- 12a. Plant with a basal tuber.
- 13a. Spur of corolla  $\pm$  as long as or shorter than lower corolla lip; leaf blade 1–3 cm ..... 12. *U. brachiata*
- 13b. Spur of corolla much longer than lower corolla lip; leaf blade 0.4–0.8 cm ..... 13. *U. forrestii*
- 12b. Plant without a basal tuber.
- 14a. Trap mouth with a dorsal deeply 2-cleft appendage; corolla spur subulate,  $\pm$  as long as lower corolla lip, apex acute ..... 17. *U. striatula*
- 14b. Trap mouth with a dorsal flabellate appendage; corolla spur cylindric, much shorter than lower corolla lip, apex obtuse.
- 15a. Middle lobe of lower corolla lip rounded; spur ca. 2  $\times$  as long as upper calyx lobe ..... 16. *U. salwinensis*
- 15b. Middle lobe of lower corolla lip emarginate; spur as long as or slightly longer than upper calyx lobe.
- 16a. Lower corolla lip 5-lobed; seed papillae short, obtuse, tufts of sometimes long bristles at both ends; leaf blade membranous ..... 14. *U. kumaonensis*
- 16b. Lower corolla lip 3-lobed; seed papillae relatively long, acute, a tuft of short bristles at distal end only; leaf blade fleshy ..... 15. *U. multicaulis*
- 9b. Bracts and bracteoles basifixed.
- 17a. Bracteoles similar to or slightly narrower than bracts.
- 18a. Scales present.
- 19a. Inflorescences and calyx glabrous; plants annual ..... 1. *U. minutissima*
- 19b. Inflorescences and calyx  $\pm$  densely covered with multicellular hairs; plants perennial ..... 2. *U. hirta*
- 18b. Scales absent.
- 20a. Leaves entire; bracts and bracteoles shortly connate to base; corolla yellowish, spur apex obtuse ..... 10. *U. peranomala*
- 20b. Larger leaves pinnately divided or lobed, smaller leaves entire; bracts and bracteoles not connate; corolla white, with a yellow dot at throat, spur apex 2-lobed ..... 11. *U. mangshanensis*
- 17b. Bracteoles much less than 1/4 as wide as bracts.
- 21a. Corolla yellow.
- 22a. Peduncle erect; pedicel strongly recurved in fruit; upper calyx lobe shorter than upper corolla lip, apex obtuse ..... 5. *U. bifida*
- 22b. Peduncle twining to erect; pedicel erect in fruit; upper calyx lobe longer than upper corolla lip, apex shortly acuminate ..... 8. *U. scandens*
- 21b. Corolla violet, mauve, lilac, or white.
- 23a. Peduncle twining; pedicel strongly deflexed in fruit ..... 9. *U. foveolata*
- 23b. Peduncle erect; pedicel erect to spreading in fruit.
- 24a. Fruiting pedicel as long as or shorter than fruiting calyx; calyx lobes suborbicular in fruit; seeds globose, with isodiametric reticulations; leaf blade 2.5–4.5 cm  $\times$  1.5–6 mm ..... 6. *U. uliginosa*
- 24b. Fruiting pedicel much longer than fruiting calyx; calyx lobes ovate in fruit; seeds ovoid to ellipsoid, with elongate reticulations; leaf blade 0.4–2 cm  $\times$  0.8–3 mm ..... 7. *U. graminifolia*

**1. *Utricularia minutissima* Vahl, Enum. Pl. 1: 204. 1804.**

斜果挖耳草 xie guo wa er cao

*Utricularia brevilabris* Lace; *U. brevilabris* var. *parviflora* Pellegrin; *U. evardii* Pellegrin; *U. lilliput* Pellegrin; *U. nigri-caulis* Ridley; *U. nipponica* Makino; *U. siamensis* Ostenfeld.

Annuals, terrestrial. Rhizoids capillary, simple. Stolons

capillary, sparsely branched. Traps on rhizoids, stolons, and leaves, stalked, ovoid, ca. 0.2 mm, mouth lateral; appendage 1, dorsal, subulate, with 1 or 2 ventral pairs of trichome rows. Leaves few, from peduncle base and stolons, glabrous; leaf blade narrowly obovate to linear, 0.3–2 cm  $\times$  0.4–0.8 mm, membranous, vein 1, base attenuate onto petiole, margin entire, apex slightly obtuse. Inflorescences erect, 3–12 cm, 1–10-flowered, glabrous; peduncle terete, 0.2–0.4 mm thick; scales few,

similar to bracts; bracts basifixed, narrowly ovate, 0.5–1 mm, apex acute. Pedicel erect,  $\pm$  as long as bracts, filiform; bracteoles similar to bracts but sometimes narrower or less acute. Calyx lobes convex, 1.5–2 mm, subequal, glabrous; lower lobe apex emarginate; upper lobe ovate, apex obtuse. Corolla violet or white, 3–7 mm; lower lip suborbicular, base with a rounded 4-lobed swelling, margin distinctly 3-lobed; spur subulate, much longer than lower corolla lip, apex acute; upper lip oblong to obovate, apex emarginate to rounded. Filaments ca. 0.8 mm, slightly curved; anther thecae distinct. Ovary ovoid; style short; stigma lower lip transversely elliptic, upper lip deltoid. Capsule obliquely ellipsoid, 1.5–2 mm, dehiscing by a single longitudinal ventral slit. Seeds globose to broadly ellipsoid, 2–3 mm; seed coat with prominent reticulations. Fl. Sep–Nov, fr. Nov–Dec.  $2n = 16$ .

Sandy soil in open areas, grassy places, wet rocks; near sea level. Fujian, S Guangdong, Guangxi, S Jiangsu, Jiangxi [Cambodia, India, Indonesia, S Japan, Laos, Malaysia, Myanmar, Papua New Guinea, Philippines, Sri Lanka, Thailand, Vietnam; N Australia].

**2. *Utricularia hirta*** Klein ex Link, Jahrb. Gewächsk. 1(3): 55. 1820.

毛挖耳草 mao wa er cao

*Utricularia hirta* var. *elongata* Pellegrin; *U. tayloriana* J. Joseph & Mani.

Probably perennials, terrestrial. Rhizoids capillary; stolons capillary, sparsely branched. Traps on rhizoids, stolons, and leaves, ovoid, ca. 0.2 mm, long stalked, with 1 or 2 ventral pairs of rows of gland-tipped hairs, mouth lateral; appendage 1, dorsal, subulate. Leaves few from stolons, 0.8–1.5 cm  $\times$  0.3–0.5 mm, glabrous; leaf blade narrowly obovate, membranous, 1-veined, base attenuate onto long petiole, margin entire, apex rounded. Inflorescences erect, 5–15 cm, 1–6-flowered,  $\pm$  densely covered with multicellular hairs; peduncle terete, 0.2–0.5 mm thick; scales few, similar to bracts; bracts basifixed, narrowly ovate-deltoid, 0.5–1 mm. Pedicel erect, filiform, longer than bracts; bracteoles subulate, as long as or longer than bracts. Calyx lobes subequal, 1.5–2 mm, with dense hairs; lower lobe slightly larger, apex truncate to emarginate; upper lobe ovate, apex obtuse. Corolla violet or white, 4–8 mm; lower lip subcircular, base with a rounded 4-lobed swelling, apex 3-lobed; upper lip oblong from a deltoid base, apex  $\pm$  emarginate; palate inside shortly pubescent; spur subulate, much longer than lower lip, apex subacute. Filaments 0.5–0.6 mm, curved; anther thecae subdistinct. Ovary ovoid; style short; stigma lower lip subcircular, upper lip much smaller and deltoid. Capsule obliquely ovoid, 1.5–2 mm, dehiscing by a single longitudinal ventral slit. Seeds ovoid, ca. 0.2 mm; testa with prominent reticulations. Fl. Sep–Nov, fr. Nov–Dec.

Wet open grassy places, wet rocks; near sea level. S Guangxi (Nanning) [Bangladesh, Cambodia, India, Laos, Malaysia, Sri Lanka, Thailand, Vietnam].

Annuals, terrestrial. Rhizoids and stolons capillary, branched. Traps on stolons and leaves, stalked, ovoid, 0.2–1 mm, with stipitate glands on appendage and mouth margin, mouth lateral; appendage 1, dorsal, subulate, beaklike. Leaves numerous, from peduncle base and stolon nodes, glabrous; leaf blade linear to linear-obovate, 0.3–2 cm  $\times$  0.5–2 mm, membranous, veins 3, base attenuate onto petiole, margin entire, apex rounded. Inflorescences erect, 5–44 cm, 1–15-flowered, glabrous; peduncle terete, 0.3–1.2 mm thick; scales 1–12, similar to bracts; bracts basisolate, oblanceolate, 1.5–3 mm, base cuneate, apex acute. Pedicel erect at anthesis but spreading to deflexed in fruit, 0.2–1 mm, minutely papillose; bracteoles basisolate, ovate-lanceolate, 1–2 mm. Calyx lobes minutely papillose, glabrous; lower lobe suborbicular, smaller than upper lobe, apex retuse; upper lobe ovate-oblong, 2–3 mm, apex rounded. Corolla violet, pink, or white, marked with yellow at throat, 4–10 mm; lower lip broadly ovate, with a basal 4-ridged swelling, apex rounded to emarginate; spur narrowly conic, usually longer than lower corolla lip, apex subacute; upper lip oblong to ovate-oblong, apex retuse. Filaments 1–2 mm, straight; anther thecae  $\pm$  distinct. Ovary globose; style short; stigma lower lip semicircular, upper lip deltoid. Capsule globose to ellipsoid, 1.5–2 mm, dehiscing by a short longitudinal ventral slit. Seeds obovoid to oblong-ellipsoid, 0.2–0.3 mm; seed coat with prominent elongate reticulations and conic to clavate papillae. Fl. Jun–Jan, fr. Jul–Feb.  $2n = 36, 40$ .

Wet rocks, beside streams, wet grassland, swamps, damp places; near sea level to 2000 m. S Fujian, Guangdong, Guangxi, Guizhou, Hainan, Hunan, Shandong, Taiwan, Yunnan [Bangladesh, Cambodia, India, Indonesia, Japan, Korea, Laos, Malaysia, Myanmar, Nepal, Papua New Guinea, Philippines, Sri Lanka, Thailand, Vietnam; Australia, Madagascar, Pacific islands (Guam, Palau)].

Reports of *Utricularia caerulea* from Anhui, Jiangsu, Jiangxi, Sichuan, and Zhejiang (Z. Yu Li, FRPS 69: 594. 1990; S. R. Chen, Higher Pl. China 10: 440. 2004) are in fact *U. warburgii*.

*Utricularia baouleanensis* A. Chevalier; *U. scandens* Oliver (1859), not Benjamin (1847); *U. tenerrima* Merrill.

Annuals, terrestrial. Rhizoids and stolons capillary, branched. Traps on stolons and leaves, shortly stalked to sessile, globose, 0.8–1.2 mm, mouth basal; appendages 2, dorsal, filiform-subulate, sparsely branched, stipitate, glandular. Leaves few, from stolon nodes, petiolate, glabrous; leaf blade linear, 1–3 cm  $\times$  0.4–1 mm, membranous, vein 1, base attenuate onto petiole, margin entire, apex acute to rounded. Inflorescences twining, 15–20 cm, 2–5-flowered, glabrous; peduncle terete, 0.2–0.5 mm thick; scales few, similar to bracts; bracts basifixed, ovate to ovate-oblong, ca. 1.2 mm, apex obtuse to shortly acuminate. Pedicel erect to spreading at anthesis but sharply deflexed in fruit, 2–4 mm, filiform, dorsiventrally flattened and narrowly winged; bracteoles linear-subulate, ca. 1/2 as long as bracts, apex acute. Calyx lobes ovate, 2–4 mm; lower lobe slightly longer and narrower than upper lobe, apex obtuse

to subacute. Corolla pale mauve, 3–4 mm; lower lip suborbicular, galeate, basal swelling obscurely 2-lobed, apex entire or obscurely 3-crenate; spur narrowly conic, slightly longer than lower corolla lip, apex obtuse; palate with a scarcely raised minutely ciliate rim; upper lip oblong, slightly longer than calyx, apex truncate. Filaments ca. 1 mm, straight; anther thecae  $\pm$  distinct. Ovary ovoid; style short but evident; stigma lower lip semicircular, upper lip truncate. Capsule broadly ovoid, ca. 4 mm, slightly dorsiventrally compressed, dehiscing by a single longitudinal ventral slit. Seeds obliquely ovoid to ellipsoid, ca. 0.3 mm; seed coat with prominent elongate reticulations. Fl. Oct–Nov, fr. Nov–Dec.  $2n = 20$ .

Wet grasslands, rice fields; near sea level. Hainan [Bangladesh, India, Indonesia, Philippines, Thailand; tropical Africa, NE Australia, Madagascar].

**10. *Utricularia peranomala*** P. Taylor, Kew Bull. 41: 12. 1986.

合苞挖耳草 he bao wa er cao

Annuals, lithophytic. Stolons and rhizoids capillary, simple. Traps on stolons or leaf blades near margin, shortly stalked, ovoid, ca. 1 mm, mouth lateral; appendages 2, dorsal, subulate, simple, with sessile glands. Leaves few, from peduncle base, glabrous; leaf blade narrowly obovate to linear, 8–10  $\times$  1–1.5 mm, membranous, veins pinnate, base attenuate onto petiole, margin entire, apex rounded. Inflorescences erect, 1.5–2.5 cm, 1- or 2-flowered, glabrous; peduncle terete, ca. 0.3 mm thick; scales absent; bracts basifixed, broadly ovate, ca. 0.5 mm, base shortly connate, apex rounded. Pedicel erect at anthesis but apically decurved in fruit, 2–7 mm, filiform, slightly dorsiventrally compressed; bracteoles basifixed, oblong,  $\pm$  as long as bracts, apex rounded. Calyx lower lobe ovate to oblong, smaller than upper lobe, apex rounded; upper lobe broadly ovate, 1.5–2 mm, apex obtuse. Corolla yellowish, 4–6 mm; lower lip broadly flabellate to transversely elliptic, base with a 4-lobed swelling, apex rounded to retuse; spur subulate, slightly longer than corolla lower lip, almost straight, apex obtuse; palate with a slightly raised ring, fringed with short hairs; upper lip oblong, slightly longer than upper calyx lobe, apex truncate. Filaments ca. 0.6 mm, slightly curved; anther thecae distinct. Ovary globose; style short but evident; stigma lower lip circular, upper lip oblong. Capsule globose, ca. 2.5 mm, dehiscing by a single longitudinal ventral slit. Seeds narrowly ellipsoid-fusiform, ca. 1 mm, curved or straight; seed coat with prominent very elongate reticulations. Fl. Jul–Aug, fr. Aug.

- Wet rocks among moss. NE Guangxi (Ziyuan).

*Utricularia peranomala* is known only from the type collection (T. S. Tsoong 83427), which does not record the elevation.

**11. *Utricularia mangshanensis*** G. W. Hu, Ann. Bot. Fenn. 44: 389. 2007.

莽山挖耳草 mang shan wa er cao

Annuals, bryophilous lithophytes. Rhizoids short, simple; stolons capillary, simple or branched near terminal. Leaves numerous, from peduncle base and stolon nodes, 0.8–2.2 cm  $\times$  1–2.5 mm, glabrous, petiolate or sessile; leaf blade linear to obovate, membranous, pinnately veined, base attenuate, margin entire or on larger leaves irregularly and pinnately parted or

lobed, apex rounded. Traps on stolons or near leaf blade margins, ovoid, 0.6–0.9 mm, stalked, mouth lateral; appendages 2, dorsal, subulate, simple. Inflorescences erect, 3–6 cm, 1- or 2 (or 3)-flowered, glabrous; peduncle terete, 0.4–0.7 mm thick; scales absent; bracts basifixed, broadly ovate, ca. 0.8 mm, apex rounded. Pedicel filiform, 0.6–1.3 cm, ascending at anthesis; bracteoles basifixed, oblong, slightly narrower than bracts, apex rounded. Calyx lobes unequal; lower lobe ovate to elliptic-oblong, apex usually emarginate; upper lobe broadly ovate or cordate, 1.5–2 mm, apex acute. Corolla white with a yellow dot at throat; lower lip broadly flabellate or axelike, slightly undulate, apex rounded; spur subulate, 3.5–5 mm, slightly curved upward, apex unequally 2-lobed; upper lip ovate-oblong, equal to or slightly longer than upper calyx lobe, apex truncate; palate with dense short hairs. Filaments ca. 0.6 mm, curved; anther thecae distinct. Ovary globose; style short but distinct; stigma lower lip circular, upper lip ovate-oblong and much smaller. Capsule and seeds unknown. Fl. Apr–May.

- Among moss on wet cliffs; 700–800 m. Hunan (Yizhang).

**12. *Utricularia brachiata*** Oliver, J. Proc. Linn. Soc., Bot. 3: 187. 1859.

肾叶挖耳草 shen ye wa er cao

Perennials, lithophytic. Tuber 1, at peduncle base, globose to ellipsoid, 1–2 mm. Rhizoids and stolons capillary, simple. Traps on rhizoids and stolons, stalked, ovoid, ca. 1 mm, mouth lateral; appendage 1, dorsal, transversely elliptic to flabellate, fringed with multicellular stipitate glands. Leaves few, from tuber, glabrous; leaf blade reniform, 1–3 cm  $\times$  2.5–6 mm, membranous, veins dichotomously branched, base cordate and attenuate onto long petiole, margin entire, apex rounded to emarginate. Inflorescences erect, 3–8 cm, 1- or 2-flowered, glabrous; peduncle terete, 0.2–0.4 mm thick; scales absent; bracts basolute, oblong, ca. 1.5 mm, base truncate to emarginate, margin erose denticulate, apex rounded. Pedicel spreading, 2–8 mm, filiform, dorsiventrally compressed; bracteoles basolute, similar to bracts. Calyx lobes 3–4 mm, glabrous; lower lobe oblong, much smaller than upper lobe, apex emarginate; upper lobe orbicular, apex emarginate. Corolla white, with a yellow spot at base of lower lip and violet streaks on upper lip; lower lip suborbicular, distinctly 5-lobed; spur narrowly cylindric, 2 or more  $\times$  as long as upper calyx lobe, apex obtuse; palate with a slightly raised rim, fringed with moniliform hairs; upper lip much shorter than upper calyx lobe, apex 2-lobed. Filaments ca. 0.5 mm, curved; anther thecae  $\pm$  distinct. Ovary globose; style very short; stigma lower lip circular, upper lip obsolete. Capsule globose with a ventral keel, ca. 2.5 mm, dehiscing by a longitudinal ventral slit. Seeds ovoid, ca. 0.5 mm, with a tuft of hairs of variable length at each end usually  $\pm$  as long as body of seed and a few shorter hairs on distal surface. Fl. Jul–Sep, fr. Aug–Oct.

Forests among bryophytes on rocks; 2600–4200 m. W Sichuan, SE Xizang, N Yunnan [Bhutan, N India, N Myanmar, Nepal].

**13. *Utricularia forrestii*** P. Taylor, Kew Bull. 41: 13. 1986.

长距挖耳草 chang ju wa er cao

Perennials, lithophytic. Tuber 1, at peduncle base, globose,

1–2 mm. Rhizoids and stolons capillary, simple. Traps on rhizoids and stolons, stalked, ovoid, ca. 1 mm, mouth lateral; appendage 1, dorsal, broadly flabellate, fringed with multicellular stipitate glands. Leaves few, from a short vertical stem between tuber and peduncle base, glabrous; leaf blade broadly obovate, orbicular, or reniform, 4–8 × 1–3 mm, membranous, veins dichotomously branched, base broadly cuneate to subcordate, margin entire, apex rounded. Inflorescences erect, 2–4 cm, 1- or 2-flowered, glabrous; peduncle terete, 0.2–0.3 mm thick; scales absent; bracts basisolute, narrowly ovate, ca. 1 mm, base truncate, apex subacute. Pedicel spreading, 2–8 mm, filiform, dorsiventrally compressed; bracteoles basisolute, similar to bracts. Calyx lobes glabrous; lower lobe oblong to obovate, much smaller than upper lobe, apex emarginate; upper lobe orbicular to broadly transversely elliptic, 2–3 mm, apex emarginate. Corolla mauve to violet, 1.2–1.5 cm; lower lip suborbicular, apex 3-lobed ± to middle; lobes retuse to shortly 2-cleft; spur filiform, 0.9–1.5 cm, much longer than corolla lower lip, curved; palate with a slightly raised rim fringed with hairs; upper lip suborbicular, shorter than upper calyx lobe, apex shortly 2-lobed. Filaments ca. 0.5 mm, curved; anther thecae ± distinct. Ovary ovoid; style very short; stigma lower lip suborbicular, upper lip obsolete. Capsule globose, ca. 2 mm, with a ventral keel, dehiscing by a single longitudinal ventral slit. Seeds narrowly elliptic, ca. 0.5 mm, with a hollow obscurely apically dentate multicellular appendage at each end. Fl. Jul–Aug, fr. Aug–Sep.

Among moss on rocks; 2100–3000 m. W Yunnan [N Myanmar].

毛籽挖耳草 mao zi wa er cao

*Diurospermum album* Edgeworth (1847), not *Utricularia alba* Hoffmannsegg ex Link (1820).

Annuals, epiphytic, lithophytic, or terrestrial. Rhizoids and stolons capillary, simple. Traps on rhizoids and stolons, stalked, ovoid, ca. 1 mm, mouth lateral; appendage 1, dorsal, flabellate, fringed with multicellular stipitate glands. Leaves few, rosulate at peduncle base, petiolate, glabrous; leaf blade broadly obovate, orbicular, or reniform, 2–6 × 1.5–3 mm, membranous, veins dichotomously branched, base broadly cuneate, margin entire, apex rounded. Inflorescences erect, 2–7 cm, 1–3-flowered, glabrous; peduncle terete, 0.2–0.3 mm thick; scales absent; bracts basisolute, ovate-oblong, ca. 0.5 mm, base truncate, apex obtuse. Pedicel erect at anthesis but decurved in fruit, terete, 2–6 mm, filiform; bracteoles basisolute, similar to bracts. Calyx lower lobe oblong, much smaller than upper lobe, apex truncate and emarginate to erose; upper lobe obcordate, ca. 2 mm, base rounded, apex deeply 2-parted. Corolla white, with a basal yellow spot and mauve lobes on lower lip, 3–5(–7) mm; lower lip suborbicular, 5-lobed, middle lobe much larger than lateral lobes; spur broadly cylindric, ± as long as upper calyx lobe, slightly curved, apex obtuse; palate with a slightly raised rim, fringed with short hairs; upper lip subquadrate, ca. 1/2 as long as upper calyx lobe, apex truncate to obscurely 2-lobed. Filaments ca. 0.5 mm, curved; anther thecae distinct. Ovary globose; style very short; stigma lower lip circular, upper lip

nearly obsolete. Capsule obliquely ovoid, 2–2.5 mm, dehiscing by a single longitudinal ventral slit. Seeds few per capsule, ellipsoid, ca. 0.5 mm, with a tuft of hairs at each end, hairs usually longer than body of seed. Fl. Jul–Aug, fr. Aug–Sep.

Among moss on rocks, cliffs, fallen trees; 2600–2700 m. NW Yunnan [Bhutan, N India, N Myanmar, Nepal].

**15. *Utricularia multicaulis*** Oliver, J. Proc. Linn. Soc., Bot. 3: 188. 1859.

多序挖耳草 duo xu wa er cao

Annuals, terrestrial or lithophytic. Rhizoids and stolons capillary, simple. Traps on rhizoids and stolons, shortly stalked, ovoid, ca. 1 mm, mouth lateral; appendage 1, dorsal, flabellate, fringed with multicellular stipitate glands. Leaves few, rosulate at peduncle base, long petiolate, glabrous; leaf blade obovate, 2–8 × 1–1.5 mm, rather fleshy, veins dichotomously branched, base attenuate, margin entire, apex rounded. Inflorescences erect, 1–5 cm, 1–3-flowered, glabrous; peduncle terete, 0.3–0.4 mm thick; scales absent; bracts basisolute, oblong, 0.6–1.2 mm, base truncate, apex obtuse to acute. Pedicel spreading at anthesis but decurved and distally thickened in fruit, terete, 1–5 mm, filiform; bracteoles basisolute, similar to bracts. Calyx lower lobe oblong, much smaller than upper lobe, apex entire, emarginate, or erose; upper lobe orbicular to broadly transversely elliptic, 1–1.5 mm, apex deeply emarginate. Corolla white or pale mauve, with a yellow spot at base of lower lip, 2–5 mm; lower lip 3-lobed, middle lobe much longer than lateral lobes, apex rounded to emarginate; spur cylindric, slightly longer than upper calyx lobe, straight or almost so, apex obtuse; palate with a slightly raised rim fringed with short hairs; upper lip subquadrate, much shorter than upper calyx lobe, apex shortly 2-lobed. Filaments ca. 0.5 mm, slightly curved; anther thecae distinct. Ovary globose; style very short; stigma lower lip circular, upper lip obsolete. Capsule globose to obliquely ovoid, 1.5–2 mm, dehiscing by a single longitudinal ventral slit. Seeds ovoid, 0.7–0.9 mm, distal end with a tuft of short hairs ca. 1/2 as long as body of seed; seed coat with regular longitudinal rows of acute papillae. Fl. Jul–Sep, fr. Aug–Oct.

Moist rocks, open swampy meadows among bryophytes and species of Cyperaceae; 2800–3900 m. SE Xizang, NW Yunnan [Bhutan, India (Sikkim), N Myanmar, Nepal].

**16. *Utricularia salwinensis*** Handel-Mazzetti, Symb. Sin. 7: 873. 1936.

怒江挖耳草 nu jiang wa er cao

Probably perennials, terrestrial or lithophytic. Rhizoids capillary, simple. Stolons capillary, branched. Traps on rhizoids and stolons, stalked, ovoid, ca. 1 mm, mouth lateral; appendage 1, dorsal, flabellate, fringed with multicellular stipitate glands. Leaves few, from peduncle base and stolons, long petiolate, glabrous; leaf blade obovate to orbicular, 2–12 × 1–2 mm, membranous, veins dichotomously branched, base attenuate, margin entire, apex rounded. Inflorescences erect, 3–7 mm, 1-flowered, glabrous; peduncle terete, 0.2–0.4 mm thick; scales absent; bracts basisolute, oblong, ca. 1.5 mm, base truncate, margin 2-cleft or erose, apex acute to truncate. Pedicel erect, spreading, or ± recurved, 2–10 mm; bracteoles basisolute, simi-

lar to bracts. Calyx lower lobe oblong, much smaller than upper lobe, apex emarginate; upper lobe suborbicular, ca. 2 mm, apex emarginate. Corolla white or pale pink, with a yellow spot at base of lower lip; lower lip 3-lobed, middle lobe much larger than lateral lobes, apex rounded; spur narrowly cylindric, ca. 2 × as long as upper calyx lobe, apex obtuse; palate with a slightly raised rim, fringed with moniliform hairs; upper lip subquadrate, much shorter than upper calyx lobe, apex emarginate. Filaments 0.5–0.7 mm, curved; anther thecae ± distinct. Ovary globose; style very short; stigma lower lip circular, upper lip obsolete. Capsule and seeds not seen. Fl. Jul–Aug.

• Among moss on wet cliffs and in bogs; 3200–4000 m. SE Xizang, NW Yunnan.

*Utricularia salwinensis* had been reported from the mountains of N Sumatra in Indonesia (P. Taylor, Fl. Malesiana, ser. 1, 8(2): 292. 1977). However, the Sumatran plants were later described as *U. steenisii* P. Taylor.

**17. *Utricularia striatula*** Smith in Rees, Cycl. 37: *Utricularia* no. 17. 1818.

圆叶挖耳草 *yuan ye wa er cao*

*Meloneura striatula* (Smith) Barnhart; *Utricularia anthrophophora* Ridley; *U. harlandii* Oliver ex Benth; *U. orbiculata* Wallich ex A. Candolle; *U. rosulata* Benjamin; *U. taikankensis* Yamamoto.

Perennials, epiphytic or lithophytic. Rhizoids and stolons capillary, simple. Traps on rhizoids and stolons, stalked, ovoid, 0.6–0.8 mm, mouth lateral; appendage 1, dorsal, deeply 2-cleft, fringed with multicellular stipitate glands. Leaves numerous, from peduncle base and stolons, subsessile to petiolate; leaf blade obovate, orbicular, or transversely elliptic, 3–10 × 2–6 mm, thinly fleshy, veins dichotomously branched, base cuneate, attenuate, or rounded, margin entire, apex rounded. Inflorescences erect, 1–15 cm, 1–10-flowered; peduncle terete, 0.2–0.4 mm thick, glabrous; scales few, similar to bracts; bracts basisolate, narrowly ovate to oblong, 1–1.5 mm, glandular, base truncate, margin irregularly crenulate to denticulate, apex subacute to rounded. Pedicel spreading at anthesis but often pendulous and withered in fruit, 2–6 mm, capillary, slightly dorsiventrally compressed; bracteoles similar to bract but slightly smaller. Calyx lower lobe oblong-elliptic, much smaller than upper lobe, apex rounded to emarginate; upper lobe suborbicular to broadly obcordate, 1.5–2.5 mm, apex rounded to emarginate. Corolla white or violet, with a yellow spot at base of lower lip, 3–10 mm or much smaller when cleistogamous; lower lip transversely elliptic to suborbicular, apex 5-lobed; spur subulate, ± as long as lower lip, straight or curved, apex acute; palate fringed with hairs; upper lip subovate, much shorter than calyx, apex shortly 2-cleft. Filaments ca. 0.6 mm, straight; anther thecae distinct. Ovary ovoid to depressed globose; style very short; stigma lower lip semicircular, upper lip obsolete. Capsule globose, ca. 2.5 mm in diam., dorsiventrally compressed, dehiscing by a single longitudinal ventral slit. Seeds obovoid, 0.2–0.4 mm, densely covered with glochidiate processes except proximal end. Fl. Jun–Oct, fr. Jul–Nov.

Damp rocks, tree trunks; 400–3600 m. S Anhui, Chongqing, Fujian, Guangdong, Guangxi, Guizhou, Hainan, Hubei, Hunan, Jiangxi,

Sichuan, Taiwan, S and SE Xizang, Yunnan, Zhejiang [Bhutan, India, Indonesia, Malaysia, Myanmar, Nepal, Papua New Guinea, Philippines, Sri Lanka, Thailand, Vietnam; tropical Africa, Indian Ocean islands (N Andaman Islands)].

长梗狸藻 *chang geng li zao*

*Nelipus limosa* (R. Brown) Rafinesque; *Utricularia verticillata* Benjamin.

Perennials or annuals, subaquatic or terrestrial. Rhizoids and stolons capillary, branched. Traps on stolons and leaves, long stalked, obliquely ovoid, 0.5–1 mm, covered externally with clavate glands, mouth lateral; appendages 2, dorsal, branched, setiform. Leaves numerous, from peduncle base and stolon nodes, long petiolate, to 5 cm including petiole; leaf blade narrowly oblong in outline, pinnately divided; segments alternate, capillary, terete, glabrous. Inflorescences erect, 5–25 cm, 2–10-flowered; peduncle terete, 0.5–0.8 mm thick; scales few, similar to bracts; bracts basisolate, elliptic, 1.5–2 mm, base obliquely truncate, margin erosely denticulate, apex acute. Pedicel ascending, 2–6 mm, filiform, slightly dorsiventrally flattened, minutely papillose; bracteoles absent. Calyx lower lobe obovate-oblong, 1.3–2 mm, apex rounded; upper lobe transversely elliptic, 1.1–1.5 mm, apex rounded. Corolla violet, with a yellow spot at base of lower lip, 4.5–6 mm; lower lip subquadrate, longer than upper lip, 2-lobed to ca. 1/2 its length, lobes ovate-oblong; spur narrowly cylindric from a conic base, somewhat longer than corolla lower lip, apex obtuse; palate with a slightly raised, rounded marginal rim; upper lip broadly ovate, ca. 2 × as long as upper calyx lobe, apex rounded. Filaments ca. 0.6 mm, strongly curved; anther thecae confluent. Ovary globose; style short; stigma lower lip semicircular and margin papillose, upper lip obsolete. Capsule globose, 2–3 mm, dehiscing by an ovate-oblong ventral pore. Seeds globose, 0.2–0.3 mm in diam.; seed coat with prominent nearly isodiametric coarse reticulations. Fl. Aug–Sep, fr. Sep–Oct.

Swamps, rice fields, wet grasslands; near sea level. S Guangdong, S Guangxi, Hainan [Indonesia (Papua Barat), Laos, Malaysia (peninsular), Thailand, Vietnam; N Australia].

**19. *Utricularia punctata*** Wallich ex A. Candolle, Prodr. 8: 5. 1844.

盾鳞狸藻 *dun lin li zao*

*Utricularia fluitans* Ridley.

Perennials, freely suspended aquatic. Rhizoids apparently absent. Stolons filiform, branched. Traps on leaves, shortly stalked, broadly obliquely ovoid, 1–2 mm, mouth lateral; appendages 2, dorsal, branched, setiform, with simple shorter setae. Leaves numerous on stolons, 2–6 cm, divided from near base into 2 or 3 primary segments; segments elliptic in outline, dichotomously divided into numerous further segments; ultimate segments capillary, terete, sparsely minutely setulose. Inflorescences erect, 6–20 cm, 5–10-flowered; peduncle terete, 0.6–1 mm thick, glabrous; scales few, similar to bracts; bracts basisolate, ovate, 2–2.5 mm, glandular. Pedicel erect, 3–10 mm, filiform, slightly dorsiventrally compressed; bracteoles absent. Calyx lobes orbicular, convex, 1–1.8 mm; lower lobe slightly

smaller, apex truncate to retuse; upper lobe apex rounded. Corolla lilac, violet, or white, with a yellow blotch at base of lower lip, 6–10 mm; lower lip transversely oblong-elliptic to subreniform, base with prominent 2-lobed swelling, apex rounded to retuse; spur narrowly conic,  $\pm$  as long as and parallel with lower lip, slightly curved, apex truncate to emarginate; palate margin glabrous; upper lip transversely elliptic, cucullate, apex rounded. Filaments ca. 1.5 mm, curved; anther thecae confluent. Ovary broadly ovoid; style evident, glandular; stigma lower lip transversely elliptic, upper lip semicircular to deltoid. Capsule ellipsoid, ca. 3 mm, dehiscing by longitudinal dorsal and ventral slits. Seed few per capsule, lenticular, ca. 2 mm in diam., margin broadly winged, wing irregularly dentate; seed coat with small prominent reticulations. Fl. Jun–Aug, fr. Jul–Sep.

Lakes, swamps, rice fields; near sea level. S Fujian (Longhai), S Guangxi (Dongxing) [Indonesia, Malaysia, Myanmar, Thailand, Vietnam].

Annuals or perennials, affixed or suspended aquatic. Rhizoids absent or present, filiform, branched. Stolons filiform, much branched, often mat-forming. Traps lateral on leaf segments, stalked, ovoid, 1–2.5 mm, mouth lateral; appendages 2, dorsal, branched, setiform, with shorter setae. Leaves numerous on stolons, 0.5–1.5 cm; primary segments (1 or) 2, unbranched or sparsely dichotomously branched into 3–8 ultimate segments; ultimate segments capillary, slightly flattened, margin entire or sparsely denticulate, apex and teeth setulose. Inflorescences erect, 2–15 cm, 1–3(–6)-flowered; peduncle terete, 0.3–0.5 mm thick, glabrous; scale 1, similar to bracts; bracts basifixed, semiorbicular, ca. 1 mm, minutely glandular, apex truncate and obscurely dentate. Pedicel erect to spreading, 2–12 mm, filiform; bracteoles absent. Calyx lobes subequal, broadly ovate to orbicular, 1.5–2 mm, apex rounded. Corolla yellow, 4–8 mm; lower lip slightly smaller than upper lip, base with a prominent 2-lobed swelling, apex rounded; spur narrowly conic to cylindric from a conic base, shorter or longer than corolla lower lip, distal part sparsely stipitate glandular, apex obtuse; palate densely pubescent; upper lip broadly ovate to suborbicular, ca.  $2 \times$  as long as upper calyx lobe, apex obscurely 3-lobed. Filaments 1–1.5 mm, curved; anther thecae confluent. Ovary globose; style evident; stigma lower lip transversely elliptic, upper lip obsolete. Capsule globose, 2–3 mm in diam., 2-valvate. Seeds lenticular, 0.8–1 mm in diam., margin broadly winged, wing shallowly and irregularly dentate; seed coat with small prominent reticulations. Fl. Apr–Nov, fr. May–Dec.  $2n = 28$ .

Shallow still or slowly flowing water, pools, lakes, bogs, swamps, marshes, rice fields; near sea level to 900 m. **21. *Utricularia vulgaris* Linnaeus, Sp. Pl. 1: 18. 1753.**

狸藻 li zao

Perennials, suspended aquatic. Rhizoids usually present, filiform, with dichotomously divided branches. Stolons filiform, branched. Traps on leaf segments, stalked, ovoid, 1.5–5 mm, mouth lateral; appendages 2, dorsal, simple or branched, setiform, with shorter simple lateral setae. Leaves numerous on stolons, 1.5–6 cm, divided from base into 2 unequal primary segments; primary segments ovate, elliptic, or ovate-oblong in outline, pinnately divided into secondary segments; secondary segments dichotomously divided into many further segments; ultimate segments capillary, slightly flattened, apically and laterally minutely setulose, without or sometimes with short marginal teeth. Inflorescences erect, 10–30 cm, 3–12-flowered, glabrous; peduncle terete, 1–2.4 mm thick; scales 1–4, similar to bracts; bracts basifixed, broadly ovate, 3–7 mm, base cordate to auriculate, apex acute to obtuse. Pedicel erect at anthesis but decurved in fruit, terete, 0.6–1.5 cm; bracteoles absent. Calyx lobes ovate, 2.5–5 mm, glandular; lower lobe slightly shorter than upper lobe, apex obtuse to emarginate; upper lobe apex acute to subacute. Corolla yellow, 1.2–2 cm; lower lip transversely elliptic to broadly ovate, base with prominent swelling, margin strongly deflexed, apex retuse; spur narrowly conic to narrowly cylindric from a conic base, shorter than or  $\pm$  as long as corolla lower lip, straight or curved upward, apex slightly obtuse; palate distal 1/2 covered with short hairs and stipitate glands; upper lip broadly ovate, ca.  $2 \times$  as long as upper calyx lobe, apex retuse to truncate. Filaments ca. 2 mm, curved; anther thecae  $\pm$  distinct. Ovary globose, densely glandular; style evident; stigma lower lip suborbicular and ciliate, upper lip truncate to broadly deltoid. Capsule globose, ca. 5 mm in diam., circumscissile. Seeds prismatic,  $0.3\text{--}0.4 \times 0.5\text{--}0.7$  mm, 4–6-angled, narrowly winged on all angles; seed coat with small prominent slightly elongate reticulations. Fl. Jun–Aug, fr. Jul–Sep.

*Lentibularia intermedia* (Hayne) Nieuwland & Lunell.

Perennials, usually affixed aquatic. Rhizoids usually present, filiform, with short dichotomously divided branches. Stolons filiform, sparsely branched, some green, others without chlorophyll. Traps lateral on reduced leaves on colorless stolons, stalked, ovoid, 1.5–4 mm, mouth lateral; appendages 2, dorsal, branched, setiform, with a few lateral simple setae. Leaves numerous on green stolons, suborbicular to elliptic in outline, 0.3–1.5(–2)  $\times$  0.4–1.8 cm, palmately divided from base into 2 or 3 primary segments; primary segments dichotomously divided from base into 2–5 further segments; ultimate segments flattened, narrowly linear, 0.2–0.7 mm wide, margin entire or sparsely denticulate, laterally and apically setulose. Inflorescences erect, 8–20 cm, 2–5-flowered, glabrous; peduncle terete, 0.4–0.8 mm thick; scales 1–3, similar to bracts; bracts basifixed, broadly ovate to ovate-deltoid, 2–4 mm, base conspicuously auriculate, apex acute. Pedicel erect, terete, 0.5–1.5 cm; bracteoles absent. Calyx lobes ovate, 3–5 mm; lower lobe slightly shorter than upper lobe, apex obtuse, shortly 2-cleft, or truncate; upper lobe apex acute. Corolla yellow, 0.9–1.5 cm; lower lip transversely elliptic, base with a prominent rounded swelling, apex rounded; spur subulate, slightly shorter than corolla lower lip, apex acute; palate glabrous; upper lip broadly ovate, apex rounded. Filaments ca. 2 mm, curved; anther thecae  $\pm$  confluent. Ovary globose, glandular; style relatively long; stigma lower lip circular and ciliate, upper lip deltoid and apex acute or 2-cleft. Capsule globose, 2.5–3 mm in diam., circumscissile. Seeds not seen. Fl. Jun–Sep.  $2n = 44$ .

Bogs, lakes, ponds; 300–4000 m. Heilongjiang, Jilin, Nei Mongol, W Sichuan, S and SE Xizang [Japan, Korea, Kyrgyzstan, Mongolia, Russia; Europe, North America].

**24. *Utricularia minor*** Linnaeus, Sp. Pl. 1: 18. 1753.

细叶狸藻 *xi ye li zao*

*Lentibularia minor* (Linnaeus) Rafinesque; *Utricularia minor* var. *multispinosa* Miki; *U. multispinosa* (Miki) Miki; *U. nepalensis* Kitamura; *U. rogersiana* Lace; *Xananthes minor* (Linnaeus) Rafinesque.

Perennials, usually affixed aquatic. Rhizoids absent. Stolons filiform, terete, sparsely branched, some green, others without chlorophyll. Traps lateral on leaf segments, shortly stalked, ovoid, 0.8–2.5 mm, mouth lateral; appendages 2, dorsal, long, branched, setiform, with a few lateral simple setae. Leaves numerous on green stolons, semicircular to suborbicular in outline, 2–15  $\times$  3–15 mm, palmately divided from base into 2 or 3 primary segments; primary segment dichotomously divi-

ded from base into 2–11 further segments; ultimate segments flattened, narrowly linear, 0.1–0.5 mm wide, margin entire or sparsely denticulate, apex acute, apex and teeth with or without microscopic setulae. Inflorescences erect, 5–20(–25) cm, 2–8-flowered, glabrous; peduncle terete, 0.3–1 mm thick; scales 2–4, similar to bracts; bracts basifixed, broadly ovate to ovate-deltoid, 1.5–2 mm, base conspicuously auriculate, apex acute to obtuse. Pedicel erect at anthesis but spreading and decurved in fruit, terete, 4–8 mm; bracteoles absent. Calyx lobes broadly ovate, 2–3 mm, subequal; lower lobe smaller, apex narrowly truncate; upper lobe apex subacute. Corolla lemon-yellow, 6–8 mm; lower lip broadly obovate, margin deflexed, apex rounded to retuse; spur saccate to obtusely broadly conic; palate elongate, with a raised marginal rim, distally narrowed and glandular; upper lip ovate to ovate-oblong, apex retuse. Filaments ca. 1.5 mm, curved; anther thecae  $\pm$  distinct. Ovary broadly ellipsoid; style relatively long; stigma lower lip broadly ovate and ciliate, upper lip deltoid and apex acute or 2- or 3-cleft. Capsule globose, 2–3 mm in diam., circumscissile. Seeds lenticular-prismatic,  $0.3\text{--}0.4 \times \text{ca. } 1$  mm, scarcely winged on angles; seed coat with small prominent  $\pm$  isodiametric reticulations. Fl. Aug–Sep, fr. Sep–Oct.  $2n = 40, 44$ .

Bogs, ponds, marshes; 3100–3700 m. Heilongjiang, Jilin, Nei Mongol, Shanxi, Sichuan, N Xinjiang, E Xizang, Yunnan [Afghanistan, Bhutan, India, Japan, Kashmir, Kyrgyzstan, Mongolia, Myanmar, Nepal, Pakistan, Papua New Guinea, Russia, Uzbekistan; SW Asia, Europe, North America].

**25. *Utricularia aurea*** Loureiro, Fl. Cochinch. 1: 26. 1790.

黄花狸藻 huang hua li zao

*Utricularia confervifolia* Jackson ex D. Don; *U. extensa* Hance; *U. fasciculata* Roxburgh; *U. flexuosa* Vahl; *U. pilosa* (Makino) Makino; *U. vulgaris* Linnaeus var. *pilosa* Makino.

Perennials or annuals, suspended aquatic. Rhizoids usually present, verticillate at base or shortly above base of peduncle, fusiform, inflated, with filiform branches. Stolons filiform to

relatively thick, branched. Traps on leaf segments, stalked, obliquely ovoid, 1–4 mm, mouth lateral or basal; appendages 2 or sometimes absent, dorsal, sparsely branched, setiform. Leaves numerous on stolons, 2–8 cm, divided from base into 3 or 4(or 5) semiverticillate primary segments; primary segments ovate to oblong-lanceolate in outline, 1.5–3 cm wide, pinnately divided into secondary segments; secondary segments dichotomously divided from base into numerous further segments; ultimate segments capillary, slightly flattened, laterally and apically setulose; stipulelike auricles usually present at base of primary segments, semicircular in outline, divided dichotomously into filiform sparsely setulose segments. Inflorescences erect, 5–25 cm, 3–10-flowered, glabrous; peduncle terete, 0.5–1.5 mm thick; scales absent; bracts basifixed, broadly ovate to orbicular, 1–2 mm, apex rounded. Pedicel erect at anthesis but sharply deflexed and thickened in fruit, 0.4–2 cm, dorsiventrally compressed; bracteoles absent. Calyx lobes ovate, subequal, apex rounded to subacute; lower lobe often slightly broader than upper lobe, 2–3 mm at anthesis, becoming fleshy, 7–9 mm, and spreading to reflexed in fruit. Corolla pale yellow, 1–1.5 cm, pubescent or glabrous; lower lip transversely elliptic, base with a prominent 2-lobed swelling, apex rounded to emarginate; spur cylindric from a narrowly conic base,  $\pm$  as long as and parallel with lower lip, straight or slightly curved, apex obtuse to subacute; palate pubescent; upper lip broadly ovate, apex rounded. Filaments 1–1.5 mm, curved; anther thecae  $\pm$  confluent. Ovary ovoid; style evident; stigma lower lip semicircular, upper lip obsolete. Capsule globose, 4–5 mm in diam., circumscissile; persistent style greatly enlarged and elongated, often equaling or exceeding capsule. Seeds prismatic, 1–2 mm wide, 5- or 6-angled, narrowly winged on all angles; seed coat with  $\pm$  isodiametric obscure reticulations. Fl. Jun–Nov, fr. Jul–Dec.  $2n = 80$ .

Pools, lakes, swamps, river backwaters, rice fields; near sea level to 2700 m. Anhui, Fujian, Guangdong, Guangxi, Guizhou, Hainan, Hubei, Hunan, Jiangsu, Jiangxi, Shandong, Taiwan, Yunnan, Zhejiang [Cambodia, India, Indonesia, Japan, Kashmir, Korea, Laos, Nepal, Pakistan, Papua New Guinea, Philippines, Sri Lanka, Thailand, Vietnam; Australia].

## MYOPORACEAE

苦檻藍科 ku jian lan ke

Hong Deyuan (洪德元)<sup>1</sup>; Robert J. Chinnock<sup>2</sup>

Prostrate or erect shrubs or small trees, glabrous, glandular papillate or covered with stellate, villous, or glandular simple or branched trichomes, often with embedded resin cavities protruding from vegetative and floral parts, viscid to resinous. Stipules absent. Leaves simple, alternate to densely spiral, more rarely opposite or whorled, sessile to petiolate; leaf blade margin entire, serrate, crenate, or rarely lobed. Inflorescences a reduced dichasial cyme of 1–12 axillary flowers; bracts absent. Flowers bisexual, rarely functionally male or female. Sepals (4 or) 5 (or 6–9), distinct, basally connate, or rarely forming a deep calyx tube, valvate or imbricate,  $\pm$  persistent. Corolla bilabiate, campanulate, rarely urceolate, actinomorphic, or zygomorphic, 5-lobed, lower lip 1–3-lobed, upper lip 2–4-lobed. Stamens 4(–8), inserted in corolla tube, alternate with corolla lobes, included or exserted; filaments filiform; anther cells confluent, reniform or sagittate. Gynoecium of 2 connate carpels; ovary superior, 2-carpelled, becoming 4(–12)-loculed by division of ovary; ovules 1–3 (or 4) per locule, pendulous, anatropous; stigma capitate. Fruit usually indehiscent, rarely semi-dehiscent or subschizocarpic, dry or drupaceous with fleshy or watery mesocarp; endocarp woody. Seeds with a straight or slightly curved embryo; endosperm absent or sparse.

Seven genera and ca. 250 species: tropical America, E and SE Asia, Australia, Indian Ocean islands (Mauritius and Rodrigues); one species in China.

The family has recently been monographed (R. J. Chinnock, *Eremophila* and allied genera: A monograph of the plant family Myoporaceae, 1–672. 2007), and *Pentacoelium* was re-instated as a genus distinct from *Myoporum* Banks & Solander ex G. Forster. Although *Pentacoelium* is comparable vegetatively with species of *Myoporum*, the flowers are much larger and the fruit are quite different. The fruit of *Pentacoelium* are large and the most complex in the family. The fruit are similar in size and internal structures to *Bontia* Linnaeus, a genus endemic to the Caribbean and surrounding coastal areas of South America. Both genera show fruit features that suggest adaptation to dispersal by water, but the fruit of *Pentacoelium* are more complicated with a star-shaped inner woody zone and up to 10 locules and subapical lacunae extending down into the fruit.

Li Zhenyu. 2002. Myoporaceae. In: Hu Chiachi, ed., Fl. Reipubl. Popularis Sin. 70: 310–313.

### 1. PENTACOELIUM Siebold & Zuccarini, Abh. Math.-Phys. Cl. Königl. Bayer. Akad. Wiss. 4(3): 151. 1846.

苦檻藍屬 ku jian lan shu

*Polycoelium* A. Candolle.

Shrubs, evergreen, slightly resinous, glandular papillate, glabrous. Leaves alternate, petiolate. Flowers axillary, solitary or in fascicles, pedicellate. Sepals 5, small, distinct, imbricate. Corolla regular to slightly zygomorphic. Stamens exserted. Fruit slightly fleshy at maturity but soon drying and exocarp separating from endocarp; exocarp papery; endocarp 2-zoned, outer zone light and spongy, inner zone 5–10-rayed star-shaped, hard, woody, and with a locule at base of each ray. Seed 1 per locule.

One species: restricted to coastal areas of SE China, S Japan, and N Vietnam.

**1. *Pentacoelium bontiioides*** Siebold & Zuccarini, Abh. Math.-Phys. Cl. Königl. Bayer. Akad. Wiss. 4(3): 151. 1846.

*Myoporum bontiioides* (Siebold & Zuccarini) A. Gray; *M. chinense* (A. Candolle) A. Gray; *Polycoelium bontiioides* (Siebold & Zuccarini) A. Candolle; *P. chinense* A. Candolle.

Shrubs 1–2 m tall. Stems erect, branched; twigs pale brown, terete, 3–5 mm in diam. Leaves alternate, glabrous; petiole 1–2 cm; leaf blade narrowly elliptic, elliptic, or oblanceolate-elliptic, 4–13  $\times$  1.5–4 cm, softly leathery, secondary veins 3 or 4 on each side of midvein, base attenuate, margin entire or rarely obscurely serrulate, apex acute to shortly acuminate and often mucronate. Flowers axillary, 1 or 2(–4) in fascicles. Pedicel 1–2.7 cm, apically thickened, glabrous. Sepals 5, ovate-

elliptic to triangular-ovate, 3.5–5.5 mm, with some translucent glands, glabrous, persistent, apex acute. Corolla white to pale pinkish purple with purple spots or streaks, funnel-shaped to campanulate, 5-lobed, outside glabrous; tube 1.2–1.5 cm, throat 5–6 mm broad; lobes ovate to broadly ovate, ca. 8 mm, inside basally sparsely pubescent, apex rounded. Stamens inserted in corolla tube ca. 1 mm from base, glabrous; filaments 1.5–1.8 cm; anthers ca. 2 mm. Gynoecium glabrous; ovary ovoid-spherical, ca. 2 mm, with 5–8 locules, apically tapering; style filiform, ca. 2.5 cm; stigma capitate, 5-lobed. Fruit purplish red but drying pale brown, ovoid-spherical, 1–1.5  $\times$  0.9–1.2 cm, fleshy, 5–8-ribbed when dry, apically tapering, glabrous, with 5–8 seeds. Fl. Apr–Jun, fr. May–Jul.

Sandy sites or stony thickets along coasts; near sea level. E Fujian, S Guangdong, S Guangxi (Fangcheng, Hepu), Hainan (Wanning, Xisha Qundao), W Taiwan, E Zhejiang (Dongtou) [S Japan, N Vietnam].

## PHRYMACEAE

透骨草科 *tou gu cao ke*

Hong Deyuan (洪德元)<sup>1</sup>; Jun Wen (文军)<sup>2</sup>

Herbs, annual or perennial [or subshrubs to shrubs], erect, prostrate, creeping to ascending. Stems 4-angular or winged or terete, occasionally highly reduced. Stipules absent. Leaves simple, opposite; leaf blade margin serrate or entire or variously toothed. Inflorescences a terminal [or axillary] spike [or a terminal raceme or a cyme] or flowers solitary and axillary. Flowers perfect, with [or without] a bract and a bracteole. Calyx connate, 5-lobed or dentate; lobes usually less than 1/3 of calyx length. Corolla connate, tubular or cylindric, 2-lipped; lower lip with 3 imbricate lobes; upper lip 2-lobed. Stamens [2 or] 4, inserted in corolla tube or exserted, anterior 2 longer; anthers longitudinally dehiscent. Gynoecium of 2 connate carpels; ovary superior, 1- or 2-locular; stigma broadly 2-lobed to 2-lipped, receptive only on inner surface and close together upon contact. Fruit an achene (in *Phryma*), loculicidal capsule (e.g., in *Mimulus* Linnaeus) [or occasionally berrylike (in *Leucocarpus* D. Don)]. Seeds numerous, rarely to 1, with an oblong embryo; endosperm scanty.

About 14 genera and 150 species: worldwide, especially well developed in W North America and Australia; two genera and six species (four endemic) in China; one species treated here, one genus and five species previously treated in Fl. China 18 (see comment below).

Z. Yu Li (in FRPS 70: 314–317. 2002) treated Phrymaceae to include only the genus *Phryma*, but recent studies have shown that the family should include a number of genera previously considered to be part of Scrophulariaceae. For China Phrymaceae now includes *Mimulus* with five species (four endemic), which has already been treated for the *Flora of China* in Scrophulariaceae (D. Y. Hong & N. H. Holmgren, Fl. China 18: 40–41. 1998), and *Phryma* with a single species. Two additional genera from Scrophulariaceae in China, *Mazus* Loureiro and *Lancea* J. D. Hooker & Thomson, were included in Phrymaceae by P. R. Beardsley and R. G. Olmstead (Amer. J. Bot. 89: 1093–1102. 2002), but we have excluded these two genera from Phrymaceae (see B. Oxelman et al., Taxon 54: 411–425. 2005; Z. Xia et al., Amer. J. Bot. 96: 519–530. 2009).

Yang Han-pi. 1979. *Mimulus*. In: Tsoong Pu-chiu & Yang Han-pi, eds., Fl. Reipubl. Popularis Sin. 67(2): 164–172; Li Zhenyu. 2002. Phrymaceae. In: Hu Chiachi, ed., Fl. Reipubl. Popularis Sin. 70: 314–317.

### 1. PHRYMA Linnaeus, Sp. Pl. 2: 601. 1753.

透骨草属 *tou gu cao shu*

*Leptostachia* Adanson (1763), not *Leptostachya* Nees (1832, nom. cons. prop.).

Herbs, perennial, erect. Stems 4-angular. Stipules absent. Leaves simple, opposite; leaf blade margin serrate. Inflorescences a terminal [or axillary] spike. Flowers perfect, each with a bract and a bracteole. Calyx connate, tubular, 5-ribbed; limb 2-lipped; abaxial lip with 2 short triangular lobes; adaxial lip with 3 apically ± hooked long subulate lobes. Corolla connate, tubular-funnelform; limb 2-lipped; abaxial lip larger, patent, with 3 imbricate lobes; adaxial lip erect, margin subentire but apically emarginate or shallowly 2-lobed. Stamens 4, inserted in corolla tube, anterior 2 longer; filaments filiform; anthers dorsifixed, cells parallel, not convergent at apex, longitudinally dehiscent. Gynoecium pseudomonomerous (2-carpellate with 1 carpel reduced developmentally); ovary superior, 1-locular, with basal placentation and 1 orthotropous ovule; style single, apical, elongate; stigma 2-lipped. Fruit an achene, enveloped in persistent calyx, 1-seeded. Seeds with an oblong embryo; endosperm thin, with 2 layers of cells.

One species: E and S Asia, E North America.

**1. *Phryma leptostachya* Linnaeus subsp. *asiatica* (H. Hara) Kitamura, Acta Phytotax. Geobot. 17: 7. 1957.**

透骨草 *tou gu cao*

*Phryma leptostachya* var. *asiatica* H. Hara, Enum. Sperm. Jap. 1: 297. 1948; *P. asiatica* (H. Hara) O. Degener & I. Degener; *P. esquirolii* H. Léveillé; *P. humilis* Koidzumi; *P. leptostachya* var. *humilis* (Koidzumi) H. Hara; *P. leptostachya* var. *melanostachya* Kitagawa; *P. leptostachya* var. *nana* (Koidzumi) H. Hara; *P. leptostachya* var. *oblongifolia* (Koidzumi) Honda; *P. nana* Koidzumi; *P. oblongifolia* Koidzumi.

Herbs, perennial, (10–)30–80(–100) cm tall. Stems simple or sometimes with apical branches bearing inflorescences, erect,

4-angular, apically pubescent or rarely subglabrous. Leaves petiolate or sometimes apical ones sessile; petiole to 4 cm, puberulent; leaf blade ovate-oblong, ovate-lanceolate, ovate-elliptic, ovate-triangular, or broadly ovate, 1–16 × 1–8 cm, herbaceous, both surfaces puberulent and sometimes more densely so along veins, secondary veins 4–6 on each side of midvein, base cuneate, rounded, or truncate but often decurrent for middle and basal leaves, margin serrate, dentate, or crenulate, apex acuminate, acute, or rarely subrounded. Spikes terminal or axillary, puberulent; peduncle 3–20 cm; inflorescence axis 10–30 cm; bracts subulate to linear, 1–2.5 mm. Pedicel short, erect at anthesis but later reflexed; bracteoles 2, at base of pedicel, subulate to linear, 0.5–2 mm. Calyx tubular, 5-ribbed, puberulent

<sup>1</sup> State Key Laboratory of Systematic and Evolutionary Botany, Institute of Botany, Chinese Academy of Sciences, 20 Nanxincun, Xiangshan, Beijing 100093, People's Republic of China.

<sup>2</sup> United States National Herbarium, Department of Botany, National Museum of Natural History, MRC-166, Smithsonian Institution, P.O. Box 37012, Washington, DC 20013-7012, U.S.A.

outside; tube 2.5–3.2 mm at anthesis; abaxial teeth 2, triangular, ca. 0.3 mm; adaxial teeth 3, subulate, 1.2–2.3 mm, apex  $\pm$  hooked. Corolla light purplish, pale red, to white, tubular-funnelform, 6.5–7.5 mm, glabrous outside; tube 4–4.5 mm, ca. 1.5 mm broad at mouth, inside anteriorly puberulent; limb 2-lipped; abaxial lip 2.5–3 mm, apex 3-lobed with central lobe larger; adaxial lip erect, 1.3–2 mm, apex 2-lobed. Stamens inserted in corolla tube 2.5–3 mm from base, glabrous; filaments filiform, 1.5–1.8 mm, anterior 2 longer; anthers reniform-spherical, 0.3–0.4  $\times$  ca. 0.5 mm. Gynoecium glabrous; ovary obliquely oblong-lanceolate, 1.9–2.2 mm; style 3–3.5 mm; stigma 2-lipped, basal lip longer and oblong. Achene long ellipsoid, enveloped in persistent clavate calyx; persistent calyx tube 4.5–6 mm. Fl. Jun–Oct, fr. Aug–Dec.

Moist ravines, forests, roadsides, mountain slopes, hillsides; 300–2800 m. Anhui, Chongqing, Fujian, S Gansu, Guangxi, Guizhou, Hebei, Heilongjiang, Henan, Hubei, Hunan, Jiangsu, Jiangxi, Jilin, Liaoning, Nei Mongol, Shaanxi, Shandong, Shanxi, Sichuan, Taiwan, Xizang (Bomi, Gyirong), Yunnan, Zhejiang [Bhutan, N India, Japan, Kashmir, Korea, Nepal, N Pakistan, Russia (Far East), N Vietnam].

*Phryma leptostachya* subsp. *leptostachya* occurs in North America, from SE Canada to SE United States, W to South Dakota. The two intercontinental subspecies are morphologically highly similar, with the North American typical subspecies different in general from subsp. *asiatica* by having calyx tube 2–2.2 mm, adaxial calyx teeth nearly as long as calyx tube at anthesis, and adaxial corolla lip entire or emarginate. Yet they are genetically highly distinct (Z. Nie et al., Amer. J. Bot. 93: 1343–1356. 2005).

## PLANTAGINACEAE

车前科 che qian ke

Li Zhenyu (李振宇)<sup>1</sup>, Wei Lai (魏来)<sup>1</sup>; Ronald K. Hoggard<sup>2</sup>

Herbs or small shrubs, rarely arborescent. Stipules absent. Leaves spirally alternate, usually in a basal rosette, rarely opposite or whorled, simple; leaf blade veins (1 or)3–11, arcuate. Inflorescences spikes, rarely racemes or 1-flowered, pedunculate, each flower with 1 bract. Flowers small, protogynous, bisexual, rarely polygamous or unisexual. Calyx usually 4-parted, persistent, segments imbricate. Corolla scarious or membranous, gamopetalous, actinomorphic or rarely zygomorphic, (3 or)4-lobed; lobes imbricate. Stamens (1 or 2 or)4, inserted on corolla tube, alternate with lobes; anthers free, versatile, with an apical appendage, thecae 2 and parallel. Pistil consisting of 2 carpels; ovary superior, (1 or)2-loculed, axile or rarely basal; style 1, filiform, mostly longitudinally stigmatic. Fruit a pyxis, rarely an indehiscent capsule or nutlet, with 1 to numerous seeds. Seeds minute; cotyledons narrow; endosperm fleshy.

Two genera and more than 210 species: cosmopolitan; one genus and 22 species (three endemic, four introduced) in China.

Li Zhenyu. 2002. Plantaginaceae. In: Hu Chiachi, ed., Fl. Reipubl. Popularis Sin. 70: 318–345.

### 1. PLANTAGO Linnaeus, Sp. Pl. 1: 112. 1753.

车前属 che qian shu

*Bougueria* Decaisne; *Psyllium* Miller.

Herbs, or rarely small shrubs or arborescent, annual, biennial, or perennial, acaulescent or infrequently stemmed, with a taproot, caudex, or only numerous fibrous roots. Leaves simple; petiole vaginate at base; leaf blade ovate, elliptic, oblong, lanceolate, linear, or subulate, margin entire, repand, erose, or toothed, rarely pinnately or palmately cleft. Inflorescences arising from rosette or leaf axil of stem, spikes, narrowly cylindric, capitate, or rarely 1-flowered. Corolla salverform or tubular, persistent; tube cylindric or constricted at throat, as long as or slightly longer than calyx; limb 4-parted. Stamens (1 or 2 or)4; anthers ovoid, suborbicular, ellipsoid, or oblong. Ovary 2-loculed or rarely 1-locular but sometimes with an apical third compartment, placentation axile or rarely basal, with 1 to numerous ovules per locule. Fruit a pyxis, rarely an indehiscent capsule or nutlet, with 1 to numerous seeds. Seeds peltately inserted; testa mucilaginous when wet; embryo straight; cotyledons parallel or vertical to ventral (hilum) side.

About 200 species: cosmopolitan; 22 species (three endemic, four introduced) in China.

- 1a. Stem erect, with elongated internodes; leaves opposite, rarely in whorls of 3; corolla brownish ..... 22. *P. arenaria*
- 1b. Stem absent or very short; leaves usually in basal rosette, rarely densely alternate; corolla white or yellowish.
  - 2a. Plant with only fibrous roots.
    - 3a. Leaf blade lanceolate to linear-lanceolate, 3–4 × as long as wide; corolla yellowish; anthers 1.8–2.2 mm ..... 7. *P. fengdouensis*
    - 3b. Leaf blade broadly ovate to broadly elliptic, less than 2 × as long as wide; corolla white; anthers 0.8–1.5 mm.
      - 4a. Flower sessile; pyxis circumscissile at or just below middle, with (8–)12–14(–34) seeds; seeds 0.8–1.2 mm ..... 3. *P. major*
      - 4b. Flower shortly pedicellate; pyxis circumscissile near base, with (2–)5–15 seeds; seeds (1.2–)1.3–2 mm.
        - 5a. Sepals acuminate at apex, keel projecting beyond apex; anthers ca. 0.8 mm ..... 5. *P. cavaleriei*
        - 5b. Sepals obtuse or acute at apex, keel not projected at apex; anthers 1–1.5 mm.
          - 6a. Petiole not winged at middle; corolla lobes narrowly triangular; anthers 1–1.2 mm ..... 4. *P. asiatica*
          - 6b. Petiole broadly winged; corolla lobes ovate to broadly ovate; anthers ca. 1.5 mm ..... 6. *P. gentianoides*
    - 2a. Plant with a taproot.
      - 7a. Leaf blade broadly ovate to elliptic, veins 7–11; petiole retrorsely pubescent; stamens adnate to near base of corolla tube.
        - 8a. Plants turning black when dry; petiole longer than or equaling blade, not winged; bracts glabrous ..... 1. *P. maxima*
        - 8b. Plants not turning black when dry; petiole much shorter than blade, winged; bracts pubescent ..... 2. *P. media*
      - 7b. Leaf blade obovate, elliptic, lanceolate, or linear, veins 1–5(or 7); petiole with patent, appressed upward, or rarely entangled trichomes; stamens adnate to middle of corolla tube or more apically.
        - 9a. Corolla tube pubescent or lobes hirsute-villous outside.

<sup>1</sup> Institute of Botany, Chinese Academy of Sciences, 20 Nanxincun, Xiangshan, Beijing 100093, People's Republic of China.

<sup>2</sup> Robert Bebb Herbarium, 770 Van Vleet Oval, University of Oklahoma, Norman, Oklahoma 73019-0245, U.S.A.

- 10a. Leaf blade papery, sparsely villous; corolla lobes densely hirsute-villous outside; stamens adnate to near apex of corolla tube ..... 20. *P. lagocephala*
- 10b. Leaf blade leathery, sparsely strigillose or glabrous; corolla tube pubescent; stamens adnate to middle of corolla tube ..... 21. *P. maritima*
- 9b. Corolla glabrous.
  - 11a. Lower sepals connate to near apex; stamens adnate to middle of corolla tube ..... 16. *P. lanceolata*
  - 11b. All sepals distinct; stamens adnate to or near apex of corolla tube.
    - 12a. Bracts with linear to subulate apex, much longer than flower ..... 17. *P. aristata*
    - 12b. Bracts with obtuse or acute apex, shorter, equaling, or slightly longer than flower.
      - 13a. Leaf blade glabrous or abaxially pubescent, vein 1; seeds 7–30 per pyxis, fusiform.
        - 14a. Bracts broadly ovate to suborbicular; sepals broadly elliptic to orbicular; pyxis with 12–30 seeds ..... 14. *P. polysperma*
        - 14b. Bracts ovate; sepals obovate; pyxis with 7–15 seeds ..... 15. *P. tenuiflora*
      - 13b. Leaf blade hairy on both surfaces, veins (1 or) 3–7; seeds 1–4 per pyxis, ellipsoid to oblong.
        - 15a. Leaf blade elliptic, ovate-lanceolate, obovate-lanceolate, or spatulate, usually more than 1 cm wide.
          - 16a. Leaf blade spatulate to obovate-lanceolate, veins (3 or) 5; flowers heteromorphic; corolla yellowish, lobes erect when flowers fertile; seeds 2 per pyxis, ventral surface grooved ..... 8. *P. virginica*
        - 16b. Leaf blade elliptic to ovate-lanceolate, rarely obovate-elliptic, veins 5 or 7; flowers homomorphic; corolla white, lobes patent to reflexed; seeds 4 per pyxis, ventral surface flat or prominent but not grooved.
          - 17a. Bracts triangular-ovate; corolla lobes 0.5–1 mm; anthers white; pyxis 4–5 mm ..... 9. *P. depressa*
          - 17b. Bracts ovate-elliptic; corolla lobes 1–1.5 mm; anthers reddish brown; pyxis 2.5–3 mm ..... 10. *P. camtschatica*
    - 15b. Leaf blade ± linear to narrowly lanceolate or narrowly elliptic, usually less than 1 cm wide.
      - 18a. Leaf blade arachnoid or silky villous; spikes cylindric to narrowly cylindric.
        - 19a. Leaf blade arachnoid, veins 1 or 3, margin entire or repand-crenate; spikes 1–2.5(–5) cm; flowers dense; anthers ca. 1.2 mm ..... 13. *P. arachnoidea*
        - 19b. Leaf blade sparsely silky villous, veins 3 or 5, margin remotely and retrorsely denticulate or triangular dentate; spikes 4–10 cm; flowers usually interrupted at base; anthers ca. 2 mm ..... 12. *P. perssonii*
      - 18b. Leaf blade villous or lanate; spikes capitate or ovoid at first but later shortly cylindric.
        - 20a. Keel not extending to apex of sepals; seeds 3 or 4 per pyxis, black, (1–)1.5–2 mm, ventral face flat; cotyledons parallel to ventral side ..... 11. *P. komarovii*
        - 20b. Keel extending to apex of sepals; seeds 1 or 2 per pyxis, yellowish brown to brown, (2–)3–4 mm, ventral face with a groove; cotyledons vertical to ventral side.
          - 21a. Plants with short stems, usually branched at base; corolla lobes orbicular-ovate ..... 18. *P. ovata*
          - 21b. Plants stemless; corolla lobes elliptic to narrowly ovate ..... 19. *P. minuta*

1. *Plantago maxima* Jussieu ex Jacquin, Collectanea 1: 82. 1787.

巨车前 ju che qian

Herbs, perennial, robust. Taproot cylindric. Leaves basal; petiole 8–20 cm, densely retrorsely pubescent; blade broadly elliptic, broadly ovate, or broadly obovate, 8–20 × 5–14 cm, thickly papery, turning black when dry, white pubescent, veins

7–11, base broadly cuneate to decurrent onto petiole, margin entire or remotely repand-crenate, apex acute to rounded. Spikes cylindric, 6–20 cm, densely flowered; peduncle 20–50 cm, pubescent; bracts narrowly ovate, slightly shorter than calyx, glabrous, keel apparent. Sepals narrowly elliptic to ovate-elliptic, 2.2–2.5 mm, glabrous, keel broad, extending to apex. Corolla white, glabrous; lobes ovate-lanceolate, 1.5–2 mm, patent to reflexed, apex acute. Stamens lilac turning black when

dry, adnate only to near base of corolla tube, exserted; anthers ovoid-ellipsoid, 1.6–1.8 mm. Pyxis ovoid, 3–4 mm, with 2–4 seeds. Seeds yellowish brown to black, ovoid to narrowly ovoid, 1.9–2.4 mm, ventral face prominent; cotyledons parallel to ventral side. Fl. Jun–Aug, fr. Aug–Sep.  $2n = 24$ .

Meadows; 500–1000 m. N Xinjiang (Altay, Yining) [Kazakhstan, Kyrgyzstan, Mongolia, Russia, Tajikistan, Turkmenistan, Uzbekistan; E Europe].

北车前 bei che qian

*Plantago media* var. *urvilleana* Rapin; *P. stepposa* Kupria-nova.

Herbs, perennial. Taproot cylindric, thick. Leaves basal; petiole 0.5–8 cm, winged, densely retrorsely pubescent; leaf blade elliptic, ovate, or obovate, 4.5–13 × 1.5–5 cm, papery to thickly papery, white pubescent, veins 7 or 9, base cuneate to attenuate, margin entire or remotely repand-crenate, apex acute. Spikes cylindric, 3–8 cm, densely flowered; peduncle 15–40(–45) cm, white pubescent; bracts narrowly ovate, 2–3 mm, basally and adaxially pubescent, keel thick, apex subacute. Sepals as long as bract, glabrous, keel not extending to apex; lower sepals ovate-elliptic to broadly ovate; upper sepals broadly ovate. Corolla white, glabrous; lobes ovate-elliptic to ovate, 1.7–2.3 mm, patent to reflexed. Stamens lilac turning black when dry, adnate to near base of corolla tube, exserted; anthers oblong, 1.7–1.9 mm. Pyxis ovoid-ellipsoid, 2.5–4 mm, with 2–4 seeds. Seeds yellowish brown to brown, ellipsoid, 1.5–2 mm, shiny, ventral face prominent; cotyledons parallel to ventral side. Fl. Jun–Aug, fr. Jul–Sep.  $2n = 12^*, 24$ .

Meadows, wet banks, ravines, mountain slopes, terraces; 1400–2000 m. Nei Mongol, Xinjiang [Kazakhstan, Kyrgyzstan, Russia (Far East, Siberia); SW Asia, Europe].

*Plantago gigas* H. Léveillé; *P. intermedia* Gilibert; *P. jehohlsensis* Koidzumi [“*jepohlsensis*”]; *P. macronipponica* Yamamoto; *P. major* var. *gigas* (H. Léveillé) H. Léveillé; *P. major* subsp. *intermedia* (Gilibert) Lange; *P. major* var. *jehohlsensis* (Koidzumi) S. H. Li; *P. major* var. *kimurae* Yamamoto; *P. major* var. *paludosa* Béguinot; *P. major* var. *pauciflora* (Gilibert) Béguinot; *P. major* subsp. *pleiosperma* Pilger; *P. major* var. *sawadae* Yamamoto; *P. major* var. *sinuata* (Lamarck) Decaisne; *P. pauciflora* Gilibert; *P. sawadae* (Yamamoto) Yamamoto; *P. sinuata* Lamarck; *P. villifera* Kitagawa (1935), not Franchet (1879).

Herbs, perennial. Roots numerous, fibrous. Leaves basal, pubescent to subglabrous; petiole 1–10(–26) cm; leaf blade broadly ovate to broadly elliptic, 3–18(–30) × 2–11(–21) cm, herbaceous to papery, veins (3 or) 5 or 7, base cuneate, subrounded, or cordate, ± decurrent onto petiole, margin remotely dentate to subentire, apex acute to obtuse. Spikes narrowly cylindric to cylindric, 1–20(–40) cm, usually interrupted basally; peduncle 2–18(–45) cm, pubescent; bracts broadly ovate-triangular, 1.2–2 mm, glabrous or pubescent at apex, keel broad and

thick. Flowers sessile. Sepals 1.5–2.5 mm, glabrous or ciliate, keel not extending to apex, apex rounded; lower sepals elliptic to broadly elliptic; upper sepals broader. Corolla white, glabrous; lobes narrowly ovate, 1–1.5 mm, patent to reflexed. Stamens adnate only to near base of corolla tube, exserted; anthers purplish or white, ellipsoid, 1–1.2 mm. Pyxis subglobose, ovoid, or broadly ellipsoid, 2–3 mm, circumscissile at or just below middle, with (8–)12–24(–34) seeds. Seeds yellowish brown, ovoid, ellipsoid, or rhomboid, 0.8–1.2 mm, angled, ventral face prominent to slightly flat; cotyledons parallel to ventral side. Fl. Jun–Aug, fr. Jul–Sep.  $2n = 12, 18, 24$ .

Meadows, wet places, wastelands; near sea level to 2800 m. Anhui, Chongqing, Fujian, Gansu, Guangxi, Hainan, Hebei, Heilongjiang, Henan, Jiangsu, Jilin, Liaoning, Nei Mongol, Qinghai, Shandong, Shanxi, Sichuan, Taiwan, Xinjiang, Xizang, Yunnan [India, Nepal, Pakistan; C, N, and SW Asia, Europe].

*Plantago major* is widely naturalized throughout much of the world.

**4. *Plantago asiatica* Linnaeus, Sp. Pl. 1: 113. 1753.**

Herbs, perennial. Roots numerous, fibrous. Leaves basal; petiole 2–15(–27) cm, sparsely pubescent; leaf blade broadly ovate to broadly elliptic, 4–12 × 2.5–6.5 cm, thinly papery to papery, sparsely pubescent, veins 3–7, base broadly cuneate to subrounded and decurrent onto petiole, margin entire, repand, serrate, or dentate, apex obtuse to acute. Spikes narrowly cylindric, 3–40 cm, loosely to densely flowered, sometimes interrupted basally; peduncle 5–30 cm, white pubescent; bracts narrowly ovate-triangular to triangular-lanceolate, 2–3 mm, glabrous or pubescent at apex, keel thick. Sepals 2–4 mm, keel extending or not extending to apex, apex obtuse, rounded, or acute; lower sepals elliptic, keel broad; upper sepals broadly obovate-elliptic to broadly obovate. Corolla white, glabrous; lobes narrowly triangular, (0.7–)1–1.5 mm, patent to reflexed, apex acuminate to acute. Stamens adnate only to near base of corolla tube, exserted; anthers white, ovoid-ellipsoid, 1–1.2 mm. Pyxis fusiform-ovoid, ovoid, conic-ovoid, or narrowly conic-ovoid, 3–6(–8) mm, circumscissile near base, with 5–15 seeds. Seeds blackish brown, ovoid-ellipsoid to ellipsoid, 1.2–2 mm, angled, ventral face prominent to slightly flat; cotyledons parallel to ventral side. Fl. Apr–Aug, fr. Jun–Sep.

Mountain slopes, ravines, riverbanks, fields, roadsides, wastelands, lawns; near sea level to 3800 m. Anhui, Chongqing, Fujian, Gansu, Guangdong, Guangxi, Guizhou, Hainan, Hebei, Heilongjiang, Henan, Hubei, Hunan, Jiangsu, Jiangxi, Jilin, Liaoning, Nei Mongol, Qinghai, Shandong, Shanxi, Sichuan, Taiwan, Xinjiang, Xizang, Yunnan, Zhejiang [Bangladesh, Bhutan, India, Indonesia, Japan, Korea, Malaysia, Nepal, Sri Lanka].

Although *Plantago asiatica* and *P. erosa* (*P. asiatica* subsp. *erosa*) have sometimes been treated as synonyms of *P. major* (J. Parnell, Fl. Thailand 9(2): 153. 2008), molecular evidence does not support this (N. Rensted et al., Bot. J. Linn. Soc. 139: 323–338. 2002; N. Ishikawa et al., Amer. J. Bot. 96: 1627–1635. 2009).

*Plantago gigas* H. Léveillé var. *cavaleriei* (H. Léveillé) H. Léveillé; *P. schneideri* Pilger; *P. schneideri* var. *delicior* Pilger.

Herbs, perennial. Roots numerous, fibrous. Leaves basal; petiole 5–12 cm; leaf blade broadly ovate to elliptic, (2.5–)3.5–10 × (1–)2–5 cm, papery, pubescent to subglabrous, veins 5(or 7), base broadly cuneate to rounded and decurrent onto petiole, margin entire, remotely serrate, or dentate, apex rounded to acute. Spikes narrowly cylindric, 3–20 cm, usually interrupted basally; peduncle 5–25 cm, pubescent; bracts broadly ovate to broadly ovate-triangular, 1–2.3 mm, keel projecting beyond apex, apex acuminate. Sepals 2–2.8 mm, keel projected at apex, apex acuminate; lower sepals ovate-elliptic, keel broad; upper sepals broadly ovate to broadly ovate-orbicular, keel narrow and obviously projected. Corolla white, glabrous; tube slightly longer than calyx; lobes narrowly triangular, 1–1.5 mm, patent to reflexed, apex acuminate. Stamens adnate only to near base of corolla tube, exserted; anthers white, ovoid, ca. 0.8 mm. Pyxis narrowly conic-ovoid, 4–4.5 mm, circumscissile near base, with 6–9 seeds. Seeds dark brown, ovoid to ellipsoid, angled, 1.2–1.8 mm, ventral face prominent; cotyledons parallel to ventral side. Fl. May–Aug, fr. Jul–Sep.

• Wet mountain valleys, riverbanks, lake banks, roadsides; 200–3500 m. Guizhou, S Sichuan (Meigu), Yunnan.

6. *Plantago gentianoides* Sibthorp & Smith subsp. *griffithii* (Decaisne) K. H. Rechinger, Fl. Iran. 15: 9. 1965.

革叶车前 ge ye che qian

*Plantago griffithii* Decaisne in A. Candolle, Prodr. 13(1): 700. 1852 [“*griffithsii*”]; *P. gentianoides* var. *laxa* Pilger; *P. gentianoides* var. *tatarica* (Decaisne) Pilger; *P. griffithii* var. *alpina* Bornmüller; *P. griffithii* var. *pamirica* Fedtschenko; *P. tatarica* Decaisne.

Herbs, perennial. Roots numerous, fibrous. Leaves basal, glabrous or sparsely pubescent when young; petiole 1–3(–4) cm, broadly winged; leaf blade thinly leathery to leathery when dry, ovate, broadly ovate, or broadly elliptic, (1–)2–6 × 1.5–2.5 cm, veins 3 or 5, base broadly cuneate to subrounded and decurrent onto petiole, margin entire, repand, or shallowly crenate below middle, apex acute to acuminate. Spikes capitate to cylindric, 1–3 cm, densely flowered or interrupted basally; peduncle 2–10 cm, apically appressed pubescent; bracts broadly ovate to broadly ovate-triangular, 2.2–2.5 mm, glabrous, keel broad but not extending to apex. Sepals 2–2.5 mm, glabrous, keel narrower than on bract and extending to apex; lower sepals broadly obovate-elliptic to broadly elliptic; upper sepals broadly elliptic to elliptic. Corolla white turning brown when dry, glabrous; lobes ovate to broadly ovate, 1.2–1.3 mm, patent to reflexed, apex sometimes emarginate. Stamens adnate only to near base of corolla tube, exserted; anthers yellowish brown when dry, ellipsoid, ca. 1.5 mm. Pyxis ellipsoid to ovoid, apex truncate, circumscissile near base, with 2–4(–7) seeds. Seeds brown to blackish brown, ellipsoid, ca. 2 mm, angled, ventral face flat;

cotyledons parallel to ventral side. Fl. Jun–Aug, fr. Aug–Sep.  $2n = 12$ .

Riverbanks, moist stony pastures; 3000–4300 m. SW Xinjiang, NW Xizang [Afghanistan, Kashmir, Kyrgyzstan, Pakistan; SW Asia (Iran)].

*Plantago gentianoides* subsp. *gentianoides* occurs in SE Europe and differs from subsp. *griffithii* by having leaf blade ovate-lanceolate to broadly ovate, herbaceous to papery when dry, base cuneate, apex acute, and anthers yellow when dry.

**7. *Plantago fengdouensis*** (Z. E. Chao & Yong Wang) Yong Wang & Z. Yu Li, *Acta Phytotax. Sin.* 42: 558. 2004.

丰都车前 feng du che qian

*Plantago erosa* Wallich var. *fengdouensis* Z. E. Chao & Yong Wang, *J. Wuhan Bot. Res.* 20: 263. 2002.

Herbs, perennial. Roots numerous, fibrous. Leaves basal; petiole 1.5–10 cm; leaf blade lanceolate to linear-lanceolate, 4–15 × 1–4 cm, thinly papery to papery, glabrous or white pubescent near sinus between lobes, veins 3 (or 5), base narrowly cuneate to decurrent onto petiole, margin dentate to incised, each side with 1–5 triangular to linear lobes or rarely repand, apex acute to acuminate. Spikes narrowly cylindric, 2–15 cm, densely flowered, loose or interrupted basally; peduncle 4–15 cm, glabrous; bracts ovate-triangular, 2–3 mm, apically ciliate, keel thick and extending to apex. Sepals elliptic, 2.2–2.7 mm, glabrous; lower sepals longer than upper ones, keel extending to or near apex, apex subacute to rounded. Corolla yellowish, glabrous; lobes narrowly triangular, 1.4–1.6 mm, patent to reflexed, apex acuminate. Stamens adnate only to near base of corolla tube, exserted; anthers yellow, ellipsoid-ovoid, 1.8–2.2 mm. Pyxis fusiform-ellipsoid, 3–4 mm, circumscissile just below middle, with 2 or 3 seeds. Seeds blackish brown, ellipsoid to ovoid-ellipsoid, sometimes angled, with a shallow groove on ventral face; cotyledons parallel to ventral side. Fl. Apr–May, fr. Apr–May.  $2n = 24^*$ .

● Seasonally inundated alluvial areas on islets; below 200 m. Chongqing (Banan Qu, Fengdu, Zhongxian).

*Plantago fengdouensis* is an amphibious plant with a highly restricted distribution, occurring only between 140 and 160 m on the three alluvial islets in Fengdu and Zhongxian counties and Bannan district within the Three Gorges Dam area. The natural habitats were permanently submerged by the water project in Jun 2003. The living plants are conserved at Wuhan Botanical Garden and Beijing Botanical Garden of the Chinese Academy of Sciences and were reintroduced to Fengdu in 2008.

**8. *Plantago virginica*** Linnaeus, *Sp. Pl.* 1: 113. 1753.

北美车前 bei mei che qian

Herbs, annual or winter annuals. Taproot tenuous. Leaves basal; petiole 0.5–5 cm, winged or not winged; leaf blade oblanceolate, spatulate, or obovate-lanceolate, (2–)3–18 × 0.5–4 cm, sparsely white pubescent, veins (3 or 5), base narrowly cuneate to decurrent onto petiole, margin repand, irregularly dentate, or subentire, apex acute to obtuse. Spikes narrowly cylindric, (1–)3–18 cm, base usually interrupted; peduncle 4–20 cm, hollow, densely white pubescent. Sepals as long as or slightly shorter than bract, pubescent; lower sepals obovate, keel not extending to apex; upper sepals broadly ovate, keel narrower

and projected at apex. Corolla yellowish, glabrous; lobes ovate-lanceolate, 1.5–2.5 mm, erect to reflexed, apex acuminate. Stamens adnate to near apex of corolla tube, included or exserted; anthers yellowish, narrowly ovoid to broadly ellipsoid, 0.3–1.1 mm. Pyxis ovoid, 2–3 mm, circumscissile near base, with 2 seeds. Seeds light brown, ovoid to narrowly ovoid, (1–)1.4–1.8 mm, with a shallow groove on ventral face; cotyledons parallel to ventral side. Fl. Apr–May, fr. May–Jun.  $2n = 12, 24$ .

Naturalized in grasslands, roadsides, and lake banks; near sea level to 800 m. Anhui, Chongqing, Fujian, Guangxi, Hubei, Hunan, Jiangsu, Jiangxi, Taiwan, Zhejiang [native to North America; naturalized in Central America, Europe, and Japan].

*Plantago virginica* was first collected in China in Nanchang Shi, Jiangxi, in 1951. In China this species usually has cleistogamous coxexual flowers. Cleistogamous female flowers and chasmogamous male flowers are rare. Cleistogamous coxexual flowers have erect corolla lobes, included anthers and stigma, and narrowly ovoid ca. 0.3 mm anthers. Cleistogamous female flowers are similar to coxexual flowers but with vestigial anthers and an exserted stigma. Chasmogamous male flowers have patent to reflexed corolla lobes, exserted stamens, broadly ellipsoid 1–1.1 mm anthers, and often a vestigial ovary.

In North America *Plantago virginica* is typically cleistogamous and coxexual; however, flowers, inflorescences, or entire plants are frequently chasmogamous and functionally male or cleistogamous with exserted stigmas and functionally female.

**9. *Plantago depressa*** Willdenow, *Enum. Pl. Suppl.* 8. 1813.

平车前 ping che qian

Herbs, annual, winter annual, or perennial. Taproot long, ± fleshy or becoming woody when old. Leaves basal, sparsely or densely white pubescent; petiole 2–7 cm; leaf blade elliptic, elliptic-lanceolate, obovate-elliptic, or ovate-lanceolate, 3–15 × 1–5.5 cm, papery, veins 5 or 7, base cuneate and decurrent onto petiole, margin repand-crenate, irregularly serrate, dentate, or entire, apex acute to obtuse. Spikes narrowly cylindric, 6–12 cm, densely flowered, interrupted basally; peduncle 5–18 cm, white pubescent; bracts triangular-ovate, 2–3.5 mm, glabrous, keel extending near or to apex. Sepals 2–2.5 mm, glabrous, keel not extending to apex; lower sepals narrowly obovate-elliptic to broadly elliptic; upper sepals obovate-elliptic to broadly elliptic. Corolla white, glabrous; lobes elliptic to ovate, 0.5–1 mm, patent to reflexed. Stamens adnate to near apex of corolla tube, exserted; anthers white, ovoid-ellipsoid to broadly ellipsoid, 0.6–1.5 mm. Pyxis ovoid-ellipsoid to conic-ovoid, 4–5 mm, circumscissile near base, with 4 seeds. Seeds yellowish brown to black, ellipsoid, 1.2–1.8 mm, ventral face prominent to slightly flat; cotyledons parallel to ventral side. Fl. May–Jul, fr. Jul–Sep.

Meadows, wet mountain slopes, riverbanks, wet places, fields, roadsides; near sea level to 4500 m. **13. *Plantago arachnoidea* Schrenk in Fischer & C. A. Meyer, Enum. Pl. Nov. 1: 16. 1841 [“*arachnoides*”].**

蛛毛车前 zhu mao che qian

*Plantago arachnoidea* var. *lorata* J. Z. Liu; *P. lorata* (J. Z. Liu) Shipunov.

Herbs, perennial. Taproot long and thick. Leaves basal, densely arachnoid; petiole 1.5–2.5 cm; leaf blade narrowly elliptic, lanceolate, or linear,  $2-8(-15) \times 0.3-1.2(-1.5)$  cm,

papery, veins 1 or 3, base attenuate, margin entire, repand, or repand-crenate, apex acute to acuminate. Spikes cylindric to narrowly cylindric, 1–2.5(–5) cm, densely flowered or interrupted basally; peduncle 5–20 cm; bracts broadly ovate to ovate, 2–3 mm, margin arachnoid, keel broad and not extending to apex. Sepals as long as bract, keel not extending to apex, margin and apex arachnoid; lower sepals broadly elliptic; upper sepals broadly obovate-elliptic to orbicular. Corolla white, glabrous; lobes broadly ovate, 1–1.5 mm, patent to reflexed, apex acute. Stamens adnate to near apex of corolla tube, exserted; anthers yellow when dry, ellipsoid, ca. 1.2 mm. Pyxis ovoid to narrowly ovoid, 3–4 mm, circumscissile near base, with 1 or 2 seeds. Seeds yellowish brown to blackish brown, oblong to ellipsoid, (1.5–)1.8–2.8 mm, ventral face flat; cotyledons parallel to ventral side. Fl. Jun–Jul, fr. Jul–Aug.

Stony mountain slopes, saline habitats, meadows; 700–3500 m. Xinjiang [Kazakhstan].

**14. *Plantago polysperma*** Karelin & Kirilov, Bull. Soc. Imp. Naturalistes Moscou 15: 431. 1842.

多籽车前 duo zi che qian

Herbs, annual. Taproot tenuous. Leaves basal, glabrous; petiole inconspicuous; leaf blade narrowly linear to filamentous-linear, 2–10 cm × 1–2(–3) mm, thickly papery, vein 1, base attenuate, margin entire, apex slightly obtuse. Spikes cylindric to capitate, 0.5–4 cm, elongated to 7 cm after anthesis, densely flowered or interrupted basally; peduncle 2–10 cm, sparsely white pubescent or glabrous; bracts broadly ovate to suborbicular, 1.7–2.3 mm, glabrous, keel extending to apex. Sepals 1.5–1.8 mm, glabrous, keel thin and extending to apex; lower sepals broadly elliptic; upper sepals suborbicular, keel narrow. Corolla white, glabrous; lobes ovate, ca. 1 mm, erect. Stamens adnate to near apex of corolla tube, exserted, covered with erect corolla lobes. Pyxis conic-ovoid, 3–4.5 mm, apex truncate, circumscissile near base, with 12–30 seeds. Seeds dark brown, fusiform, 1–1.5 mm; ventral face flat; cotyledons parallel to ventral side. Fl. May–Jun, fr. Jun–Jul.  $2n = 24$ .

Steppes, saline habitats, sandy areas. N Xinjiang [E Kazakhstan, W Mongolia, S Russia].

**15. *Plantago tenuiflora*** Waldstein & Kitaibel, Descr. Icon. Pl. Hung. 1: 37. 1802.

小花车前 xiao hua che qian

*Plantago bungei* Steudel; *P. pusilla* Bunge (1836), not Nuttall (1818).

Herbs, annual. Taproot tenuous. Leaves basal; petiole inconspicuous; leaf blade linear to narrowly linear, 1–13 × 0.1–0.4 cm, thickly papery, glabrous or abaxially sparsely white pubescent, vein 1, base attenuate, margin entire or remotely denticulate, apex subobtuse. Spikes capitate to narrowly cylindric, 0.5–7 cm, densely flowered or interrupted basally from middle; peduncle 1–12 cm, white pubescent; bracts narrowly ovate to ovate, 2–3 mm, glabrous, keel extending to apex. Sepals 1.5–2 mm, glabrous, keel extending to apex; lower sepals narrowly obovate to elliptic-ovate; upper sepals obovate. Corolla white, glabrous; lobes oblong-ovate, 0.8–1 mm, erect, patent, or re-

flexed, apex subacute. Stamens adnate to near apex of corolla tube, usually covered by erect corolla lobes, rarely exserted; anthers ovoid, ca. 0.3 mm. Pyxis conic-ovoid, 3–4 mm, circumscissile near base, with 7–15 seeds. Seeds reddish brown to blackish brown, fusiform, 1–1.5(–2) mm, ventral face flat; cotyledons parallel to ventral side. Fl. May–Jul, fr. Jun–Aug.  $2n = 24$ .

Saline meadows, alkaline soils; ca. 200 m. N Xinjiang (Junggar Pendi) [Kazakhstan, W Mongolia, S and SW Russia; SW Asia, Europe].

**16. *Plantago lanceolata*** Linnaeus, Sp. Pl. 1: 113. 1753.

长叶车前 chang ye che qian

Herbs, perennial. Taproot long and thick. Leaves basal, glabrous or pubescent; petiole tenuous, 2–10 cm; leaf blade linear-lanceolate, lanceolate, or elliptic-lanceolate, 6–20 × 0.5–4.5 cm, papery, veins (3 or)5(or 7), base narrowly cuneate and decurrent onto petiole, margin entire or remotely denticulate, apex acuminate to acute. Spikes conic-ovoid at first but later capitate to shortly cylindric, 1–5(–8) cm, densely flowered; peduncle 10–60 cm, 5-sulcate, appressed pubescent; bracts ovate to elliptic, 3.5–5 mm, densely hirsute, keel spatulate, apex scarious and caudate. Sepals 2–3.5 mm, abaxially usually hirsute, keel narrow and not extending to apex; lower sepals connate to near apex, broadly obovate, 2-keeled, margin with sparse trichomes; upper sepals distinct, broadly ovate. Corolla white, glabrous; lobes ovate-lanceolate, 1.5–3 mm, patent to reflexed, apex shortly acuminate. Stamens adnate to near middle of corolla tube, exserted; anthers white or yellowish, ellipsoid, 2.5–3 mm. Pyxis narrowly ovoid, 3–4 mm, circumscissile near base, with (1 or)2 seeds. Seeds brown to dark brown, narrowly ellipsoid to oblong, 2–2.6 mm, shiny, with a broad groove on ventral face; cotyledons vertical to ventral side. Fl. May–Jun, fr. Jul–Aug.  $2n = 12^*, 14, 24$ .

Seaside, meadows, boggy places, stony mountain slopes, gravel beds, sandy area, roadsides, wastelands; near sea level to 900 m. Gansu, Henan, Jiangsu, Jiangxi, Liaoning, Shandong, Taiwan, Xinjiang, Yunnan, Zhejiang [Bhutan, India, Japan, Kazakhstan, Korea, Kyrgyzstan, Mongolia, Nepal, Pakistan, Russia, Tajikistan, Turkmenistan, Uzbekistan; N Africa, SW Asia, Europe, North America].

**17. *Plantago aristata*** Michaux, Fl. Bor.-Amer. 1: 95. 1803.

芒苞车前 mang bao che qian

*Plantago aristata* var. *minuta* T. K. Zheng & X. S. Wan [“*munuta*”].

Herbs, annual or winter annual. Taproot tenuous. Stem 1–4 cm, erect, obscured by leaf sheaths. Leaves spirally alternate, densely villous to glabrate; petiole, inconspicuous; leaf blade elliptic-linear to linear, 4–20 × 0.1–0.9 cm, papery, veins 3, base attenuate and decurrent onto petiole, margin entire, apex acuminate. Spikes narrowly cylindric, (0.5–)3–10 cm, densely flowered; peduncle 10–20 cm, densely appressed villous; bracts narrowly ovate, basalmost 0.8–4 cm but reduced apically, erect to spreading, densely villous, apex with linear to subulate aristata. Sepals 2–3 mm, keel and apex densely pilose; lower sepals narrowly obovate, keel broad, thick, and not extending to apex; upper sepals ovate, keel narrow and extending to apex. Corolla yellowish, glabrous; lobes broadly ovate, 2–2.5 mm, patent to

reflexed, base nearly auriculate. Stamens adnate to near apex of corolla tube; anthers yellowish, ovoid, ca. 0.4 mm, included to slightly exerted. Pyxis ellipsoid to ovoid, 2.5–3 mm, circumscissile just below middle, with 2 seeds. Seeds brown, ellipsoid to oblong, (1.9–)2.3–2.7 mm, with a broad groove on ventral face; cotyledons vertical to ventral side. Fl. May–Jun, fr. Jun–Jul.  $2n = 20$ .

Naturalized in seaside sandy areas, wastelands, and roadsides; near sea level. Jiangsu (Suqian), Shandong (Qingdao) [native to North America; naturalized in E Asia and Europe].

*Plantago aristata* was first collected in China in Qingdao Shi in 1929.

**18. *Plantago ovata* Forsskål, Fl. Aegypt.-Arab. 31. 1775.**

圆苞车前 yuán bāo chē qián

*Plantago ispaghula* Roxburgh ex Fleming.

Herbs, annual. Taproot long and tenuous, rigid. Stem short, branched basally, internode 2–15 mm, densely white villous-lanate. Leaves spirally alternate, sparsely to densely white villous-lanate; petiole 2–5 cm, tenuous; leaf blade linear to linear-lanceolate, 3–15 cm × 1–6 mm, papery, veins 3, base attenuate and decurrent onto petiole, margin entire or remotely denticulate, apex with 1.5–5 mm subulate tip. Spikes ovoid and 0.5–2 cm at anthesis but narrowly ovoid to shortly cylindric and to 5 cm after anthesis, densely flowered; peduncle 3–22 cm, villous-lanate; bracts broadly ovate to orbicular, 3–4 mm, usually glabrous, keel extending to or near apex. Sepals 2.5–3 mm, keel extending to or near apex; lower sepals obovate-elliptic, glabrous or pubescent; upper sepals elliptic, glabrous. Corolla white, glabrous; lobes orbicular-ovate, 2.5–2.8 mm, patent to reflexed, apex acute. Stamens adnate to near apex of corolla tube, exerted; anthers yellowish brown when dry, ovoid, 0.9–1.3 mm. Pyxis ellipsoid, 4–5 mm, circumscissile near middle, with 2 seeds. Seeds yellowish brown, ellipsoid to ovoid-ellipsoid, 2.5–3 mm, with a groove on ventral face; cotyledons vertical to ventral side. Fl. May–Jun, fr. Jun–Jul.  $2n = 8^*$ , 16.

Introduced for the medicinal seeds, locally naturalized in margins of fields or grasslands; near sea level to 1500 m. Fujian (Xiamen), Xinjiang (Moyu) [native to Mediterranean region; naturalized in C, E, and S Asia and North America].

**19. *Plantago minuta* Pallas, Reise Russ. Reich. 3: 716. 1776.**

小车前 xiǎo chē qián

*Plantago lessingii* Fischer & C. A. Meyer; *P. minuta* subsp. *lessingii* (Fischer & C. A. Meyer) Tzvelev; *P. mongolica* Decaisne.

Herbs, annual. Taproot tenuous. Leaves basal; petiole inconspicuous; leaf blade linear, narrowly lanceolate, or spatulate-linear, 3–8 × 0.2–0.8 cm, rigidly papery, veins 3, base attenuate and decurrent onto petiole, margin entire, apex acuminate. Spikes capitate to shortly cylindric, 0.6–2 cm, densely flowered; peduncle (1–)2–12 cm, tenuous, along with rachis densely grayish to yellowish villous-lanate or sometimes glabrate; bracts broadly ovate to broadly triangular, 2.2–2.8 mm, ± villous or glabrous, keel extending to apex, apex obtuse. Sepals 2.7–3 mm, keel extending to apex, margin wide and scarious;

lower sepals elliptic to broadly elliptic; upper sepals broadly elliptic. Corolla white, glabrous; lobes elliptic to narrowly ovate, 1.4–2 mm, patent to reflexed, apex acute to erose. Stamens adnate to near apex of corolla tube, exerted to included; anthers yellow when dry, suborbicular, ca. 1 mm. Pyxis ovoid to broadly ovoid, 3.5–4(–5) mm, circumscissile near base, with 2 seeds. Seeds yellowish brown, ellipsoid-ovoid to ellipsoid, (2.5–)3–4 mm, shiny, with a broad groove on ventral face; cotyledons vertical to ventral side. Fl. Jun–Aug, fr. Jul–Sep.

Saline places, gravel beds, sandy areas, ravines, boggy places; 400–4300 m. Gansu, Nei Mongol, Ningxia, Qinghai, Shanxi, Xinjiang, Xizang [Kazakhstan, Mongolia, S and SW Russia].

**20. *Plantago lagocephala* Bunge, Mém. Acad. Imp. Sci. St.-Pétersbourg Divers Savans 7: 445. 1851.**

毛瓣车前 máo bàn chē qián

Herbs, annual. Taproot tenuous. Leaves and inflorescences villous. Leaves basal; petiole inconspicuous; leaf blade narrowly lanceolate, lanceolate, or oblanceolate, 3–4 cm × 2–3 mm, papery, veins 3, base attenuate, margin entire, apex acuminate. Spikes ovoid to ovoid-ellipsoid, 8–10 mm but to 1.6 cm after anthesis, densely flowered; peduncle 5–12 cm; bracts broadly ovate, ca. 3 mm, keel narrow and slightly projected at apex. Sepals ca. 3 mm, villous, keel thick and not extending to apex; lower sepals lanceolate-ovate, keel as broad as or slightly narrower than lateral lamina; upper sepals very inequilateral. Corolla yellowish, glabrous except lobes; lobes triangular-ovate, ca. 1 mm, erect to patent, outside densely hirsute-villous. Stamens adnate to near apex of corolla tube; anthers yellowish when dry, broadly ellipsoid, 0.7–0.8 mm, slightly exerted. Pyxis ellipsoid, 3–3.5 mm, circumscissile just below middle, with 2 seeds. Seeds yellowish brown, narrowly ellipsoid to narrowly ovoid-ellipsoid, 2.5–3 mm, shiny, with a broad groove on ventral face; cotyledons vertical to ventral side. Fl. Apr–May, fr. May–Jun.

Stony mountain slopes, saline places, open dry pastures; ca. 200 m. N Xinjiang (Shawan) [Afghanistan, Kazakhstan, Pakistan, Tajikistan, Turkmenistan, Uzbekistan].

**21. *Plantago maritima* Linnaeus subsp. *ciliata* Printz, Veg. Siber.-Mongol. Front. 397. 1921.**

盐生车前 yán shēng chē qián

*Plantago maritima* var. *salsa* (Pallas) Pilger; *P. salsa* Pallas.

Herbs, perennial. Taproot long and thick. Leaves basal, ± strigillose; petiole inconspicuous; leaf blade linear, (4–)7–32 cm × (1–)2–8 mm, leathery, veins (1 or)3 or 5, base attenuate and decurrent onto petiole, margin entire and plane to recurved, apex long acuminate. Spikes cylindric, (2–)5–17 cm, densely flowered or interrupted basally, rachis densely strigillose; peduncle (5–)10–30(–40) cm, white strigillose; bracts triangular-ovate to lanceolate-ovate, 2–2.5 mm, margin ciliolate, keel thick but not extending to apex, apex shortly acuminate. Sepals 2.2–3 mm, keel, margin, and apex hirsutulous, keel thick and not extending to apex; lower sepals narrowly elliptic, slightly inequilateral; upper sepals broadly elliptic. Corolla yellowish;

tube outside pubescent; lobes broadly ovate to oblong-ovate, ca. 1.5 mm, patent to reflexed, margin ciliolate. Stamens adnate to middle of corolla tube, exserted; anthers yellow when dry, ellipsoid, 1.8–2 mm. Pyxis conic-ovoid, 2.7–3 mm, with 1 or 2 seeds. Seeds yellowish brown to dark brown, ellipsoid to oblong, 1.6–2.3 mm, ventral face flat; cotyledons vertical to ventral side. Fl. Jun–Jul, fr. Jul–Aug.  $2n = 12$ .

Salt marshes, saline meadows; 100–3800 m. Gansu, Hebei, Nei Mongol, Qinghai, Shanxi, Xinjiang [Afghanistan, Kazakhstan, Kyrgyzstan, Mongolia, Russia (S Siberia); SW Asia].

*Plantago maritima* subsp. *maritima* occurs in Europe and differs from subsp. *ciliata* by having the margin of the corolla lobes glabrous.

**22. *Plantago arenaria*** Waldstein & Kitaibel, Descr. Icon. Pl. Hung. 1: 51. 1802.

对叶车前 dui yè che qian

*Plantago indica* Linnaeus; *P. psyllium* Linnaeus, nom. utique rej. prop.; *Psyllium arenarium* (Waldstein & Kitaibel) Mirbel; *P. indicum* (Linnaeus) Mirbel.

Herbs, annual. Taproot tenuous. Stems, leaves, inflorescences, and sepals white glandular pubescent. Stem erect, (10–) 20–60 cm tall, branched, internode elongate. Leaves cauline, opposite, seldom in whorls of 3; petiole inconspicuous; leaf blade linear to linear-lanceolate, 3–6(–8) cm × 1–4(–5) mm, papery, veins (1 or) 3, base decurrent onto petiole, margin entire,

apex acuminate. Inflorescences arising from leaf axil apically from middle of stem; spikes ovoid to ellipsoid, 0.7–2 cm, densely flowered; peduncle 2–8 cm; basalmost bracts 0.5–2 cm but reduced apically, base orbicular-ovate, apex cuspidate. Sepals broadly veined, keel broad and not extending to apex; lower sepals obovate, 3–4 mm, inequilateral; upper sepals narrowly elliptic, 2.7–3.5 mm. Corolla brownish, glabrous; tube transversely rugose; lobes narrowly ovate, 1.5–2 mm, patent to reflexed. Stamens adnate to near apex of corolla tube, exserted; anthers yellow, ellipsoid, 1.8–2.2 mm. Pyxis ellipsoid, 3.2–3.5 mm, circumscissile near base, with 2 seeds. Seeds brown to blackish brown, ovoid-ellipsoid to ellipsoid, 2.5–2.8 mm, shiny, with a broad groove on ventral face; cotyledons vertical to ventral side. Fl. Jul–Aug, fr. Aug–Oct.  $2n = 12$ .

Cultivated for its medicinal seeds, locally naturalized in sandy areas, meadows, and roadsides; 100–3500 m. Guangxi, Hebei, Jiangsu, Liaoning, Sichuan, Xinjiang, Xizang, Zhejiang [native to N Africa, SW Asia, Europe, Kazakhstan, Kyrgyzstan, Russia (W Siberia), and Tajikistan; naturalized in Australia, India, Japan, North America, and Pakistan].

Editors' note. The name *Plantago indica* Linnaeus (Syst. Nat., ed. 10, 2: 896. 1759) has been considered to be a nomenclaturally superfluous and therefore illegitimate renaming of *P. psyllium* Linnaeus (Sp. Pl. 1: 115. 1753). When a proposal to reject *P. psyllium* (Applequist, Taxon 55: 235–236. 2006) was considered by the Nomenclature Committee for Vascular Plants (Brummitt, Taxon 58: 281. 2009), rejection as proposed was recommended but the Committee also voted that *P. indica* is a legitimate name.

## SPHENOCLEACEAE

尖瓣花科 jian ban hua ke

Hong Deyuan (洪德元)<sup>1</sup>; Nicholas J. Turland<sup>2</sup>

Herbs annual, without latex. Leaves alternate, simple. Inflorescence a dense terminal or leaf-opposed spike, bracteate and bracteolate. Flowers sessile, bisexual, actinomorphic. Calyx epigynous, 5-lobed. Corolla epigynous, tubular, 5-lobed to middle. Stamens 5, inserted at proximal part of corolla tube, alternate with corolla lobes; filament extremely short; anther 2-celled. Ovary inferior, 2-loculed; ovules numerous, anatropous; placentation axile; stigma obscurely 2-lobed, lobes subcapitate. Fruit a capsule, oblate, circumscissile. Seeds numerous, oblong.

One species: widely distributed in Old World tropics, including China; introduced in New World tropics.

Sphenocleaceae are only superficially similar to Campanulaceae s.l., and molecular data place them securely in the Solanales. They lack latex; the style is short and without hairs; there is no secondary pollen presentation; and fruit dehiscence is circumscissile, immediately inside the calyx.

Hong De-yuan. 1983. Campanulaceae (Sphenocleioideae). In: Hong De-yuan, ed., Fl. Reipubl. Popularis Sin. 73(2): 176–177.

## CAMPANULACEAE

桔梗科 jī gēng kē

Hong Deyuan (洪德元)<sup>1</sup>, Ge Song (葛颂)<sup>1</sup>; Thomas G. Lammers<sup>2</sup>, Laura L. Klein<sup>2</sup>

Herbs, lactiferous, perennial (often with rhizomes or caudices), less often annual, [or shrubs or trees outside of China]. Leaves estipulate, alternate (rarely opposite or whorled), simple, entire or variously toothed or dissected, petiolate or sessile. Flowers tetracyclic, perfect, with a specialized method of proterandrous secondary pollen presentation, resupinate in Lobelioideae, solitary in an axillary or less often terminal position, or aggregated into terminal or axillary inflorescences that appear racemose or paniculate (rarely capitate), pedicellate or rarely sessile; bracts leaflike or reduced, rarely absent; pedicels often bracteolate. Calyx synsepalous, adnate to ovary and forming a hypanthium (free in *Cyananthus*); lobes (3–)5(–10), valvate, sometimes with a reflexed appendage in each sinus, in some *Codonopsis*, inserted well below rim of hypanthium. Corolla sympetalous, actinomorphic or zygomorphic, most often some shade of blue or violet, or white; lobes (4 or)5(–10), valvate. Stamens equaling number of corolla lobes, antisepalous, distinct, coherent, or connate; anthers tetrasporangiate, dithecal, introrsely dehiscent by longitudinal slits, basifixed. Gynoecium syncarpous, 2–5(–10)-locular with axile placentation, [rarely 1-locular with parietal, basal, or apical placentation outside of China]; ovary at least partly inferior (superior in *Cyananthus*), sometimes crowned by an annular or tubular nectary; style solitary, pubescent with pollen-collecting hairs below apex; stigma typically with as many lobes as ovary locules. Fruit a capsule, commonly apically loculicidal or laterally poricidal, or a berry. Seeds usually small, numerous; embryo small, straight; endosperm copious, oily or rarely starchy.

Eighty-six genera and over 2,300 species: cosmopolitan; 16 genera (one endemic, two introduced) and 159 species (77 endemic, two introduced) in China.

Two of us (Lammers and Klein) do not agree with the separation of *Leptocodon* and *Campanumoea* from *Codonopsis* in this treatment. We consider that the single character used in each case, five lamellar glands alternate with the stamens in *Leptocodon* and baccate fruit in *Campanumoea*, is not sufficient to justify recognition of a distinct genus. We regard these two genera as embedded within *Codonopsis*, as was done by Lammers (in C. I. Peng, *Phytogeogr. Bot. Invent. Taiwan*, 43–61. 1992), Morris and Lammers (*Bot. Bull. Acad. Sin.* 38: 277–284. 1997), Lammers (in T. C. Huang, *Fl. Taiwan*, ed. 2, 4: 775–802. 1998), Lammers (in Kubitzki [Kadereit & Jeffrey], *Fam. Gen. Vasc. Pl.* 8: 26–56. 2007), and Lammers (World Checkl. Bibliogr. Campanulaceae. 262–273. 2007). On the other hand, one of us (Hong) notes that two characters distinguish *Leptocodon* from *Codonopsis*. One is the five lamellar glands and the other is the shape of the stigma segments, which are clavate in *Leptocodon* but orbicular-deltoid in *Codonopsis*. *Campanumoea* differs from *Codonopsis* not only in having baccate fruit but also in its pollen, which is shortly 5-colpate (vs. 5–8-long-colpate in the core group of *Codonopsis*). *Campanumoea* is not a very distinct genus, and it seems that it would be equally reasonable to sink it into *Codonopsis* or to separate it. However, if it were sunk, then it would also be reasonable to sink *Adenophora* into *Campanula* because the former genus differs from the latter only in having a nectar disk around the style.

*Pentaphragma* Wallich ex G. Don and *Sphenoclea* Gaertner were included in Campanulaceae in FRPS but are treated in this volume as Pentaphragmataceae and Sphenocleaceae, respectively. See the notes under those two families.

Hong De-yuan, Lian Yong-shan & Shen Lian-dai. 1983. Campanulaceae (Campanuloideae and Lobelioideae). In: Hong De-yuan, ed., *Fl. Reipubl. Popularis Sin.* 73(2): 1–173.

T. G. Lammers. 1998. Campanulaceae. In: Tseng-Chieng Huang, ed., *Fl. Taiwan*, ed. 2, 4: 775–802.

- 1a. Flowers resupinate at anthesis; odd (unpaired) calyx lobe in a ventral (anterior) position prior to resupination; corolla zygomorphic (sometimes only slightly so); stamens connate, forming an asymmetric tube; locules and stigmas 2 (Lobelioideae).
- 2a. Corolla strongly zygomorphic, unilabiate or bilabiate, lobes  $\pm$  as long as tube or slightly shorter, tube cleft to base on dorsal surface; staminal column free from corolla, exerted from dorsal fissure of corolla ..... 15. *Lobelia*
- 2b. Corolla scarcely zygomorphic, salverform, lobes less than 1/3 as long as tube, tube entire; staminal column adnate to corolla below middle, scarcely exerted from mouth of corolla ..... 16. *Hippobroma*
- 1b. Flowers oriented normally; odd (unpaired) sepal in a dorsal (posterior) position; corolla actinomorphic; stamens distinct or coherent into a symmetric tube at anthesis but eventually separating; locules and stigmas (2 or)3–6 (Campanuloideae).
- 3a. Fruit a berry; ovary and fruit apically flat.
  - 4a. Herbs twining; calyx lobes ovate-deltoid or ovate-lanceolate, margin entire ..... 4. *Campanumoea*
  - 4b. Herbs erect; calyx lobes linear or linear-lanceolate, margin dentate, rarely entire ..... 5. *Cyclocodon*
- 3b. Fruit a capsule; ovary and fruit apically conical.
  - 5a. Fruit dehiscent apically (i.e., above calyx lobes).
    - 6a. Calyx completely free from ovary, inserted below it; corolla and stamens inserted below ovary ..... 1. *Cyananthus*
    - 6b. Calyx tube adnate to ovary, forming a hypanthium (though lobes sometimes apparently inserted

<sup>1</sup> State Key Laboratory of Systematic and Evolutionary Botany, Institute of Botany, Chinese Academy of Sciences, 20 Nanxincun, Xiangshan, Beijing 100093, People's Republic of China.

- at base or middle rather than its rim); corolla and stamens inserted on rim of hypanthium (i.e., atop ovary).
- 7a. Glands 5, alternate with stamens, orbicular, compressed; herbs twining ..... 2. *Leptocodon*
- 7b. Glands absent; herbs erect, climbing, or twining.
- 8a. Taproot greatly thickened, carrotlike or tuberous; flowers large, corolla 15–50 mm; stigmas ovoid or orbicular,  $\pm$  as long as broad.
- 9a. Plants not malodorous; stems erect or ascending; locules 5, alternating with calyx lobes ... 7. *Platycodon*
- 9b. Plants often malodorous; stems often scandent, climbing, or twining; locules 3 ..... 3. *Codonopsis*
- 8b. Taproot fibrous or but scarcely thickened; flowers small, corolla 2–12 mm; stigmas filiform or linear, much longer than broad.
- 10a. Leaves pinnately lobed or parted; calyx lobes echinate; corolla lobes and stamens typically 4; pollen 4- or 5-colpate; seeds triquetrous ..... 6. *Echinocodon*
- 10b. Leaves entire or toothed; calyx lobes entire or toothed; corolla lobes and stamens typically 5; pollen 3-porate; seeds terete or compressed ..... 8. *Wahlenbergia*
- 5b. Fruit dehiscing laterally (i.e., below calyx lobes).
- 11a. Corolla rotate, lobed for 1/2 or more its length.
- 12a. Plants annual, roots fibrous; flowers both chasmogamous and cleistogamous, latter often predominating; corolla lobes cut for 1/2–3/4 their length, lanceolate ..... 13. *Triodanis*
- 12b. Plants perennial, root carrotlike; flowers all chasmogamous; corolla lobes divided to base, linear ..... 14. *Asyneuma*
- 11b. Corolla campanulate, lobed less than 2/5 its length.
- 13a. Flowers large, corolla typically 15–75 mm; fruit dehiscing via 2 or 3 definite pores in firm sclerenchymatous pericarp.
- 14a. Flowers without an obvious nectar disk ..... 9. *Campanula*
- 14b. Flowers with a conspicuous tubular (rarely annular) nectar disk ..... 10. *Adenophora*
- 13b. Flowers small, corolla 5–12 mm; fruit dehiscing irregularly via ruptures and tears of membranous or papery pericarp.
- 15a. Plants perennial via tuberiferous stolons; stems terete; flowers long pedicellate; seeds > 1.5 mm, testa finely striate ..... 11. *Peracarpa*
- 15b. Plants annual; flowers sessile; stems 3-winged; seeds < 1 mm, testa reticulate ..... 12. *Homocodon*

**1. CYANANTHUS** Wallich ex Benth in Royle, Ill. Bot. Himal. Mts. 1: 309. 1836,  
nom. cons., not Rafinesque (1815).

蓝钟花属 lan zhong hua shu

Hong Deyuan (洪德元); Thomas G. Lammers, Laura L. Klein

Herbs, annual or perennial, caudices of latter thick, lignified, covered with numerous scales, usually branched, stems thus caespitose. Leaves alternate, but sometimes 4 or 5 leaves aggregated below pedicel, appearing whorl-like. Flowers solitary, terminal on main stems and branches, rarely in a dichasium and dichasia aggregated on top of stem and branches, pedicellate. Calyx tubular or tubular-campanulate, 5- or rarely 4-lobed. Corolla tubular-campanulate, (3–)5-lobed. Stamens 5, often aggregated and surrounding ovary at upper part. Ovary superior, conical, mostly 5-locular, less frequently 4- or 3-locular. Fruit a capsule, loculicidal. Seeds numerous, brown-red or brown-black.

Eighteen species: Himalaya and the Hengduan Mountains; 17 species (nine endemic) in China.

- 1a. Plant annual, lacking a caudex (3. *C.* sect. *Annui*).
- 2a. Plants dwarf, less than 20 cm tall; flowers almost sessile, typically 4-merous; corolla usually less than 10 mm, rarely up to 15 mm ..... 17. *C. hookeri*
- 2b. Plants taller; flowers pedicellate, typically 5-merous; corolla usually more than 15 mm.
- 3a. Calyx covered with red-brown setae, base of setae swollen, black verrucose; calyx lobes obovate-oblong, broadest at middle or above middle; corolla pale yellow or white ..... 14. *C. lichiangensis*
- 3b. Calyx villous; calyx lobes sublinear or triangular, broadest below middle; corolla blue or blue-purple.
- 4a. Leaves glabrous or sparsely puberulent; flowers in dichasia, fascicled at top of stem; calyx lobes linear ..... 15. *C. fasciculatus*
- 4b. Leaves hairy; flowers solitary, terminal on top of stem and branches, rarely 3–5-fascicled; calyx lobes triangular ..... 16. *C. inflatus*
- 1b. Plant perennial with a robust caudex densely clothed in persistent and straw-colored scales.
- 5a. Calyx with brown-black setae, sometimes mixed with other hairs; corolla lobes suborbicular, broadly ovate, or oblong, as long as or slightly longer than broad (2. *C.* sect. *Cyananthus*).

- 6a. Calyx covered with brown-black and white setae; stems sparsely arachnoid.
  - 7a. Leaf blade cordate to triangular-ovate, base cordate or rounded, margin obviously crenulate ..... 12. *C. cordifolius*
  - 7b. Leaf blade linear-elliptic, base cuneate, margin entire or sinuous ..... 13. *C. sherriffii*
- 6b. Calyx covered with only brown-black setae; stems villous, scaberrulose, or sericeous.
  - 8a. Leaves less than 11 mm ..... 11. *C. microphyllus*
  - 8b. Leaves more than 10 mm.
    - 9a. Leaf blade usually oblanceolate, spatulate, or obovate, margin with 3–9 obtuse lobes above middle ..... 8. *C. lobatus*
    - 9b. Leaf blade elliptic or ovate-lanceolate, margin entire or sinuous-crenulate above middle.
      - 10a. Leaves hispidulous on both surfaces; pedicels 12–32 mm; no leaves aggregated below pedicels ..... 9. *C. pedunculatus*
      - 10b. Leaves adaxially glabrous, abaxially densely sericeous; pedicels 5–12 mm; several leaves aggregated below pedicels, whorl-like ..... 10. *C. sericeus*
- 5b. Calyx glabrous or covered with hairs other than brown-black setae; corolla lobes usually oblong, longer than broad (1. *C. sect. Stenolobi*).
  - 11a. Flowers several on a stem in racemelike inflorescence; leaves ovate-lanceolate, abaxially densely sericeous; margin strongly recurved ..... 7. *C. longiflorus*
  - 11b. Flowers solitary and terminal on a stem; leaves rhombic, flabellate, spatulate, or ovate, rarely lanceolate, rarely sericeous, margin spreading or slightly recurved.
    - 12a. Leaves usually rhombic, flabellate, or spatulate, (2–)2.5–4.8(–5.5) mm, base usually truncate or broadly cuneate, obviously petiolate.
      - 13a. Flowers 1.6–2.4 cm; leaves rhombic, base broadly cuneate ..... 1. *C. delavayi*
      - 13b. Flowers 2.5–4.8 cm; leaves spatulate to rhombic, margins serrate to sinuous-crenulate, rarely entire ..... 2. *C. formosus*
    - 12b. Leaves usually spatulate, elliptic, ovate, or obovate-lanceolate, (3–)4.5–16 mm, base cuneate or rounded, attenuate into shortly petiolate, or leaves sessile.
      - 14a. Plants densely covered with long yellow-brown appressed hairs except corolla; scales on caudexes 10–15 × ca. 3 mm; corolla 3–4 cm, lobed to 1/3 ..... 4. *C. wardii*
      - 14b. Plants glabrous or covered with other types of hairs than above, leaves adaxially white hirsute or white hispidulous; scales on caudexes much smaller; corolla 2–2.5(–3.8) cm, lobed to middle.
        - 15a. Leaves spatulate, petiole short, narrowly winged, (0.5–)1.3–5 mm ..... 3. *C. macrocalyx*
        - 15b. Leaves elliptic, ovate, narrowly ovate, or narrowly obovate, sessile or petiole extremely short, less than 1(–1.7) mm.
          - 16a. Leaves shortly petiolate or sessile, elliptic, narrowly elliptic, or oblanceolate, base cuneate; flowers blue or blue-purple ..... 5. *C. incanus*
          - 16b. Leaves sessile, broadly ovate or obovate-lanceolate, base rounded; flowers yellow or white ..... 6. *C. flavus*

1. *Cyananthus* sect. *Stenolobi* (Franchet) Y. S. Lian in D. Y. Hong, Fl. Reipubl. Popularis Sin. 73(2): 13. 1983.

多年生组 duo nian sheng zu

*Cyananthus* [unranked] *Stenolobi* Franchet, J. Bot. (Morot) 1: 258. 1887.

Plants perennial. Caudex densely clothed in persistent and straw-colored scales. Leaves alternate. Flowers solitary, terminal on main stems and branches, subtended by a whorl-like aggregation of 3–5 leaves. Calyx glabrous or covered with hairs other than brown-black setae, often ± swollen and saclike after anthesis. Corolla lobes usually oblong, longer than broad.

Seven species: Himalaya and the Hengduan Mountains; seven species (five endemic) in China.

1. *Cyananthus delavayi* Franchet, J. Bot. (Morot) 1: 280. 1887.

细叶蓝钟花 xi ye lan zhong hua

*Cyananthus barbatus* Franchet (1885), not Edgeworth (1846); *C. microrhombeus* C. Y. Wu; *C. microrhombeus* var. *leiocalyx* C. Y. Wu.

Caudexes branched; scales deltoid-lanceolate, ca. 2 × 1 mm. Stems caespitose, prostrate or ascending, slender, 7–20 cm, branched, white- or yellowish hispid, more densely so toward

apex. Leaves alternate; blade suborbicular, ovate, or deltoid, 2–5 × 1–7 mm, abaxially silvery sericeous, adaxially hispidulous, base cuneate, obtuse, rounded, or truncate, margin slightly recurved, entire, sinuous, or crenulate, apex rounded or obtuse; petiole 1–3 mm, white hispid. Flowers solitary, terminal on main stems and some branches, each subtended by a whorl-like aggregation of 3–5 leaves; pedicels 3–9 mm. Calyx brown hirsute or glabrescent; tube cylindrical at anthesis, 4.5–9 × 3.5–7 mm, base rounded or truncate, becoming enlarged in fruit; lobes narrowly triangular, 1.5–4 × 1–3 mm, both sides hirsute.

Corolla blue, tubular-campanulate, 1.8–3.4 cm, outside glabrous, inside densely villous at throat; lobes linear-oblong, 6–12 mm. Ovary 5-locular, subequal to calyx in length at anthesis; style extending to corolla throat; stigma 5-fid. Capsules conical, longer than calyx. Seeds brown, oblong or ellipsoid, ca.  $1.8 \times 0.3$  mm. Fl. Sep.

• Grassy calcareous slopes, forests, forest margins; 1900–4000 m. SW Sichuan, N Yunnan.

**2. *Cyananthus formosus*** Diels, Notes Roy. Bot. Gard. Edinburgh 5: 172. 1912.

美丽蓝钟花 *mei li lan zhong hua*

*Cyananthus chungdienensis* C. Y. Wu.

Roots carrotlike, up to 10 mm wide. Caudexes robust, often branched; scales persistent, linear-lanceolate, 3.5–5 mm. Stems caespitose, prostrate to ascending, pale purple, slender, 5–25 cm, simple or with short branches. Leaves alternate, lowermost leaves scalelike; blade ovate or rhombic,  $3-9 \times 2-6$  mm, abaxially densely white hirsute, adaxially sparsely white hirsute or glabrous, base obtuse or subtruncate, margin revolute, crenulately 3–5-lobed or -parted, rarely entire, apex truncate; petiole 2–7 mm. Flowers large, solitary and terminal on main stems and branches, subtended by a whorl-like aggregation of 4 or 5 leaves; pedicels 3–5 mm. Calyx densely hirsute with long pale brown stiff hairs; tube cylindrical, 7–12 mm; lobes triangular or narrowly triangular,  $4-6 \times 2-3.5$  mm, both sides hirsute, margins ciliate. Corolla dark blue or purple-blue, 2.5–4.8 cm, outside glabrous, inside densely villous at throat; lobes narrowly obovate or oblong,  $1/3-1/2$  as long as tube, apex with a tuft of hairs outside. Ovary 5-locular, nearly as long as calyx tube; style extended up to corolla throat; stigma 5-fid. Fl. Aug–Sep.

• Grassy slopes, forest glades, forest margins, scree; 2800–4600 m. SW Sichuan (Muli), NW Yunnan (Heqing, Lijiang, Zhongdian).

**3. *Cyananthus macrocalyx*** Franchet, J. Bot. (Morot) 1: 279. 1887.

大萼蓝钟花 *da e lan zhong hua*

Caudexes robust, lignified, branched, covered toward apex with persistent ovate-lanceolate scales; scales 2–6 mm. Stems caespitose, ascending, 5–20 cm, simple, sparsely white villous or glabrous. Leaves alternate, increasing in size toward apex; blade suborbicular, rhombic, or spatulate,  $5-10 \times 1-6$  mm, abaxially densely white hirsute, adaxially sparsely hispidulous, base attenuate into petiole, margin revolute, entire, or sinuous-serrate, apex obtuse or acute; petiole 1–4 mm. Flowers solitary, terminal, subtended by a whorl-like aggregation of 4 or 5 flowers; pedicels 4–10 mm. Calyx yellow-green or purplish, brown hirsute, glabrescent, or glabrous, conspicuously veined; tube cylindrical at anthesis, 7–13 mm, basally subglobose in fruit; lobes triangular, both sides brown hirsute, or sometimes glabrous outside. Corolla yellow, sometimes purple- or red-veined, less frequently purple basally and yellow apically, tubular-campanulate, 2–3 cm, outside glabrous, inside densely villous at throat; lobes oblanceolate, ca.  $2/3$  as long as tube. Ovary extended up to throat. Capsules exserted above calyx. Seeds oblong, ca. 1.3 mm, smooth. Fl. Jul–Aug.

Alpine meadows, grassy slopes; 2500–5300 m. SE Gansu, S Qinghai, W Sichuan, SE Xizang, Yunnan [Bhutan, NE India (Assam, Sikkim), Myanmar, E Nepal].

- 1a. Leaf blade ovate to suborbicular, margin entire; calyx more than 11 mm ..... 3a. subsp. *macrocalyx*  
 1b. Leaf blade obovate-spatulate, margin crenulate; calyx less than 11 mm ..... 3b. subsp. *spathulifolius*

**3a. *Cyananthus macrocalyx* subsp. *macrocalyx***

大萼蓝钟花(原亚种) *da e lan zhong hua* (yuan ya zhong)

*Cyananthus incanus* J. D. Hooker & Thomson var. *leiocalyx* Franchet; *C. leiocalyx* (Franchet) Cowan; *C. leiocalyx* subsp. *lucidus* K. K. Shrestha; *C. macrocalyx* var. *flavopurpureus* C. 匙叶蓝钟花 *chi ye lan zhong hua*

*Cyananthus spathulifolius* Nannfeldt, Acta Horti Gothob. 5: 30. 1930.

Leaf blade obovate, spatulate, elliptic, or narrowly elliptic, margin slightly crenulate or subentire. Pedicel 5–10 mm. Calyx tube usually less than 12 mm, rarely up to 16 mm.

Alpine meadows; 3000–5300 m. SE Xizang [Bhutan, NE India (Assam, Sikkim), Myanmar, E Nepal].

**4. *Cyananthus wardii*** C. Marquand, J. Linn. Soc., Bot. 48: 196. 1929.

棕毛蓝钟花 *zong mao lan zhong hua*

Roots ca. 5 mm in diam. Caudexes with 2 or 3 grades of branching, densely covered with persistent straw-colored scales; scales elliptic or spatulate,  $10-15 \times 2-4$  mm. Stems several from each branch of caudex, caespitose, 10–18 cm, lower half with small, straw-colored, elliptic scales, sparsely yellow arachnoid. Leaves alternate, sessile or nearly so, increasing in size toward apex; blade elliptic or spatulate,  $5-11 \times 3-5$  mm, both surfaces densely covered with brown-yellow arachnoid hairs, base cuneate, margin entire, apex rounded, acute, or obtuse. Flowers solitary and terminal, subtended by a whorl-like aggregation of 4 or 5 leaves; pedicels 2–4 mm, covered with brown-yellow arachnoid hairs. Calyx densely covered with brown-yellow arachnoid hairs; tube cylindrical,  $10-12 \times 6-8$  mm; lobes ovate or triangular,  $1/3-1/2$  as long as tube, apex acute or obtuse. Corolla tubular, 3–4 cm, outside glabrous but inside densely villous; lobes obovate, ca.  $1/2$  as long as tube, outside with a yellow villous tuft at apex. Stamens ca.  $1/2$  as long as corolla tube. Style slightly exceeding corolla tube, glabrous.

- 3400–5000 m. SE Xizang.

Leaves elliptic or obovate-lanceolate, apex acute. Flowers white.

- Grassy slopes; 2700–3400 m. SW Sichuan (Xichang, Zhaojue), NE Yunnan (Huize).

**7. *Cyananthus longiflorus*** Franchet, J. Bot. (Morot) 1: 280. 1887.

长花蓝钟花 *chang hua lan zhong hua*

*Cyananthus argenteus* C. Marquand; *C. obtusilobus* C. Marquand.

Caudexes robust, ± lignified, branched, with some scales toward apex; scales ovate, ca. 2 mm. Stems caespitose, erect, 4–22 cm tall, lignified toward base, densely gray-white lanate; branches very short. Leaves alternate; blade elliptic or ovate, 5–15 × 2–8 mm, abaxially densely silvery sericeous, adaxially sparsely puberulent or glabrescent, base cuneate, margin revolute, entire, apex acute or obtuse; petiole 2–4 mm. Flowers solitary, terminal on main stems and branches, subsessile, subtended by a whorl-like aggregation of 3–5 leaves. Calyx villous; tube cylindrical, 10–15 mm at anthesis; lobes triangular or lanceolate, 3–7 mm, pubescent throughout. Corolla blue-purple, tubular-campanulate, 3.5–5 cm, outside glabrous, inside densely villous at throat; lobes obovate-oblong, ca. 1/2 as long as to equaling tube, with a setose tuft at apex. Style almost extending up to corolla throat. Capsules slightly longer than calyx at maturity. Seeds oblong, ca. 1.3 mm. Fl. Jul–Sep.

- *Pinus* forests, dry slopes, sand dunes; 2800–4300 m. W Yunnan.

2. *Cyananthus* sect. *Cyananthus*

## 宽瓣组 kuan ban zu

Plants perennial. Caudex densely clothed in persistent and straw-colored scales. Calyx densely covered only with brown-black setae, or mixed with such hairs. Corolla lobes suborbicular, broadly ovate or oblong, as long as or slightly longer than broad.

Nine species: SW China, Himalaya; six species (two endemic) in China.

**8. *Cyananthus lobatus*** Wallich ex Benth in Royle, Ill. Bot. Himal. Mts. 1: 309. 1836.

裂叶蓝钟花 lie ye lan zhong hua

*Cyananthus lobatus* var. *farreri* C. Marquand.

Roots carrot-shaped, up to 1.3 cm in diam. Caudexes robust, branched, with persistent scales toward apex; scales ovate or lanceolate, ca. 4 mm. Stems caespitose, decumbent or ascending, 10–50 cm, simple or branched, sparsely villous toward apex. Leaves alternate, sessile or with petiole less than 5 mm; blade obovate, oblanceolate, spatulate, or rhombic, 7–35 × 5–18 mm, subleathery, abaxially villous, adaxially sparsely hispidulous or glabrescent, base cuneate, margin slightly revolute, 3–9-parted or -lobed toward apex. Flowers solitary, terminal on main stems and branches; pedicels 1–3 cm, brown hirsute. Calyx tube cylindrical, 0.3–1.5 cm, densely brown-red to brown-black hispid; lobes triangular to lanceolate, 1/4–1/2 as long as tube, both sides brown hispid. Corolla pale blue to blue-purple, tubular-campanulate, 3–5.5 cm, outside glabrous, inside densely villous at throat; lobes suborbicular, almost 1/2 as long as tube, apex with a tuft of short brown hairs in center. Ovary conical, subequal to calyx tube in length; style extending up to middle part of corolla; stigma large, 5-fid. Fl. Aug–Sep.

Grassy slopes, forests; 2800–4500 m. SE Xizang (Nyingchi, Yading, Zayü), NW Yunnan (Bijiang, Gongshan, Weixi) [Bhutan, N India, N Myanmar, Nepal].

"*Cyananthus insignis*" (R. E. Grahame, Gard. Chron., ser. 3, 107: 10. 1940) belongs here but was not validly published because no Latin description or diagnosis was provided (*Vienna Code*, Art. 36.1).

**9. *Cyananthus pedunculatus*** C. B. Clarke in J. D. Hooker, Fl. Brit. India 3: 434. 1881.

有梗蓝钟花 you geng lan zhong hua

Roots carrot-shaped, up to 1.2 cm in diam. Caudexes robust, branched, covered with persistent scales toward apex; scales straw-colored, elliptic to lanceolate. Stems caespitose, ascending or sprawling, 10–20 cm, usually simple, hispidulous. Leaves alternate, gradually increasing in size toward apex, subsessile; blade elliptic, ovate-lanceolate, lanceolate, or linear-lanceolate, 7–16 × 2–6 mm, both surfaces hispidulous, base rounded, obtuse, or cuneate, margin entire or shallowly sinuous above middle. Flowers solitary, terminal; pedicels 1.2–4 cm, brown- or black villous. Calyx densely brown-black hirsute; tube cylindrical, 9–15 × 5–10 mm; lobes lanceolate-triangular, 2/5–1/2 as long as tube. Corolla purple-blue, funnelform-campanulate, 2.5–4.5 cm, throat glabrous or sparsely villous; lobes suborbicular, ca. 1/2 as long as tube, apex with brown hirsute tuft. Ovary subequal to calyx in length; style extending up to corolla throat; stigma 5-fid. Fl. Aug–Sep.

Alpine scrub; 3600–4900 m. S Xizang (Yadong) [Bhutan, NE India, Nepal].

**10. *Cyananthus sericeus*** Y. S. Lian, Acta Phytotax. Sin. 17(3): 122. 1979.

绢毛蓝钟花 juan mao lan zhong hua

Caudexes robust, branched, densely covered with narrowly ovate or ovate-oblong persistent scales toward apex; scales 3–5 mm. Stems slender, 20–30 cm tall, densely sericeous when young, eventually glabrescent. Leaves alternate, those toward base scalelike, ca. 2 × 1 mm, sparsely villous; blade of middle and upper leaves narrowly elliptic, 8–12 × 2–4 mm, abaxially densely retrorsely and appressed sericeous, adaxially glabrous or sparsely hairy. Flowers solitary and terminal, subtended by a whorl-like aggregation of 3 or 4 leaves; pedicels 5–12 mm, brown- or black villous. Calyx densely brown- or black hirsute; tube cylindrical, 15–20 × 9–11 mm; lobes lanceolate-triangular, ca. 1/2 as long as tube, margin white villous. Corolla blue, with darker blue veins, 3.5–4 cm, glabrous; lobes broadly obovate, ca. 1/2 as long as tube. Ovary conical, slightly shorter than calyx. Style almost extending up to corolla throat. Fl. Sep.

• Rocky crevices; 3500–3600 m. SE Xizang (Cona).

**11. *Cyananthus microphyllus*** Edgeworth, Trans. Linn. Soc. London 20: 81. 1846.

小叶蓝钟花 xiao ye lan zhong hua

*Cyananthus linifolius* Wallich ex J. D. Hooker & Thomson, nom. illeg. superfl.; *C. nepalensis* Kitamura.

Caudexes robust, branched, densely covered with scales toward apex; scales elliptic to lanceolate, ca. 5 × 2 mm. Stems brownish red, slender, 5–25 cm, branched toward base, glabrous or sparsely puberulent. Leaves alternate, almost sessile; blade ovate, lanceolate, or linear-elliptic, 5–13 × 1.5–5 mm, abaxially sericeous, adaxially glabrous, base rounded to subcordate, margin revolute, entire, or sinuous, apex obtuse or acute. Flowers solitary and terminal; pedicels 3–10 mm, brown- or black setose. Calyx brown- or black setose; tube cylindrical, 7–10 mm, base truncate; lobes triangular, 1/2–2/3 as long as tube, both sides hairy. Corolla blue-purple or blue, cylindrical-campanulate, 1.8–2.8 cm, glabrous or brown- or black setose, densely white fimbriate villous inside; lobes obovate-oblong, subequal to tube in length. Ovary conical, nearly as long as calyx; style extending up to corolla throat. Seeds shiny brown, oblong, ca. 2 × 0.5–0.7 mm. Fl. Sep.

Mountain slopes; 3300–4300 m. S Xizang (Nyalam) [N India, Nepal].

Chinese plants are *Cyananthus microphyllus* subsp. *microphyllus*; *C. microphyllus* subsp. *williamsonii* K. K. Shrestha is known only from Nepal.

**12. *Cyananthus cordifolius*** Duthie, Bull. Misc. Inform. Kew 1912: 37. 1912.

心叶蓝钟花 *xin ye lan zhong hua*

Caudexes robust, branched. Stems decumbent, slender, 14–27 cm, sparsely arachnoid-villous, sterile-branched at middle. Leaves alternate, subsessile, those of main stem with blade cordate to triangular-ovate, 10–15 × 5–9 mm, abaxially sparsely villous, adaxially glabrous or sparsely puberulent, base cordate, obtuse, or rounded, margin serrate, apex acute or obtuse; leaves on sterile branches with blade much smaller, elliptic-ovate, almost entire, base rounded or rarely cordate. Flowers solitary and terminal; pedicels 5–18 mm, brown- or black setose. Calyx densely brown- or black setose; tube cylindrical, 11–16 × 5–8 mm, base truncate; lobes lanceolate-triangular, slightly shorter than tube, inside both black- and white villous. Corolla blue or pale blue, cylindrical-campanulate, 2.5–3.5 cm, densely villous at throat; lobes oblong, 12–15 × 5–6 mm. Ovary conical-ovoid, slightly shorter than calyx; style extending up to corolla throat. Fl. Aug.

Mountain thickets; 3000–4000 m. S Xizang (Gyirong) [NW India, Nepal].

**3. *Cyananthus* sect. *Annui*** (Y. S. Lian) D. Y. Hong & L. M. Ma, Acta Phytotax. Sin. 29: 48. 1991.

蓝钟花组 *lan zhong hua zu*

*Cyananthus* subsect. *Annui* Y. S. Lian in D. Y. Hong, Fl. Reipubl. Popularis Sin. 73(2): 183. 1983.

Plants annual, lacking a caudex. Calyx sometimes 4-lobed. Corolla sometimes 3- or 4-lobed. Ovary sometimes 3- or 4-locular.

Four species: Himalaya and the Hengduan Mountains; four species (two endemic) in China.

**14. *Cyananthus lichiangensis*** W. W. Smith, Notes Roy. Bot. Gard. Edinburgh 8: 109. 1913.

丽江蓝钟花 *li jiang lan zhong hua*

Stems caespitose, 10–30 cm tall, glabrous, simple or with slender branches. Leaves sparse, alternate; petiole 2–5 mm, villous; blade ovate or triangular, 5–13 × 5–11 mm, both surfaces hispidulous, base truncate or obtuse, margin revolute, entire, sinuous, or crenulate, apex obtuse. Flowers solitary, terminal on both main stems and branches, subtended by a whorl-like aggregation of 4 or 5 leaves; pedicels 2–5 mm, glabrous. Calyx with red-brown setae outside, base of setae swollen, often black verrucose; tube cylindrical, 8–10 × 6–9 mm; lobes obovate-oblong or obdeltoid, ca. 1/3 as long as tube, broadest part at or above middle, outside sparsely red-brown setose, inside appressed red-brown villous. Corolla pale or greenish yellow, sometimes blue- or purple striate, cylindrical-campanulate, ca. 2 × as long as calyx tube, outside glabrous, inside densely villous at throat; lobes oblong, 1/3–1/2 as long as tube, apex acute or obtuse. Ovary nearly as long as calyx tube; style extending up to corolla throat. Capsules exserted beyond calyx at maturity. Seeds oblong, ca. 1 × 0.5 mm, obtuse at both ends. Fl. Aug.

• Grassy slopes, grassy places at forest margins; 3000–4000 m. SW Sichuan, Xizang, N Yunnan (Dêqên, Lijiang, Zhenxiang).

**15. *Cyananthus fasciculatus*** C. Marquand, Bull. Misc. Inform. Kew 1924: 247. 1924.

**13. *Cyananthus sherriffii*** Cowan, New Fl. & Silva 10: 181. 1938.

杂毛蓝钟花 *za mao lan zhong hua*

Caudexes robust, somewhat lignified, branched, densely covered toward apex with persistent scales; scales oblong or lanceolate, up to 10 mm. Stems caespitose, dark brown, slender, 5–15 cm, sparsely arachnoid-pubescent. Leaves alternate, gradually increasing in size toward apex, sessile or shortly petiolate; blade linear or narrowly elliptic, 4–8 × 1–3 mm, abaxially silvery sericeous, adaxially sparsely arachnoid-villous along mid-vein. Flowers solitary, terminal on longer stems, subtended by a whorl-like aggregation of 4 or 5 leaves that are 8–12 × 2–3.5 mm; pedicels 5–8 mm. Calyx glaucous and densely brown- or black setose; tube cylindrical, 10–15 × 5–7 mm, base truncate; lobes triangular or lanceolate, ca. 1/3 as long as tube, both sides pubescent. Corolla blue or gray-blue, cylindrical-campanulate, ca. 2.5 cm, outside glabrous, inside villous at throat; lobes oblong, apex with a brown villous tuft. Ovary conical, nearly as long as calyx; style extending up to corolla throat; stigma 5-fid. Fl. Jul–Aug.

• Alpine meadows or thickets; 3200–5000 m. S Xizang (Lhünzê, Nangxian).

束花蓝钟花 *shu hua lan zhong hua*

Stems 30–100 cm, branched, glabrous or sparsely villous; branches long and spreading. Leaves alternate, scattered; petiole slender, 5–10 mm, glabrous or sparsely villous; blade ovate or suborbicular, 4–16 × 4–15 mm, abaxially usually glabrous, adaxially sparsely hispidulous, base obtuse, truncate, or subcordate, apex rounded or obtuse. Flowers in dichasia, aggregated at top of main stems and branches, subtended by whorl-like aggregations of 4 or 5 leaves; pedicels 2–4 mm, slender, glabrous. Calyx moderately to densely brown setose; tube subcylindrical, broader toward rounded base, 5–8 × 3–5 mm; lobes usually 5 (some on lower branches with only 4), narrowly triangular, ciliate. Corolla pale blue, cylindrical-campanulate, 14–17 mm, outside glabrous, inside villous near throat; lobes (4 or) 5, obovate-oblong, ca. 5 × 1.5–3 mm. Ovary subequaling calyx tube; style exserted above corolla tube. Capsules exceeding calyx at maturity. Seeds ellipsoid, ca. 0.5 × 0.2 mm, both ends acute. Fl. Sep–Oct.

• Forests, thickets, grassy slopes; 2400–3500 m. W Sichuan, N Yunnan.

**16. *Cyananthus inflatus*** J. D. Hooker & Thomson, J. Proc. Linn. Soc., Bot. 2: 21. 1857.

胀萼蓝钟花 *zhang e lan zhong hua*

*Cyananthus forrestii* Diels; *C. pseudoinflatus* P. C. Tsoong.

Stems erect or ascending, up to 80 cm, branched, sparsely villous or glabrous. Leaves alternate, sparse; petiole slender, 2–7 mm, villous; blade orbicular, ovate, or triangular, 5–15 × 3–10 mm, abaxially hirsute, adaxially hispidulous, base rounded, truncate, or obtuse, margin entire or obscurely crenulate, apex obtuse. Flowers usually solitary, terminal on main stems and branches, subtended by a whorl-like aggregation of 3–5 leaves; pedicels 2–5 mm, slender, brown hirsute. Calyx densely brown hirsute outside; tube urceolate at anthesis, 7–12 mm, becoming conspicuously inflated after flowering; lobes 5, deltoid, 1/4–2/5 as long as tube, both sides brown hirsute. Corolla pale blue, cylindrical-campanulate, almost 2 × as long as calyx, outside glabrous, inside densely villous at throat; lobes 5, narrowly obovate, nearly 1/2 as long as tube. Ovary slightly shorter than calyx; style extending up to corolla throat. Capsules ovoid, exceeding calyx in height at maturity, 5-loculicidal. Seeds brown-red, ellipsoid, ca. 0.5 × 0.2 mm, obtuse at both ends. Fl. Aug–Sep.  $2n = 14$ .

Alpine meadows, grassy and shrubby slopes; 1900–4900 m. W Guizhou (Weining), W Sichuan, S Xizang, N Yunnan [Bhutan, N India, Myanmar, Nepal].

**17. *Cyananthus hookeri*** C. B. Clarke in J. D. Hooker, Fl. Brit. India 3: 435. 1881.

蓝钟花 lan zhong hua

*Cyananthus cronquistii* K. K. Shrestha; *C. hookeri* var. *densus* C. Marquand; *C. hookeri* var. *grandiflorus* C. Marquand; *C. hookeri* var. *hispidus* Franchet; *C. hookeri* var. *levicalyx* Y. S. Lian; *C. hookeri* var. *levicaulis* Franchet.

Stems usually caespitose, suberect or ascending, 4–20 cm, glabrous to rather densely villous; branches 1.5–10 cm. Leaves alternate; blade rhombic or ovate, 3–7 × 2–6 mm, abaxially sparsely to rather densely hirsute, adaxially sparsely to rather densely hispidulous, base obtuse or truncate, abruptly attenuate into petiole, margin crenate or sometimes entire, apex obtuse or subacute; petiole 1–4 mm. Flowers small, solitary, terminal on main stems and branches, subtended by a whorl-like aggregation of 3–5 leaves, almost sessile. Calyx densely hirsute outside with long stiff yellow-brown hairs, rarely subglabrous; tube ovoid, 3–8 mm; lobes (3 or)4(or 5), triangular, 1/3–1/2 as long as tube, both sides hirsute. Corolla purple-blue, cylindrical, 7–15 mm, outside glabrous, inside densely villous at throat; lobes usually (3 or)4(or 5), narrowly obovate or oblong, apex often with 3 or 4 brown-yellow villous hairs. Stamens 4. Style extending above corolla throat; stigma 4-fid. Capsules ovoid, exserted above calyx at maturity. Seeds narrowly ovoid, ca. 1.2 × 0.4 mm. Fl. Aug–Sep.

Thickets, grasslands; 2700–4500 m. SE Gansu (Tao He basin), S Qinghai (Tongren, Yushu), W Sichuan (W of Kangding and Lixian), E Xizang (E of Namling), N Yunnan [Bhutan, NE India (Sikkim), Nepal].

## 2. *LEPTOCODON* (J. D. Hooker & Thomson) Lemaire, Ill. Hort. 3. Misc. 49. 1856.

Hong Deyuan (洪德元); Thomas G. Lammers, Laura L. Klein

*Codonopsis* subg. *Leptocodon* J. D. Hooker & Thomson, Ill. Himal. Pl. t. 16, A. 1855.

Vines, perennial. Stems slender. Leaves alternate, but on branches often opposite or subopposite. Flowers solitary, outside axils, less frequently in axils, or opposite to leaves. Calyx 5-lobed, tube broadly obconical. Corolla tubular, 5-lobed. Stamens 5; filaments long, base slightly dilated, alternate with 5 free, lamellar glands. Ovary semi-inferior, with superior part narrowly conical, 3-locular; style long; stigma 3-fid, segments clavate. Capsule 3-loculicidal at superior part. Seeds numerous.

Two species: Bhutan, SW China, N India, N Myanmar, E Nepal; two species (one endemic) in China.

- 1a. Plants glabrous throughout except young leaves sparsely villous; calyx lobes linear-oblong, often reflexed, distant from each other, glabrous, base clawlike ..... 1. *L. gracilis*  
 1b. Plants ± hairy, rarely sparsely villous only on leaf margin; calyx lobes ovate to narrowly ovate, not reflexed, overlapping each other, at least villous on margin, base obtuse, truncate, or cordate, but not clawlike ..... 2. *L. hirsutus*

**1. *Leptocodon gracilis*** (J. D. Hooker & Thomson) Lemaire, Ill. Hort. 3: Misc. 49. 1856.

细钟花 xi zhong hua

*Codonopsis gracilis* J. D. Hooker & Thomson, Ill. Himal. Pl. t. 16, A. 1855; *Campanumoea gracilis* (J. D. Hooker & Thomson) G. Nicholson.

Plants glabrous throughout except young leaves sparsely villous, odorous. Roots unknown. Stems long, slender, branched. Leaves alternate, rarely those on branchlets opposite, long petiolate; blade abaxially gray, adaxially green, ovate-orbicular, 0.9–2.5 × 0.9–2.5 cm, membranous, base truncate or obtuse, margin sinuate-crenate, apex obtuse. Flowers pendent; pedicels slender, 1–5 cm, straight or curved. Calyx glabrous;

tube 2–3 mm; lobes narrowly oblong, 5–8 × 1–2 mm, margin with 1 or 2 pairs of callose serratures. Corolla blue or purple, 2.8–3.5 cm; tube ca. 4 mm in diam.; limb 1–1.5 cm in diam.; lobes triangular, 4–5 mm. Filaments ca. 2 cm. Style ca. 2 cm. Inferior part of capsule semiglobose or obconic, 4–5 mm; superior part conical or ovoid, 8–10 mm. Seeds red-brown, linear-oblong, 1.5–1.8 mm, smooth. Fl. Aug–Oct.

Forests, thickets; 2000–2500 m. SW Sichuan (Huili, Muli, Yanbian), NW Yunnan [Bhutan, N India, N Myanmar, E Nepal].

**2. *Leptocodon hirsutus*** D. Y. Hong, Acta Phytotax. Sin. 18: 246. 1980.

(1999), not (Handel-Mazzetti) D. Y. Hong & L. M. Ma (1992); *C. hongii* Lammers.

Plants malodorous. Roots slender, not thickened. Stems hirsute on young parts. Leaves on main stems alternate, those on branchlets almost opposite, all leaves long petiolate; blade abaxially villous, rarely extremely sparsely villous. Flowers subopposite to leaves. Calyx lobes ovate, overlapping each

other at anthesis, separated at fruiting, upright, 5–7 × 3–4 mm, hirsute on abaxial side and margin, base cordate or subtruncate, not clawlike, margin sinuate-crenate. Inferior part of capsule semiglobose, 8–10 mm in diam.; superior part conical, ca. 10 mm. Seeds ellipsoid, ca. 1 mm. Fl. Jul–Aug, fr. Oct–Nov.

• Mixed forests, thickets, grasslands; 2000–2700 m. SE Xizang (Bomi, Cona, Zayü), NW Yunnan (Gongshan, Weixi).

### 3. CODONOPSIS Wallich in Roxburgh, Fl. Ind. 2: 103. 1824.

党参属 dang shen shu

Hong Deyuan (洪德元); Thomas G. Lammers, Laura L. Klein

*Glosocomia* D. Don.

Herbs, perennial, often fetid. Roots thickened, carrot-shaped, fusiform, or tuberous, mostly fleshy, rarely lignified. Stems erect, ascending, climbing, procumbent, or twining. Leaves alternate, opposite, or fascicled (pseudovercillate). Flowers solitary, terminal on main stems and branches, sometimes opposite to leaves, rarely axillary. Calyx tube variously adnate to ovary, often 10-ribbed; lobes 5. Corolla epigynous, 5-lobed for less than 1/2 its length and campanulate, funnelform, or tubular, or 5-fid for more than 3/4 its length and rotate, various shades of purple and blue, yellow, green, or white. Stamens 5; filaments often dilated at base, glabrous or hairy, rarely alternating with lamellar glands; anthers basifixed, connective glabrous or setose. Ovary inferior or at least inferior to corolla, 3-locular; ovules numerous; style glabrous or hairy; stigma usually 3-fid, lobes broad. Fruit with persistent calyx, an ovoid or obconic loculicidal capsule. Seeds numerous, ellipsoid, oblong, or globose, winged or wingless, smooth, faintly striate, or reticulate; embryo straight, embedded in copious endosperm.

Forty-two species: C, E, and S Asia; 40 species (24 endemic) in China.

- 1a. Plants usually not fetid; fruit an obconic capsule, dehiscent apex relatively short; seed testa smooth or finely striate.
  - 2a. Corolla campanulate, lobed for less than 1/2 its length (2. *C. subg. Obconicapsula*) ..... 36. *C. dicentrifolia*
  - 2b. Corolla rotate, divided for more than 3/4 its length (3. *C. subg. Pseudocodonopsis*).
    - 3a. Stem erect or procumbent, scapiform; leaves rosulate ..... 37. *C. rosulata*
    - 3b. Stem twining or suberect; leaves opposite or alternate, not rosulate.
      - 4a. Stem usually more than 1 m, twining and leafy throughout ..... 39. *C. convolvulacea*
      - 4b. Stem usually less than 1 m, erect or twining only at apex; leaves mostly aggregated toward stem base.
        - 5a. Stem and adaxial surface of leaves hirsute; leaves ovate, serrate ..... 38. *C. hirsuta*
        - 5b. Stem and leaves glabrous; leaves linear, entire ..... 40. *C. graminifolia*
  - 1b. Plants commonly fetid; fruit an ovoid capsule, dehiscent apex elongate; seeds reticulate (1. *C. subg. Codonopsis*).
    - 6a. Stem twining, leafy throughout, often over 1 m (*C. sect. Codonopsis*).
      - 7a. Leaves pseudovercillate, in fascicles of 3 or 4 at apex of lateral branches.
        - 8a. Roots usually fusiform; leaf apex acute; calyx lobes 2–3 cm; corolla 2.5–3.5 cm; seeds winged ..... 1. *C. lanceolata*
        - 8b. Roots tuberous; leaf apex obtuse; calyx lobes 1–1.5 cm; corolla 2–2.5 cm; seeds terete ..... 2. *C. ussuriensis*
      - 7b. Leaves alternate or opposite, not pseudovercillate.
        - 9a. Corolla tubular.
          - 10a. Leaves deeply incised, large serrate, base cordate to broadly cuneate ..... 14. *C. deltoidea*
          - 10b. Leaves shallowly incised, serrate, or subentire, base cuneate to rounded ..... 15. *C. tubulosa*
        - 9b. Corolla campanulate, globose-campanulate, or tubular-campanulate.
          - 11a. Calyx lobes linear to linear-lanceolate, well separated, 10–20 × 2–3 mm, length/width ratio > 5 ..... 8. *C. viridis*
          - 11b. Calyx lobes wider, proximate, length/width ratio < 3.
            - 12a. Calyx ± pubescent.
              - 13a. Leaves less than 3 × 3 cm; calyx tube hirsute, lobes ovate-orbicular or rhombic-ovate, dentate and hirsute; corolla globose-campanulate ..... 6. *C. subglobosa*
              - 13b. Leaves much more than 3 × 3 cm; calyx tube sparsely hairy, lobes narrowly oblong or lanceolate, subentire, densely puberulent; corolla broadly campanulate ..... 7. *C. affinis*
          - 12b. Calyx glabrous.
            - 14a. Lower leaves cordate, truncate, or rounded at base.
              - 15a. Stem almost simple; leaves subentire or slightly sinuous on margins ..... 3. *C. cordifolioidea*
              - 15b. Stem branched; leaves serrate on margins.

- 16a. Corolla large, more than  $1.5 \times 1.7$  cm, usually longer than calyx lobes ..... 4. *C. pilosula*  
 16b. Corolla small, less than  $1 \times 1.5$  cm, shorter than or subequal to calyx lobes ..... 5. *C. micrantha*
- 14b. Lower cauline leaves cuneate or rounded (occasionally cordate) at base.  
 17a. Stems and leaves glabrous; leaves entire.  
 18a. Leaves  $0.5-2 \times 0.5-1.5$  cm, apex acute or obtuse ..... 9. *C. farreri*  
 18b. Leaves  $6-7 \times 2-2.5$  cm, apex shortly acuminate ..... 10. *C. rotundifolia*  
 17b. Stems and leaves  $\pm$  hairy; leaves crenulate or serrate on margins.  
 19a. Calyx lobes ciliate, reflexed ..... 11. *C. henryi*  
 19b. Calyx lobes glabrous, not reflexed.  
 20a. Leaf blade  $3-15 \times 1-7$  cm, apex acuminate ..... 12. *C. levicalyx*  
 20b. Leaf blade up to  $2.3 \times 1.7$  cm, apex rounded or acute ..... 13. *C. kawakamii*
- 6b. Stems erect or ascending (sometimes climbing or procumbent but not twining), often scapiform, less than 1 m tall (*C. sect. Erectae*).  
 21a. Stems without branches like pinnate leaves and usually sterile.  
 22a. Corolla tubular or tubular-campanulate; filaments villous; stems mostly procumbent or climbing.  
 23a. Corolla 2-4 cm, yellow-green, base shaded brown-red, glabrous ..... 16. *C. benthamii*  
 23b. Corolla only ca. 1.7 cm, yellowish, with purple-blue spots, densely puberulent outside ..... 17. *C. pianmaensis*  
 22b. Corolla campanulate; filaments not villous; stems mostly erect or scapiform.  
 24a. Leaves located at lower part of stems, main stems scapiform.  
 25a. Petiole 2-7 cm, leaf blade  $2-13 \times 1.5-5$  cm; main stem with 1-4 flowers; calyx lobes  $5-7 \times$  ca. 3 mm, with sinus between them broad and obtuse; corolla less than 1.5 cm wide ..... 19. *C. subscaposa*  
 25b. Petiole less than 1 cm, leaf blade  $5-8 \times 1.5-3$  cm; main stem with 1 or 2 flowers; calyx lobes  $8-12 \times 4-6$  mm, with sinus between them narrow; corolla up to 3 cm wide ..... 20. *C. meleagris*  
 24b. Leaves evenly arranged on main stems, not scapiform.  
 26a. Leaves opposite; plants glabrous throughout ..... 21. *C. purpurea*  
 26b. Leaves alternate.  
 27a. Plants  $\pm$  hairy; corolla less than 2 cm ..... 18. *C. subsimplex*  
 27b. Plants glabrous; corolla more than 3.5 cm.  
 28a. Leaves lanceolate,  $1.5-6.5$  cm, entire; calyx lobes narrowly lanceolate,  $18-20 \times 2-3$  mm ..... 23. *C. gombalana*  
 28b. Leaves broadly lanceolate,  $5-14 \times 3-7$  cm, serrate; calyx lobes  $20-30 \times 6-10$  mm ..... 24. *C. chimiliensis*
- 21b. Stems with branches like pinnate leaves and usually sterile.  
 29a. Veins on leaves conspicuous, leaf margins revolute forming thick periphery.  
 30a. Corolla broadly tubular, ca. 1.2 cm; lower slender branches sometimes fertile ..... 35. *C. bhutanica*  
 30b. Corolla campanulate, more than 1.5 cm; lower slender branches sterile.  
 31a. Leaves subentire; flowers entirely glabrous.  
 32a. Leaves not more than  $1.8 \times 1.5$  cm, sparsely puberulent abaxially; corolla purple-green, with purple veins ..... 30. *C. alpina*  
 32b. Leaves up to  $3.2 \times 2.6$  cm, glabrous on both surfaces; corolla pale blue, with red-brown spots inside ..... 31. *C. cardiophylla*  
 31b. Leaves crenulate; flowers  $\pm$  hairy on some parts.  
 33a. Calyx lobes  $5-7 \times 2-3$  mm, with sinus between them broad and obtuse ..... 34. *C. chlorocodon*  
 33b. Calyx lobes more than 10 mm, with sinus between them narrow and acute.  
 34a. Corolla glabrous throughout; calyx tube mostly glabrous, lobes ovate or ovate-lanceolate, broadest at middle, hispidulous only at apex outside ..... 32. *C. viridiflora*  
 34b. Corolla villous inside; calyx tube mostly hairy, lobes narrowly triangular, broadest at base, mostly entirely hispidulous ..... 33. *C. tsinlingensis*
- 29b. Veins on leaves inconspicuous, leaf margins not revolute.  
 35a. Corolla tubular or tubular-campanulate, at least lower part tubular.  
 36a. Corolla tubular; connective setose ..... 25. *C. thalictrifolia*  
 36b. Corolla tubular-campanulate, lower half tubular but abruptly expanded at middle; connective glabrous ..... 26. *C. bulleyana*
- 35b. Corolla broadly campanulate.  
 37a. Plants white with dense white hairs; leaf blade less than  $1.5 \times 1$  cm ..... 28. *C. canescens*  
 37b. Plants green with sparse hairs; leaf blade usually larger.  
 38a. Calyx lobes  $15-20 \times 6-8$  mm, hairy only at apex; leaf blades  $1-5 \times 0.8-3.2$  cm ..... 22. *C. clematidea*  
 38b. Calyx lobes much smaller, hairy throughout; leaf blades mostly smaller.  
 39a. Corolla villous both inside and outside ..... 29. *C. argentea*  
 39b. Corolla glabrous or hairy only toward lobes outside ..... 27. *C. foetens*

1. *Codonopsis* subg. *Codonopsis*

党参亚属 dang shen ya shu

Plants fetid, often strongly so. Roots carrot-shaped, fusiform, or tuberous. Stems erect, ascending, climbing, procumbent, or twining. Corolla epigynous, 5-lobed for less than 1/2 its length and campanulate, funnelform, or tubular. Fruit an ovoid loculicidal capsule or globose berry. Seed testa reticulate.

Thirty-seven species: Tajikistan to Russia (Far East), Japan, and Indonesia (Java); 35 species (21 endemic) in China.

Species nos. 1–15, with stem twining, leafy throughout, often over 1 m, are assigned to *Codonopsis* sect. *Codonopsis*. Species nos. 16–35, with stems erect or ascending, often scapiform, sometimes climbing or procumbent but never twining, less than 1 m tall, belong to *C. sect. Erectae* (Komarov) D. Y. Hong.

1. *Codonopsis lanceolata* (Siebold & Zuccarini) Trautvetter, Trudy Imp. S.-Peterburgsk. Bot. Sada 6: 46. 1879.

羊乳 yang ru

*Campanumoea lanceolata* Siebold & Zuccarini, Fl. Jap. 1: 174. 1841; *C. japonica* Siebold ex E. Morren; *Codonopsis bodinieri* H. Léveillé; *Glosocomia lanceolata* (Siebold & Zuccarini) Maximowicz.

Plants glabrous throughout or occasionally sparsely villous on stems and leaves. Caudexes subcylindrical. Roots usually fusiform-thickened, 10–20 × 1–6 cm. Stems twining, yellow-green but with purplish shade, more than 100 cm, often branched. Leaves on main stems alternate, lanceolate, ovate, or elliptic, 8–14 × 3–7 mm; usually leaves 2–4-fascicled on top of branchlets, subopposite or verticillate, petiole 1–5 mm; blade abaxially gray-green, adaxially green, ovate, narrowly ovate, or elliptic, 3–12 × 1.3–5.5 cm, abaxially rarely hirsute, veins obvious, base attenuate or sometimes rounded, margin usually entire or sparsely sinuate, occasionally revolute and hispid, apex acute or obtuse. Flowers solitary or paired on top of branchlets; pedicels 1–9 cm. Calyx adnate to ovary by half; tube hemispherical; lobes ovate or deltoid, 1–3 × 0.5–1 cm, entire, acute; sinus between calyx lobes acute or gradually becoming broader after anthesis. Corolla broadly campanulate, 2–4 × 2–3.5 cm, shallowly lobed; lobes yellow-green or milk-white, with purple spots, deltoid, 0.5–1 cm, revolute. Disk dark green, fleshy. Filaments subulate, slightly dilated at base, 4–6 mm; anthers 3–5 mm; ovary inferior. Capsule hemispherical at base, rostrate toward apex, 1.6–3.5 cm in diam. Seeds numerous, brown, winged, seed body oblong or ellipsoid. Fl. and fr. Jul–Aug.  $2n = 16$ .

Shrublands, broad-leaved forests; 200–1500 m. Anhui, Fujian, Hebei, Henan, Hubei, Hunan, Jiangsu, Shandong, Shanxi, Zhejiang [Japan, Korea, Russia (Far East)].

2. *Codonopsis ussuriensis* (Ruprecht & Maximowicz) Hemsley, J. Linn. Soc., Bot. 26: 6. 1889.

雀斑党参 que ban dang shen

*Glosocomia ussuriensis* Ruprecht & Maximowicz, Bull. Cl. Phys.-Math. Acad. Imp. Sci. Saint-Petersbourg 15: 223. 1857; *Codonopsis lanceolata* (Siebold & Zuccarini) Trautvetter var. *ussuriensis* (Ruprecht & Maximowicz) Trautvetter; *G. lanceolata* (Siebold & Zuccarini) Maximowicz var. *ussuriensis* (Ruprecht & Maximowicz) Regel.

Plants glabrous throughout, or stems and leaves sparsely villous. Roots gray-yellow, tuberous or oblong, 1–3 cm in diam.

Stems twining, green, white, or dark-purple, slender, glabrous or internodes sparsely villous. Leaves on main stems alternate, lanceolate or ovate, smaller, those on top of branches usually 3–5-fascicled, pseudoverticillate; petiole short; blade abaxially gray-green, adaxially green, elliptic, lanceolate, or oblong, 2–6 × 1–2.5 cm, abaxially glabrous or sparsely villous, adaxially glabrous, base attenuate, margin entire, occasionally revolute, apex acute or obtuse. Flowers solitary, terminal on slender branches; pedicels 2–5 cm; bracts single, small, lanceolate or narrowly ovate. Calyx tube adnate to ovary up to its middle, semiglobose; lobes narrowly lanceolate or ovate-deltoid, 10–20 × 6–8 mm, margin entire, apex acute. Corolla campanulate, 2–3 × 1.5–2.5 cm, shallowly lobed; lobes dark purple, deltoid, inside with remarkable black-purple stripes or black spots. Filaments 3–5 mm, slightly dilated at base; anthers 2–4 mm. Capsules hemispherical at base, rostrate toward apex, ca. 15 mm. Seeds numerous, dark brown, lucid, ovoid, wingless. Fl. Jul–Aug.  $2n = 16$ .

Ravines, moist meadows, mostly in sandy soil; ca. 800 m. E Heilongjiang, E Jilin [Japan, Korea, Russia (Far East)].

3. *Codonopsis cordifolioides* P. C. Tsoong, Contr. Inst. Bot. Natl. Acad. Peiping 3: 93. 1935.

心叶党参 xin ye dang shen

Plants glabrous or subglabrous or only leaves sparsely shortly setose. Stems twining, more than 1 m, with a few very short branches. Leaves on main stems lax, alternate, ca. 10 cm distant between 2 leaves; petiole filiform, 5–9 cm; blade abaxially gray-green, adaxially green, broadly ovate, up to 10 × 7 cm, base subcordate, with a square sinus, subentire, apex shortly acuminate or acute; veins conspicuous, lateral veins from base; leaves on branches usually only 2 and opposite, petiole less than 1 cm, blade similar to those on main stems in shape, but sinus not square. Flowers solitary, opposite to leaves; pedicels 3–6 cm. Calyx tube adnate to ovary up to its middle, semiglobose; lobes deltoid-lanceolate, ca. 10 × 5–6 mm, margin entire, apex acuminate; sinus between calyx lobes narrow. Corolla campanulate, 1.7–1.8 × 1–1.2 cm, 5-lobed to middle; lobes dark blue, lanceolate-deltoid. Filaments dilated at base, ca. 5 mm; anthers ca. 5 mm. Capsule semiglobose in lower half, rostrate above, ca. 1.5 cm in diam. Seeds numerous, brown, ellipsoid, obscurely reticulate. Fl. and fr. Sep–Oct.

• Forests; 1700–2200 m. NW Yunnan (Fugong, Gongshan).

4. *Codonopsis pilosula* (Franchet) Nannfeldt, Acta Horti Gothob. 5: 29. 1930.

党参 dang shen

Roots carrot-shaped or fusiform-cylindrical, 15–30 × 1–3 cm, often branched. Stems twining, 1–2 m, glabrous, branched; lateral branches 15–30 cm; branchlets 1–5 cm, sterile or fertile. Leaves on main stems and branches alternate, those on branchlets opposite; petiole 0.5–2.5 cm, sparsely shortly setose; blade abaxially gray-green, adaxially green, ovate or narrowly ovate, 1–7.3 × 0.8–5 cm, abaxially sparsely or densely appressed hirsute or villous, rarely glabrous, base subcordate, rounded, or truncate, margin crenulate, apex obtuse or acute. Flowers solitary and terminal on branches, pedicellate. Calyx adnate to ovary up to middle; lobes broadly lanceolate or narrowly oblong, 10–23 × 6–8 mm, margin subentire or sinuate, apex obtuse or acute; sinus between calyx lobes narrow and pointed. Corolla yellow-green, with purple spots inside, broadly campanulate, 1.8–2.3 × 1.8–2.5 cm, shallowly lobed; lobes deltoid, apex acute. Filaments slightly dilated at base, ca. 5 mm; anthers elongate, 5–6 mm. Stigma white setose. Capsule hemispheric at base, conical toward apex, 1–2.4 cm. Seeds numerous, red-brown to dark brown, oblong to ellipsoid, ca. 1 mm, smooth. Fl. and fr. Jul–Oct.  $2n = 16$ .

Forests, thickets, meadows or scrub at forest margins; 900–3900 m. Chongqing, E Gansu, N Guizhou, Hebei, Heilongjiang, Henan, W Hubei, NW Hunan, Jilin, Liaoning, Nei Mongol, Ningxia, E Qinghai, Shaanxi, Shandong, Shanxi, Sichuan, NW Yunnan; one subspecies widely cultivated [Korea, Mongolia, Russia (Far East)].

- 1a. Calyx tube almost entirely free from ovary; ovary almost entirely superior to calyx ..... 4c. subsp. *tangshen*  
 1b. Calyx adnate to ovary up to middle or near middle; ovary half-inferior to calyx.

*Codonopsis handeliana* Nannfeldt in Handel-Mazzetti, Symb. Sin. 7: 1078. 1936; *C. pilosula* var. *handeliana* (Nannfeldt) L. T. Shen.

Leaves 1–3 × 0.8–2.5 cm, both surfaces usually hirsute. Calyx lobes 1.5–2 cm. Corolla 2–2.6 cm.

• Forests, thickets, meadows at forest margins; 2300–3900 m. W Sichuan, NW Yunnan.

#### 4c. *Codonopsis pilosula* subsp. *tangshen* (Oliver) D. Y. Hong, Novon 20: 423. 2010.

川党参 chuan dang shen

*Codonopsis tangshen* Oliver, Hooker's Icon. Pl. 20: t. 1966. 1891.

Calyx nearly entirely free from ovary, inferior; tube nearly absent or only up to 1.5 mm. Ovary inferior only for corolla.

• Scrub at forest margins; 900–2300 m. Chongqing, N Guizhou, W Hubei, NW Hunan, SE Shaanxi, NE Sichuan; also cultivated on a large scale.

#### 5. *Codonopsis micrantha* Chipp, J. Linn. Soc., Bot. 38: 382. 1908.

小花党参 xiao hua dang shen

*Campanumoea violifolia* H. Léveillé; *Melothria violifolia* H. Léveillé.

Roots narrowly cylindrical, 20–30 × 0.5–1 cm. Stems twining, yellow-green or green, more than 1 m, branched, sparsely villous or subglabrous. Leaves alternate, or opposite on branches; petiole 2–5 cm; blade gray-green abaxially, green adaxially, ovate to broadly ovate, 2–5.5 × 2.4–4 cm, abaxially sparsely villous, base cordate with a broad obtuse or subsquare sinus, margin crenate or serrate, apex obtuse or acute. Flowers axillary or opposite leaves; pedicels 1–2.5 cm, glabrous. Calyx tube semiglobose; lobes inserted at middle, triangular or lanceolate, 8–15 × 3.5–5.5 cm, glabrous or sparsely ciliate, apex acute, separated by narrow acute sinuses. Corolla white, campanulate, 7–8 × 6–9 mm, glabrous or ciliate; lobes triangular, equaling tube. Filaments slightly dilated at base, ca. 3 mm; anthers ca. 2 mm. Capsule semiglobose below, conical and rostrate above, 8–11 mm in diam., superior part very short, 2.5–3.5 mm. Seeds numerous, brown-yellow, ovoid, slightly compressed, ca. 1 × 0.5 mm, minutely foveolate. Fl. and fr. Jul–Oct.

• Mountain scrub, sunny forests; 1900–2600 m. SW Sichuan, N Yunnan.

#### 6. *Codonopsis subglobosa* W. W. Smith, Notes Roy. Bot. Gard. Edinburgh 8: 108. 1913.

球花党参 qiu hua dang shen

Roots fusiform, carrot-shaped or cylindrical, 12–50 × 1.5–8 cm. Stems twining, 2–4 m, branched, sparsely white hirsute. Leaves on main stem and branches alternate, those on branchlets subopposite; petiole 0.5–2 cm, sparsely white hirsute; blade abaxially gray-green, adaxially green, ovate, 0.5–3 × 0.5–2.5 cm, abaxially hirsute, adaxially hispidulous, base subcordate, truncate, or rounded, margin shallowly sinuate or crenulate, apex obtuse or acute. Flowers solitary, terminal on branchlets or opposite to leaves; pedicels 2.5–6 cm, hirsute. Calyx tube fully adnate to ovary, semiglobose, with 10 conspicuous sparsely white hirsute ribs; lobes rhombic, elliptic, or ovate, 9–13 × 4.5–

8 mm, conspicuously veined, abaxially white hirsute, margins serrate, separated by broad flat sinuses. Corolla pale yellow-green with dark red-purple on lobes and sometimes at base, globose-campanulate,  $2-2.5 \times 2.5-3.7$  cm; lobes broadly triangular, ca.  $1/2$  as long to nearly as long as tube. Filaments slightly dilated; anthers ellipsoid, 4–6 mm. Capsule semiglobose below, conical and rostrate above,  $14-15 \times 15-18$  mm. Seeds numerous, yellow-brown, ellipsoid or ovoid, wingless, smooth. Fl. and fr. Jul–Oct.

• Stony mountain meadows, wooded limestone cliffs, scrub by streams; 2500–3700 m. W Sichuan, E Xizang, NW Yunnan (Dêqên, Lijiang).

**7. *Codonopsis affinis*** J. D. Hooker & Thomson, J. Proc. Linn. Soc., Bot. 2: 12. 1857.

大叶党参 da ye dang shen

Roots much thickened, fusiform, branched. Stems twining, yellow-green or green, more than 2 m, branched, subglabrous or sparsely white hirsute. Leaves on main stems and major branches alternate, those on branchlets subopposite; petiole 1–6 cm, shortly white hirsute; blade abaxially gray-green, adaxially green, ovate or ovate-oblong,  $2.5-15 \times 1-9$  cm, abaxially densely white hirsute, adaxially sparsely white hirsute, base deeply cordate to rounded, margin entire to shallowly crenate, apex shortly acuminate. Flowers solitary, terminal, or opposite leaves; pedicels 1–4 cm, hispidulous. Calyx tube adnate to whole ovary, semiglobose, obscurely 10-ribbed, hispidulous; lobes distant from each other, linear-oblong or linear-lanceolate,  $8-17 \times 2-3$  mm, both surfaces white lanate, margin wavy, apex acute or  $\pm$  obtuse; veins obscure. Corolla yellow-green at lower and middle parts, purple-red at upper part, broadly campanulate, ca.  $2 \times 2$  cm, outside hirsute apically, shallowly 5-lobed; lobes triangular. Filaments slightly dilated at base; anthers ellipsoid, ca. 5 mm, glabrous. Capsule semiglobose or subglobose below, conical and rostrate above, 1.5–5 cm in diam., rostrum ca. 4 mm. Seeds numerous, yellow-brown, ellipsoid or ovoid, wingless, smooth. Fl. and fr. Jul–Oct.

Forests; 2300–3200 m. S Xizang (Nyalam) [Bhutan, N India, N Myanmar, Nepal].

**8. *Codonopsis viridis*** Wallich in Roxburgh, Fl. Ind. 2: 103. 1824.

细萼党参 xi e dang shen

Roots unknown. Stems twining, more than 1 m, glabrous, branched. Leaves alternate; petiole 0.5–2 cm, puberulent; blade ovate to lanceolate,  $2-10 \times 1-6$  cm, abaxially densely pubescent, adaxially hispidulous, base cordate to rounded, margin minutely serrate or subentire, apex acute to acuminate. Flowers axillary, almost opposite to leaves, forming cymes; pedicels 2.5–7 cm, glabrous at lower and middle part, pubescent at top. Calyx adnate to ovary up to middle part; tube semiglobose, 10-ribbed, glabrous or sparsely pubescent; lobes linear to linear-

lanceolate,  $10-20 \times 2-3$  mm, both sides hispidulous entirely or only above, with 1 or 2 verrucose denticles on each side, sinus between calyx lobes broad and truncate. Corolla pale greenish white, flushed and spotted crimson, purple inside, or tube white, lobes deep purple, campanulate,  $2-3.2 \times 2-3$  cm, pubescent less frequently, outside glabrous, lobed to  $1/3$ ; lobes deltoid, sometimes recurved. Filaments slightly dilated at base, ca. 6 mm, glabrous; anthers as long as filaments, glabrous. Capsules globose in inferior part, conical in superior part,  $1-2 \times 1.2-1.6$  cm. Seeds brownish yellow, oblong, ca. 0.7 mm. Fl. Sep–Nov, fr. Oct–Nov.

Scrub on open slopes, forest margins; 1500–3000 m. SE Xizang (Cona) [Bhutan, N India, Nepal, Pakistan].

**9. *Codonopsis farreri*** J. Anthony, Notes Roy. Bot. Gard. Edinburgh 15: 181. 1926.

秃叶党参 tu ye dang shen

*Codonopsis farreri* var. *grandiflora* S. H. Huang.

Stems twining, 60–500 cm, branched. Leaves on main stems and major branches alternate or subopposite, those on branchlets opposite or pseudoverticillate; petiole 0.7–1.5 cm; blade ovate, lanceolate, or elliptic,  $0.5-3.5 \times 0.5-1.5$  cm, both surfaces glabrous, base cuneate or rounded, margin entire, apex acuminate, acute, or slightly obtuse. Flowers solitary, terminal; pedicels 4–5 cm. Calyx tube adnate to ovary only up to middle; lobes lanceolate or narrowly oblong,  $2-2.8 \times 0.3-0.6$  cm, subentire, apex acute or slightly obtuse. Corolla pale green or greenish yellow, with brown-red or purple reticulate markings, campanulate,  $3.3-5.8 \times 3-5$  cm; tube 2–3.5 cm; lobes deltoid,  $1.2-1.8 \times 1.2-2$  cm, acute. Filaments slightly dilated at base, 6–13 mm; anthers elongate, 4–7 mm.

Alpine forests and thickets; 3600–4000 m. NW Yunnan (Bijiang, Fugong) [N Myanmar].

**10. *Codonopsis rotundifolia*** Benth in Royle, Ill. Bot. Himal. Mts. 1: 254. 1836.

长叶党参 chang ye dang shen

*Codonopsis longifolia* D. Y. Hong.

Plants twining, 1–1.8 m, glabrous throughout. Roots carrot-shaped, ca.  $18 \times 1$  cm, not branched. Stems purple, branched. Leaves on main stems and major branches alternate, larger; petiole 0.5–2 cm; blade lanceolate or ovate-lanceolate,  $5-7 \times 0.8-2.5$  cm, thin, base rounded to cuneate, margin entire, apex shortly acuminate; those on branchlets similar but much smaller. Flowers solitary, terminal; pedicels 6–13 cm. Calyx tube adnate to ovary up to middle, semiglobose; lobes broadly linear,  $22-30 \times 5-8$  mm, margin entire, apex obtuse or acute. Corolla yellow-green with purple reticulate markings,  $50-55 \times 25-28$  mm. Fl. and fr. Aug–Sep.

Mountain slopes; 3200–3700 m. S Xizang (Nyalam), NW Yunnan (Gongshan) [NW India, Kashmir, Nepal].

**11. *Codonopsis henryi*** Oliver, Hooker's Icon. Pl. 20: t. 1967. 1891.

川鄂党参 chuan e dang shen

Stems twining, more than 1 m; branches short, less than 3 cm, with 2–4 leaves, sterile or with terminal flowers, sparsely puberulent or glabrescent at internodes. Leaves on main stems alternate, those on branches subopposite; petiole 0.2–2 cm, puberulent; blade abaxially gray-green, adaxially green, ovate-lanceolate or lanceolate, 3–15 × 1–7 cm, abaxially appressed puberulent, adaxially puberulent, base decurrent or cuneate, margin conspicuously dentate, apex acuminate. Flowers solitary, terminal on branches; pedicels ca. 1 cm, puberulent. Calyx tube adnate to ovary up to middle, semiglobose, puberulent or gradually glabrescent; lobes distant from each other, triangular, 6–10 × 3–7 mm, apex acute, puberulent and ciliate, sinus between lobes broad and obtuse. Corolla campanulate or ± tubular-campanulate, 1.5–3 cm; lobes triangular, glabrous. Stamens glabrous; filaments slightly dilated at base, ca. 7 mm, glabrous; anthers ca. 5 mm. Capsule ca. 1.5 cm in diam. Fl. and fr. Jul–Sep.

• Forest margins, scrub; 2300–3800 m. Chongqing, W Hubei, N Sichuan.

**12. *Codonopsis levicalyx*** L. T. Shen, Acta Phytotax. Sin. 13(3): 55. 1975.

光萼党参 guang e dang shen

*Codonopsis levicalyx* var. *hirsuticalyx* L. T. Shen; *C. rotundifolia* Benth var. *angustifolia* Nannfeldt.

Roots carrot-shaped, 10–35 × 0.5–1.4 cm. Stems twining, up to 2 m, branched, branches 15–30 cm, fertile or sterile, sparsely hirsute. Leaves on main stems alternate, those on branches opposite; petiole less than 10 mm; blade ovate or ovate-lanceolate, ca. 13 × 5 cm, abaxially sparsely or densely hirsute, adaxially sparsely hirsute, base cuneate or obtuse, margin crenulate or entire, apex acute or shortly acuminate. Flowers terminal on main stems or branches; pedicels glabrous, up to 10 cm. Calyx adnate to ovary up to middle; tube semiglobose, glabrous or sparsely hirsute; lobes ovate-triangular, 10–15 × ca. 6 mm, glabrous or hirsute, margin entire or crenulate, apex acute or obtuse, sinus between lobes narrow and pointed. Corolla yellow-green, with purple veins, campanulate, 1.8–2.5 × ca. 1.5 cm, glabrous; lobes deltoid, acute. Stamens glabrous; filaments slightly dilated at base, ca. 3 mm; anthers ca. 3 mm. Fl. Jul–Aug.

• Forests, scrub; 2300–3300 m. W Sichuan, SE Xizang.

A study conducted by D. Y. Hong after this treatment was finalized found *Codonopsis levicalyx* to comprise two species. The specimens from Sichuan belong to *C. henryi*, whereas those from SE Xizang represent a new species, which is to be published in 2011 or 2012.

**13. *Codonopsis kawakamii*** Hayata, J. Coll. Sci. Imp. Univ. Tokyo 30(1): 165. 1911.

台湾党参 tai wan dang shen

Roots carrot-shaped. Main stems scrambling or twining, fertile, sparsely villous; branches sterile or fertile, with subopposite leaves. Leaves on main stems alternate, those on branches subopposite; petiole 5–18 mm, hirsute; blade ovate or deltoid, 7–23 × 5–17 mm, abaxially hispid, adaxially hispidulous, base rounded or truncate, rarely shallowly cordate, margin mostly entire or sinuous, or very obscurely crenate, apex acute or obtuse. Flowers solitary, terminal on main stems and some branches, slightly pendent; pedicels 1–2.5 cm, sparsely hispid.

Calyx tube adnate to ovary up to middle, hemispherical, glabrous or rarely sparsely hairy; lobes ovate to lanceolate, 5–9 × 3–5 mm, subentire, sparsely hispid, apex acute; sinus between calyx lobes narrow and acute at anthesis. Corolla greenish yellow or pale blue, tubular, 1.5–2 cm, subglabrous, shallowly lobed. Stamens glabrous; filaments slightly dilated at base, ca. 3 mm; anthers ca. 3 mm. Capsule 10–15 × 6–12 mm. Seeds brown, ellipsoid, ca. 1.5 mm. Fl. Aug–Sep, fr. Oct.

• Grassy slopes; 2500–3100 m. Taiwan (Nantou).

**14. *Codonopsis deltoidea*** Chipp, J. Linn. Soc., Bot. 38: 387. 1908.

三角叶党参 san jiao ye dang shen

Roots conical or cylindrical, 15–30 × 1–1.4 cm, ± branched. Stems twining, more than 1 m; branches and branchlets short, no more than 5 cm, leafy, sterile or with terminal flowers, sparsely villous or eventually glabrescent. Leaves alternate or opposite; petiole 1–8 cm, villous or hirsute; blade abaxially gray-green, adaxially green, deltoid or broadly ovate, 3–10 × 4–10 cm, both surfaces sparsely puberulent or hirsute, base shallowly cordate, truncate, or rounded, margin coarsely dentate, apex acuminate or acute. Flowers terminal on main stems, branches, and/or branchlets, solitary or sometimes in few-flowered cymes; pedicels 1–2 cm, villous. Calyx tube adnate to ovary up to middle, semiglobose or broadly obconic, 4–5 × 7–8 mm, glabrous; lobes ovate-lanceolate or triangular, 9–13 × 3–7 mm, margin denticulate, often white ciliate, apex acuminate or acute. Corolla pale yellow-green, with purple veins, tubular, 2–2.5 × 0.9–1.5 cm; lobes deltoid, ca. 1/3 as long as tube. Filaments slightly dilated at base, ca. 6 mm, glabrous; anthers ca. 3 mm. Capsules semiglobose below, broadly conical above. Seeds numerous, yellow-white, ovoid, wingless, smooth. Fl. and fr. Jul–Oct.

• Mountain forest margins, scrub; 1800–2800 m. W Sichuan (Emei Shan).

**15. *Codonopsis tubulosa*** Komarov, Trudy Imp. S.-Peterburgsk. Bot. Sada 29: 112. 1908.

管花党参 guan hua dang shen

*Codonopsis accrescenticalyx* H. Léveillé; *C. pilosa* Chipp.

Roots carrot-shaped, 10–20 × 0.5–2 cm, simple or branched below middle. Stems usually 1–3 m and twining, rarely ascending and 50–75 cm, branched; branches and branchlets both leafy, sterile or with a terminal flower, subglabrous or sparsely villous. Leaves opposite or tending to alternate at top of stems and branches; petiole short, 1–7 mm, puberulent; blade abaxially gray-green, adaxially green, lanceolate, ovate, or elliptic, 2.5–8 × 0.7–4 cm, abaxially sparsely or densely puberulent, adaxially hispidulous, base cuneate or rounded, margin crenate or subentire, apex acute or obtuse. Flowers terminal; pedicels 1–6 cm, villous. Calyx tube adnate to ovary up to middle, hemispheric, subglabrous to densely villous; lobes broadly ovate, 10–18 × 5.5–12 mm, ciliate, abaxially sparsely villous, adaxially glabrous, margins crenate or verrucose toothed, apex obtuse or acute. Corolla yellow-green, tubular, 2–3.7 × 0.5–1.6 cm, glabrous, shallowly lobed; lobes deltoid, acute at apex. Filaments dilated at base, ca. 10 mm, ciliate; anthers 3–5 mm. Capsule globose below, conical above.

Seeds brown-yellow, ovoid, wingless, smooth. Fl. and fr. Jul–Oct.

• Mountain scrub, grasslands; 1900–3000 m. W Guizhou (Nanyang, Panxian), S Sichuan, Yunnan (Dali, Lanping, Mengzi).

**16. *Codonopsis benthamii*** J. D. Hooker & Thomson, J. Proc. Linn. Soc., Bot. 2: 14. 1857.

大萼党参 *da e dang shen*

*Codonopsis macrocalyx* Diels; *C. macrocalyx* var. *coerulescens* Handel-Mazzetti; *C. macrocalyx* var. *parviloba* J. Anthony.

Roots carrot-shaped or cylindrical, 20–30 × 1.5–2.5 cm. Stems erect, climbing, or ascending, up to 2 m, branched; branches and branchlets leafy, sterile or with a terminal flower, sparsely puberulent. Leaves alternate or those on branches subopposite; petiole 1–6 cm, sparsely villous; blade abaxially gray-white, adaxially green, broadly ovate, triangular-ovate, ovate, or ovate-lanceolate, 3–9 × 1.5–7 cm, abaxially sparsely or densely puberulent, adaxially sparsely puberulent, base truncate, cuneate, or rounded, margin irregularly pinnatifid to shallowly lobed, or dentate, crenate, or rarely subentire, apex acute or obtuse. Flowers terminal, long pedicellate; pedicels villous or occasionally subglabrous. Calyx tube adnate to ovary up to middle, 10-ribbed, glabrous or sparsely villous; lobes ovate or deltoid, 10–25 × 5–15 mm, both surfaces glabrous, margin crenulate, ciliate, apex acuminate, acute, or obtuse; sinus between lobes narrow and pointed. Corolla yellow-green, pale brown-red at base, tubular, 2–4 × 1.5–2 cm, glabrous, shallowly lobed; lobes triangular, apex acute. Stamens villous; filaments slightly dilated at base, 6–10 mm; anthers 5–6 mm. Capsule 1.2–1.6 cm in diam. Seeds brown-yellow, ovoid, wingless. Fl. and fr. Jul–Oct.

Grassy slopes, forest margins, scrub, by streams; 2800–3700 m. W Sichuan (Baoping, Muli), SE Xizang (Markam, Yadong, Zayü), NW Yunnan [Bhutan, NE India, N Myanmar, Nepal].

**17. *Codonopsis pianmaensis*** S. H. Huang, Acta Bot. Yunnan. 6: 393. 1984.

片马党参 *pian ma dang shen*

Stems decumbent or climbing, 80–120 cm, branched, subglabrous. Leaves alternate; petiole 0.8–3.5 cm; blade ovate-deltoid, 2–5.5 × 1.5–4 cm, abaxially sparsely or densely puberulent, adaxially sparsely puberulent, base cuneate or obtuse, margin irregularly serrate, apex acuminate; leaves on branches smaller. Flowers solitary and terminal; pedicels 1–6.5 cm. Calyx adnate to ovary up to middle, semiglobose, puberulent; lobes ovate-deltoid, ca. 12 × 8 mm, margin repand, apex acute; sinus between lobes acute. Corolla yellow, with purple-blue spots inside, tubular-campanulate, ca. 17 × 10 mm, outside densely puberulent; lobes triangular. Filaments dilated at base, ca. 7 mm, densely villous; anthers oblong, ca. 4.5 mm, abaxially densely puberulent. Ovary semi-inferior. Fl. Jul.

• Grassy slopes with shrubs; ca. 3500 m. W Yunnan (Lushui).

**18. *Codonopsis subsimplex*** J. D. Hooker & Thomson, J. Proc. Linn. Soc., Bot. 2: 16. 1857.

藏南党参 *zang nan dang shen*

Roots carrot-shaped, 15–20 × 0.5–1.2 cm. Stems erect or ascending, 35–70 cm, few branched, subglabrous or sparsely white villous. Leaves on main stems alternate, those on branches subopposite; petiole 0.5–1.5 cm, sparsely white villous; blade broadly ovate, ovate, or subelliptic, 3–7 × 2–4.5 cm, abaxially hispidulous but hirsute along veins, adaxially hispidulous, base cordate, truncate, or rounded, margin sparsely crenulate, apex acute or obtuse. Calyx tube fully adnate to ovary; lobes triangular or ovate, 11–16 × 6–8.5 mm, margin dentate, sparsely ciliate, apex acute or obtuse; sinus between calyx lobes acute. Corolla pale yellow-green or pale blue, broadly campanulate, 1.5–2.3 × 1.5–2.5 cm, glabrous; lobes ovate-deltoid, ca. 1/3 as long as tube. Filaments slightly dilated at base, 2–3 mm; anthers ca. 5 mm. Capsules semiglobose below, broadly conical above, ca. 8 mm in diam., rostrum 4–6 mm. Seeds numerous, yellow, ellipsoid, ca. 1.5 mm, wingless. Fl. Jul–Aug, fr. Sep–Oct. *2n* = 16.

Mountain forests or scrub; ca. 3100 m. S Xizang (Mainling, Yadong) [Bhutan, NE India, Nepal].

**19. *Codonopsis subscaposa*** Komarov, Trudy Imp. S.-Peterburgsk. Bot. Sada 29: 114. 1908.

抽葶党参 *chou ting dang shen*

Roots carrot-shaped, 15–20 × 0.5–1 cm. Stems erect, 40–100 cm, simple or sparingly branched, sparsely pubescent, eventually glabrescent. Leaves on main stems alternate, those on branches opposite; petiole 1–7(–10) cm, sparsely villous; blade abaxially gray-green, adaxially green, ovate, elliptic, narrowly elliptic, or lanceolate, 2–8(–13) × 1–3.8(–5) cm, abaxially glabrous or sparsely villous along veins, adaxially sparsely puberulent or glabrous, base rounded, obtuse, cuneate, or attenuate, margin dentate or crenate, apex acute or obtuse. Flowers terminal or axillary, often 1–4 at tops of stems and branches, long pedicellate. Calyx tube adnate to ovary up to middle, semiglobose, 10-ribbed, sparsely villous; lobes triangular or narrowly elliptic, 5–8 × 2–3 mm, glabrous, margin serrulate or crenulate, apex acute. Corolla yellowish or greenish white with red-purple veins, or red-purple with yellowish spots, broadly campanulate, 1.5–3 × 2–4 cm, 5-fid to middle, both sides glabrous or sparsely villous at apex of lobes. Stamens glabrous; filaments dilated at base, 6–8 mm; anthers 4–5 mm. Capsule obconic at base, conical at apex, 14–15 mm. Seeds brown-yellow, ovoid, smooth. Fl. and fr. (Apr–)Jul–Oct.

• Grassy slopes, wet meadows, open woods; 2500–4200 m. W Sichuan, NW Yunnan (Zhongdian).

**20. *Codonopsis meleagris*** Diels, Notes Roy. Bot. Gard. Edinburgh 5: 172. 1912.

珠鸡斑党参 *zhu ji ban dang shen*

Roots carrot-shaped, 13–20 × 0.5–1.5 cm. Stems erect, simple or with elongate branches in lower part, 40–90 cm, sparsely hairy, eventually glabrescent. Leaves on main stems alternate, those on branches opposite, sessile or with short petiole less than 1 cm; blade abaxially gray-green, adaxially green, ovate, elliptic, or lanceolate, 4–8.5 × 1.5–3.5 cm, abaxially

densely hirsute, adaxially glabrous or sparsely hispidulous, base cuneate or attenuate, margin crenate, apex obtuse or rounded. Flowers terminal or axillary, long pedicellate. Calyx tube adnate to ovary up to top, semiglobose, 10-ribbed, glabrous or sparsely scaberrulose; lobes ovate or ovate-triangular,  $8-12 \times 4-6$  mm, glabrous, margins entire or sparsely serrulate, apex acute or obtuse. Corolla yellowish green with red-purple veins, or red-purple with yellowish green spots, broadly campanulate,  $2.2-3(-4) \times 2.4-3(-4)$  cm, both sides glabrous; lobes deltoid, ca.  $1/2$  as long as tube, often sparsely villous at apex. Stamens glabrous; filaments slightly dilated at base, ca. 7 mm; anthers ca. 5 mm. Capsules semiglobose below, conical above, ca.  $10 \times 8$  mm. Seeds numerous, brown-yellow, ovoid, wingless. Fl. and fr. Jul-Oct.

• Grassy slopes, open forests; 3000–4000 m. NW Yunnan (Lijiang).

**21. *Codonopsis purpurea*** Wallich in Roxburgh, Fl. Ind. 2: 105. 1824.

紫花党参 *zi hua dang shen*

*Campanula purpurea* (Wallich) Sprengel; *Glosocomia purpurea* (Wallich) Ruprecht; *Wahlenbergia purpurea* (Wallich) A. Candolle.

Plants glabrous throughout. Roots fusiform or carrot-shaped. Stems erect or sprawling, 30–50 cm, few branched. Leaves opposite or those at top sometimes alternate; petiole 1–7 mm; blade ovate or lanceolate,  $4-9 \times 1.6-3.5$  cm, base rounded or obtuse, margin subentire or sinuous, apex acute or acuminate. Flowers terminal or opposite leaves at top. Calyx tube adnate to ovary for its entire length, broadly obconic,  $6-10 \times 15-18$  mm; lobes triangular,  $10-20 \times 6-9$  mm, margin entire, apex acute or acuminate. Corolla dark red-purple, broadly campanulate or funnelform-campanulate,  $2-3.4 \times 2.4-4$  cm; lobes triangular, equaling tube. Filaments slightly dilated, ca. 6 mm; anthers ca. 5 mm. Capsules semiglobose below, conical above, 1.5–2 cm in diam.; valves 5–8 mm. Seeds numerous, yellow, oblong, ca.  $2 \times 1$  mm, narrowly winged. Fl. and fr. Sep–Oct.

Grassy slopes, scrub, epiphytic on trunks in forests; 2000–3300 m. S Xizang (Nyalam), W Yunnan (Jingdong) [N India, Nepal].

**22. *Codonopsis clematidea*** (Schrenk) C. B. Clarke in J. D. Hooker, Fl. Brit. India 3: 433. 1881.

新疆党参 *xin jiang dang shen*

*Wahlenbergia clematidea* Schrenk in Fischer & C. A. Meyer, Enum. Pl. Nov. 1: 38. 1841; *Codonopsis clematidea* var. *obtusata* (Chipp) Kitamura; *C. obtusata* (Chipp) Nannfeldt; *C. ovata* Benth. var. *cuspidata* Chipp; *C. ovata* var. *obtusata* Chipp; *C. ovata* var. *ramosissima* J. D. Hooker & Thomson; *Glosocomia clematidea* (Schrenk) Fischer ex Regel.

Roots carrot-shaped,  $25-45 \times 1-3$  cm. Stems single or caespitose, erect or ascending, or slightly procumbent, 50–100 cm tall; branches slender, erect or slightly spreading, mostly at lower part but those at upper part usually fertile, hispidulous when young. Leaves on main stems smaller and alternate, those on branches opposite; petiole up to 2.5 cm, sparsely hispidulous; blade ovate, oblong, broadly lanceolate, or lanceolate, 1–

$3.5(-5.2) \times 0.8-2(-3.2)$  cm, abaxially densely hispidulous, adaxially sparsely or densely hispidulous, base slightly cordate or rounded, margin entire or occasionally crenulate or sinuate, apex acute. Flowers solitary, terminal on main stems and branches, long pedicellate; pedicels sparsely white hispidulous. Calyx tube adnate to ovary up to middle, hemispheric, 10-ribbed, glabrous or rarely sparsely white scaberrulose; lobes ovate, elliptic, or lanceolate,  $10-20 \times 6-8$  mm, glabrous or apex sparsely puberulent, margin entire, apex acute; sinus between calyx lobes narrow and pointed. Corolla pale blue with dark blue veins and purple spots inside, broadly campanulate,  $1.7-2.6$  cm, glabrous. Stamens glabrous; filaments slightly dilated at base, 5–6 mm; anthers oblong, 5–6 mm. Capsule semiglobose below, conical above, rostrum acute,  $15-20 \times 12-15$  mm in total; persistent calyx lobes much enlarged, revolute. Seeds numerous, pale brown-yellow to brown, narrowly ellipsoid or oblong, terete, smooth. Fl. and fr. Jul–Oct.  $2n = 16$ .

Mountain forests, ravines, by streams; 1700–2500 m. Xinjiang, W Xizang [Afghanistan, NW India, Kazakhstan, Kyrgyzstan, Pakistan, Tajikistan].

**23. *Codonopsis gombalana*** C. Y. Wu, Rep. Yunnan Trop. Subtrop. Fl. Res. Rep. 1: 81. 1965.

贡山党参 *gong shan dang shen*

Roots carrot-shaped. Stems erect or ascending, 50–160 cm tall, branched at all parts, leafy, lower branches sterile, upper ones fertile. Leaves alternate; petiole slender, 4–17 mm; blade elliptic to narrowly lanceolate,  $15-65 \times 3-18$  mm, both surfaces glabrous, base broadly cuneate to rounded, margin entire, apex acute or obtuse. Flowers solitary and terminal; pedicels 1–3 cm. Calyx tube almost entirely free from ovary or adnate to ovary up to middle, semiglobose, 10-ribbed; lobes linear-lanceolate,  $18-20 \times 2.5-3$  mm, 3-veined, margin entire and slightly recurved, apex acuminate; sinus between lobes broad. Corolla yellow-green with purple veins, tubular-campanulate, ca.  $4.5 \times 4$  cm, 5-lobed; lobes deltoid, ca.  $1.6 \times 1.6$  cm, apex acute. Filaments slightly dilated at base, ca. 1.3 cm; anthers ca. 6 mm. Capsule semiglobose below, conical above; persistent calyx lobes very much enlarged, ca.  $2 \times$  as large as at anthesis. Seeds numerous, brown-yellow, subellipsoid, wingless, smooth. Fl. and fr. Jul–Oct.

• Mountain scrub, bamboo thickets; ca. 3600 m. NW Yunnan (Gongshan).

**24. *Codonopsis chimiliensis*** J. Anthony, Notes Roy. Bot. Gard. Edinburgh 15: 184. 1926.

滇缅党参 *dian mian dang shen*

Plants glabrous throughout. Stems erect, multi-branched, 60–90 cm. Leaves alternate; petiole 0.5–2 cm; blade ovate to ovate-lanceolate,  $5-14 \times 3-7$  cm, base rounded, decurrent, margin crenulate, apex acute to shortly acuminate. Flowers solitary, terminal; pedicels 3–10 cm. Calyx entirely free from ovary; lobes oblong-lanceolate,  $18-30 \times 6-10$  mm, margin entire, apex acute. Corolla pale creamy yellow, with pale purple veins, campanulate; tube  $1.6-2 \times 2.4-3$  cm; lobes triangular,  $1.2-1.5 \times 0.8-1.2$  cm, apex acute. Filaments filiform, ca. 8 mm.

• Grassy slopes; 3600–4300 m. W Yunnan (Bijiang).

The type specimen of this species was collected from the border between China and Myanmar.

**25. *Codonopsis thalictrifolia*** Wallich in Roxburgh, Fl. Ind. 2: 106. 1824.

唐松草党参 tang song cao dang shen

*Campanula thalictrifolia* (Wallich) Sprengel; *Codonopsis mollis* Chipp; *C. thalictrifolia* var. *mollis* (Chipp) L. T. Shen; *Glosocoma tenera* D. Don, nom. illeg. superfl.; *G. thalictrifolia* (Wallich) Wallich; *Wahlenbergia thalictrifolia* (Wallich) A. Candolle.

Roots carrot-shaped, 15–20 × 0.5–1 cm. Stems erect or ascending, main stems robust, fertile, 15–30 cm tall, glabrous or sparsely villous; branches sterile, slender, leafy, aggregated at base of main stems, 4–6 cm, villous. Leaves on main stems alternate, those on branches subopposite; petiole ca. 2 mm, white hirsute; blade ovate or suborbicular, 3–20 × 3–17 mm, both surfaces villous, base cordate or truncate, margin subentire or crenate, apex obtuse or acute. Flowers solitary, terminal on main stems, slightly pendent. Calyx tube adnate to ovary up to middle, hemispheric, 3–5 × 6–10 mm, glabrous or villous; lobes triangular or oblong, 6–7 × 2–3 mm, outside hairy, margin entire, apex acute or obtuse; sinus between lobes broad and obtuse. Corolla tubular-campanulate, 2–4.8 × 1.5–4.3 cm, shallowly lobed; lobes triangular, 2–4 × 7–9 mm, apex obtuse; tube pale blue, 18–23 × 6–9 mm, glabrous or occasionally sparsely villous. Filaments slightly dilated at base, ca. 1 cm; anthers ca. 3 mm, villous at connective. Capsule hemispherical at base, conical toward apex, rostrate. Seeds numerous, brown-yellow, ellipsoid, smooth. Fl. Jul–Sep, fr. Sep–Oct.

Grassy slopes, scrub; 3600–5300 m. C and S Xizang [NE India, Nepal].

**26. *Codonopsis bulleyana*** Forrest ex Diels, Notes Roy. Bot. Gard. Edinburgh 5: 171. 1912.

管钟党参 guan zhong dang shen

*Cyananthus mairei* H. Léveillé.

Roots carrot-shaped, 15 × 0.5 cm. Main stems erect or ascending, 25–55 cm tall, sparsely white villous; branches aggregated at lower part, leafy, sterile, 1–10 cm, densely villous. Leaves on main stems alternate, those on branches subopposite; petiole 1–2.5 mm, densely villous; blade cordate, broadly ovate, or ovate, 8–18 × 8–14 mm, white villous, base cordate or rounded, margin sinuous or obscurely crenate, or subentire, apex acute or obtuse. Flowers solitary, terminal on main stems, slightly pendent; pedicels 4–8 cm, glabrous or villous. Calyx tube adnate to ovary up to middle, hemispheric, sparsely villous; lobes deltoid or ovate, 8–10 mm, both sides sparsely hispidulous, margin somewhat sinuous, revolute, apex acute; sinus between lobes narrow and pointed, or broad and obtuse due to being revolute. Corolla pale blue but tube purplish, tubular-campanulate, 2.2–3 cm, shallowly lobed; lobes broad, margin and apex involute; tube 1–1.2 cm in diam.; limb 2–3.5 cm in diam. Stamens glabrous; filaments ca. 6 mm; anthers ca. 5 mm. Capsule hemispheric at base, conical toward apex, rostrate, 2–2.4 × 1–1.5 cm; persistent calyx lobes revolute. Seeds numerous, brown-yellow, ellipsoid, ca. 1.5 mm. Fl. Jul–Sep, fr. Sep–Oct.

• Grassy slopes, scrub; 3300–4200 m. SW Sichuan, SE Xizang, N Yunnan.

**27. *Codonopsis foetens*** J. D. Hooker & Thomson, J. Proc. Linn. Soc., Bot. 2: 16. 1857.

臭党参 chou dang shen

Roots slender, 10–55 × 1–2 cm. Caudexes abundantly branched, and thus stems several to many from one caudex, caespitose. Main stems erect or ascending, 20–40 cm tall, villous; branches numerous, aggregated in lower part, 1–10 cm tall, usually sterile. Leaves on main stems alternate, those on branches opposite or subopposite; blade cordate or ovate, 5–30 × 5–24 mm, both surfaces variously pubescent, margin entire or nearly so, apex acute or obtuse; petiole 2–3 mm. Flowers solitary (rarely several), terminal on main stems and sometimes branches, ± pendent; pedicels 1–8 cm. Calyx tube adnate to ovary up to middle, semiglobose or hemispherical, glabrous or very sparsely white hispidulous; lobes ovate, ovate-oblong, or ovate-lanceolate, 7–20 × 2–7 mm, rather densely hispidulous, entire, recurved at margin, apex acute or obtuse. Corolla pale blue or pale purple with interior markings, campanulate or subglobose-campanulate, 2–4.5 × 2.5–3 cm; lobes suborbicular, 8–12 mm, apex obtuse or acute. Stamens glabrous; filaments slightly dilated at base, ca. 5 mm; anthers 4–5 mm. Capsule obconical at inferior part, conical at superior part, ca. 2 × 1.5 cm. Seeds brown-yellow, ellipsoid or oblong, ca. 1 mm, smooth. Fl. Jul–Sep, fr. Sep–Oct.

Grassy slopes, alpine scrub, crevices, forests, meadows at forest margins on N-facing slopes; 3300–4600 m. SE Gansu, S Qinghai, W Sichuan, E and S Xizang, NW Yunnan [Bhutan, N India].

- 1a. Leaf blades 5–9 × 5–7 mm, very rarely up to 15 × 12 mm; margin of calyx lobes often recurved ..... 27a. subsp. *foetens*
- 1b. Leaf blades mostly 10–15 × 10–15 mm; margin of calyx lobes very rarely recurved ..... 27b. subsp. *nervosa*

**27a. *Codonopsis foetens* subsp. *foetens***

臭党参(原亚种) chou dang shen (yuan ya zhong)

Leaves on main stems alternate, mostly yellow scaly, only several upper ones green and ordinary, those on branches opposite or subopposite, all ordinary leaves with petiole 2–3 mm; blade cordate or cordate-ovate, 5–9 × ca. 5 mm, both surfaces rather densely white hispidulous, margin entire, apex obtuse. Calyx lobes ovate-oblong or ovate-lanceolate, ca. 8 × 4–5.5 mm, rather densely hispidulous, margin recurved, entire. Corolla pale blue or pale purple with dark purple veins, campanulate or broadly campanulate, 2–3 cm; lobes suborbicular, 8–12 mm, apex obtuse or acute. Fl. Jul–Sep, fr. Sep–Oct.

Alpine scrub, crevices; 3900–4600 m. S Xizang [Bhutan, N India].

**27b. *Codonopsis foetens* subsp. *nervosa*** (Chipp) D. Y. Hong, Novon 20: 422. 2010.

脉花党参 mai hua dang shen

*Codonopsis ovata* Benth. var. *nervosa* Chipp, J. Linn. Soc., Bot. 38: 385. 1908; *C. macrantha* Nannfeldt; *C. nervosa* (Chipp) Nannfeldt; *C. nervosa* subsp. *macrantha* (Nannfeldt) D. Y. Hong & L. M. Ma; *C. nervosa* var. *macrantha* (Nannfeldt) L. T. Shen.

Leaves on main stems alternate, those on branches subopposite; petiole 2–3 mm, white villous; blade broadly cordate, cordate, or ovate, 1–3 × 1–2.4 cm, abaxially sparsely white hirsute, adaxially densely white hirsute, subentire, apex acute or obtuse. Flowers solitary, rarely several, terminal on main stems and branches, slightly pendent; pedicels 1–8 cm. Calyx lobes ovate or lanceolate, 7–20 × 2–7 mm, densely white hispidulous but usually more sparsely or even becoming glabrous toward base, margin entire, apex acute or obtuse. Corolla pale blue, often with red-purple spots at base inside, subglobose-campanulate, 2–4.5 × 2.5–3 cm, shallowly lobed; lobes obtuse, involute, villous at apex and along veins on abaxial side. Fl. Jul–Sep, fr. Sep–Oct.

• Grassy slopes, scrub, forests, meadows at forest margins on N-facing slopes; 3300–4500 m. SE Gansu, S Qinghai, W Sichuan, E Xizang, NW Yunnan.

**28. *Codonopsis canescens*** Nannfeldt, Svensk Bot. Tidskr. 34: 386. 1940.

灰毛党参 hui mao dang shen

Roots carrot-shaped, 20–30 × 1–2.5 cm. Main stems single or several from one root, erect or ascending, 25–85 cm tall, leafy in middle part; branches mostly aggregated in middle part, leafy, usually sterile, densely white villous. Leaves on main stems alternate, those on branches subopposite; petiole less than 2 mm; blade ovate, broadly ovate, or subcordate, 1–1.5 × 0.5–1.2 cm, both surfaces densely white hispidulous, margin entire, apex acute or obtuse. Flowers solitary, terminal on main stems and upper branches; pedicels 2–15 cm. Calyx tube adnate to ovary up to middle, hemispherical, 10-ribbed, densely white hispidulous; lobes ovate to lanceolate, 4–6 × 2–4 mm, densely white puberulent, entire; sinus between lobes broad and obtuse. Corolla pale blue or blue-white, with blue veins at base inside, broadly campanulate, 1.5–1.8 × 2–3 cm, shallowly lobed; lobes deltoid, villous at apex and on abaxial side. Stamens glabrous; filaments slightly dilated at base, 2–2.5 mm; anthers ca. 3 mm. Capsule hemispherical at base, conical toward apex, 0.8–1.5 cm. Seeds numerous, brown-yellow, ellipsoid or oblong, ca. 1 mm, smooth. Fl. Jun–Sep, fr. Sep–Oct.

• Grassy slopes, sunny or stony river terraces; 3000–4200 m. S Qinghai (Nangqên, Yushu), NW Sichuan, E Xizang (Gonjo, Jomda, Markam).

**29. *Codonopsis argentea*** P. C. Tsoong, Contr. Inst. Bot. Natl. Acad. Peiping 3: 92. 1935.

银背叶党参 yin bei ye dang shen

Roots not seen. Stems erect or ascending, ca. 30 cm tall; branches fertile, densely leafy, pale brown or yellow, lanate. Leaves on main stems alternate, those on branches subopposite; petiole absent or less than 3 mm; blade ovate or oblong-

ovate, 7–20 × 2–12 mm, abaxially white tomentose, adaxially appressed tomentose, base cordate, margin sinuous or subentire, slightly recurved, apex obtuse. Flowers terminal on main stems and branches, slightly pendent; pedicels brownish yellow, tomentose. Calyx tube adnate to ovary up to middle, semiglobose, 10-ribbed; lobes triangular-ovate or ovate-lanceolate, ca. 8 × 4 mm, brownish yellow tomentose, subentire, recurved, apex acute or obtuse; sinus between calyx lobes broad and obtuse. Corolla pale blue, campanulate, ca. 2.2 × 2–2.5 cm, shallowly lobed; lobes rounded, setose on both sides, apex acute. Stamens glabrous; filaments slightly dilated at base, ca. 6 mm; anthers 4–5 mm. Fruit unknown.

• Exposed rocky slopes; 2000–2300 m. Guizhou (Fanjing Shan).

**30. *Codonopsis alpina*** Nannfeldt, Notes Roy. Bot. Gard. Edinburgh 16: 154. 1931.

高山党参 gao shan dang shen

*Codonopsis foetens* J. D. Hooker & Thomson var. *major* Handel-Mazzetti.

Roots carrot-shaped, 14–15 × 0.7–1 cm. Main stems erect or ascending, 15–25 cm, or even longer, glabrous or sparsely white hirsute; branches aggregated at lower part, leafy, sterile, sparsely white hirsute. Leaves on main stems sparse and alternate, those on branches subopposite, rarely alternate; petiole 4–6 mm, glabrous or sparsely hirsute; blade ovate, 1.2–1.8 × 0.6–1.5 cm, abaxially sparsely white hispidulous, adaxially glabrous or subglabrous, base cordate or rounded, margin sinuous or subentire, recurved, apex acute or obtuse. Flowers solitary, terminal on main stems; pedicels sparsely hirsute. Calyx tube adnate to ovary up to middle, obconical or semiglobose, 10-ribbed; lobes triangular, 8–12 × 5–7 mm, both sides glabrous, margin entire or sinuous, recurved, apex acute or obtuse; sinus between lobes obtuse. Corolla purple-green with purple veins, broadly campanulate, 2.5–3 × 2.5–3 cm, glabrous; lobes deltoid-orbicular, equaling tube. Stamens glabrous; filaments slightly dilated at base, 6–8 mm; anthers 4–5 mm. Fl. Aug.

• Alpine open stony grassy slopes; 4000–4300 m. SE Xizang (Markam, Zayü), NW Yunnan (Dêqên, Gongshan).

**31. *Codonopsis cardiophylla*** Diels ex Komarov, Trudy Imp. S.-Peterburgsk. Bot. Sada 29: 117. 1908.

光叶党参 guang ye dang shen

Roots carrot-shaped, 10–15 × 1–1.5 cm. Stems several from one caudex, ascending or suberect, 20–60 cm tall; branches 10–17 cm, very sparsely white hispidulous, glabrescent, those at lower part slender, sterile, those at upper part fertile. Lower and middle leaves subopposite but upper ones alternate; petiole 0.5–3 mm, glabrous or hirsute; blade ovate or lanceolate, 1–3 × 0.5–2.5 cm, abaxially sparsely hispidulous, adaxially subglabrous, base subcordate, truncate, or rounded, margin entire, recurved, apex obtuse. Flowers terminal on main stems and upper branches; pedicels sparsely hirsute, eventually glabrescent. Calyx tube adnate to ovary up to middle, semiglobose, 10-ribbed, glabrous; lobes triangular or

lanceolate, 9–12 × 4–5 mm, glabrous or hispidulous, margin entire, apex obtuse; sinus between lobes acute. Corolla pale blue, with red-purple or brown-red spots, broadly campanulate, 2–3.2 × 2.3–3 cm; lobes ovate, ca. 1/2 as long as tube, inside villous, apex acute. Stamens glabrous; filaments slightly dilated at base, 6–7 mm; anthers ca. 5 mm. Capsules semiglobose below, conical above, 8–10 mm in diam.; valves 5–7 mm. Seeds brown-yellow, ellipsoid, 1–1.5 × ca. 0.5 mm, wingless. Fl. and fr. Jul–Oct.

• Grassy slopes or cliffs; 2000–2900 m. W Hubei, S Shaanxi (Foping, Huaxian, Weinan), S Shanxi (Yuanqu).

**32. *Codonopsis viridiflora*** Maximowicz, Bull. Acad. Imp. Sci. Saint-Pétersbourg 27: 496. 1882.

绿花党参 lǜ huā dāng shēn

*Codonopsis bicolor* Nannfeldt.

Roots carrot-shaped, 10–15 × 1–1.5 cm. Stems 1–3 from one caudex, suberect, 30–70 cm tall; branches at lower part, sparsely hirsute or subglabrous. Leaves on main stems alternate, tending smaller and bractlike, those on branches opposite or subopposite and thus branches like pinnate leaves; blade broadly ovate, ovate, or lanceolate, 1.5–3.5(–5) × 0.8–3 cm, both surfaces hispidulous, base slightly cordate or rounded, margin crenate or subentire, apex acute or obtuse. Flowers 1–3, terminal on main stems and branches; pedicels 6–15 cm, subglabrous or lower part sparsely hispidulous. Calyx tube adnate to ovary up to middle, hemispheric, 3–4 × 10–13 mm, 10-ribbed, glabrous; lobes ovate, lanceolate, or oblong 10–15 × 6–8 mm, sparsely hispidulous near apex or occasionally glabrous abaxially, ciliate, sparsely crenate at margin, apex acute or obtuse. Corolla yellow-green, purplish only at base, campanulate, 1.7–2.5 × 2–3 cm, glabrous throughout, lobed to half; lobes triangular, 8–10 × 9–11 mm. Stamens glabrous; filaments slightly dilated at base, ca. 5 mm; anthers ca. 5 mm. Capsule ca. 1.5 cm in diam. Seeds numerous, brown-yellow, ellipsoid, wingless. Fl. and fr. Jul–Oct.

• Alpine meadows or forest margins; 3000–4000 m. SE Gansu, S Ningxia (Jingyuan), E Qinghai (Huangyuan), Shaanxi (Taibai Shan), W Sichuan, E Xizang (Jomda), NW Yunnan (Dèqên).

**33. *Codonopsis tsinlingensis*** Pax & K. Hoffmann, Repert. Spec. Nov. Regni Veg. Beih. 12: 500. 1922.

秦岭党参 qín líng dāng shēn

Roots carrot-shaped, 10–20 × 0.6–3.5 cm. Stems several from one caudex, erect or ascending, 26–35 cm tall; branches slender, with leaves aggregated at top, white hirsute. Leaves on main stems alternate, those on branches subopposite; petiole less than 1 cm, white hirsute; blade ovate or broadly ovate, 1–2.6 × 0.6–1.8 cm, hispidulous, base rounded or cordate, margin crenulate to subentire, slightly revolute, apex acuminate, acute, or obtuse. Flowers solitary, terminal; pedicels 3–15 cm, densely hispid. Calyx tube adnate to ovary up to middle, hemispherical, 10-ribbed, hispid entirely or along ribs, rarely glabrous; lobes narrowly triangular, 8–10 × 4–6 mm, abaxially hispidulous, margin entire, revolute toward middle rib, apex acute. Corolla

pale purple, with purple spots inside, campanulate, 20–30 × 20–30 mm, 5-fid almost to middle, inside villous. Stamens glabrous; filaments slightly dilated at base, ca. 5 mm; anthers ca. 4 mm. Capsule hemispherical at base, conical toward apex. Seeds brown-yellow, ellipsoid. Fl. and fr. Jul–Oct.

• Alpine scrub, grassy slopes; 2700–3600 m. Shaanxi (Taibai Shan).

**34. *Codonopsis chlorocodon*** C. Y. Wu, Rep. Yunnan Trop. Subtrop. Fl. Res. Rep. 1: 82. 1965.

绿钟党参 lǜ zhōng dāng shēn

*Codonopsis viridiflora* Maximowicz var. *chlorocodon* (C. Y. Wu) S. H. Huang.

Roots carrot-shaped, up to 20 cm or longer. Stems erect, 60–100 cm tall, lower branches leafy, sterile, middle ones often absent, upper ones, if present, fertile but leafless. Leaves on main stems alternate, those on branches opposite, sessile or with petiole up to 1 cm; blade triangular, ovate, or lanceolate, 10–25 × 5–20 mm, glabrous or sparsely hispid, base shallowly cordate, rounded, or truncate, margin entire or crenate, revolute, apex acute. Flowers solitary, terminal on main stems, but upper branches often with 1 or 2 flowers. Calyx tube adnate to ovary up to middle, hemispheric, campanulate, or obconic, 10-ribbed; lobes distant from each other, narrowly triangular or lanceolate, 4–6 × 2–3 mm, margins entire or with denticles above, glabrous or very sparsely hispidulous at upper part. Corolla pale yellow-green, tubular-campanulate, 1.5–1.8 cm. Capsule ca. 1 cm in diam., obtuse or slightly cuneate at base. Seeds brown-yellow, ellipsoid, ca. 1.5 mm. Fl. Jun–Aug, fr. Sep.

• Sunny grassy slopes, open thickets; 2700–3700 m. W Sichuan, NW Yunnan (Dèqên).

**35. *Codonopsis bhutanica*** Ludlow, J. Roy. Hort. Soc. 97: 127. 1972.

西藏党参 xī zāng dāng shēn

*Codonopsis xizangensis* D. Y. Hong.

Roots carrot-shaped, up to 20 × 1.8 cm. Stems erect or procumbent, 20–50 cm, branches several to many at lower and middle part, slender. Leaves on main stems alternate, those on branches opposite or nearly so; all leaves sessile or with petiole up to 4 mm; blade cordate, 10–24 × 8–24 mm, glabrous or villous or sparsely hispidulous, margin recurved. Flowers solitary, terminal on main stems and sometimes on upper branches, and rarely also on some slender branches. Calyx tube adnate to ovary up to middle, glabrous; lobes narrowly ovate, 5–13 × 3–5 mm, hispidulous entirely or only at upper part, margins recurved to middle rib; sinus between lobes narrow and pointed. Corolla pale blue with dark blue at base, tubular, 12–15 mm, lobed to 1/3. Stamens glabrous. Capsule globose in inferior part, conical in superior part, 14–16 × 8–10 mm. Seeds ellipsoid, ca. 1 mm. Fl. Jul–Sep, fr. Sep–Oct.

Meadows, grassy slopes, thickets; 3700–4600 m. SE Xizang (Cona) [Bhutan, Nepal].

## 2. *Codonopsis* subg. *Obconicapsula* D. Y. Hong, Acta Phytotax. Sin. 18: 245. 1980.

锥果党参亚属 *zhui guo dang shen ya shu*

Plants usually not fetid. Roots tuberous, ovoid or ellipsoid. Stems erect. Corolla epigynous, 5-lobed for less than 1/2 its length, campanulate. Fruit an obconic loculicidal capsule. Seed testa smooth or faintly striate.

One species: SW China, NE India, Nepal.

### 36. *Codonopsis dicentrifolia* (C. B. Clarke) W. W. Smith, Rec. Bot. Surv. India 4: 388. 1913.

珠峰党参 *zhu feng dang shen*

*Wahlenbergia dicentrifolia* C. B. Clarke in J. D. Hooker, Fl. Brit. India 3: 430. 1881; *Campanopsis dicentrifolia* (C. B. Clarke) Kuntze.

Plants glabrous throughout. Roots tuberous, subovoid or ellipsoid, ca. 6 × 3 cm. Stems erect, 40–50 cm tall, branched at upper part. Leaves mostly alternate, those on branches subopposite; petiole 2–5 mm; blade ovate or ovate-oblong, up to 3 × 1.5 cm, base cuneate or rounded, margin entire or sinuous,

sometimes slightly recurved, apex acute or obtuse. Flowers solitary, terminal on main stems and branches; pedicels 0.5–3 cm. Calyx tube adnate to ovary up to top, obconical, 5–7 × 7–10 mm; lobes sublinear, 7–10 × ca. 1 mm, margin entire, apex acuminate; sinus between lobes broad and obtuse. Corolla pale blue, campanulate, 2.5–3.5 × 2.5–3.5 cm, 5-fid to 1/3; lobes ovate, apex acute. Filaments slightly dilated, slender above, 3–4 mm; anthers 7–8 mm. Capsule broadly conical above, obconical or obdeltoid-conical below, obscurely 10-ribbed. Seeds elliptic, strongly compressed. Fl. and fr. Aug–Oct.

Broad-leaved forests on rocks; 2700–3300 m. S Xizang (N-facing slopes of Qomolangma Feng) [NE India, Nepal].

## 3. *Codonopsis* subg. *Pseudocodonopsis* Komarov, Trudy Imp. S.-Peterburgsk. Bot. Sada 29: 102. 1908.

幅冠党参亚属 *fu guan dang shen ya shu*

Plants usually not fetid. Roots tuberous, ovoid or ellipsoid. Stems erect or twining. Corolla epigynous, 5-fid for more than 3/4 its length, rotate. Fruit an obconic loculicidal capsule. Seed testa smooth or faintly striate.

Four species: Himalaya and the Hengduan Mountains; four species (three endemic) in China.

### 37. *Codonopsis rosulata* W. W. Smith, Notes Roy. Bot. Gard. Edinburgh 13: 157. 1921.

莲座状党参 *lian zuo zhuang dang shen*

Plants glabrous throughout. Roots globose or ovoid, 0.5–2.2 × 0.5–2.5 cm. Stems erect or ± decumbent, 10–40 cm tall, simple or with 2 or 3 branches. Basal leaves rosulate; blade ovate or broadly elliptic, 0.5–7 × 0.4–5.8 cm, base cordate, margin doubly crenate, apex rounded or obtuse; petiole 1–30 mm; cauline leaves lanceolate or linear-lanceolate, 1–15 × 0.5–8 mm, base rounded or cuneate, margin sinuous-crenate or subentire, apex acute or acuminate. Flowers solitary and terminal on main stems and branches; pedicels 4–15 cm. Calyx tube obconic, 4–8 × 4–6 mm; lobes lanceolate or ovate-lanceolate, 3–8 mm, margin entire, apex acute; sinus between lobes acute. Corolla blue-purple, rotate, 5-fid to near base; lobes ovate or broadly ovate, 7–14 × 5–9 mm, apex acute or obtuse. Filaments dilated at base; anthers oblong, 2.5–3 mm. Capsule obconical below, slightly truncate-obtuse above, ca. 12 × 6 mm, persistent style acute at base. Seeds numerous, brown-yellow, elliptic, compressed, wingless. Fl. and fr. Sep–Oct.

• Grassy slopes, margins of *Pinus* forests; 2600–3600 m. SW Sichuan, NW Yunnan.

### 38. *Codonopsis hirsuta* (Handel-Mazzetti) D. Y. Hong & L. M. Ma, Fl. Sichuan. 10: 546. 1992.

毛叶鸡蛋参 *mao ye ji dan shen*

*Codonopsis limprichtii* Lingelsheim & Borza var. *hirsuta* Handel-Mazzetti, Anz. Akad. Wiss. Wien, Math.-Naturwiss. Kl.

61: 169. 1924; *C. convolvulacea* Kurz var. *hirsuta* (Handel-Mazzetti) Nannfeldt.

Roots ovoid-globose, 1–2 cm in diam. Stems up to 1 m, decumbent below, twining only at upper part, hirsute at leafing section. Cauline leaves alternate, aggregated at lower part, sessile or with extremely short petiole ca. 2 mm; blade ovate or narrowly oblong, 1.5–5 × 0.3–1.6 cm, abaxially densely hirsute, adaxially glabrous, rarely sparsely hirsute, base cuneate or rounded, margin entire or sinuous-crenulate, often recurved toward lateral sides, apex acute or obtuse. Flowers solitary, terminal. Calyx glabrous; tube adnate to ovary up to top of ovary, obconical, 4–7 mm in diam.; lobes narrowly triangular-lanceolate, 6–18 × 2–6 mm, margin entire, apex acuminate or acute. Corolla pale blue or blue-purple, 5-divided to near base; lobes elliptic, 1–3.5 × 0.5–1.6 cm. Filaments dilated at base, villous on sides. Capsule broadly conical at superior part, obconical at inferior part. Seeds numerous, brown-yellow, smooth. Fl. Sep.

• Open thickets, sunny grassy slopes; 2400–3100 m. SW Sichuan (Huili, Muli, Yanyuan), NW Yunnan (Lijiang).

### 39. *Codonopsis convolvulacea* Kurz, J. Bot. 11: 195. 1873.

鸡蛋参 *ji dan shen*

Roots tuberous, ovoid-globose or ovoid, 2.5–5 × 1–1.5 cm. Stems twining, usually with a few branches, up to more than 1 m, glabrous. Leaves alternate or sometimes opposite, evenly distributed along stems; petiole absent or to 22 mm; blade linear-lanceolate to ovate or deltoid, 2–10 × 0.4–3.5 cm, base cuneate, rounded, truncate, or cordate, margin entire, sub-

entire, sinuous-crenate, or serrate, apex obtuse, acute, or acuminate. Flowers solitary, terminal on main stems and branches; pedicels 2–12 cm, glabrous. Calyx tube adnate to ovary up to top, obconical, 3–7 × 4–10 mm, glabrous, 10-ribbed; lobes narrowly triangular-lanceolate, 4–11 × 1–5 mm, glabrous, margin entire, apex acuminate or acute; sinus between lobes narrow, pointed or slightly obtuse. Corolla pale blue or blue-purple, rotate, 5-fid to near base; lobes elliptic, 1–3.5 × 0.6–1.2 cm, apex acute. Filaments slightly dilated and ciliate at base, 1–3 mm; anthers 4–5 mm. Superior part of capsule broadly conical, valves ca. 4 mm; inferior part obconical, 10–16 × ca. 8 mm. Seeds numerous, brown-yellow, oblong, ca. 1.5 mm, wingless. Fl. and fr. Jul–Oct.

Forests, open woods, forest margins, thickets, grassy slopes, pastures, meadows; 1000–4600 m. W Guizhou, SW Sichuan, S and SE Xizang, Yunnan [Bhutan, N Myanmar, Nepal].

Two of us (Lammers and Klein) do not agree with the broad treatment of *Codonopsis convolvulacea* adopted here, i.e., with *C. forrestii*, *C. grey-wilsonii*, and *C. vinciflora* treated as subspecies of *C. convolvulacea*, with *C. limprichtii*, *C. efilamentosa*, and *C. mairei* included in the synonymy of *C. convolvulacea* subsp. *forrestii*, and with *C. limprichtii* var. *pinifolia* included in the synonymy of *C. graminifolia*. Instead, based on our analysis of herbarium material including types, we recognize seven morphologically discrete entities. The nature of the differences distinguishing them suggests each is reproductively isolated from the others and so we treat them as species: *C. convolvulacea* (including *C. forrestii* var. *heterophylla*), *C. efilamentosa*, *C. forrestii* (including *C. forrestii* var. *hirsuta*), *C. grey-wilsonii*, *C. limprichtii* (including *C. graminifolia* and *C. limprichtii* var. *pinifolia*), *C. mairei* (including *C. retroserrata*), and *C. vinciflora*. We also recognize an eighth species, *C. macrophylla* Lammers & L. L. Klein, known only in cultivation but believed to be from Xizang. See Lammers and Klein (Bot. Stud. (Taipei) 51: 553–561. 2010). However, one of us (Hong) notes that the taxonomy of this complex has been extremely controversial in the past, with several different classifications having been proposed. Based on critical examination of all available specimens in BM, E, K, KUN, and PE and recent field observations in S and SE Xizang and NW Yunnan, the *C. convolvulacea* complex is found to be extremely variable, particularly in the length of the petioles and in the shape, texture, and margin of the leaf blades. Some characters, e.g., shape of leaf blade, are merely a polymorphism within populations, and the characters distinguishing *C. convolvulacea*, *C. forrestii*, *C. grey-wilsonii*, and *C. vinciflora* are variable within geographic regions but are not distinct.

- 1a. Leaf blade thinly membranous, margin usually serrate ..... 39c. subsp. *vinciflora*
- 1b. Leaf blade thickly papery, margin mostly entire, less often serrate.
  - 2a. Leaf blade mostly cordate (less often rounded) at base; corolla with a broad dark purple circle at base ..... 39d. subsp. *grey-wilsonii*
  - 2b. Leaf blade truncate to cuneate at base; corolla with a narrow dark purple circle at base or without a dark purple circle at base.
    - 3a. Leaf blade lanceolate to linear-lanceolate, base rounded to cuneate, margin entire; petiole no more than 3 mm ..... 39a. subsp. *convolvulacea*

- 3b. Leaf blade deltoid or ovate to linear-lanceolate, base cordate or truncate to cuneate, margin entire, subentire, sinuous-crenate, or serrate; petiole 3–22 mm ..... 39b. subsp. *forrestii*

### 39a. *Codonopsis convolvulacea* subsp. *convolvulacea*

鸡蛋参(原亚种) ji dan shen (yuan ya zhong)

Leaves subsessile or petiole no more than 3 mm; blade lanceolate to linear-lanceolate, 2–7 × 0.5–1.5 cm, papery, base rounded to cuneate, margin entire.

Thickets, grassy slopes; 1000–1800 m. S Yunnan [N Myanmar].

**39b. *Codonopsis convolvulacea* subsp. *forrestii*** (Diels) D. Y. Hong & L. M. Ma, Fl. Sichuan. 10: 546. 1992.

珠子参 zhu zi shen

*Codonopsis forrestii* Diels, Notes Roy. Bot. Gard. Edinburgh 5: 171. 1912; *C. convolvulacea* var. *efilamentosa* (W. W. Smith) L. T. Shen; *C. convolvulacea* var. *forrestii* (Diels) Ballard; *C. convolvulacea* var. *limprichtii* (Lingelsheim & Borza) J. Anthony; *C. efilamentosa* W. W. Smith; *C. forrestii* var. *hirsuta* P. C. Tsoong & L. T. Shen; *C. limprichtii* Lingelsheim & Borza; *C. mairei* H. Léveillé; *C. retroserrata* Z. T. Wang & G. J. Xu.

Leaves petiolate; petiole 3–22 mm; blade deltoid or ovate to linear-lanceolate, 2–10 × 0.4–3.5 cm, papery, base cordate or truncate to cuneate, margin entire, subentire, sinuous-crenate, or serrate.

Open woods, forest margins, thickets, meadows; 1800–3900 m. W Guizhou (Anshun), SW Sichuan, C and N Yunnan [N Myanmar].

**39c. *Codonopsis convolvulacea* subsp. *vinciflora*** (Komarov) D. Y. Hong, Fl. Xizang. 4: 582. 1985.

薄叶鸡蛋参 bao ye ji dan shen

*Codonopsis vinciflora* Komarov, Trudy Imp. S.-Peterburgsk. Bot. Sada 29: 103. 1908; *C. forrestii* var. *heterophylla* C. Y. Wu; *C. convolvulacea* var. *vinciflora* (Komarov) L. T. Shen.

Leaves shortly petiolate; petiole 3–12 mm; blade ovate-lanceolate to linear-lanceolate, 2–10 × 0.4–3 cm, thinly membranous, base truncate to cuneate, margin mostly serrate, rarely entire.

• Forests, thickets; 1800–4600 m. SW Sichuan, SE Xizang, NW Yunnan (Dêqên).

**39d. *Codonopsis convolvulacea* subsp. *grey-wilsonii*** (J. M. H. Shaw) D. Y. Hong, Novon 20: 421. 2010.

喜马拉雅鸡蛋参 xi ma la ya ji dan shen

*Codonopsis grey-wilsonii* J. M. H. Shaw, New Plantsman 3(2): 93. 1996, based on *C. nepalensis* Grey-Wilson, Plantsman 12(2): 99. 1990, not H. Hara (1978).

Leaf blades mostly cordate (less often rounded) at base.

Corolla often with a broad dark purple circle at base. Calyx tube and capsule rounded or obconic at base.

Forests, thickets; 2100–4000 m. S Xizang (Gyirong, Nyalam) [Bhutan, Nepal].

**40. *Codonopsis graminifolia*** H. Léveillé, Cat. Pl. Yun-Nan, 24. 1916.

松叶鸡蛋参 song ye ji dan shen

*Codonopsis convolvulacea* Kurz var. *pinifolia* (Handel-Mazzetti) Nannfeldt; *C. limprichtii* Lingelsheim & Borza var. *pinifolia* Handel-Mazzetti.

Plants glabrous throughout. Roots ovoid or oblong, 0.8–1.5 cm in diam. Stems decumbent below, twining only at upper part, sometimes suberect, up to 1 m, simple or branched. Cauline leaves alternate, usually aggregated at lower part, sessile, linear to linear-lanceolate, 2–10.5 × 0.1–1 cm, base cuneate, margin entire, often recurved toward lateral sides, apex acuminate. Flowers solitary, terminal. Calyx tube adnate to ovary up to top of ovary, obconical; lobes narrowly triangular, 4–10 × 2–

3 mm, entire. Corolla blue or purple, divided to near base; lobes elliptic, 8–26 × 4–12 mm. Filaments dilated at base, densely white villous on sides; anthers ca. 3 mm. Capsule obconical and ca. 6 mm in diam. at inferior part, broadly conical at superior part. Seeds numerous, brown-yellow. Fl. Jul–Sep, fr. Sep–Oct.

• *Pinus* forests, thickets, open grassy slopes; 1500–3300 m. W Guizhou (Weining), SW Sichuan, N Yunnan.

Two of us (Lammers and Klein) regard *Codonopsis graminifolia* and *C. limprichtii* var. *pinifolia* as synonyms of *C. limprichtii* because we can discern no way to distinguish *C. limprichtii* from the other two entities; see Lammers and Klein (Bot. Stud. (Taipei) 51: 553–561. 2010). However, one of us (Hong) notes that the description in the protologue of *C. limprichtii* (Lingelsheim & Borza, Repert. Spec. Nov. Regni Veg. 13: 391–392. 1914; "... *Folia ... inferiora ovalia, parce obtuse dentata, ad 3 cm longa, 2 cm lata, superiora lanceolata, integerrima, ad 5 cm longa et 1 cm lata, ...*") and the isotype, *H. W. Limpricht 851* (WU), represent a broader-leaved entity rather than the narrow-leaved plant described here as *C. graminifolia*. Therefore, *C. graminifolia* and *C. limprichtii* cannot be conspecific, and the latter is instead treated here in the synonymy of *C. convolvulacea* subsp. *forrestii*.

#### 4. CAMPANUMOEAE Blume, Bijdr. 726. 1826.

金钱豹属 jin qian bao shu

Hong Deyuan (洪德元); Thomas G. Lammers, Laura L. Klein

Herbs, perennial. Roots thickened, carrot-shaped. Stems voluble. Leaves opposite or alternate. Flowers solitary, axillary or almost opposite to leaves, or in cymes of 3, pedicellate, 4–7-merous. Calyx tube (hypanthium) adnate to ovary to different extents, or free from ovary. Corolla epigynous; tube obvious; limb 5(or 6)-lobed. Stamens 5; filaments glabrous or hairy. Ovary completely inferior, or inferior only to corolla but inferior, semi-inferior, or superior to calyx, 3–6-locular; style glabrous or hairy; stigma 3–6-fid. Berry globose, apically flat. Seeds numerous.

Two species: Bhutan, China, NE India, Indonesia, Japan, Laos, Myanmar, Nepal, Thailand, Vietnam; two species in China.

- 1a. Leaves opposite; calyx nearly completely hypogynous but corolla epigynous ..... 1. *C. javanica*  
1b. Leaves alternate; both calyx and corolla epigynous ..... 2. *C. inflata*

**1. *Campanumoea javanica*** Blume, Bijdr. 727. 1826.

金钱豹 jin qian bao

Roots thickened. Stems twining, multi-branched, glabrous. Leaves opposite, rarely alternate, long petiolate; blade cordate or cordate-ovate, sometimes becoming trilobate, 2.6–8 × 2–7.5 cm, glabrous or abaxially sometimes sparsely villous, margin dentate or crenate, or rarely entire. Flowers axillary, glabrous throughout. Calyx free from ovary, cleft nearly to base; lobes lanceolate or ovate, rarely narrowly triangular, 8–20 mm. Corolla epigynous, white or yellow-green, purple or reddish inside, campanulate, cleft to middle. Stigma 4- or 5-fid; ovary and berry 5-locular. Berry violet or greenish white suffused with red, globose, 7–26 mm. Seeds irregular in shape, surface reticulate. Fl. and fr. May–Nov.

S Anhui, Fujian, SE Gansu, Guangdong, Guangxi, N and SW Guizhou, Hainan, W Hubei, Hunan, Jiangxi, Sichuan, Taiwan, Yunnan, Zhejiang [Bhutan, NE India, Indonesia, Japan, Laos, Myanmar, Nepal, Thailand, Vietnam].

- 1a. Corolla 15–30 mm; berry violet, 15–26 mm in diam. .... 1a. subsp. *javanica*

- 1b. Corolla 6–13 mm; berry greenish white suffused with red, 7–15 mm in diam. .... 1b. subsp. *japonica*

藏南金钱豹 zang nan jin qian bao

*Codonopsis inflata* J. D. Hooker & Thomson, Ill. Himal. Pl. t. 16, C. 1855.

Plants voluble. Roots slightly thickened, branched. Stems almost glabrous. Leaves alternate; petiole 3–6 cm; blade ovate to ovate-lanceolate, 4–10 × 2–5 cm, abaxially glaucous, puberulent, adaxially glabrous or sparsely puberulent, base deeply cordate, margin entire or sinuate, apex acuminate. Flowers almost opposite to leaves, or in terminal and few-flowered cymes; pedicels 2–3 cm. Calyx adnate up to top of ovary; tube obdeltoid-conical, puberulent; lobes and corolla inserted at same position, ovate-triangular, ca. 1 cm, margin often recurved. Corolla pale yellow or pale green, but often purple at margin and veins, campanulate, 2.5–3 cm, cleft to 1/3. Filaments glabrous. Style glabrous; stigma 3-lobed; ovary 3-locular. Berry ?yellow-green, globose, 12–15 mm in diam. Seeds ovoid-globose, surface reticulate. Fl. and fr. Aug–Sep.

Broad-leaved forests, herb communities at forest margins; below 2500 m. SE Xizang (Médog) [Bhutan, NE India, E Nepal].

## 5. **CYCLOCODON** Griffith ex J. D. Hooker & Thomson, J. Proc. Linn. Soc., Bot. 2: 17. 1857.

轮钟花属 lun zhong hua shu

Hong Deyuan (洪德元); Thomas G. Lammers

*Codonopsis* A. Candolle (1839), not Wallich (1824).

Herbs, (perennial or annual), erect or ascending. Stems mostly branched. Leaves opposite, rarely whorled. Flowers solitary, terminal or axillary, or in dichasium, perfect; bracteoles present, filiform or leaflike, or absent. Calyx partly adnate to or completely free from ovary, and thus epigynous or hypogynous for ovary; lobes 4–6, from subentire to branched. Corolla epigynous, tubular, 4–6-merous. Stamens 4–6; filaments dilated below, glabrous or ciliate at dilated part. Ovary inferior for corolla but from semi-inferior to superior for calyx, 3–6-locular; stigma 4–6-fid; ovules extremely numerous. Fruit a berry. Seeds extremely numerous, subglobose.

Three species: from the Himalaya to Japan (Ryukyu Islands), Philippines, and Papua New Guinea; three species in China.

- 1a. Flowers often 4-merous; calyx inserted on pedicel, distant from other floral parts by 1–4 mm, like involucrel bracts ..... 3. *C. parviflorus*  
 1b. Flowers usually 5- or 6-merous; calyx at least partly adnate to ovary.  
 2a. Flowers all terminal; bracteoles often absent, rarely present and then stalked and ± leaflike; calyx lobes denticulate to subentire; filaments glabrous; berry often white, less often yellow or pale red ..... 2. *C. celebicus*  
 2b. Flowers terminal and axillary; bracteoles present and filiform; calyx lobes branched; filaments hairy below; berry purple-black ..... 1. *C. lancifolius*

**1. *Cyclocodon lancifolius*** (Roxburgh) Kurz, Flora 55: 303. 1872.

轮钟花 lun zhong hua

*Campanula lancifolia* Roxburgh, Fl. Ind. 2: 96. 1824; *Campanumoea axillaris* Oliver; *C. lancifolia* (Roxburgh) Merrill; *C. truncata* (Wallich ex A. Candolle) Diels; *Codonopsis lancifolia* (Roxburgh) Moeliono; *C. truncata* Wallich ex A. Candolle; *Cyclocodon truncatus* (Wallich ex A. Candolle) J. D. Hooker & Thomson.

Herbs, (perennial or annual), erect or ascending, sometimes lignified at base, usually glabrous throughout. Stems up to 3 m tall, hollow; branches multiple, horizontal or pendulous. Leaves opposite, rarely in whorls of 3, shortly petiolate; blade ovate or ovate-lanceolate to lanceolate, 6–15 × 1–5 cm, margin serrate, dentate, or crenate, apex acuminate. Flowers usually solitary, terminal, or both terminal and axillary, sometimes in a cyme of 3; pedicels or peduncles 1–10 cm, with a pair of

filiform bracteoles at middle to top. Calyx adnate to ovary up to lower part of ovary; lobes (4 or)5(–7), filiform or linear, margins with ramiform teeth. Corolla white or pale red, tubular-campanulate, 7–12 mm, 5- or 6-cleft to middle; lobes ovate to ovate-triangular. Stamens 5 or 6; filaments equal to anthers in length, base dilated into lamellar part, margins villous-ciliate. Style glabrous or hairy; stigma (4 or)5- or 6-fid; ovary (4 or)5- or 6-locular. Berry purple-black when mature, globose, (4 or)5- or 6-locular, 5–10 mm in diam. Seeds extremely numerous, subglabrous. Fl. and fr. Jul–Nov.

Forests, thickets, grasslands; below 1500 m. Chongqing, S Fujian, Guangdong, Guangxi, Guizhou, Hainan, SW Hubei, S and W Hunan, S Jiangxi (Quannan), Sichuan, Taiwan, SE Yunnan [Bangladesh, Cambodia, NE India, Indonesia, Japan (including Ryukyu Islands), Laos, Philippines, Vietnam].

**2. *Cyclocodon celebicus*** (Blume) D. Y. Hong, Acta Phytotax. Sin. 36: 109. 1998.

小叶轮钟草 xiao ye lun zhong cao

*Campanumoea celebica* Blume, Bijdr. 727. 1826; *Campanula celebica* (Blume) D. Dietrich; *Codonopsis celebica* (Blume) Miquel; *C. lancifolia* (Roxburgh) Moeliono subsp. *celebica* (Blume) Moeliono; *Cyclocodon lancifolius* (Roxburgh) Kurz subsp. *celebicus* (Blume) K. E. Morris & Lammers.

Herbs, (perennial or annual?), without caudexes, nor rhizomes, erect, 1–2 m tall, sometimes lignified at base. Stems terete, branched, sparsely hispidulous or subglabrous. Leaves shortly petiolate; petiole up to 5 mm; blade ovate-lanceolate to lanceolate, 5–10 × 2–4 cm, those on branches smaller, glabrous or sparsely puberulent along veins on both surfaces, base usually rounded, margins serrate, teeth pointed at apex, blade apex acuminate. Flowers terminal, usually in a dichasium of 3; pedicels 8–20 mm, hispidulous, usually without bracteoles, rarely with stalked and ± leaflike bracteoles. Calyx adnate to ovary up to ca. 1/3 of ovary; tube glabrous; lobes mostly 5 or 6, linear to linear-elliptic, 3–10 × 1–3 mm, entire or with 2–4 pairs of serrate teeth. Corolla pale blue, campanulate, 7–10 mm, 5- or 6-lobed to middle. Stamens 5 or 6, glabrous; filaments slightly dilated below. Ovary globose; stigma 5- or 6-fid. Berry white, oblate, 5- or 6-locular, up to 8 × 12 mm. Seeds extremely numerous. Fl. and fr. Jul–Jan.

Grassy slopes, thickets, woodlands; 800–2600 m. SE Xizang (Bomi, Mêdog, Zayü), S and W Yunnan [Bangladesh, NE India (Darjeeling, Sikkim), Indonesia, Laos, Malaysia, Myanmar, Papua New Guinea, Philippines, Thailand, Vietnam].

**3. *Cyclocodon parviflorus*** (Wallich ex A. Candolle) J. D. Hooker & Thomson, J. Proc. Linn. Soc., Bot. 2: 18. 1857.

小花轮钟草 xiao hua lun zhong cao

*Codonopsis parviflora* Wallich ex A. Candolle, Monogr. Campan. 123. 1830; *Campanula punduana* D. Dietrich; *Campanumoea parviflora* (Wallich ex A. Candolle) Benth. ex C. B. Clarke.

Herbs, (perennial or annual?), erect, 1–2 m tall. Stems terete, branched, glabrous. Leaves shortly petiolate; petiole up to 6 mm; blade abaxially somewhat glaucous, lanceolate, 5–11 × 1.5–3 cm, those on branches smaller, both surfaces glabrous, base rounded or broadly cuneate, margin serrate, teeth apiculate at apex, blade apex acuminate. Flowers terminal, often in a dichasium of 3; pedicels 1–4 cm, glabrous, with or without a pair of leaflike or linear bracteoles. Calyx entirely free from ovary, and thus hypogynous, just below ovary or 1–4 mm distant from ovary, forming an anthophore; lobes usually 4, free from each other, linear, 3.5–8 mm, with 1–4 pairs of teeth. Corolla white, lobes equaling tube in length, 5–8 mm. Stamens 4; filaments subulate. Ovary globose or obovoid, 4-locular; stigma 4-fid. Fruit a globose berry, 4–6 mm. Seeds extremely numerous, light brown, orbicular or circular, compressed, reticulate. Fl. and fr. Sep–Jan.

Thickets, herb communities; below 1500 m. S and SW Yunnan [Bangladesh, Bhutan, NE India (Assam, Sikkim), Laos, Myanmar].

## 6. ECHINOCODON D. Y. Hong, Acta Phytotax. Sin. 22: 183. 1984.

刺萼参属 ci e shen shu

Hong Deyuan (洪德元); Thomas G. Lammers

Herbs, perennial. Roots slightly thickened, carrot-shaped. Leaves alternate, pinnatifid. Flowers solitary, terminal, or 2 or 3 in a cyme. Calyx 2–5 (often 4)-lobed; lobes with 2–4 spinose lobules. Corolla tubular, 3–5-cleft to middle. Stamens 3–5, mostly 4, free but connivent initially; filaments dilated at base, dilated part ciliate. Ovary almost entirely inferior, 3–5-locular; stigma lobes equal in number to ovary locules, linear, recurved; ovules numerous. Capsule globose, superior part conical, loculicidal, valves alternate with calyx lobes. Seeds numerous, ellipsoid, 3-ribbed, ribs obtuse.

• One species: China.

**1. *Echinocodon lobophyllus*** D. Y. Hong, Acta Phytotax. Sin. 22: 183. 1984.

刺萼参 ci e shen

Plants diffuse, glabrous throughout. Roots up to 5 mm in diam. Stems up to 40 cm, multi-branched. Leaves petiolate; petiole 5–10 mm; blade abaxially green-gray, adaxially green, elliptic, 5–20 × 3–15 mm, base narrowly cuneate, margin

pinnatifid nearly to middle vein or to middle, apex obtuse. Pedicels 1–5 cm. Calyx lobes ovate-lanceolate, 2–6 × 1–3 mm (lobules excluded). Corolla purple-blue, 3–4.5 mm. Stamens ca. 1.5 mm; anthers narrowly oblong, ca. 1 mm. Style ca. 1 mm; stigma segments linear, recurved. Capsule globose, 3–5 mm in diam., superior part conical, up to 2 mm. Seeds minute, ca. 0.3 mm. Fl. and fr. Jun–Jul. 2n = 16\*.

• Herb communities in stony places; ca. 300 m. Hubei (Yunxi).

## 7. PLATYCODON A. Candolle, Monogr. Campan. 125. 1830.

桔梗属 jie geng shu

Hong Deyuan (洪德元); Laura L. Klein, Thomas G. Lammers

Herbs, perennial. Taproot thickened, carrotlike. Stems erect. Leaves cauline, 3- or 4-verticillate, opposite, or alternate, sessile or shortly petiolate. Flowers large, terminal, solitary, pedicellate. Calyx lobes 5, shorter than hypanthium. Corolla bowl-shaped; lobes 5, shorter than or equaling tube. Stamens 5, free; filaments dilated into a triangular base, dilated part ciliate; anthers longer than fila-

ments. Disk absent. Ovary semi-inferior, 5-locular, locules opposite calyx lobes; stigma 5-fid. Capsule 5-loculicidal at apex, valves with septa, opposite to calyx lobes. Seeds numerous, black or dark brown, large, terete, ellipsoid or oblong, longitudinally keeled.

One species: E Asia; widely cultivated elsewhere.

**1. *Platycodon grandiflorus*** (Jacquin) A. Candolle, Monogr. Campan. 125. 1830 [*"grandiflorum"*].

桔梗 jie geng

*Campanula grandiflora* Jacquin, Hort. Bot. Vindob. 3: 4. 1776; *C. glauca* Thunberg; *Platycodon autumnalis* Decaisne; *P. chinensis* Lindley & Paxton; *P. glaucus* (Thunberg) Nakai; *P. sinensis* Lemaire.

Stems 20–120 cm tall, usually glabrous, rarely densely puberulent, simple, rarely branched above. Leaf blade adaxially green, ovate, elliptic, or lanceolate, 2–7 × 0.5–3.5 cm, abaxially glabrous (rarely puberulent along veins) and glaucous, adaxi-

ally glabrous, base broadly cuneate or rounded, margin serrate, apex acute or acuminate. Hypanthium hemispherical, obovoid, or obconic, rarely campanulate, glaucous. Calyx lobes triangular or narrowly triangular, sometimes toothlike. Corolla blue or purple (rarely pink or white), 1.5–4.5 cm. Capsule globose, obconic, or obovoid, 0.7–2.5 × 0.7–1.5 cm. Fl. Jul–Sep, fr. Aug–Oct.  $2n = 18, 36$ .

Sunny herb communities, thickets, rarely in forests; below 2000 m. Anhui, Chongqing, Fujian, Guangdong, N Guangxi, Guizhou, Hebei, Heilongjiang, Henan, Hubei, Hunan, Jiangsu, Jiangxi, Jilin, Liaoning, Nei Mongol, Shaanxi, Shandong, Shanxi, E Sichuan (west to Pingwu and Liangshan), SE Yunnan (Mengzi, Wenshan, Yanshan), Zhejiang [Japan, Korea, Russia (Far East, SE Siberia); widely cultivated elsewhere].

## 8. WAHLENBERGIA Schrader ex Roth, Nov. Pl. Sp. 399. 1821, nom. cons.

藍花參屬 lan hua shen shu

Hong Deyuan (洪德元); Thomas G. Lammers

*Campanopsis* (R. Brown) Kuntze; *Campanula* sect. *Campanopsis* R. Brown; *Cephalostigma* A. Candolle; *Cervicina* Delile.

Herbs, perennial or annual, rarely subshrubs or shrubs. Leaves cauline and often basally rosulate, alternate or rarely opposite, usually sessile. Flowers small to medium-sized, sessile or pedicellate, terminal or axillary, solitary or in thyrses, panicles, or fascicles. Calyx lobes typically 5. Corolla blue or white, campanulate or funnelform, lobed, cleft, or divided; segments typically 5. Stamens typically 5; filaments free and distinct, dilated into a triangular base, dilated part ciliate; anthers coherent. Ovary inferior, 2- or 3(–5)-locular; stigma 2- or 3(–5)-fid, segments linear. Capsule loculicidal at apex. Seeds numerous or few.

About 260 species: mainly in S Hemisphere, particularly S Africa, extending north to W Europe, E and S Asia, and N South America; two species in China.

1a. Perennials; flowers solitary; pedicels 5–20 cm; corolla cleft for 2/3 its length; ovary and capsule 3-locular ..... 1. *W. marginata*

1b. Annuals; flowers numerous in a terminal panicle; pedicels 0.5–2 cm corolla divided nearly to base; ovary

and capsule 2-locular ..... 2. *W. hookeri*

**1. *Wahlenbergia marginata*** (Thunberg) A. Candolle, Monogr. Campan. 143. 1830.

藍花參 lan hua shen

*Campanula marginata* Thunberg in Murray, Syst. Veg., ed. 14, 211. 1784; *Adenophora microsperma* Y. Y. Qian; *Campanopsis marginata* (Thunberg) Kuntze; *Wahlenbergia gracilis* (G. Forster) A. Candolle var. *misera* Hemsley.

Herbs, perennial. Roots elongate, carrotlike. Stems erect or ascending, 10–40 cm, branched at base, glabrous or sparsely hirsute below. Leaves alternate, mostly on lower part of stem, lowermost sometimes caducous, sessile or with petiole up to 7 mm; blade spatulate, oblanceolate, elliptic, or linear, 10–40 × 2–8 mm, glabrous or sparsely hirsute, margin sinuate, sparsely serrulate, or entire. Pedicels erect, terminal and sometimes axillary, slender, up to 20 cm. Hypanthium obovoid or conic, glabrous. Calyx lobes triangular or subulate. Corolla blue, broadly campanulate, 3–12 mm, cleft for 1/3–2/3 its length; lobes obovate, oblong, or narrowly oblong. Capsule obconic, obovoid, or subglobose, 3–8 mm, 3-locular. Seeds yellow-brown or dark brown, oblong or ellipsoid, slightly compressed, 0.3–0.5 mm, smooth. Fl. and fr. Feb–May.  $2n = 36, 72$ .

Wastelands, fields, slopes, streams; lower elevations (to 2800 m in Yunnan). Anhui, Chongqing, Fujian, Guangdong, Guangxi, Guizhou,

Hubei, Hunan, Jiangsu, Jiangxi, Sichuan, Taiwan, Yunnan, Zhejiang [Bhutan, India, Indonesia, Japan (including Ryukyu Islands), Korea, Laos, Malaysia, Myanmar, Nepal, Papua New Guinea, Philippines, Sri Lanka, Vietnam; naturalized in the Pacific islands (Hawaiian Islands) and North America].

**2. *Wahlenbergia hookeri*** (C. B. Clarke) Tuyn in Steenis, Fl. Males., Ser. 1, Spermat. 6: 114. 1960.

星花草 xing hua cao

*Cephalostigma hookeri* C. B. Clarke in J. D. Hooker, Fl. Brit. India 3: 429. 1881.

Herbs, annual. Stems erect, 8–20 cm tall, sparsely villous, dichotomously branched. Leaves shortly petiolate; blade ovate or ovate-elliptic, ca. 2.5 × 1.2 cm, base and apex obtuse, margin denticulate. Cymes in large and lax panicles; bracts small; pedicels slender, up to 2 cm. Calyx ca. 1.5 mm; tube obconical; lobes triangular, ca. 0.5 mm. Corolla blue, 5-divided to near base; lobes spreading, starlike, linear-elliptic, 2–3 mm. Stamens ca. 1.5 mm. Style almost equal to corolla in length. Capsule subglobose, ca. 3 mm in diam., 2-locular. Seeds small, broadly ellipsoid, 3-ribbed. Fl. Nov.

Sunny slopes in moist ravines; 1300–1400 m. S Yunnan (Menghai) [E India, Indonesia (Java), N Thailand; Africa].

## 9. CAMPANULA Linnaeus, Sp. Pl. 1: 163. 1753.

风铃草属 feng ling cao shu

Hong Deyuan (洪德元); Thomas G. Lammers, Laura L. Klein

*Neocodon* Kolakovsky & Serdyukova.

Herbs, perennial, with long horizontal rhizomes or with short caudexes and thickened  $\pm$  fleshy roots; less often annual. Basal leaves sometimes rosulate; cauline leaves all alternate. Flowers solitary and terminal, or in cymes; cymes paniculate or capitellate, later subtended by an involucre. Calyx adnate to ovary; lobes 5, sometimes with an appendage between lobes. Corolla campanulate, tubular-campanulate, or funnelform, sometimes subrotate, 5-lobed. Filaments dilated; anthers coherent or rarely connate. Disk absent. Ovary inferior, 3–5-locular. Capsules dehiscent by lateral, upper or lower pores, crowned by persistent calyx lobes. Seeds numerous, ellipsoid, smooth.

About 420 species: throughout the Arctic and N temperate regions, most abundant from the Mediterranean to the Caucasus; 22 species (11 endemic) in China.

- 1a. Capsule poricidal above middle; flowers solitary, terminal, or several terminal on main stems and branches; cauline leaves mostly toward base, upper cauline leaves sessile or nearly so, usually linear if present; basal leaves persistent at anthesis (2. *C.* subg. *Rapunculus*).
  - 2a. Plants with horizontal rhizomes; stems simple; stems and leaves glabrous.
    - 3a. Hypanthium narrowly cylindrical; calyx lobes filiform, longer than corolla ..... 21. *C. aristata*
    - 3b. Hypanthium obovoid or obconic; calyx lobes subulate or narrowly triangular, shorter than corolla.
      - 4a. Plants 20–50 cm tall; middle cauline leaves longer than 2 cm; calyx lobes 5–9 mm; corolla 15–20 mm, cleft for ca. 1/2 its length ..... 16. *C. stevenii*
      - 4b. Plants 7–22 cm tall; middle cauline leaves shorter than 2 cm; calyx lobes 1.8–5 mm; corolla 4–11 mm, cleft for ca. 1/3 its length ..... 22. *C. immodesta*
  - 2b. Plants without horizontal rhizomes; stems simple or branched; stems and leaves variously pubescent.
    - 5a. Flowers pendent.
      - 6a. Plants 20–50 cm tall; calyx lobes 1–5.5 mm; corolla lobes as long as tube ..... 17. *C. delavayi*
      - 6b. Plants 6–33 cm tall; calyx lobes 3–12 mm; corolla lobes ca. 1/2 as long as tube ..... 18. *C. crenulata*
    - 5b. Flowers erect.
      - 7a. Basal leaves cordate-reniform; stems slender but not filiform, hairy, lower half with cordate to ovate-lanceolate leaves; capsule 4–8 mm ..... 19. *C. calcicola*
      - 7b. Basal leaves cordate; stems filiform, glabrous or subglabrous, with mostly linear leaves; capsule 9–19 mm ..... 20. *C. chrysosplenifolia*
- 1b. Capsule poricidal toward base; stems with numerous flowers, solitary or in various types of inflorescences; leaves many and evenly distributed on stems; basal leaves usually wilted at anthesis (1. *C.* subg. *Campanula*).
  - 8a. Appendages between calyx lobes present, reflexed, setose on margins.
    - 9a. Annuals, ca. 6 cm tall; corolla 6–8 mm, green ..... 3. *C. gansuensis*
    - 9b. Perennials, over 25 cm tall; corolla 9–65 mm, white, purple, or yellow.
      - 10a. Corolla large, 3–6.5 cm, punctate ..... 1. *C. punctata*
      - 10b. Corolla smaller, narrowly campanulate, less than 1.5 cm, not punctate ..... 2. *C. sibirica*
  - 8b. Appendages between calyx lobes absent.
    - 11a. Flowers in a head of 2 to several in axils of involucre bracts, several heads aggregated into a large compound head; leaf blades more than 4 cm, often up to 17 cm.
      - 12a. Corolla lobes linear-lanceolate, longer than tube; plants ca. 10 cm tall ..... 6. *C. austroxinjiangensis*
      - 12b. Corolla lobes ovate, shorter than tube; plants 14–130 cm tall.
        - 13a. Lower cauline leaves long petiolate; calyx lobes subulate ..... 4. *C. glomerata*
        - 13b. Lower cauline leaves shortly winged-petiolate; calyx lobes ligulate, rounded at apex ... 5. *C. glomeratoides*
    - 11b. Flowers solitary or in a lax inflorescence; leaves usually much smaller, up to 6 cm.
      - 14a. Leaves glabrous on both surfaces or hairy only on margins; corolla glabrous outside; calyx lobes linear or subulate, glabrous on both surfaces or sparsely ciliate.
        - 15a. Leaves and calyx lobes hispidulous on margins; blades of cauline leaves obovate-elliptic or elliptic ..... 7. *C. nakaoi*
        - 15b. Leaves and calyx lobes glabrous throughout; blades of cauline leaves linear ..... 8. *C. langsdorffiana*
      - 14b. Leaves hairy on both surfaces; corolla  $\pm$  hairy outside; calyx lobes hairy, narrowly triangular to subtriangular, rarely subulate-triangular (subulate only in *C. mekongensis*).
        - 16a. Annual herbs; rosulate basal leaves sometimes present at anthesis; each branch with compound cymes ..... 14. *C. dimorphantha*

- 16b. Perennial herbs; basal leaves often absent at anthesis; branches with a single cyme or solitary flower.
- 17a. Cauline leaves, at least lower ones, long petiolate; petiole 5–12 cm ..... 9. *C. omeiensis*
- 17b. Cauline leaves sessile or shortly winged-petiolate.
- 18a. Calyx tube hairy only along veins; lateral branches with several flowers; calyx lobes subulate, sinus between lobes truncate-obtuse ..... 15. *C. mekongensis*
- 18b. Calyx tube densely hairy; lateral branches with a solitary flower or single simple inflorescence; calyx lobes subulate-triangular to deltoid, overlapping, or sinus acute.
- 19a. Calyx lobes deltoid, with a pair of large teeth; stems long and prostrate; cauline leaves of lower half of stem wilted at anthesis, rest of leaves pannose abaxially, sessile, suborbicular ..... 13. *C. yunnanensis*
- 19b. Calyx lobes subulate-triangular, rarely subdeltoid, with or without teeth; stems erect or diffuse; lower cauline leaves often present at anthesis; leaves sparsely hispid or densely pannose abaxially, elliptic, rhombic, or linear-elliptic.
- 20a. Style strongly exerted; anthers completely or partially connivent; corolla cleft more than halfway ..... 12. *C. chinensis*
- 20b. Style included; anthers completely free; corolla cleft down to middle.
- 21a. Calyx lobes narrowly triangular to subdeltoid, toothed or not; leaves often hispid, less frequently pannose abaxially; stems single or several from one caudex, erect or ascending ..... 10. *C. pallida*
- 21b. Calyx lobes subulate-triangular to narrowly triangular, rarely toothed; leaves densely pannose abaxially; stems usually numerous from one caudex, often diffuse, less often ascending ..... 11. *C. cana*

### 1. *Campanula* subg. *Campanula*

风铃草亚属 feng ling cao ya shu

Basal leaves absent or wilted at anthesis; cauline leaves evenly distributed on stems, upper ones sessile or not, often relatively broad. Flowers numerous, in cymes aggregated into raceme-, spike-, or headlike inflorescences. Capsule poricidal toward base.

About 275 species: throughout the Arctic and N temperate regions of the Old World, extending south into Macronesia, tropical E Africa, the Arabian Peninsula, India, Indochina, and east into the Aleutian Islands; 15 species (seven endemic) in China.

#### 1. *Campanula punctata* Lamarck, Encycl. 1: 586. 1785.

刺毛风铃草 ci mao feng ling cao

紫斑风铃草 zi ban feng ling cao

*Campanula nobilis* Lindley.

Plants perennial, setose throughout or rarely subglabrous. Rhizomes long, horizontal. Stems erect, robust, 20–100 cm tall, usually branched above. Basal leaves long petiolate; blade cordate or ovate; cauline leaves ovate, lanceolate, or triangular, base rounded or truncate, margin irregularly dentate, apex acute or acuminate; lower leaves winged-petiolate, upper ones sessile. Flowers terminal on top of main stems and branches, pendent. Calyx lobes narrowly triangular; reflexed appendages elliptic, triangular, ovate, or lanceolate. Corolla white, yellow, or pink, commonly purple- or red punctate, tubular-campanulate, 3–6.5 cm. Capsule broadly campanulate or obconic. Seeds gray-brown, oblong or elliptic, slightly compressed, ca. 1 mm, smooth. Fl. Jun–Sep, fr. Sep–Oct.  $2n = 34$ .

Forests, thickets, meadows; below 2300 m. E Gansu, Hebei, Heilongjiang, W Henan, W Hubei, Jilin, Liaoning, Nei Mongol, Shaanxi, Shanxi, NE Sichuan [Japan, Korea, Russia (Far East, Siberia); widely cultivated].

Plants perennial. Roots thickened, carrot-shaped, sometimes lignified. Stems erect, purplish, cylindrical, 20–70 cm tall, multi-branched; branches upright, slender, white hirsute. Basal and lower cauline leaves 5–8 × 1–3 cm, white hirsute, with long winged petiole; blade oblong or elliptic, sparsely crenate; upper cauline leaves sessile, ± amplexicaul, linear-lanceolate, entire. Flowers pendent in narrow terminal panicles on main stems and branches; pedicels 2–8 mm, longer than linear bracts. Hypanthium glabrous, obconic; calyx lobes linear-subulate, 3–4 mm, nearly 1 mm wide at base, margin setose; reflexed appendages ovate-oblong or ovate-lanceolate, slightly shorter than hypanthium, margin setose. Corolla pale blue-purple, sometimes nearly white, narrowly campanulate, 9–12 mm, inside sparsely pubescent; lobes ovate-deltoid, 1/3–1/2 as long as tube. Style equal to or slightly shorter than corolla; stigma 3-fid. Capsule obconic, ca. 4 × 3 mm. Seeds elliptic, ca. 1 mm. Fl. May–Jul.  $2n = 34$ .

Dry forests or meadows. Xinjiang (Altay Shan, Tian Shan) [Kazakhstan, Russia (European part, W Siberia); SW Asia (Turkey), Europe].

#### 2. *Campanula sibirica* Linnaeus, Sp. Pl. 1: 236. 1753.

*Campanula sibirica* is divided into ten subspecies; the Chinese

plants are *C. sibirica* subsp. *sibirica*, which is also found in Kazakhstan, Russia, and Europe.

**3. *Campanula gansuensis* L. Z. Wang & D. Y. Hong, Bot. Bull. Acad. Sin. 41: 159. 2000.**

甘肃风铃草 gan su feng ling cao

Plants annual. Roots slender. Stems slender, 5–6 cm tall, simple,  $\pm$  hairy. Leaves 2 or 3, alternate; blade triangular-ovate or rhombic-ovate, ca.  $10 \times 5$ –6 mm, base attenuate, margin sparsely and irregularly serrate, apex obtuse; petiole winged, ca. 0.5 cm. Flowers solitary, terminal on branches, pendent. Calyx lobes narrowly triangular or linear-triangular; reflexed appendages ovate. Corolla green, tubular-campanulate, 6–8 mm; lobes ca.  $1/2$  as long as tube. Filaments free, dilated at base, hairy; anthers ca. 3 mm. Ovary hemispherical; style up to 4 mm. Fl. Jul.

• Thickets by streams; ca. 1100 m. Gansu (Huixian).

**4. *Campanula glomerata* Linnaeus, Sp. Pl. 1: 235. 1753.**

北疆风铃草 bei jiang feng ling cao

Plants perennial. Stems erect, 0.2–1.3 m tall. Basal leaves long petiolate; blade ovate-lanceolate or ovate,  $6$ – $15 \times 2$ –7 cm, base cordate, margin serrulate, apex acute; cauline leaf blade elliptic, narrowly ovate, or ovate-lanceolate,  $4$ – $10 \times 0.7$ –4 cm, base truncate, rounded, or cuneate, margin serrulate, apex acute or acuminate; lower ones long petiolate, upper ones sessile. Flowers sessile, aggregated into a terminal compound involucrate capitulum, sometimes with additional simple capitula sessile in upper and median leaf axils; involucre bracts ovate-deltoid, that of first-blooming central flower smallest. Hypanthium glabrous or puberulent; calyx lobes subulate or linear-triangular,  $7$ – $13 \times 2$ –3 mm. Corolla purple, blue-purple, or blue (rarely white), tubular-campanulate, 1.5–2.5 cm; lobes equaling tube. Capsule subglobose or obovoid-conical, ca. 4.5 mm. Seeds oblong, compressed, 1–1.5 mm. Fl. Jul–Sep, fr. Sep–Oct.  $2n = 30, 34, 90$ .

Meadows, subalpine meadows, thickets, grassy slopes; below 2600 m. Heilongjiang, Jilin, Liaoning, Nei Mongol, Xinjiang [Japan (Kyushu), Kazakhstan, Korea, Mongolia, Russia (European part, Far East, Siberia); SW Asia (Turkey), Europe; widely cultivated; naturalized in North America].

Fifteen subspecies are recognized, three of which occur in China.

- 1a. Simple capitula present in leaf axils in addition to terminal compound capitulum; leaf blade 1.7–7 cm wide ..... 4b. subsp. *speciosa*
- 1b. Simple capitula rarely present in leaf axils, most flowers in terminal compound capitulum; leaf blade 1–3.5 cm wide.
  - 2a. Plants 20–85 cm tall; leaves 4–13 cm; stems and leaves subglabrous to sparsely white hirsute ..... 4a. subsp. *glomerata*
  - 2b. Plants 14–50 cm tall; leaves 5–8(–11) cm; stems and leaves glabrous or hirsute along main veins ..... 4c. subsp. *daqingshanica*

**4a. *Campanula glomerata* subsp. *glomerata***

北疆风铃草(原亚种) bei jiang feng ling cao (yuan ya zhong)

Plants 20–85 cm tall. Stems simple, stems and leaves subglabrous to sparsely white hirsute. Leaves  $4$ – $13 \times 1.5$ –3.5 cm.

Meadows, subalpine meadows; 1300–2600 m. Xinjiang (Tian Shan and northward) [Kazakhstan, Russia (European part, Siberia); Europe; widely cultivated; naturalized in North America].

Hafn. 2: 957. 1815, not Gilibert (1782), nor Pourret (1788); *C. cephalotes* Fischer ex Schrank; *C. glomerata* subsp. *cephalotes* (Fischer ex Schrank) D. Y. Hong; *C. glomerata* var. *dahurica* Fischer ex Ker Gawler; *C. glomerata* var. *grandiflora* Herder (1872), nom. illeg. superfl., not Kuntze (1867); *C. glomerata* var. *salviifolia* Komarov; *C. glomerata* f. *speciosa* (Sprengel) Voss.

Plants 40–130 cm tall. Stems sometimes branched above; stems and leaves subglabrous or sparsely white hirsute, or densely white villous. Capitula numerous, many simple capitula present besides terminal compound capitula.

Meadows, thickets. Heilongjiang, Jilin, E Liaoning, NE Nei Mongol (Dong Ujimqin) [Japan (Kyushu), Korea, Mongolia, Russia (Far East, SE Siberia); widely cultivated].

**4c. *Campanula glomerata* subsp. *daqingshanica* D. Y. Hong & Y. Z. Zhao, Fl. Reipubl. Popularis Sin. 73(2): 184. 1983.**

大青山风铃草 da qing shan feng ling cao

Plants 14–50 cm tall. Stems subglabrous or sparsely hirsute only along ribs, rarely entirely sparsely hirsute. Leaves  $5$ – $8$ – $(11) \times 1$ –2.8 cm, hirsute only along main veins. Capitula several, often aggregated into terminal compound capitula, simple capitula rarely present.

• Grassy slopes; 1400–2000 m. SE Nei Mongol (Daqing Shan, Manhan Shan).

**5. *Campanula glomeratoides* D. Y. Hong, Acta Phytotax. Sin. 18: 247. 1980.**

头花风铃草 tou hua feng ling cao

Plants ?annual, white hispid throughout. Rhizomes unknown. Stems erect, robust, ca. 60 cm tall. Basal leaves shortly petiolate, caducous, blade lanceolate; lower cauline leaves winged-petiolate, blade oblanceolate or linear-oblong; middle and upper cauline leaves sessile, blade lanceolate or ovate-lanceolate, up to  $9 \times 1$  cm, margin dentate. Flowers sessile, 2 to several in sessile capitula aggregated into a terminal involucrate compound capitulum; involucre bracts ovate-lanceolate to orbicular, forming a series continuous with upper cauline leaves, 1 or 2 in capitula with several flowers, but absent in capitula with only 2 flowers. Hypanthium obovoid or obconic; lobes ligulate, ca. 4 mm, apex obtuse. Corolla blue,

tubular-campanulate, ca. 1.5 cm. Filaments ca. 3 mm; anthers ca. 4 mm. Style slightly longer than corolla. Fruit unknown. Fl. Jul.

- Meadows; ca. 2700 m. Xizang (Bomi).

**6. *Campanula austroxinjiangensis*** Y. K. Yang, J. K. Wu & J. Z. Li, *Acta Phytotax. Sin.* 30: 92. 1992.

南疆风铃草 *nan jiang feng ling cao*

Plants perennial, ca. 10 cm tall. Roots carrot-shaped. Stems single, simple, sparsely puberulent. Basal leaves rosulate, blade elliptic, petiole 1–1.2 cm, winged; cauline leaves shortly petiolate, blade ovate or elliptic, 1–2.2 × 1.1–1.5 cm, both surfaces ± puberulent, base slightly ovate or subrounded, margin obtusely serrate, apex obtuse or acute. Flowers sessile in terminal and axillary capitula of 3–5 (rarely 1 or 2), terminal ones sessile, axillary ones ± pedunculate, both bractless. Calyx lobes linear-lanceolate, 7–9 × 1–1.2 mm, with hooked hairs along midvein and margin. Corolla blue, tubular-campanulate, ca. 2.7 × 7 mm; lobes linear-lanceolate, 12–14 × 4–5 mm, equaling tube, acuminate at apex. Stamens 5 or rarely 4; filaments dilated at base, 1–1.5 × 1–1.5 mm; anthers 10–13 × 1–1.2 mm. Ovary ovoid, 1.5–2 mm in diam.; style ca. 1.5 cm, included. Fl. Jul.

- Grassy slopes; ca. 2300 m. Xinjiang (Hejing).

**7. *Campanula nakaoi*** Kitamura, *Acta Phytotax. Geobot.* 15: 108. 1954.

藏南风铃草 *zang nan feng ling cao*

Plants perennial. Rhizome slender and long. Stems ascending or erect, usually dark purple, less frequently straw-colored, up to 35 cm, angular when dry, subglabrous or sparsely retrorsely hispid, sometimes branched. Middle cauline leaves largest, obovate-elliptic or elliptic, 12–35 × 4–12 mm, apex obtuse; lower cauline leaves gradually attenuate into short petiole; upper cauline leaves sessile; all leaves sparsely serrate, hispidulous near margins or along veins. Flowers solitary, terminal, pendulous. Hypanthium obconic, densely hirsute or granulate-glandular; calyx lobes subulate, 5–7 × ca. 1.5 mm, both sides glabrous, margin serrate and hispidulous-ciliate. Corolla blue or blue-purple, broadly campanulate, 14–20 mm, glabrous; lobes equaling or slightly longer than tube. Style ca. 1 cm; stigma 3-lobed. Fl. Jul.

Margins of *Pinus griffithii* forests; 2800–3400 m. Xizang (Gyirong) [Nepal].

**8. *Campanula langsdorffiana*** (A. Candolle) Fischer ex Trautvetter & C. A. Meyer in Middendorff, *Reise Sibir.* 1 (2, Lfg. 3): 60. 1856.

石生风铃草 *shi sheng feng ling cao*

*Campanula linifolia* Linnaeus var. *langsdorffiana* A. Candolle, *Monogr. Campan.* 279. 1830; *C. chinganensis* A. I. Baranov; *C. rotundifolia* Linnaeus subsp. *langsdorffiana* (A. Candolle) Vodopianova; *C. rotundifolia* var. *langsdorffiana* (A. Candolle) Britton.

Plants perennial, 10–40 cm tall. Roots carrot-shaped or cylindrical, up to 2 cm in diam. Stems several to many from a

caudex, slender, branched or simple, glabrous or sometimes hirsutulous at base. Basal leaves (if present) ovate or elliptic, base cordate, petiolate; cauline leaves sessile, filiform or linear, 45–70 × 1–3 mm. Flowers solitary or several, terminal, ± pendent. Hypanthium glabrous (rarely hirsutulous), obconic, ribbed; calyx lobes linear or subulate, 4–10 mm, sometimes almost equal to corolla in length, reflexed after anthesis. Corolla pale blue, campanulate, 10–20 mm, glabrous; lobes ca. 1/2 as long to ± as long as tube. Style included. Capsule obconic or campanulate, 5–8 mm. Seeds brown, oblong or elliptic, slightly compressed, ca. 1 mm, smooth. Fl. Jun–Aug.  $2n = 34$ .

Usually on rocks in forests, also in alpine belts. Heilongjiang, Jilin, Liaoning [Russia (Far East, S Siberia)].

This species is vicarious with *Campanula rotundifolia* Linnaeus of Europe, from which it differs in having fewer flowers and longer reflexed calyx lobes.

**9. *Campanula omeiensis*** (Z. Y. Zhu) D. Y. Hong & Z. Yu Li in Z. Yu Li, *Pl. Mt. Emei*, 484. 2007.

峨眉风铃草 *e mei feng ling cao*

*Adenophora omeiensis* Z. Y. Zhu, *Bull. Sichuan School Medic. Mater.* 22(2): 29. 1990.

Plants perennial, 50–65 cm tall. Roots carrot-shaped, 5–15 mm in diam. Stems simple, sparsely hirsute. Basal and lower cauline leaves with petiole 5–12 cm; upper cauline leaves shortly petiolate to sessile, blade adaxially green, ovate-triangular or ovate-lanceolate, 2.5–3.5 × 1.2–1.8 cm, abaxially sparsely strigose or hispidulous, base subtruncate or cuneate, margin irregularly serrate, apex acuminate or acute. Panicles terminal, narrow, inflorescence branches reduced and sometimes with solitary flowers; bracts linear, strigose; pedicels slender, 5–15 mm, sparsely strigose. Hypanthium obovoid or obconic, sparsely strigose; calyx lobes lanceolate or linear-lanceolate, 5–8 × 1–1.8 mm, outside strigose, apex acuminate or acute. Corolla blue-purple or pale blue, campanulate, 1.5–2.3 cm, outside glabrous, inside white villous; lobes ovate-triangular, 6–8 × ca. 5 mm. Filaments white, base dilated; anthers linear. Style included; stigma 2- or 3-fid. Capsule subglobose, 3–5 mm. Seeds oblong or ovate-oblong, slightly compressed, ca. 1 mm. Fl. Jun–Jul, fr. Jul–Sep.

- About 600 m. Sichuan (Emei Shan).

**10. *Campanula pallida*** Wallich, *Asiat. Res.* 13: 375. 1820.

西南风铃草 *xi nan feng ling cao*

*Campanula colorata* Wallich; *C. colorata* var. *tibetica* J. D. Hooker & Thomson; *C. microcarpa* C. Y. Wu; *C. pallida* var. *tibetica* (J. D. Hooker & Thomson) H. Hara.

Plants perennial. Roots carrot-shaped, sometimes slightly thicker than stems. Stems single, sometimes 2 or rarely several from a single caudex, ascending or erect, up to 60 cm tall, hirsute. Lower leaves winged-petiolate, upper leaves sessile; blade elliptic, rhombic-elliptic, or oblong, 1–4 × 0.3–1.5 cm, abaxially densely hirsute or hispid only along veins, adaxially appressed hispid, margin denticulate or almost entire, apex acuminate, acute, or obtuse. Flowers pendent, terminal, sometimes

in cymes. Hypanthium obconic or campanulate, hispid; calyx lobes deltoid, narrowly triangular, or subulate, 2–8 mm, abaxially hispid (sometimes only along veins), margin entire or rarely serrulate. Corolla purple, blue-purple, or blue, tubular-campanulate, 4–15 mm; lobes ca. 1/2 as long to  $\pm$  as long as tube. Style less than 2/3 as long as corolla, included. Capsule obconic, obovoid, or globose. Seeds golden brown, oblong or elliptic, compressed. Fl. May–Sep.  $2n = 24, 28$ .

Grassy slopes, open woods; 1000–1400 m. W Guizhou, W Sichuan, S Xizang, Yunnan [Afghanistan, Bhutan, India, Laos, Myanmar, Nepal, Pakistan, Thailand].

Both chasmogamous and cleistogamous flowers are found in this species. In the latter, development of the corolla is arrested at an early stage; as a result, the calyx lobes are deltoid (vs. narrowly triangular or subulate) and much shorter than in the former. The capsules produced by cleistogamous flowers are globose (vs. obconic or obovoid) and much smaller than those from chasmogamous flowers. Individual plants may bear both types of flowers or, less commonly, only cleistogamous flowers; the type of *C. microcarpa* is a specimen of the latter.

**11. *Campanula cana*** Wallich in Roxburgh, Fl. Ind. 2: 101. 1824.

灰毛风铃草 hui mao feng ling cao

*Campanula aprica* Nannfeldt; *C. pasumensis* C. Marquand; *C. tortuosa* C. Y. Wu; *C. xylopoda* Jeffrey.

Plants perennial, densely white villous on all parts except corolla. Taproot thickened,  $\pm$  carrot-shaped, up to 8 mm in diam. Caudexes branched. Stems caespitose, usually diffuse, 15–30 cm. Leaves alternate, sessile or lower ones with petiole up to 5 mm; blade ovate, elliptic, oblanceolate, or linear-lanceolate, 4–25  $\times$  2–10 mm, base cuneate, margin subentire, crenulate, or serrate, apex obtuse or acute. Flowers several, in a terminal cyme; pedicels 0.5–3 cm, ebracteolate. Hypanthium obdeltoid to broadly obconical, 2–3  $\times$  2–3 mm at anthesis; calyx lobes subulate or narrowly triangular, 3–5  $\times$  1–2 mm, margin entire. Corolla blue, blue-purple, or violet, tubular-campanulate, 10–15 mm, outside villous; lobes 1/2–2/3 as long as tube. Stamens included. Style slightly exserted; stigma 3-fid. Capsule globose or obovoid-globose, 3–5  $\times$  3–4 mm, 10-ribbed, 3-poricidal at base. Seeds brownish yellow, shiny, elliptic, 0.5–0.6 mm, smooth. Fl. and fr. May–Nov.

Open rocky slopes, grassy slopes, thickets; 1000–3200 m. NW Guizhou (Xifeng), SW Sichuan, S Xizang, N Yunnan [Bhutan, N India, N Myanmar, Nepal].

**12. *Campanula chinensis*** D. Y. Hong, Acta Phytotax. Sin. 18: 247. 1980.

长柱风铃草 chang zhu feng ling cao

Plants perennial. Roots carrotlike. Stems caespitose, ascending, up to 35 cm, branched, hispid. Leaves winged-petiolate; blade elliptic or lanceolate, 1–3.5  $\times$  0.4–1.2 cm, abaxially densely villous, adaxially appressed hispid, base cuneate, margin entire or denticulate, apex obtuse, acute, or acuminate. Flowers terminal on main stems and branches, solitary or several in a cyme. Hypanthium obconic, densely villous; calyx lobes triangular, margin entire. Corolla blue or blue-purple, campanulate, 8–10 mm; lobes linear-oblong, slightly longer than

tube. Stamens exserted; anthers all connivent into a tube, or 2 and 3 respectively connivent into 2 groups. Style 13–15 mm, much exserted. Capsule globose, obovoid, or obconic. Seeds yellowish brown, oblong, ca. 0.5 mm. Fl. Jul–Sep, fr. Aug–Oct.

• Rocks, coniferous forests with dry and poor soil; 2400–3800 m. S Qinghai (Nangqên), SE Xizang (Markam), NW Yunnan (Dêqên, Gongshan).

**13. *Campanula yunnanensis*** D. Y. Hong, Fl. Reipubl. Popul. Sin. 73(2): 184. 1983.

云南风铃草 yun nan feng ling cao

Plants perennial. Roots  $\pm$  thickened, carrot-shaped, sometimes branched. Stems several from one caudex, almost entirely prostrate, 30–45 cm. Leaves withered during anthesis except uppermost, sessile; blade ovate to ovate-orbicular, 7–11 mm, abaxially densely tomentose, adaxially densely appressed hispid, margin crenate. Flowers terminal, erect or declined somewhat. Hypanthium gyroidal, densely hirsute; calyx lobes triangular, densely tomentose, margin with a pair of teeth. Corolla purple or blue-purple, tubular-campanulate, ca. 8 mm; lobes equaling tube. Style ca. 5 mm. Capsule obovoid-conical, 4–5  $\times$  3–4 mm. Seeds yellow-brown, elliptic, slightly compressed, ca. 0.5 mm, smooth. Fl. Oct–Dec.

• Rocks; 1900–2200 m. Yunnan.

**14. *Campanula dimorphantha*** Schweinfurth, Beitr. Fl. Aethiop. 140. 1867.

一年生风铃草 yi nian sheng feng ling cao

*Campanula benthamii* Wallich ex Kitamura; *C. canescens* Wallich ex A. Candolle (1830), not Roth (1827); *C. veronicifolia* Hance; *C. wallichii* Babu, nom. illeg. superfl.; *Cephalostigma spathulatum* Thwaites.

Plants annual. Stems erect, up to 45 cm tall, simple, or branched from base and thus caespitose, hispid. Basal leaves sometimes rosulate, shortly petiolate; blade spatulate or elliptic, withering early, base cuneate or attenuate, margin serrulate, apex acute. Cauline leaves winged-petiolate, 2–7 cm; blade spatulate, elliptic, or linear, base attenuate, margin serrulate or subentire, apex acute or acuminate. Cymes multiple, aggregated into a terminal panicle; pedicels unequal in length, those of upper flowers in a cyme longer. Hypanthium semiglobose to obconic, base acute; calyx lobes narrowly triangular, 3–5 mm. Corolla purple or blue-purple, campanulate, outside hispid, inside glabrous; lobes equaling tube. Style included. Capsules globose. Seeds yellow-brown, oblong or elliptic, compressed, ca. 0.3 mm, smooth. Fl. and fr. Mar–Apr.

Grassy slopes, roadsides; below 2000 m. Chongqing (Wushan), N Guangdong, Guizhou (Luodian), Shaanxi (Mianxian), Sichuan (Chengdu, Dujiangyan, Emei), Taiwan, Yunnan (Weishan) [Afghanistan, India, Laos, Myanmar, Nepal, Pakistan, Sri Lanka, Vietnam, Africa].

Cleistogamy may be the predominant reproductive strategy of this species, at least in China, as most specimens we examined had only cleistogamous flowers. The capsules produced by such flowers are of unequal size, with the apical flowers within a cyme producing larger capsules than the basal ones.

**15. *Campanula mekongensis*** Diels ex C. Y. Wu, Rep. Yunnan Trop. Subtrop. Fl. Res. Rep. 1: 58. 1965.

澜沧风铃草 lan cang feng ling cao

Plants perennial. Roots thickened, woody. Stems several from one caudex, ascending or erect, 20–30 cm tall, white villous. Leaves sessile; blade elliptic or spatulate, 1–3 × 0.5–1.2 cm, abaxially hirsute (sometimes only along veins), adaxially sparsely hirsute, base attenuate, margin entire, crenulate, or serrulate, apex obtuse. Flowers terminal, solitary or in cymes;

pedicels slender. Hypanthium obconic or campanulate, base cuneate, setose along veins; calyx lobes subulate, 2–4 mm, setose along veins, hirsute on margin; sinuses obtuse. Corolla blue or white, campanulate, ca. 8 mm; lobes somewhat longer than tube, outside sparsely villous. Style slightly shorter than corolla. Capsule obovoid or obovoid-obconic, 3–4 mm in diam. Seeds yellow, oblong, ca. 0.5 mm. Fl. Jan–Mar.

• Sandy herb communities, thickets by rivers, shaded rocks by streams; lower elevations. Guangxi (Tian'e), S Yunnan (Xishuangbanna).

**2. *Campanula* subg. *Rapunculus*** (Dumortier) Kharadze, Zametki Sist. Geogr. Rast. 32: 54. 1976.

基生叶风铃草亚属 ji sheng ye feng ling cao ya shu

*Campanula* sect. *Rapunculus* Dumortier, Fl. Belg. 58. 1827.

Basal leaves rosulate, persistent at anthesis; cauline leaves mostly toward base, upper ones sessile or nearly so, usually linear if present. Flowers solitary and terminal, or several terminal on main stems and branches. Capsule poricidal above middle.

About 140 species: throughout Arctic and N temperate regions, extending south into N Africa, Iran, India, China, N Mexico, and SE United States (Florida); seven species (four endemic) in China.

**16. *Campanula stevenii*** M. Bieberstein, Fl. Taur.-Caucas. 3: 138. 1819 [“*Steueni*”].

沙参属 sha shen shu

Hong Deyuan (洪德元), Ge Song (葛颂); Thomas G. Lammers, Laura L. Klein

Herbs, perennial. Roots usually thickened, various in shape, carrot-shaped, mostly fleshy. Caudexes often short, sometimes elongated and branched. Stems erect, less frequently ascending. Basal leaves often rosulate, usually long petiolate, cordate; cauline leaves mostly alternate, rarely opposite or verticillate. Flowers in a cyme; cymes sometimes reduced to a branch with 1 terminal flower and 1 to several bracts, sometimes glomerate into a panicle. Calyx epigynous, rarely semi-epigynous, tube various in shape; lobes 5, entire or dentate. Corolla always epigynous, campanulate, funnelform, or tubular, 5-lobed or 5-fid to middle. Stamens 5; filaments much dilated into a lamella at base; lamellae densely ciliate-villous, valvate, enveloping disk; anthers elongate. Disk usually

tubular, rarely annular. Ovary inferior, 3-locular; ovules numerous; style with pollen-receiving hairs; stigma 3-lobed, lobes narrow, recurved. Capsule 3-porcidal below persistent calyx lobes. Seeds numerous, ellipsoid, 1-angular.

Sixty-two species: E Asia, south to India and Vietnam, with one species extending into Europe and another endemic to Crimea; 38 species (23 endemic) in China.

- 1a. Cauline leaves all or mostly verticillate.
  - 2a. Corolla small, less than 11 mm; calyx lobes filiform ..... 38. *A. tetraphylla*
  - 2b. Corolla larger than 13 mm; calyx lobes lanceolate or subulate.
    - 3a. Calyx lobes toothed; corolla tubular-campanulate, 18–25 mm; style slightly shorter than corolla ..... 33. *A. wulingshanica*
    - 3b. Calyx lobes entire; corolla campanulate, 13–20 mm; style exserted or included.
      - 4a. Cauline leaves partially verticillate; inflorescence branches not verticillate; calyx lobes lanceolate, 3–6 mm ..... 31. *A. pereskiiifolia*
      - 4b. Cauline leaves all verticillate; inflorescence branches often verticillate; calyx lobes elliptic-lanceolate, 5–10 mm ..... 32. *A. divaricata*
- 1b. Cauline leaves all alternate.
  - 5a. Cauline leaves (at least lower ones) petiolate, very rarely subsessile.
    - 6a. Calyx lobes toothed.
      - 7a. Cauline leaves pinnatifid up to over half; capsule columnar, base rounded, only ca. 3 mm wide ..... 34. *A. lobophylla*
      - 7b. Cauline leaves toothed; capsule ellipsoid, base obtuse, more than 3 mm wide.
        - 8a. Cauline leaves with petioles 2–4 cm, cordate at base; disk ca. 0.7 mm high; style equal to corolla in length ..... 7. *A. cordifolia*
        - 8b. Cauline leaves with petioles less than 2.5 cm, cuneate or shallowly cordate at base; disk 1.5–2.5 mm; style  $\pm$  exserted.
          - 9a. Inflorescence a pseudoraceme or narrow panicle, without secondary branches; calyx lobes with verrucose teeth, or even entire; leaves glabrous adaxially ..... 8. *A. liliifolia*
          - 9b. Inflorescence a large panicle, with secondary branches; calyx lobes often with 1–4 pairs of long teeth, rarely verrucose teeth; leaves sparsely scaberulose adaxially ..... 20. *A. potaninii*
    - 6b. Calyx lobes entire, usually ovate to lanceolate, rarely linear-lanceolate, (1–)1.5–4 mm wide.
      - 10a. Cauline leaves all obviously petiolate, base cordate or rounded, not decurrent or shortly decurrent; calyx lobes obtuse at apex.
        - 11a. Cauline leaves all cordate, papery; calyx tube (hypanthium) obconic at least at anthesis ..... 1. *A. trachelioides*
        - 11b. Cauline leaves rounded or broadly cuneate, only some lower ones shallowly cordate, membranous; calyx tube obovoid or obovoid-conical ..... 2. *A. remotiflora*
      - 10b. Cauline leaves only lower ones petiolate, upper ones sessile or shortly cuneate-petiolate; calyx lobes acute or acuminate at apex.
        - 12a. Cauline leaves only 2, lower one cordate, upper one much smaller ..... 5. *A. brevidiscifera*
        - 12b. Cauline leaves many, not cordate.
          - 13a. Calyx tube globose, calyx lobes subulate-lanceolate, 8–14 mm; pedicels 1.5–3 cm ..... 6. *A. longipedicellata*
          - 13b. Calyx tube obovoid or obconical, calyx lobes usually shorter; pedicels shorter.
            - 14a. Corolla 1.5–2.7 cm, lobes 5–11 mm; calyx lobes ovate to linear-lanceolate, 1.5–4 mm wide ..... 3. *A. petiolata*
            - 14b. Corolla less than 1.8 cm, lobes less than 5 mm; calyx lobes linear-lanceolate or subulate, 1–2 mm wide.
              - 15a. Leaves usually sparsely hispidulous, 7–13  $\times$  1.5–3 cm; calyx mostly hairy, occasionally glabrous, lobes 1–2 mm wide; corolla ca. 17 mm ..... 4. *A. rupicola*
              - 15b. Leaves glabrous or hairy along veins, 3–8 cm; calyx glabrous, occasionally scaberulose; corolla 13–15 mm.
                - 16a. Leaves often hairy on margins and along veins; calyx tube obovoid or obconic; inflorescence a narrow panicle or pseudoraceme ..... 8. *A. liliifolia*
                - 16b. Leaves glabrous throughout; calyx tube usually globose, rarely obovoid-globose; inflorescence a panicle ..... 11. *A. sinensis*
    - 5b. Cauline leaves sessile, only some individuals of some species (e.g., *A. stricta*) with lower cauline leaves very shortly winged-petiolate.
      - 17a. Corolla small, less than 17 mm, constricted at throat and thus corolla urceolate; style strongly exserted, more than 1.5  $\times$  as long as corolla; disk narrowly tubular, 2–7 mm, less than 1 mm wide.
        - 18a. Calyx lobes filiform, 3–20 mm, sometimes with 1 or 2 pairs of verrucose teeth at lower part ..... 37. *A. capillaris*
        - 18b. Calyx lobes subulate, entire.
          - 19a. Stems and leaves densely scaberulose; corolla 10–17 mm ..... 35. *A. stenanthina*
          - 19b. Stems and leaves glabrous or villous; corolla 8–12 mm ..... 36. *A. liliifolioides*
      - 17b. Corolla usually larger, campanulate; style slightly exserted or included, less than 1.5  $\times$  as long as corolla; disk not much longer than broad.

- 20a. Calyx lobes entire.
- 21a. Calyx scaberrulose; calyx lobes subulate, broadest at base, 6–8 mm; style nearly as long as corolla ..... 10. *A. stricta*
- 21b. Calyx mostly glabrous, if hairy then corolla  $\pm$  constricted at throat; calyx lobes triangular-lanceolate to linear-lanceolate, 2–6 mm, if more than 6 mm then calyx tube never globose and glabrous; style obviously exserted or not.
- 22a. Calyx lobes very short, shorter than 2.5 mm.
- 23a. Cauline leaf blade linear, ca. 5 cm  $\times$  0.8 mm; corolla 18–19 mm ..... 14. *A. pinifolia*
- 23b. Cauline leaf blade linear to oblong, 1.5–4  $\times$  0.3–1 cm; corolla 12–14 mm ..... 15. *A. micrantha*
- 22b. Calyx lobes longer than 3 mm, broadest at middle.
- 24a. Calyx variously hairy; corolla shallowly lobed,  $\pm$  constricted at throat, lobes less than 1/4 as long as total length, often reflexed.
- 25a. Corolla throat slightly constricted, 9–15 mm wide; corolla lobes 4–6 mm ..... 12. *A. polyantha*
- 25b. Corolla throat strongly constricted, 4–7 mm wide; corolla lobes up to 3 mm ..... 13. *A. contracta*
- 24b. Calyx glabrous; corolla more deeply lobed, not constricted at throat, lobes more than 1/4 as long as total length.
- 26a. Calyx lobes elliptic, ca. 2 mm wide, middle part broadest, nearly 2  $\times$  as broad as base ..... 16. *A. palustris*
- 26b. Calyx lobes linear-lanceolate or subulate, base broadest or middle part broadest but not 2  $\times$  as broad as base.
- 27a. Calyx lobes subulate, base broadest.
- 28a. Disk broadly tubular, 3–8 mm, up to 3 mm wide; calyx lobes 5–10 mm; inflorescence a pseudoraceme ..... 17. *A. himalayana*
- 28b. Disk less than 1.5 mm; calyx lobes 3–5 mm; inflorescence a panicle, rarely a pseudoraceme.
- 29a. Cauline leaves ovate to lanceolate, 5–25 mm wide; corolla 12–21 mm ..... 18. *A. amurica*
- 29b. Cauline leaves mostly linear to linear-elliptic, less than 5 mm wide; corolla 10–13 mm ..... 23. *A. stenophylla*
- 27b. Calyx lobes linear-lanceolate, middle part broadest, or at least broadest part not at base.
- 30a. Corolla 16–28 mm, lobes 6–8 mm; leaves entire or sparsely serrate, 2–13 mm wide; style usually shorter than or nearly as long as corolla ..... 19. *A. gmelinii*
- 30b. Corolla 13–22 mm, lobes 4–6 mm; leaves always crenulate, 5–40 mm wide; calyx lobes 3–6 mm; style exserted or not.
- 31a. Style included or as long as corolla; leaves 2.5–7 cm; corolla lobes 4–6 mm ..... 9. *A. lamarckii*
- 31b. Style exserted; leaves 6–13 cm; corolla lobes ca. 4 mm ..... 31. *A. pereskiiifolia*
- 20b. Calyx lobes toothed.
- 32a. Calyx lobes ovate-triangular, overlapping at lower part, recurved toward lateral side; capsule subglobose; style included ..... 21. *A. tricuspidata*
- 32b. Calyx lobes narrower, never overlapping, not recurved; capsule subglobose or not; style exserted or included.
- 33a. Cauline leaves aggregated at middle part of stems, glabrous, lanceolate or linear-elliptic ..... 22. *A. wilsonii*
- 33b. Cauline leaves evenly distributed or aggregated at lower part of stems, glabrous or hairy.
- 34a. Cauline leaves linear or linear-elliptic, less than 5 mm wide; calyx lobes subulate, 3–4 mm; corolla 10–13 mm ..... 23. *A. stenophylla*
- 34b. Cauline leaves wider; calyx lobes mostly larger; corolla mostly longer.
- 35a. Flowers solitary and terminal, or several in a pseudoraceme, very occasionally in a narrow panicle; corolla 2–3.4 cm, narrowly campanulate ..... 24. *A. elata*
- 35b. Flowers several to numerous, in a pseudoraceme or panicle; corolla rarely (except in *A. morrisonensis*) more than 2.4 cm, campanulate or broadly campanulate.
- 36a. Leaves mostly glabrous; stems mostly glabrous, or puberulent.
- 37a. Calyx lobes narrowly subulate, ca. 0.5 mm wide; style exserted 4–7 mm above corolla ..... 28. *A. hubeiensis*
- 37b. Calyx lobes 1–2 mm wide; style included, or slightly exserted, less than 4 mm above corolla.
- 38a. Corolla 28–35 mm; disk less than 1 mm ..... 29. *A. morrisonensis*
- 38b. Corolla much shorter; disk longer.
- 39a. Capsule ellipsoid or oblong, more than 3 mm in diam.; calyx lobes 5–7 mm ..... 8. *A. liliifolia*
- 39b. Capsule narrowly ellipsoid, ca. 3 mm in diam.; calyx lobes 2–4(–6) mm ..... 30. *A. ningxianica*
- 36b. Leaves  $\pm$  hairy; stems usually hairy.
- 40a. Leaves mostly aggregated at lower half of stems, upper ones absent or much smaller; calyx lobes 5–20 mm, obviously toothed.
- 41a. Calyx lobes 5–8(–10) mm, often gray; corolla lobed to middle or near middle; disk 0.5–1 mm ..... 26. *A. jasionifolia*
- 41b. Calyx lobes 8–20 mm, green; corolla lobed to 1/3; disk 1.2–3.5 mm ..... 27. *A. coelestis*

- 40b. Leaves evenly distributed; calyx lobes 3–7 mm.  
 42a. Cauline leaves with 2 to several large teeth on each side, puberulent on both surfaces; disk 1.5–3 mm ..... 20. *A. potaninii*  
 42b. Cauline leaves with numerous teeth, adaxially sparsely scaberulose, hispidulous, or glabrous, abaxially hirsute or hispidulous; disk less than 1.4 mm.  
 43a. Cauline leaves narrowly elliptic or lanceolate, 0.5–2.5 cm; style mostly as long as corolla ..... 18. *A. amurica*  
 43b. Cauline leaves ovate, 1.5–6.5 cm; style  $\pm$  exserted ..... 25. *A. khasiana*

**1. *Adenophora tracheloides*** Maximowicz, Mém. Acad. Imp. Sci. St.-Petersbourg Divers Savans 9 [Prim. Fl. Amur.]: 186. 1859.

茅茛 ji ni

Stems single, 40–120 cm tall, up to 1 cm in diam., often  $\pm$  zigzag-twisted, sometimes branched. Cauline leaves alternate; blade ovate or elliptic, 3–13  $\times$  2–8.5 cm, base cordate, truncate, obtuse, or cuneate, margin serrate or doubly serrate, apex obtuse to shortly acuminate; petiole 1–6 cm, sometimes winged. Inflorescence branches mostly long and horizontally spreading, forming a large panicle, less frequently short, forming a narrow panicle. Hypanthium broadly obconic; calyx lobes elliptic or lanceolate 4–13  $\times$  2–4 mm, margin entire (rarely ciliate). Corolla blue, blue-purple, or white, campanulate, 2–2.5 cm; lobes broadly elliptic, 5–7 mm wide, apex acute. Disk tubular, 2–3 mm. Style as long as corolla. Capsule ovoid-conical, ca. 7  $\times$  5 mm. Seeds yellow-brown, black at both ends, narrowly oblong, slightly compressed, 0.8–1.5 mm. Fl. Jul–Aug, fr. Aug–Sep.  $2n = 34^*$ ,  $36^*$ .

• Mountain and hill slopes, grasslands, forest margins; below 2400 m. Anhui, Hebei, Jiangsu, Liaoning, Nei Mongol, Shandong, Zhejiang.

- 1a. Stems, leaves, calyx, and disk all glabrous ..... 1a. subsp. *tracheloides*  
 1b. Stems, leaves, calyx, and disk nearly always hairy ..... 1b. subsp. *giangsuensis*

**1a. *Adenophora tracheloides* subsp. *tracheloides***

茅茛(原亚种) ji ni (yuan ya zhong)

*Adenophora isabellae* Hemsley; *A. remotiflora* (Siebold & Zuccarini) Miquel var. *cordatifolia* (Debeaux) Zahlbruckner; *A. tracheloides* var. *cordatifolia* Debeaux; *A. tracheloides* f. *puberula* A. I. Baranov.

Stems, calyx, and disk always glabrous. Leaves occasionally sparsely hispidulous along veins.

• Mountain slopes, grasslands, forest margins; below 2400 m. Anhui (Huang Shan), Hebei, N Jiangsu, Liaoning, Nei Mongol (Ongniud Qi), Shandong, Zhejiang (Hangzhou, Tianmu Shan).

**1b. *Adenophora tracheloides* subsp. *giangsuensis*** D. Y. Hong, Fl. Reipubl. Popularis Sin. 73(2): 186. 1983.

苏南茅茛 su nan ji ni

Stems and leaves usually densely white hirsute. Leaves often whitish green abaxially. Calyx and disk typically white hairy. Corolla pale purple.

• Hill slopes; lower elevations. S Jiangsu (Nanjing, Taihu, Zhenjiang).

**2. *Adenophora remotiflora*** (Siebold & Zuccarini) Miquel, Ann. Mus. Bot. Lugduno-Batavi 2: 193. 1866.

薄叶茅茛 bao ye ji ni

*Campanula remotiflora* Siebold & Zuccarini, Abh. Math.-Phys. Cl. Königl. Bayer. Akad. Wiss. 4: 180. 1846; *Adenophora remotiflora* f. *cordata* Komarov; *A. remotiflora* f. *longifolia* Komarov.

Stems single, 40–100 cm tall, glabrous, usually simple. Cauline leaves long petiolate; blade typically ovate to ovate-lanceolate, rarely ovate-orbicular, 5–13  $\times$  2–7 cm, membranous, glabrous, base mostly truncate, rounded, or obtuse, rarely cordate, margin serrate or doubly serrate, apex usually acuminate; petiole up to 3 cm. Flowers often solitary on pedicels, less frequently in several-flowered cymes, forming a pseudoraceme or narrow panicle. Hypanthium obovoid or obovoid-obconic, glabrous; calyx lobes lanceolate, 7–12  $\times$  1.5–2 mm, margin entire. Corolla blue, campanulate, 2–3.5 cm; lobes 7–12 mm. Disk cylindrical, 2.5–3 mm, ca. 1 mm in diam. Capsule obovoid, 5–8  $\times$  4–7 mm. Seeds narrowly oblong, slightly curved, ca. 1 mm. Fl. Jul–Aug, fr. Aug–Sep.  $2n = 34$ ,  $36$ .

Forest margins, forests, meadows; below 1700 m. Heilongjiang (Ning'an, Shangzhi), Jilin (E of Fusong and Jiaohe), SE Liaoning (Benxi, Huanren, Kuandian) [Japan, Korea, Russia (Far East)].

**3. *Adenophora petiolata*** Pax & K. Hoffmann, Repert. Spec. Nov. Regni Veg. Beih. 12: 499. 1922.

秦岭沙参 qin ling sha shen

Stems 60–120 cm tall, simple, glabrous or sparsely white hispidulous. Cauline leaves usually long petiolate, very rarely almost sessile; blade ovate, 3–15  $\times$  2–5 cm, abaxially glabrous or hispidulous along veins, adaxially sparsely puberulent or glabrous, base broadly cuneate or subtruncate, margin serrate, apex acute to acuminate; petiole winged, up to 8 cm. Inflorescence branches long and horizontally spreading, forming a large panicle, or extremely short, with only 2 or 3 flowers or even a single flower, and thus forming an extremely narrow panicle or even a pseudoraceme; inflorescence rachises and all floral parts glabrous, scaberulose, or puberulent. Hypanthium obconic or obovoid; calyx lobes ovate, ovate-lanceolate, or linear-lanceolate, 4–9  $\times$  1.5–4 mm, overlapping at base or not. Corolla blue, pale blue, purple, or white, campanulate, 15–27 mm; lobes ovate-deltoid, 4–11  $\times$  7–9 mm. Disk shortly tubular, (0.5–)1–2.5 mm, glabrous or hairy at apex. Style nearly as long as corolla. Capsule ovoid-ellipsoid or obovoid, 5–8  $\times$  4–6 mm. Seeds yellow-brown, oblong, slightly compressed, 1–1.5 mm, 1-ribbed. Fl. Jul–Sep, fr. Sep–Oct.  $2n = 34^*$ ,  $34+1B^*$ .

• Grassy slopes, mountain slopes, grasslands, forest margins, forests or roadsides on mountains; below 2300 m. S Anhui, Chongqing, W Fujian, Gansu, Guangdong, Guangxi, Guizhou, S Hebei, W Henan, Hubei, Hunan, Jiangsu, Jiangxi, Shaanxi, Shanxi, Sichuan, Zhejiang.

- 1a. Calyx lobes ovate-lanceolate to linear-lanceolate, 1–2(–3) mm wide, never overlapping; disk glabrous; corolla 2–2.7 cm, lobes deltoid, 8–11 mm ..... 3a. subsp. *petiolata*
- 1b. Calyx lobes ovate to ovate-lanceolate, 1.5–4 mm wide, broadest at middle-lower part, usually  $\pm$  overlapping; disk  $\pm$  hairy, rarely glabrous; corolla 1.5–2 cm, lobes deltoid-ovate, 5–7 mm.
- 2a. Cauline leaves petiolate, at least lower ones obviously petiolate, petiole up to 2.5 cm; calyx lobes 2–4 mm wide; disk 1.5–2.5 mm, mostly hairy ..... 3b. subsp. *hunanensis*
- 2b. Cauline leaves subsessile or only lower ones shortly petiolate, petiole rarely up to 1.5 cm; calyx lobes 1.5–2.5 mm wide; disk (0.5–)1–1.5(–2) mm, mostly glabrous ..... 3c. subsp. *huadungensis*

### 3a. *Adenophora petiolata* subsp. *petiolata*

秦岭沙参(原亚种) qin ling sha shen (yuan ya zhong)

Cauline leaves all long petiolate. Inflorescence rachises and all floral parts glabrous. Calyx lobes 1.5–2(–3) mm wide, never overlapping. Corolla 2–2.7 cm; lobes deltoid, 8–11 mm.

• Forests or roadsides on mountains; (1000–)1700–2300 m. Gansu (Chengxian, Huating, Wenxian), W Henan (Lushi, Songxian), Shaanxi (Qin Ling), Shanxi (Puxian, Qinxian, Ruicheng).

### 3b. *Adenophora petiolata* subsp. *hunanensis* (Nannfeldt) D. Y. Hong & S. Ge, Novon 20: 427. 2010.

杏叶沙参 xing ye sha shen

*Adenophora hunanensis* Nannfeldt in Handel-Mazzetti, Symb. Sin. 7: 1070. 1936.

Cauline leaves mostly petiolate, or at least lower ones petiolate, rarely subsessile. Inflorescence rachises and floral parts often scaberrulose. Calyx lobes 2–4 mm wide,  $\pm$  overlapping at base. Disk 1.5–2.5 mm, mostly hairy. Corolla 1.5–2 cm; lobes 4–7 mm.

• Mountain slopes, grasslands, forest margins; below 2000 m. Chongqing, Guangdong (Liannan, Renhua, Ruyuan), Guangxi (Lingchuan, Xing'an, Yangshuo), Guizhou (Kaili), S Hebei (Cixian), W Henan, Hubei, Hunan, W Jiangxi, Shaanxi (S of Tongchuan), S Shanxi (Jincheng, Lingchuan, Yangcheng), Sichuan.

华东杏叶沙参 hua dong xing ye sha shen

*Adenophora hunanensis* subsp. *huadungensis* D. Y. Hong, Fl. Reipubl. Popularis Sin. 73(2): 186. 1983.

Cauline leaves subsessile, only lower ones shortly petiolate; petiole rarely up to 1.5 cm. Calyx lobes 1–2.5 mm wide, never overlapping. Disk (0.5–)1–1.5(–2) mm, mostly glabrous.

• Grassy slopes, forests; below 1900 m. S Anhui, W Fujian (Liancheng, Yong'an), Jiangsu (Liyang, Nanjing), E Jiangxi (including Lu Shan), Zhejiang (Longquan, Tianmu Shan).

### 4. *Adenophora rupincola* Hemsley, J. Linn. Soc., Bot. 26: 13. 1889.

多毛沙参 duo mao sha shen

*Adenophora pubescens* Hemsley.

Stems 70–150 cm tall, simple or with branches slender and upright, usually scaberrulose, less often subglabrous. Lower cauline leaves petiolate, upper ones sessile; blade ovate-lanceolate to elliptic, 6–13  $\times$  1.5–3 cm, both surfaces usually sparsely hispidulous, rarely almost glabrous, base attenuate, margin serrate, apex acuminate; petiole winged. Inflorescences with branches forming a panicle; inflorescence rachises, pedicels, and calyx rather densely puberulent or hispidulous, occasionally glabrous; pedicels short and stout, ca. 5 mm, or rarely elongate. Hypanthium obovoid or obconic; calyx lobes lanceolate to linear-lanceolate, 5–8  $\times$  1–2 mm, very rarely reflexed. Corolla blue-purple or purple, campanulate, ca. 17 mm; lobes deltoid, ca. 5 mm. Disk annular to shortly tubular, 0.5–1.5 mm, glabrous. Style 2–2.2 cm, obviously exerted. Fl. Sep.

• Ravines, grassy slopes; below 1500 m. W Hubei, NW Hunan (Cili), Jiangxi, Sichuan.

### 5. *Adenophora brevidiscifera* D. Y. Hong, Fl. Reipubl. Popularis Sin. 73(2): 184. 1983.

短花盘沙参 duan hua pan sha shen

Stems ascending, slender, ca. 35 cm tall, simple, densely hirsute below, glabrous above. Basal leaves long petiolate, hirsute; blade ovate, ca. 3 cm wide, abaxially sparsely hirsute along veins, adaxially hirsute, base cordate with sinus up to 4 cm deep, margin sinuate-crenate or serrate; petiole ca. 3 cm. Lowermost cauline leaf similar to basal leaves but slightly smaller; petiole ca. 2 cm. Upper cauline leaves only 2–4, less than 1 cm, linear, sessile. Cymes 2 or 3, lax, with only terminal flower; bracts filiform, minute; pedicels slender. Hypanthium obovoid, glabrous; calyx lobes subulate, 2–3  $\times$  ca. 0.5 mm, margin entire. Corolla narrowly campanulate, ca. 1.8 cm; lobes narrowly ovate-elliptic, equaling tube, ca. 4 mm wide, apex acute. Disk annular, less than 0.5 mm high. Style ca. 12 mm. Capsule oblong or obovoid, 5–7  $\times$  3–4 mm. Fl. Aug–Sep, fr. Sep.

• Forests of *Pinus yunnanensis*; 2700–3000 m. SW Sichuan (Yanyuan).

*Adenophora brevidiscifera* resembles *A. jasionifolia*, from which it differs in having calyx lobes entire, the lower cauline leaves long petiolate and cordate, and disk shorter.

### 6. *Adenophora longipedicellata* D. Y. Hong, Fl. Reipubl. Popularis Sin. 73(2): 185. 1983.

湖北沙参 hu bei sha shen

Stems 1–3 m tall, simple or with slender branches up to 70 cm, glabrous. Basal leaves ovate, base cordate. Cauline leaves (at least lower ones) petiolate; blade ovate-elliptic or lanceolate, 7–12  $\times$  2–5 cm, papery, glabrous or abaxially sparsely hispid along veins, base cuneate or obtuse, margin serrate or doubly serrate, apex acuminate. Inflorescences with slender and long branches, forming a large lax panicle, glabrous or puberulent; pedicels slender, 1–3 cm. Hypanthium subglobose or obovoid,

glabrous; calyx lobes subulate-lanceolate, 8–14 mm. Corolla white, purple, or pale blue, funnelform, 1.9–2.1 cm; lobes deltoid, 5–6 mm. Disk annular, ca. 1 mm or shorter, glabrous. Style ca. 2.1 cm, almost as long as or slightly longer than corolla. Fl. Aug–Oct.

• Meadows, scrub, cliffs; below 2400 m. Chongqing (Fengjie, Nanchuan), Guizhou (Xishui), W Hubei (Laifeng), WC Sichuan.

**7. *Adenophora cordifolia*** D. Y. Hong, Fl. Reipubl. Popularis Sin. 73(2): 185. 1983.

心叶沙参 xin ye sha shen

Caudexes with horizontal branches and alternate membranous scales. Stems 1 or 2, erect, ca. 50 cm tall, simple, glabrous or retrorsely hirsute. Basal leaves unknown. Cauline leaf blade orbicular or ovate, 3–7 × 2–6 cm, both surfaces sparsely hispidulous or abaxially glabrous, base cordate with sinus 3–5 mm deep; petiole 2–4 cm, upper ones often shorter and sometimes ± decurrent. Inflorescences with short branches, forming a narrow panicle; pedicels less than 5 mm. Hypanthium obovoid, glabrous; calyx lobes linear-lanceolate, 3–7 × 1–1.5 mm, with 2 or 3 pairs of denticles up to 1 mm. Corolla purple, campanulate, 13–15 mm; lobes ovate-deltoid, ca. 1/2 as long as tube. Disk annular, 0.5–0.7 mm, glabrous. Style as long as corolla. Fl. Jul–Aug.

• Shaded and moist rock crevices; ca. 2100 m. Henan (Songxian, Tongbai, Yichuan).

新疆沙参 xin jiang sha shen

*Campanula liliifolia* Linnaeus, Sp. Pl. 1: 165. 1753; *C. alpini* Linnaeus.

Roots carrot-shaped, 8–10 × 1–2 cm. Stems 50–150 cm tall, simple or branched, glabrous. Cauline leaves sessile or shortly petiolate; blade lanceolate or ovate, 5–13 × 1–5 cm, both surfaces glabrous, rarely sparsely white hirsute abaxially, margin serrate, apex acute to shortly acuminate; petiole (if present) up to 6 mm. Inflorescence a narrow panicle with branches with up to 7 flowers, or rarely only several flowers forming a pseudoraceme; pedicels slender, up to 2.5 cm. Hypanthium obovoid or obconic, glabrous; lobes lanceolate, 5–7 × 1–1.5 mm, mostly reflexed from anthesis, margin usually with a pair of denticles or rarely entire. Corolla blue or pale blue, campanulate, 1.2–2.2 cm; lobes ovate, ca. 1/2 as long as tube, apex acute. Disk shortly tubular, 1.5–2.5 mm, glabrous. Style as long as corolla or slightly exserted. Fl. Jul–Aug.  $2n = 34$ , 102.

Forests, scrub. NW Xinjiang (Burqin, Korgas, Toli) [Kazakhstan, Russia (European part); Europe].

**9. *Adenophora lamarckii*** Fischer, Mém. Soc. Imp. Naturalistes Moscou 6: 168. 1823.

天山沙参 tian shan sha shen

*Adenophora liliifolia* (Linnaeus) A. Candolle var. *lamarckii* (Fischer) Krylov; *Campanula lamarckii* (Fischer) D. Dietrich.

Roots carrot-shaped, up to 2.5 cm in diam. Stems simple, 30–100 cm tall, glabrous, rarely white pubescent. Cauline leaves sessile; blade ovate-lanceolate, 2.5–7 × 0.5–3 cm, both surfaces glabrous, sometimes hispidulous abaxially, base cuneate, margin serrate, apex acute or acuminate. Flowers several in a pseudoraceme or inflorescences with short branches of 2–4 flowers, forming a narrow panicle; pedicels less than 1 cm. Hypanthium obovoid or obconic, glabrous; calyx lobes linear-lanceolate or subulate, 3–5 × 1–1.2 mm, widest at base or at lower part, margin usually entire. Corolla blue, funnelform-campanulate, 1.5–2.2 cm; lobes ovate, ca. 1/2 as long as tube, apex acute. Disk shortly tubular, 1–2.5 mm, glabrous. Style nearly as long as or slightly longer than corolla. Fl. Jul–Aug.  $2n = 34$ , 102.

Forests, forest margins. N Xinjiang (Fukang, Toli, Wenquan) [Kazakhstan, Korea, N Mongolia, Russia (Siberia)].

**10. *Adenophora stricta*** Miquel, Ann. Mus. Bot. Lugduno-Batavi 2: 192. 1866.

沙参 sha shen

Stems 40–80 cm tall, simple, often hispidulous or villous, rarely glabrous. Basal leaves ovate, base cordate. Cauline leaves sessile (lower ones sometimes with extremely short, winged petiole); blade elliptic or narrowly ovate, 3–11 × 1.5–5 cm, sparsely hispidulous, hirsute, or subglabrous, base cuneate, apex acute or shortly acuminate. Flowers often in a pseudoraceme, or inflorescences with short branches and thus in an extremely narrow panicle, very occasionally with long branches and panicle ample; pedicels less than 5 mm. Hypanthium obovoid or obconic, puberulent, verrucose-hairy, or less often glabrous; calyx lobes typically subulate, less often linear-lanceolate, 6–8 × 1–1.5 mm, margin entire. Corolla blue or purple, broadly campanulate, 1.5–2.5 cm, glabrous or hirsute at least along veins outside; lobes deltoid-ovate, ca. 1/2 as long as tube. Disk shortly tubular, 1–2.5 mm, glabrous. Style usually slightly longer (rarely shorter) than corolla. Capsule ellipsoid-globose (very rarely ellipsoid), 6–10 mm. Seeds brown-yellow, slightly compressed, ca. 1.5 mm. Fl. Aug–Oct.  $2n = 34$ .

Meadows, forest margins, scrub, open mountain slopes, forests, among grasses, in rock crevices; below 3300 m. Anhui, Chongqing, Fujian, SE Gansu, Guangxi, Guizhou, SE and W Henan, W Hubei, Hunan, Jiangsu, Jiangxi, S Shaanxi, NW and S Sichuan, Yunnan, Zhejiang [Korea; naturalized in Japan].

The diagnostic characters of the present species are cauline leaves sessile; inflorescences pseudoracemose or narrowly paniculate; pedicels short; calyx mostly hairy, and calyx lobes subulate and entire.

- 1a. Leaves glabrous or sparsely villous;  
stems hispidulous ..... 10c. subsp. *confusa*
- 1b. Leaves hispidulous; stems hispidulous,  
less frequently hirsute, rarely glabrous.
  - 2a. Corolla 2–2.5 cm; disk 1.8–2.5 mm  
..... 10d. subsp. *aurita*
  - 2b. Corolla 1.5–2.3 cm; disk 1–1.8 mm.
    - 3a. Corolla nearly always hirsute,  
very rarely subglabrous outside  
..... 10a. subsp. *stricta*

- 3b. Corolla glabrous or with a few hairs along veins at top outside ..... 10b. subsp. *sessilifolia*

**10a. *Adenophora stricta* subsp. *stricta***

dolle) Pampanini; *A. sinensis* var. *glabra* A. Candolle; *Campanula sinensis* (A. Candolle) D. Dietrich.

Stems single or several from one root, 20–100 cm tall, simple, glabrous or sparsely scaberrulose. Basal leaves ovate-orbicular, base rounded. Cauline leaves petiolate, at least toward base; blade narrowly elliptic or narrowly lanceolate, 3–8 × 0.5–2 cm, both surfaces glabrous, base cuneate, margin serrate, apex obtuse to acuminate. Inflorescence branches often slender, forming a narrow panicle; pedicels slender, up to 3 cm. Hypanthium globose or obovoid, usually glabrous, less often sparsely scaberrulose; calyx lobes linear-lanceolate, 5–7 × ca. 1 mm. Corolla purple or purple-blue, campanulate, 1.3–1.5 cm. Disk shortly cylindrical, 1–1.5 mm. Style 2–4 mm longer than corolla. Capsule broadly ellipsoid or globose, 6–7 × ca. 5 mm. Seeds brown-yellow, ellipsoid, ca. 1.8 mm. Fl. and fr. Aug–Oct.

• Grassy places or scrub by rivers or streams; below 1200 m. S Anhui (Qimen), Fujian (Jianning), N Guangdong (Liannan), Hunan (Xiangyin Shan), Jiangxi.

**12. *Adenophora polyantha*** Nakai, Bot. Mag. (Tokyo) 23: 188. 1909.

石沙参 shi sha shen

Stems single or several from one root, 20–100 cm tall, often simple, glabrous or hispidulous. Basal leaves reniform, base cordate, margin irregularly serrate. Cauline leaves sessile; blade ovate, lanceolate, or elliptic, occasionally linear-lanceolate, 2–10 × 0.5–2.5 cm, glabrous or hispidulous, margin serrate with teeth distant. Cymes with solitary flowers forming a pseudoraceme, or in a narrow panicle with short inflorescence branches; pedicels usually less than 1 cm. Hypanthium obconic, usually pubescent, rarely glabrous; calyx lobes triangular-lanceolate, 3.5–7 × 1–2 mm, margin entire. Corolla purple or dark blue, campanulate, slightly constricted at throat, 1.4–2.2 cm; lobes often reflexed, short, up to 1/4 as long as whole corolla. Disk tubular, (2–)2.5–4 mm, often sparsely puberulent. Style usually slightly exerted or sometimes as long as corolla. Capsule ovoid-ellipsoid, 5–12 × 4–7 mm. Seeds yellow-brown, ovoid-ellipsoid, slightly compressed, ca. 1.2 mm. Fl. Aug–Oct.  $2n = 34, 68$ .

Inflorescences usually with branches at base, forming a panicle, sometimes with only several flowers glomerate into a pseudoraceme; pedicels less than 1 cm. Hypanthium obovoid or globose-obovoid, glabrous, base rounded or  $\pm$  obtuse; calyx lobes triangular-subulate, 3–9 mm, margin with 1 or 2 pairs of long denticles. Corolla purple, blue,

or blue-purple, rarely white, campanulate, 1.5–2.5 cm; lobes ovate-deltoid, 5–8 mm. Disk tubular, 2–2.6(–3) mm, hairy at least at apex. Style nearly as long as or slightly longer than corolla. Capsule globose-ellipsoid or ellipsoid,  $7\text{--}11 \times 4\text{--}6$  mm. Seeds brown-yellow, ellipsoid, ca. 1.4 mm, 1-ribbed. Fl. Jul–Oct, fr. Oct–Nov.  $2n = 34^*$ , 102\*.

• Sunny grassy slopes, among grasses on shaded slopes, scrub, sparse woods, stony places or rock crevices, less often forests; below 3100 m. Gansu, Hebei, Henan, SW Liaoning, SE Nei Mongol, Ningxia, E Qinghai, Shaanxi, Shanxi, W Sichuan.

1a. Cauline leaves sessile, lower ones rarely shortly petiolate ..... 20a. subsp. *potaninii*

1b. Cauline leaves usually petiolate, though sometimes very shortly so ..... 20b. subsp. *wawreana*

**20a. *Adenophora potaninii* subsp. *potaninii***

泡沙参(原亚种) pao sha shen (yuan ya zhong)

*Adenophora bockiana* Diels; *A. polydentata* P. F. Tu & G. J. Xu; *A. potaninii* var. *bockiana* (Diels) S. W. Liu.

Cauline leaves sessile, lower ones rarely shortly petiolate.

• Sunny grassy slopes, less often scrub or forests; 1000–3100 m. Gansu (E of Yongchang), Ningxia (Guyuan, Jingyuan), E Qinghai (Menyuan, Tongren, Xining), Shaanxi (Lüeyang, Mianxian, N part of province), SW Shanxi (W of Wuzhai, Xiaoyi, Yuncheng), W Sichuan.

**20b. *Adenophora potaninii* subsp. *wawreana*** (Zahlbruckner) S. Ge & D. Y. Hong, J. Syst. Evol. 48: 452. 2010.

多歧沙参 duo qi sha shen

*Adenophora wawreana* Zahlbruckner, Ann. K. K. Naturhist. Hofmus. 10 (Notizen): 56. 1895; *A. biformifolia* Y. Z. Zhao; *A. wawreana* f. *foliosa* Zahlbruckner; *A. wawreana* var. *lanceifolia* Y. Z. Zhao; *A. wawreana* f. *oligotricha* Kitagawa; *A. wawreana* f. *polytricha* Kitagawa.

Cauline leaves usually petiolate, though sometimes petiole very short; blades varying greatly, from linear to ovate, even on same individual.

• Among grasses on shaded slopes, scrub, sparse woods, mostly in stony places or rock crevices; below 2000 m. Hebei (N to Weichang), Henan (Song Shan), SW Liaoning, SE Nei Mongol (Hohhot, Liangcheng, Zhuozi), Shanxi (E of Jiaocheng, Wuzhai, Yuncheng).

**21. *Adenophora tricuspidata*** (Fischer ex Schultes) A. Candolle, Monogr. Campan. 355. 1830.

锯齿沙参 ju chi sha shen

*Campanula tricuspidata* Fischer ex Schultes, Syst. Veg. 5: 158. 1819; *Adenophora communis* Fischer var. *denticulata* (Fischer) Trautvetter; *A. denticulata* Fischer; *A. polymorpha* Ledebour var. *denticulata* (Fischer) Trautvetter ex Herder; *C. denticulata* (Fischer) Sprengel (1824), not Burchell (1822).

Stems single or sometimes 2 from one root, 70–100 cm tall, simple, glabrous. Cauline leaves sessile, glabrous; blade narrowly elliptic or ovate-elliptic,  $2.5\text{--}8 \times 0.6\text{--}2$  cm, base ob-

tuse or cuneate, margin serrate, apex acute. Inflorescence branches (cymes) extremely short, only 2–3 cm, with 2 to several flowers, several forming a narrow panicle; pedicels very short. Hypanthium globose-ovoid or globose-obconic, glabrous; calyx lobes often reflexed, ovate-deltoid,  $3-6 \times 1-2$  mm, overlapping at base, margin with 2 or rarely 3 or 4 pairs of long denticles, apex acuminate. Corolla blue or purple-blue, broadly campanulate, 1–2 cm; lobes broadly ovate-deltoid, ca.  $1/2$  as long as tube, apex obtuse. Disk shortly tubular, 1–2 mm, glabrous. Style shorter than corolla. Capsule subglobose. Fl. Jul–Sep.  $2n = 34$ .

Wet meadows, forests of *Betula*, sunny grassy slopes. Heilongjiang (Luobei, Nenjiang, Yichun), N Nei Mongol (Xilin Gol Meng: Xi Ujimqin Qi) [Russia (Far East, S Siberia)].

**22. *Adenophora wilsonii*** Nannfeldt in Handel-Mazzetti, Symb. Sin. 7: 1075. 1936.

聚叶沙参 ju ye sha shen

Stems often 2 to several from one root, erect, 25–80 cm tall, simple or branched above, glabrous, densely leafy at middle during anthesis but basal leaves withered. Leaves shortly petiolate; blade linear-elliptic or lanceolate,  $4-10 \times 0.5-1.2$  cm, thickly papery, both surfaces glabrous, base attenuate into petiole, margin serrate or crenate. Inflorescence a panicle with long or short branches; pedicels up to 1 cm. Hypanthium obovoid or obconic, sometimes subglobose, glabrous; calyx lobes subulate or linear-lanceolate,  $5-7 \times$  ca. 1 mm, with 1 or 2 pairs of verrucose denticles. Corolla purple or blue-purple, funnellform-campanulate, 1.5–2 cm; lobes ovate-deltoid, ca.  $1/2$  as long as tube. Disk annular or shortly tubular, less than 1.2 mm, glabrous. Style 2–2.5 mm, ca. 5 mm longer than corolla. Capsule globose-ellipsoid,  $7-8 \times 4-5$  mm. Fl. Aug–Oct, fr. Sep–Oct.

• Thickets, rocks by streams; below 1600 m. Chongqing (Chengkou), Gansu (Kangxian, Wenxian), Guizhou (Renhuai), W Hubei (Hefeng, Shennongjia), Shaanxi (Nanzheng), Sichuan (Emei Shan, Jiange, Tianquan).

扫帚沙参 sao zhou sha shen

*Adenophora mongolica* A. I. Baranov; *A. stenophylla* var. *denudata* Kitagawa.

Stems numerous from one root, 25–50 cm tall, often with slender branches, densely hispidulous or glabrous. Basal leaf blade ovate-orbicular, base rounded. Cauline leaves sessile; blade needlelike to linear-oblong, up to  $6 \times 0.5$  cm, glabrous or hispidulous, margin entire or sparsely serrate. Inflorescence branches slender, erect, forming a narrow panicle, rarely only several flowers in a pseudoraceme; pedicels slender. Hypanthium obovoid-oblong, glabrous; calyx lobes subulate, 3–4 mm, margin entire or with 1 or 2 pairs of verrucose denticles. Corolla blue or purple-blue, campanulate, 8–13 mm; lobes ovate-triangular, 3–3.5 mm. Disk tubular, 1–1.5 mm, glabrous or sparsely puberulent. Style slightly shorter than corolla. Capsule ellipsoid,  $4-8 \times 2.3-5$  mm. Seeds brown-yellow, ellipsoid, slightly compressed, ca. 1 mm. Fl. Jul–Sep, fr. Sep.  $2n = 34^*$ .

Dry grasslands. Heilongjiang (Anda), W Jilin, Nei Mongol (Jarud Qi) [Mongolia].

**24. *Adenophora elata*** Nannfeldt, Acta Horti Gothob. 5: 16. 1930.

狭长花沙参 xia chang hua sha shen

*Adenophora wutaiensis* Hurusawa.

Root carrotlike,  $8-18 \times 1.4-2.4$  cm. Stems single, 20–120 cm tall, simple, glabrous or sometimes puberulent. Cauline leaves very rarely opposite, sessile or lower leaves sometimes with short winged petiole; blade broadly elliptic, elliptic, narrowly elliptic, lanceolate, or oblanceolate,  $2-8 \times 0.5-2.5$  cm, glabrous, base rounded, obtuse, or cuneate, margin crenate or serrate, apex acute or less often acuminate. Flowers usually several in a pseudoraceme, sometimes solitary and terminal, or very rarely with short branches, forming a narrow panicle; pedicels usually less than 1 cm. Hypanthium narrowly obovoid or obconic, glabrous; calyx lobes narrowly triangular,  $5-10 \times 1-1.5$  mm, margin with 1 or 2 pairs of denticles or entire. Corolla blue or purple-blue, narrowly campanulate or tubular-campanulate, less often campanulate, 2–3.5 cm; lobes deltoid, 5–10 mm. Disk tubular, 1.6–2.8 mm, glabrous. Style shorter than corolla. Capsule ellipsoid or oblong,  $10-14 \times 5-7$  mm. Seeds yellow-brown, ellipsoid, ca. 1.5 mm. Fl. Jul–Sep, fr. Sep.  $2n = 68^*$ .

• Grassy slopes; 1700–3000 m. W Hebei, SE Nei Mongol (Zhuzi), Shanxi (Wutai Shan).

**25. *Adenophora khasiana*** (J. D. Hooker & Thomson) Oliver ex Collett & Hemsley, J. Linn. Soc., Bot. 28: 80. 1890.

云南沙参 yun nan sha shen

裂叶沙参 lie ye sha shen

Stems erect, 20–100 cm tall, simple, sparsely retrorsely hirsute. Cauline leaves all or only lower and middle leaves petiolate; blade ovate or ovate-lanceolate, 2–5 × 1–2 cm, abaxially hirsute along veins, adaxially sparsely puberulent, margin pinnatifid or rarely only dentate-lobed; petiole 0.5–2.5 cm. Inflorescence with slender and ascending branches, forming a panicle, or several flowers in a pseudoraceme, rarely flowers solitary and terminal; pedicels slender, 5–20 mm. Hypanthium oblong or obovoid, base obtuse or rounded, glabrous; calyx lobes subulate, 3–4 × less than 1 mm, margin with 1 or 2 pairs of verrucose denticles, rarely ciliate. Corolla blue or purple-blue, campanulate, 11–17 mm; lobes ovate-deltoid, 4–6 mm. Disk tubular, 2–3 mm, sparsely puberulent above. Style nearly as long as or slightly longer than corolla. Capsule cylindrical, base rounded, 6–8 × ca. 3 mm. Seeds yellow, ellipsoid, ca. 0.8 mm. Fl. Jul–Oct, fr. Aug–Oct.  $2n = 34^*$ ,  $34+2B^*$ .

• Thickets, open woods, forest margins; 2000–3400 m. NW Sichuan (Barkam, Danba, Jinchuan).

**35. *Adenophora stenanthina*** (Ledebour) Kitagawa, Lin. Fl. Manshur. 418. 1939.

长柱沙参 chang zhu sha shen

Root carrotlike, up to 10 × 0.7–0.8 cm. Stems several, caespitose, 40–120 cm, sometimes branched above, usually finely scaberulose. Basal leaves petiolate; blade cordate or truncate at base, margin deeply and irregularly serrate. Cauline leaves sessile; blade filiform, linear, elliptic, lanceolate, or ovate, 2–10 × 0.1–2 cm, both surfaces scaberulose or subglabrous, margin entire or sparsely serrulate. Inflorescence a pseudoraceme or a panicle. Hypanthium obovoid, ellipsoid, or campanulate, glabrous; calyx lobes subulate or narrowly triangular, 1.5–5(–7) mm, margin entire or denticulate. Corolla pale to dark blue, blue-purple, or purple, subtubular or tubular-campanulate, 10–17 × 5–8 mm. Disk narrowly tubular, 4–7 mm, glabrous or villous. Style 1.8–2.2 cm. Capsule ellipsoid, 7–9 × 3–6 mm. Fl. Jul–Sep, fr. Aug–Sep.  $2n = 34$ .

Conifer forests, scrub, grasslands, grassy slopes, sandy places; below 4000 m. Gansu, Hebei, W Jilin, Nei Mongol, Ningxia, NE Qinghai, N Shaanxi, Shanxi [Mongolia, Russia (Far East, S Siberia)].

Leaves up to 12 mm wide. Calyx lobes 1.5–3 mm. Corolla subtubular, 10–13 mm, ± constricted at throat; lobes 1.5–3 mm. Style 6–10 mm longer than corolla. Disk glabrous or hairy. Capsule narrowly ellipsoid.

Grassy slopes, sandy places; below 1800 m. Gansu (Huining), Hebei (Kangbao, Longguan, Zhangbei), W Jilin (Zhenlai), Nei Mongol, Ningxia (Guyuan, Yanchi), N Shaanxi, Shanxi (N of Taigu) [Mongolia, Russia (Far East, S Siberia)].

**35b. *Adenophora stenanthina*** subsp. *sylvatica* D. Y. Hong, Fl. Reipubl. Popularis Sin. 73(2): 187. 1983.

林沙参 lin sha shen

Leaves linear to ovate or oblong, up to 2 cm wide, entire or sparsely serrulate. Calyx lobes 3–5(–7) mm. Corolla tubular-campanulate, 12–17 mm; lobes 3–4.5 mm. Style only 3–7 mm longer than corolla. Disk all hairy. Capsule ellipsoid.

• Conifer forests, scrub, also among grasses; 2500–4000 m. Gansu (Qilian Shan, Tao He basin), NE Qinghai.

**36. *Adenophora liliifolioides*** Pax & K. Hoffmann, Repert. Spec. Nov. Regni Veg. Beih. 12: 499. 1922.

川藏沙参 chuan zang sha shen

*Adenophora gracilis* Nannfeldt.

Stems often single, 30–100 cm tall, simple, usually hirsute, less often glabrous. Basal leaves long petiolate; blade ovate, base cordate, margin coarsely serrate. Cauline leaves sessile; blade ovate, lanceolate, elliptic, or linear, 2–11 × 0.4–3 cm, abaxially hispidulous but hirsute along major veins (or less often glabrous throughout), adaxially glabrous or hispidulous, base cuneate or attenuate, margin entire or sparsely serrate, apex acuminate. Inflorescence a narrow panicle with short branches, sometimes only several flowers in a pseudoraceme. Hypanthium ellipsoid, glabrous; calyx lobes narrowly triangular, 2–6 × 0.6–1 mm, margin entire or very rarely with verrucose denticles. Corolla blue, purple-blue, or pale purple, rarely white, subtubular or tubular-campanulate, 8–12 mm. Disk narrowly tubular, 3–6.5 mm, usually glabrous. Style 1.5–2 cm, remarkably exerted. Capsule ovoid or ellipsoid, 6–9 × 3–4 mm. Seeds brownish yellow, ellipsoid, 1.2–1.5 mm, finely striate, 1-ribbed. Fl. Jul–Sep, fr. Sep–Oct.

• Meadows, scrub, among debris; 2400–4600 m. SE Gansu (Lintao, Xiahe), Shaanxi (Qin Ling), NW Sichuan, NE Xizang.

**37. *Adenophora capillaris*** Hemsley, J. Linn. Soc., Bot. 26: 10. 1889.

丝裂沙参 si lie sha shen

Stems single, 0.5–1 m tall, glabrous or hirsute. Cauline leaves usually sessile; blade ovate-lanceolate, elliptic-lanceolate, or sometimes linear, 3–19 × 0.2–5 cm, glabrous or hirsute, margin entire or serrate (denticulate when narrow), apex acuminate. Inflorescence with long branches, forming a large and lax panicle, sometimes with short branches, forming a narrow panicle, less frequently only several flowers in a pseudoraceme; main axis and branches filiform. Hypanthium ellipsoid or sometimes ovoid; calyx lobes spreading or reflexed, filiform, (3–)6–14(–20) mm, margin entire or sometimes with 1 to several verrucose denticles below. Corolla pale blue, pale purple, or white, subtubular, tubular-funnelform, or urceolate, 10–18 mm; lobes narrowly triangular, 3–4 mm. Disk narrowly tubular, 2–5 mm, often glabrous. Style 15–25 mm, strongly exserted. Capsule globose, ellipsoid, or ovoid, 4–9 × 4–5 mm. Seeds brown, ellipsoid, 1–1.6 mm, 1-ribbed.

• Forests, forest margins, grasslands, grassy slopes; 1100–3600 m. Chongqing, Guizhou, Hebei, W Henan, W Hubei, SE Nei Mongol, Shaanxi, Shandong, Shanxi, Sichuan, W Yunnan.

- 1a. Calyx lobes (2–)3–5(–7) mm, margin entire; capsule ovoid to ovoid-oblong ..... 37c. subsp. *paniculata*
- 1b. Calyx lobes (3–)6–14(–20) mm, margin sometimes lower part with 1 or 2 pairs of verrucose denticles; capsule globose, less often ovoid.
  - 2a. Calyx lobes (3–)6–9 mm, rarely up to 20 mm, margin usually entire; corolla 10–14 mm, very rarely up to 17 mm; stems and leaves mostly glabrous ..... 37a. subsp. *capillaris*
  - 2b. Calyx lobes (4–)9–14 mm, mostly with denticles; corolla 13–18 mm; stems and leaves mostly ± hirsute ..... 37b. subsp. *leptosepala*

Root carrotlike, 7–16 × 1.5–1.8 cm. Stems up to 1.5 m tall, simple, glabrous, less often white hispidulous. Cauline leaves 3–6-verticillate, sessile or subsessile; blade broadly to narrowly elliptic, linear-lanceolate, or linear, 1.8–10 × 0.2–3.2 cm, both surfaces sparsely puberulent or glabrous, base cuneate or attenuate, margin serrate or serrulate, apex acuminate, acute, or obtuse. Inflorescence a narrow panicle with branches (cymes) mostly verticillate. Hypanthium obconic or campanulate, glabrous; calyx lobes subulate, linear, or linear-triangular, 1.5–4 mm, margin entire. Corolla blue to purple, tubular or narrowly funnelform, sometimes slightly constricted at throat, 7–10 mm; tube 2.5–7 mm in diam.; lobes deltoid, 1–2 mm. Disk narrowly tubular, 2–4 mm. Style 14–20 mm, strongly exserted. Capsule

obovoid or broadly obovoid, 5–8 × 3–6 mm. Seeds yellow-brown, oblong, slightly compressed, 1–1.5 mm. Fl. (Feb–)Mar–Nov, fr. May–Nov.  $2n = 34, 34+2B^*$ .

Grassy places, scrub; low elevations but up to 2000 m in south.

Anhui, Fujian, N Guangdong, Guangxi, Guizhou, Hebei, Heilongjiang, Henan (Lushi, Xinyang), Hunan (Xinning, Yizhang), Jiangsu, Jiangxi, Jilin, Liaoning, E Nei Mongol, Shandong (Muping), Shanxi (Lingkong Shan), Sichuan (Ebian, Emei Shan), Taiwan, Yunnan (Yanshan), Zhejiang [Japan (including Ryukyu Islands), Korea, Laos, Russia (Far East, E Siberia), N Vietnam].

## 11. PERACARPA J. D. Hooker & Thomson, J. Proc. Linn. Soc., Bot. 2: 26. 1857.

袋果草属 dai guo cao shu

Hong Deyuan (洪德元); Thomas G. Lammers

*Perocarpa* Feer.

Plants perennial. Rhizomes elongate, with scales and buds. Leaves alternate. Flowers usually solitary, axillary, pedicellate. Calyx 5-lobed. Corolla funnelform-campanulate, 5-lobed to middle or slightly beyond. Stamens 5, free from corolla; filaments ciliate. Ovary inferior, 3-locular; style villous above; stigma 3-lobed, lobes recurved. Fruit a 2- or 3-locular irregularly dehiscent capsule. Seeds relatively few, ellipsoid, large, smooth.

One species: Bhutan, China, India, Japan, Korea, Myanmar, Nepal, Papua New Guinea, Philippines, Russia (Sakhalin), Thailand.

**1. *Peracarpa carnos*** (Wallich) J. D. Hooker & Thomson, J. Proc. Linn. Soc., Bot. 2: 26. 1857.

袋果草 dai guo cao

Plants delicate. Rhizomes creeping, prostrate, slender, branched. Stems erect or reclining, rarely prostrate, 4–25 cm tall, slender, fleshy, glabrous, unbranched or rarely few branched at base, sometimes rooting at nodes. Leaves crowded toward apex of stem, those toward base distant and smaller; blade abaxially green, sometimes suffused with purple, adaxially green, ovate to orbicular, 3–38 × 3–28 mm, membranous or papery, abaxially glabrous or rarely pubescent, adaxially glabrous or sparsely appressed hispidulous, base truncate, subcordate, or cordate, margin flat, crenulate, serrate, serrulate, sometimes cili-

ate, with gland at each sinus, apex rounded, obtuse, or acute, often mucronate; petiole 2–17 mm. Flowers solitary and axillary, rarely 2–4(–17) in a fascicle. Pedicels slender, ebracteolate, 2–70 mm. Hypanthium obconic or obovoid, glabrous; calyx lobes subulate, narrowly triangular, or triangular. Corolla white, blue-purple, or sometimes pale blue, funnelform-campanulate, 3–10 mm; lobes linear to elliptic. Capsule pendent, obovoid or broadly obovoid, rarely ellipsoid, 2.5–5.5 × 1.5–5 mm; pericarp thin, membranous, prominently veined, distended by mature seeds, eventually ruptured irregularly, mostly at base. Seeds 10–16 per capsule, brown, finely striate, oblong, narrowly oblong, ellipsoid, or fusiform, ca. 1.7 mm. Fl. Mar–May, fr. Apr–Nov.  $2n = 30$ . \*

Forests or moist rocks by streams; 1300–3800 m. Anhui (Jinzhai), Chongqing (Jinfo Shan), Guizhou (Kaili), Hubei (Shennongjia), S Jiangsu, Sichuan (Baoping, Ebian, Emei), Taiwan, S Xizang (Yadong), W Yunnan, Zhejiang (Hangzhou) [Bhutan, NE India, Japan, Korea (Cheju Do), N Myanmar, Nepal, Papua New Guinea, Philippines, Russia (Sakhalin), N Thailand].

## 12. HOMOCODON D. Y. Hong, Acta Phytotax. Sin. 18: 473. 1980.

同钟花属 tong zhong hua shu

Hong Deyuan (洪德元); Thomas G. Lammers

Plants annual, prostrate. Stems longitudinally 3-winged. Leaves alternate. Flowers 1–3 on extremely short branches, sessile or shortly pedicellate. Calyx epigynous, 5-lobed, lobes dentate. Corolla epigynous, tubular-campanulate, 5-lobed. Stamens 5, free from corolla and free from each other; filaments slightly dilated and sparsely ciliate at base. Ovary inferior, 3-locular; stigma 3-fid; lobes linear, recurved. Fruit dry, irregularly dehiscent or irregularly poricidal in lower part. Seeds ellipsoid, not angular, shallowly reticulate.

Two species: Bhutan, China; two species (one endemic) in China.

These species have been included in *Heterocodon* Nuttall, but their flowers are on short branches, not solitary and opposite to leaves on main stems; and their seeds are terete and reticulate, not angular and smooth.

- 1a. Pedicels absent; corolla smaller, ca. 3.5 mm; style as long as corolla ..... 1. *H. brevipes*  
1b. Pedicels ca. 6 mm; corolla 7–9 mm; style exserted ..... 2. *H. pedicellatus*

**1. *Homocodon brevipes*** (Hemsley) D. Y. Hong, *Acta Phytotax. Sin.* 18: 474. 1980.

同钟花 tong zhong hua

*Wahlenbergia brevipes* Hemsley, Hooker's Icon. Pl. 28: t. 2768. 1903; *Heterocodon brevipes* (Hemsley) Handel-Mazzetti & Nannfeldt; *W. monantha* H. J. P. Winkler ex H. Limpricht.

Stems up to 50 cm, slender, glabrous, longitudinally 3-winged, branches extremely short, with several leaves appearing in a fascicle. Petiole 2–9 mm; leaf blade paler green abaxially, deltoid, orbicular, or ovate, 7–12 × 7–12 mm, glabrous or appressed hispidulous, base truncate or rounded, sometimes cordate, margin serrate, teeth mucronate, blade apex acute. Flowers sessile, ca. 5 mm, single or 2 inserted at apex of short lateral branches. Hypanthium campanulate, 1–2 mm; calyx lobes narrowly triangular or subulate, 1–2 mm, with a pair of teeth. Corolla white, pale blue, or pale purple, 3–4 mm; lobes cleft to slightly over half its length, linear or oblong. Filaments ca. 1 mm; anthers elongate or lanceolate; style ciliate, exerted or equal to length of corolla. Fruit ovoid to globose, ca. 2.5 mm, pericarp thin. Seeds several, brown, ellipsoid, ca. 0.7 mm. Fl. and fr. Apr–Aug.

Forests, thickets, among grasses on slopes; 1000–2900 m. SW Guizhou, W Sichuan, Yunnan [Bhutan].

This species was recorded from Bhutan in Fl. Bhutan (2(3): 1380. 2001).

**2. *Homocodon pedicellatus*** D. Y. Hong & L. M. Ma, *Acta Phytotax. Sin.* 29: 268. 1991.

长梗同钟花 chang geng tong zhong hua

Stems slender, glabrous or retrorsely hispidulous, longitudinally 3-winged, almost all axils on main stem with a short branch, branches with several smaller leaves. Petiole 2–4 mm; leaf blade fan-shaped, 4–9 × 3–12 mm, glabrous or hispidulous, base truncate, margin dentate, teeth mucronate. Flowers solitary in axils of leaves on branches, 1–3 on each branch, glabrous throughout; pedicels up to 8 mm. Hypanthium obconical, 1.5–3 mm; calyx lobes triangular, ca. 2 mm, with a pair of teeth. Corolla blue, 7–9 mm; lobes linear or oblong, equaling length of tube. Filaments ca. 4.5 mm; anthers terete, ca. 2 mm. Style exerted; stigma 3-fid; lobes linear, recurved at anthesis. Fl. Jul.

• Ravines; 1400–1600 m. Sichuan (Luding: Hailuogou).

### 13. **TRIODANIS** Rafinesque, *New Fl. N. Amer.* 4: 67. 1838.

异檐花属 yi yan hua shu

Hong Deyuan (洪德元); Thomas G. Lammers

Herbs, annual. Roots fibrous. Stems erect or ascending, simple or branched below, ribbed. Leaves alternate, sessile, ovate, elliptic, lanceolate, or linear, entire or dentate. Flowers 1–3(–8) in an axillary cyme, sessile or subsessile; cleistogamous flowers in axils of lower leaves; normal flowers in axils of middle to upper leaves. Calyx 3- or 4(–6)-lobed, with lobes shorter in cleistogamous flowers, 5(or 6)-lobed in normal flowers. Corolla blue-purple or pale purple, rarely white, rotate, 5(or 6)-fid nearly to base; lobes lanceolate, apex acute or acuminate. Stamens 5(or 6), free; filaments dilated at base; anthers elongate, longer than filaments. Ovary inferior, (2 or)3-locular; ovules numerous; style upright, but reduced in cleistogamous flowers; stigma (2 or)3-fid, densely puberulent. Capsule subcylindrical or clavate, (2 or)3-poricidal at inferior part. Seeds numerous, globose to broadly ellipsoid, slightly compressed.

Six species: the Americas; one species (introduced) in China.

**1. *Triodanis perfoliata*** (Linnaeus) Nieuwland, *Amer. Midl. Naturalist* 3: 192. 1914.

穿叶异檐花 chuan ye yi yan hua

Stems erect or ascending, 15–60 cm tall, simple or branched, ribbed, glabrous or scabrous mostly on ribs. Leaves ovate, suborbicular, or elliptic, sometimes lanceolate toward apex, 0.6–2 cm, glabrous or shortly hispid on veins and margins, base clasping cordate, obtuse, broadly cuneate, or rounded, margin shallowly entire, crenate, serrate, or dentate, apex rounded, obtuse, or acute, sometimes acuminate. Flowers 1–3 in axil, sessile. Hypanthium campanulate, oblong, or obconic; calyx lobes of upper flowers (later ones) 5, rarely 4, rigid, triangular to lanceolate; lower flowers (earlier ones) smaller, with lobes 3 or 4, narrowly triangular, triangular, or lanceolate. Corolla bluish purple or rose-purple, rarely white, rotate, 8–10 mm; earlier flowers rudimentary. Capsule oblong, 4–10 mm, opening by lateral valves. Seeds light brown to brown, smooth. Fl. and fr. Apr–Jul.  $2n = 28, 56$ .

Naturalized on mountain slopes, by streams, among grasses, and

in cracks of concrete; 100–1000 m. Anhui, Fujian, Taiwan, Zhejiang [native to North and South America].

- 1a. Leaves ovate to orbicular, base cordate or amplexicaul, margins crenate or dentate; bracts as long as broad; capsule poricidal below middle ..... 1a. subsp. *perfoliata*
- 1b. Leaves ovate to elliptic, base usually rounded, slightly cordate or obtuse, not amplexicaul, margins subentire or shallowly crenate; bracts longer than wide; capsule poricidal above middle .... 1b. subsp. *biflora*

#### **1a. *Triodanis perfoliata* subsp. *perfoliata***

穿叶异檐花(原亚种) chuan ye yi yan hua (yuan ya zhong)

*Campanula perfoliata* Linnaeus, Sp. Pl. 1: 164. 1753; *Dysmicodon perfoliatus* (Linnaeus) Nuttall; *Legousia perfoliata* (Linnaeus) Britton; *Pentagonia perfoliata* (Linnaeus) Kuntze; *Prismatocarpus perfoliatus* (Linnaeus) Sweet; *Specularia perfoliata* (Linnaeus) A. Candolle.

Stems rather stiffly erect, 15–60 cm tall, simple or branched, sometimes especially on angles with spreading, bristlelike hairs of uneven length. Leaves broadly ovate to sub-orbicular, 1–2 cm, shortly hispid on veins and margins, base strongly cordate-clasping, margin rather shallowly crenate-dentate or sometimes entire, apex subacute or rounded. Flowers 1–3 in axil, sessile. Calyx lobes of upper flowers (later ones) 5, rarely 4, rigid, triangular-lanceolate, acuminate; lower flowers (earlier ones) smaller, with 3 or 4 shorter calyx lobes. Corolla blue or white, rotate, 8–20 mm wide; corolla on earlier flowers rudimentary. Capsule oblong to narrowly turbinate, 4–6 mm, tardily opening near middle. Seeds lenticular. Fl. and fr. Apr–Jul.  $2n = 56$ .

Naturalized on mountain slopes and by streams; 100–1000 m. Fujian (Chong'an, Jianning) [native to North America].

Meyer; *Triodanis biflora* (Ruiz & Pavon) Greene; *T. perfoliata* var. *biflora* (Ruiz & Pavon) T. R. Bradley.

Plants glabrous or nearly so throughout except for scabrous angles of stems. Stems simple or branched, slender and often weak, 15–60 cm tall. Leaves ovate to ovate-elliptic or obovate-lanceolate, 6–20 mm, margin entire, or inconspicuously crenate-serrate with very short and broad teeth, base usually rounded, not amplexicaul. Earlier flowers with 3 or 4 ovate to lanceolate calyx lobes; later ones with 4 or 5 longer, lanceolate-subulate calyx lobes. Capsule oblong-cylindric, 6–10 mm, opening by valves close under calyx lobes. Fl. and fr. Apr–Jul.  $2n = 28, 56$ .

Naturalized among grasses and in cracks of concrete; 100–600 m. Anhui (Anqing), Fujian (Jiangle), Taiwan (Xinzhu), Zhejiang (Putuo) [native to North and South America].

## 14. *ASYNEUMA* Grisebach & Schenk, Arch. Naturgesch. 18: 335. 1852.

牧根草属 *mu gen cao shu*

Hong Deyuan (洪德元); Thomas G. Lammers

*Phyteuma* Linnaeus sect. *Podanthum* G. Don; *Podanthum* (G. Don) Boissier, nom. superfl.; *Trachanthelium* Kitaibel ex Schur.

Herbs, perennial. Roots carrot-shaped. Leaves alternate. Inflorescence elongate, spikelike or racemelike, comprising several axillary cymes, each composed of (1 or) 2–4 flowers and subtended by a bract; pedicels short, with a pair of linear bracteoles at base. Calyx 5-lobed; lobes linear (at least in Chinese species). Corolla 5-divided to base; lobes almost free, linear. Stamens 5; filaments dilated at base, margin densely ciliate. Ovary inferior, 3-locular; style nearly as long as corolla, hairy above; stigma 3-fid, segments linear, recurved. Capsule 3-poricidal above middle, 10-ribbed. Seeds ovoid, ellipsoid, or oblong, sometimes angular.

Thirty-three species: N Africa, temperate Asia, Europe; three species (one endemic) in China.

- 1a. Stems hirsute throughout; leaves white hirsute on both surfaces; calyx lobes often recurved after anthesis ..... 3. *A. chinense*  
 1b. Stems glabrous or sometimes sparsely hirsute only below; leaves glabrous or rarely sparsely hirsute along veins; calyx lobes not recurved.  
 2a. Style longer than corolla; capsule globose ..... 1. *A. japonicum*  
 2b. Style shorter than corolla; capsule obovoid-conical, base acute or acuminate ..... 2. *A. fulgens*

牧根草 *mu gen cao*

*Phyteuma japonicum* Miquel, Ann. Mus. Bot. Lugduno-Batavi 2: 192. 1866; *Campanula japonica* (Miquel) Vatke.

Roots fleshy, up to 20 cm, up to 1.5 cm in diam., branched or not. Stems single, erect, more than 60 cm tall, simple or branched above, glabrous or very rarely sparsely hirsute toward base. Lower cauline leaves with petiole up to 4 cm; upper cauline leaves almost sessile; blade ovate, lanceolate, or elliptic from below toward apex, 3–12 × 1.4–5.5 cm, abaxially glabrous, adaxially sparsely puberulent, base cuneate or obtuse, margin serrate, apex acute to acuminate. Flowers glabrous except on filaments and style. Calyx tube globose or campanulate; lobes linear, 4–8 mm. Corolla purple-blue or blue-purple; lobes 8–14 mm. Style 9–15 mm. Capsule globose, base truncate or concave, ca. 5 mm in diam. Seeds yellow to brown, ovoid, ellipsoid, or oblong, ca. 1 mm. Fl. Jul–Aug, fr. Sep.  $2n = 28$ .

Forests, rarely meadows. Heilongjiang (Huachuan), Jilin (E of Jingyu), Liaoning [Japan, Korea, Russia (Far East)].

**2. *Asyneuma fulgens*** (Wallich) Briquet, Candollea 4: 334. 1931.

长果牧根草 *chang guo mu gen cao*

*Campanula fulgens* Wallich in Roxburgh, Fl. Ind. 2: 99. 1824.

Roots fleshy. Stems often single, erect, 30–100 cm tall, usually simple, branching rarely or more in response to damage, usually glabrous, sometimes sparsely hirsute below. Leaves all subsessile, or lower leaves with petiole up to 2 cm; blade ovate, lanceolate, or elliptic, 3.5–7 × 1–3 cm, abaxially usually glabrous, sometimes sparsely hispidulous along veins, adaxially glabrous or sparsely hispidulous. Cymes distantly separated from each other, sometimes gaps up to 10 cm. Calyx glabrous; tube obovoid to obconic, longer than broad; lobes 5–10 mm. Corolla blue or purple; lobes equal to calyx lobes in length or slightly longer. Style much shorter than corolla. Young capsule narrowly obovoid, 7–10 × 3–5 mm. Fl. Jul.

Grassy slopes, forest margins in ravines; 1800–3000 m. S Xizang (Gyirong, Yadong, Zayü) [Bhutan, India, Myanmar, Nepal, Sri Lanka].

**3. *Asyneuma chinense*** D. Y. Hong, Fl. Reipubl. Popularis Sin. 73(2): 188. 1983.

球果牧根草 *qiu guo mu gen cao*

Roots fleshy. Stems single, erect, 20–100 cm tall, usually simple, ± hirsute. Leaves all subsessile, or lower cauline leaves with petiole up to 3.5 cm; blade ovate, lanceolate, or elliptic, 2–8 × 0.5–4 cm, both surfaces ± white hirsute, margin serrate or crenate, rarely callose-denticulate. Spikes with bract subtending

1–4 flowers; bract sometimes pubescent or rarely callose-denticulate. Calyx usually glabrous, less frequently hispidulous; tube globose or campanulate; lobes 7–10 mm, slightly longer than corolla, recurved after anthesis, rarely callose-denticulate. Corolla purple or blue. Style slightly shorter than corolla. Capsule globose, with 3 broad pores, 4–6 × 4–5 mm, base truncate or concave. Seeds brown-yellow, ovoid to oblong, slightly compressed, ca. 0.5 mm, with 1 rib. Fl. and fr. Jun–Sep (capsule mature in Apr in Guangxi).

• Grassy slopes, forest margins, forests; below 3000 m. Guangxi (Yangshuo), Guizhou, W Hubei, SW Sichuan, Yunnan.

## 15. *LOBELIA* Linnaeus, Sp. Pl. 2: 929. 1753.

半边莲属 *ban bian lian shu*

Hong Deyuan (洪德元); Thomas G. Lammers

*Cardinalis* Fabricius; *Dortmanna* Hill; *Laurentia* Adanson; *Rapuntium* Miller.

Herbs, but some species lignified at base, and even some species in Africa and Hawaiian Islands trees and shrubs. Leaves alternate, in 2 rows or spiral. Flowers solitary and axillary, or in terminal racemes, or in panicles of racemes, bisexual [some Australian species dioecious]; bracteoles present or absent. Flowers pedicellate, solitary and axillary or in terminal racemes (rarely secund or corymbose) or panicles. Calyx lobes entire or serrate, persistent, rarely auriculate. Corolla zygomorphic, rarely with a narrow nectar spur; dorsal side typically divided longitudinally to base or nearly so, sometimes laterally fenestrate; limb commonly bilabiate, dorsal lip 2-lobed, ventral lip 3-lobed, or rarely ventrally unilabiate. Stamens connate, enveloping style, exerted from corolla dorsally; all 5 anthers or just ventral pair barbate at apex (rarely all nude). Ovary inferior or semi-inferior, very rarely almost superior, 2-locular; stigma 2-fid; ovules numerous. Fruit an apically 2-valved capsule or a berry. Seeds numerous, oblong or 3-angled, sometimes winged, smooth, foveolate, striate, or verrucose.

About 414 species: mainly in tropics and subtropics, particularly tropical Africa and America, with a few species extending to temperate regions; 23 species (six endemic) in China.

Doubtful species: *Lobelia cavaleriei* H. Léveillé (Repert. Spec. Nov. Regni Veg. 9: 455. 1911). Type: Guizhou, *Cavalerie* 2989 (isotype, E). See Lammers (World Checkl. Bibliogr. Campanulaceae, Kew, 2007).

- 1a. Plants 0.02–0.5(–2) m tall; stems slender or rarely somewhat robust, herbaceous or rarely subshrubby toward base or throughout; flowers commonly entomophilous; corolla 1–20(–46) mm, commonly bilabiate or sub-bilabiate (if unilabiate then no more than 15 mm), lobes dimorphic or monomorphic; seed coat striate or reticulate.
- 2a. Plants low, stems commonly prostrate and seldom over 40 cm tall; corolla various shades of blue, purple, pink, or white, sub-bilabiate or unilabiate, lobes monomorphic; anther tube with a single elongate bristle or awn at apex of each ventral anther (sometimes also bearded with tufts of shorter filiform hairs, very rarely nude); seed coat commonly reticulate (1. *L. sect. Hypsela*).
- 3a. Leaves ovate or broadly ovate, commonly petiolate; corolla sub-bilabiate; fruit a berry ..... 1. *L. nummularia*
- 3b. Leaves elliptic-lanceolate to linear; corolla unilabiate; fruit a capsule ..... 2. *L. chinensis*
- 2b. Plants taller, stems erect, ascending, or decumbent, commonly over 40 cm (sometimes as much as 2 m) tall; corolla distinctly bilabiate, lobes dimorphic, dorsal pair much smaller and narrower than ventral 3 (that commonly form a trifold lip); anther tube bearded with tufts of filiform hairs at apex of at least ventral pair (rarely all nude); seed coat striate.
- 4a. Pedicels typically bibracteolate at base; corolla tube commonly fenestrate laterally; seeds terete or irregularly angular (2. *L. sect. Stenotium*).
- 5a. Stems winged; leaves adaxially sparsely puberulent; corolla small, only 3–5 mm ..... 3. *L. heyneana*
- 5b. Stems terete or angular, not winged; leaves glabrous or villous; corolla larger or also small ..... 4. *L. hainanensis*
- 4b. Pedicels typically bibracteolate at or below middle; corolla tube almost always entire laterally; seeds trigonous or compressed (3. *L. sect. Delostemon*).
- 6a. Stems prostrate, rooted at nodes; leaves 1–4 × 0.8–3 cm; petiole 3–12 mm ..... 5. *L. zeylanica*
- 6b. Stems erect, not rooted or rooted only at basal nodes; leaves smaller, subsessile.
- 7a. Stems and leaves glabrous; bracteoles linear-lanceolate ..... 6. *L. alsinoides*
- 7b. Stems and leaves villous; bracteoles absent or minute ..... 7. *L. terminalis*
- 1b. Plants (0.2–)1–9 m tall; stems robust and sometimes pachycaul, herbaceous, subshrubby, or woody; flowers often ornithophilous; corolla unilabiate or sub-bilabiate, rarely bilabiate, (12–)20–60(–103) mm, lobes monomorphic; seed coat reticulate or striate-reticulate, less often striate.

- 8a. Flowers solitary in upper leaf axils (rarely supplemented by a terminal raceme); corolla tube straight or nearly so; fruit a berry; seeds cuboidal or quadrate, subterete to slightly compressed (5. *L.* sect. *Speirema*).
- 9a. Plants rhizomatous; corolla 12–18 mm, tube 3–6 mm; filament tube 6.5–8 mm; anther tube cream-colored, dorsal anthers 6–8 mm, slightly shorter to slightly longer than filament tube ..... 23. *L. deleiensis*
- 9b. Plants lacking rhizomes; corolla (15–)18–26 mm, tube 6–13 mm; filament tube 8.5–12 mm; anther tube gray, dorsal anthers 4.8–7 mm, 2/5–3/4 as long as filament tube.
- 10a. Stems sparsely to densely puberulent toward apex; leaves sessile; uppermost 10–25 flowers often subtended by bracts only 1/10–1/4 as long as foliage leaves, thus forming a terminal raceme; pedicels densely puberulent; hypanthium pubescent along veins; calyx lobes narrowly triangular or triangular, 1.5–1.9 mm wide, erect; corolla greenish with purple spots on lip; anther tube 1.4–1.8 mm in diam., glabrous; trichomes at apex of ventral anthers 0.5–1 mm ..... 21. *L. fangiana*
- 10b. Stems glabrous (rarely sparsely scabrous); leaves petiolate; all flowers subtended by unreduced foliage leaves; pedicels glabrous; hypanthium glabrous; calyx lobes linear or linear-triangular, 0.5–1.4 mm wide, ascending, spreading, or recurved; corolla dark violet or purple to bluish lilac, lip often paler, or striped or blotched with white; anther tube 2–2.8 mm in diam., dorsal surface sparsely shortly pubescent at least toward apex; trichomes at apex of ventral anthers 1.2–2 mm ..... 22. *L. montana*
- 8b. Flowers in terminal racemes or panicles; corolla tube curved or arcuate; fruit a capsule; seeds ovoid, lenticular (4. *L.* sect. *Rhynchoptalum*).
- 11a. Leaves truncate, rounded, or obtuse at base; pedicels ebracteolate; calyx lobe margins revolute ..... 20. *L. sessilifolia*
- 11b. Leaves cuneate or attenuate at base; pedicels commonly bibracteolate; calyx lobe margins flat.
- 12a. Stems densely pubescent.
- 13a. Stems tomentose; leaves hispidulous; pedicels 5–12 mm, densely pannose; hypanthium densely pannose; corolla white or faintly tinged with blue or pink ..... 13. *L. clavata*
- 13b. Stems hispidulous or scaberulose; leaves glabrous adaxially and sometimes abaxially; pedicels 3–5 mm, hispidulous; hypanthium scaberulose; corolla purple-red or red-purple.
- 14a. Capsule 6–10 × 6–8 mm; raceme 10–25 cm, densely flowered ..... 19. *L. erectiuscula*
- 14b. Capsule 4–6 × 4–5 mm; raceme 20–50 cm, laxly flowered ..... 18. *L. davidii*
- 12b. Stems glabrous or sparsely pubescent.
- 15a. Corolla 11–20 mm.
- 16a. Leaves rounded and mucronate at apex; corolla glabrous ..... 16. *L. colorata*
- 16b. Leaves acuminate (sometimes acute or obtuse) at apex; corolla pubescent at least internally.
- 17a. Leaves 12–31 cm, attenuate at base; corolla white, sometimes suffused with pale blue or pink; anther tube densely white hirsute in sutures; flowering Jan–May ..... 10. *L. pyramidalis*
- 17b. Leaves 6–12(–15) cm, cuneate at base; corolla purple-red, reddish, or blue-purple; anther tube sparingly pubescent on back; flowering Aug–Oct.
- 18a. Stems and leaves glabrous; pedicels 3–5 mm; calyx lobes 13–21 × < 1 mm, entire ..... 8. *L. melliana*
- 18b. Stems sparsely pubescent; leaves densely white hirsute; pedicels 5–13 mm; calyx lobes 6–14 × 1–1.5 mm, denticulate ..... 9. *L. pleotricha*
- 15b. Corolla 20–35 mm.
- 19a. Bracteoles leaflike, denticulate, 6–12 × 1–2 mm, at summit of pedicel ..... 15. *L. foliiformis*
- 19b. Bracteoles subulate, entire, 1–2 × ca. 0.2 mm, near middle of pedicel.
- 20a. Leaves 3.5–7 cm, obtuse or acute at apex ..... 17. *L. taliensis*
- 20b. Leaves (6–)10–35 cm, acuminate at apex.
- 21a. Raceme lax; hypanthium hemispheric ..... 14. *L. iteophylla*
- 21b. Raceme dense; hypanthium campanulate, oblong, or obconic.
- 22a. Leaves glabrous abaxially; hypanthium glabrous; calyx lobes entire ..... 11. *L. seguinii*
- 22b. Leaves sparsely hispidulous abaxially; hypanthium scaberulose; calyx lobes denticulate ..... 12. *L. doniana*

### 1. *Lobelia* sect. *Hypsela* (C. Presl) Lammers, comb. nov.

半边莲组 ban bian lian zu

Basionym: *Hypsela* C. Presl, Prodr. Monogr. Lobel. 45. 1836; *Pratia* Gaudichaud-Beaupré.

Plants perennial or less often annual, 2–40 cm tall; a few species dioecious. Stems commonly prostrate, radicant, or caespitose, rarely decumbent or ascending, slender, herbaceous. Leaves commonly small, petiolate or rarely sessile; blade typically not much longer than wide, variously rounded at apex and base, margin coarsely toothed or shallowly lobed. Flowers typically solitary in axils of upper leaves. Corolla sub-bilabiate (unilabiate in *Lobelia chinensis*), blue, purple, magenta, pink, or white, 2–12(–15) mm; lobes typically monomorphic. Anthers with a single long bristle on apex of each ventral anther, often also bearded with tufts of shorter filiform hairs, very rarely all nude. Fruit a capsule or fleshy berry. Seeds ovoid to oblong, terete (rarely slightly compressed); testa reticulate.

Forty-three species: amphi-Pacific, largely in the S Hemisphere; two species in China.

**1. *Lobelia nummularia*** Lamarck, *Encycl.* 3: 589. 1792.铜锤玉带草 *tong chui yu dai cao*

*Lobelia begoniifolia* Wallich; *L. horsfieldiana* Miquel; *L. javanica* Thunberg; *L. obliqua* Buchanan-Hamilton ex D. Don; *Pratia begoniifolia* (Wallich) Lindley; *P. nummularia* (Lamarck) A. Brown & Ascherson; *P. wollastonii* S. Moore.

Herbs, perennial. Stems prostrate, 12–55 cm, villous, rarely glabrous, simple or branched at base, nodes rooted. Leaves alternate, petiolate; petiole 2–14 mm, puberulent; blade orbicular, reniform, or ovate, 0.7–2.6 × 0.5–2.7 cm, both surfaces glabrous or puberulent, base obliquely cordate or rarely truncate, margin serrate or crenulate, apex acute, obtuse, or rounded. Flowers solitary and axillary; pedicels 0.7–3.5 cm, glabrous. Hypanthium narrowly ellipsoid or urceolate, 2–4 × 2–3 mm, glabrous or villous; calyx lobes linear-triangular, 2.5–6 mm, margin with 2 or 3 pairs of denticles. Corolla purple-red, pale purple, pink, green, or yellow-white, 6–10 mm; tube glabrous or rarely ciliate outside, villous inside; limb 2-lipped; upper 2 lobes linear-triangular; lower 3 lobes lanceolate. Stamens connate above middle; filament tube glabrous; anther tube 1–1.5 mm, back villous; lower 2 anthers barbate at apex. Fruit a berry, purple-red, ellipsoid or globose, 0.7–1.5 cm. Seeds sub-orbicular, slightly compressed, reticulate. Fl. and fr. all year round.

By fields, roadsides, wet places on hills, grassy slopes, open woods; lower elevations. Hubei, Hunan, Guangxi, Taiwan, Xizang [Bangladesh, Bhutan, India, Indonesia, Laos, Malaysia, Myanmar, Nepal, New Guinea, Philippines, Sri Lanka, Thailand, Vietnam].

**2. *Lobelia* sect. *Stenotium*** (C. Presl) Lammers, **comb. nov.**卵叶半边莲组 *luan ye ban bian lian zu*

Basionym: *Rapuntium* sect. *Stenotium* C. Presl, *Prodr. Monogr. Lobel.* 11. 1836.

Plants annual or perennial, 2–50(–90) cm tall. Stems slender, herbaceous or subshrubby, prostrate, decumbent, ascending, or erect, sometimes rhizomatous or stoloniferous, terete to sharply 3- or 4-angled or -winged. Leaves sessile or petiolate. Flowers solitary in axils of upper leaves or these reduced in size, creating a terminal sometimes secund raceme (rarely spiciform or corymbose); pedicels often ebracteolate. Corolla bilabiate, various shades of blue, purple, pink, or white, 3–20(–24) mm; lobes strongly dimorphic, spreading, sometimes with a pair of gibbosities on ventral lip at mouth of tube. Anthers bearded with tufts of filiform hairs at apex of ventral pair. Fruit a capsule or rarely baccate. Seeds ovoid to oblong, terete or somewhat compressed; testa striate.

About 145 species: throughout most of the range of the genus; two species (one endemic) in China.

**3. *Lobelia heyneana*** Schultes, *Syst. Veg.* 5: 50. 1819.翅茎半边莲 *chi jing ban bian lian*

*Lobelia trialata* Buchanan-Hamilton ex D. Don; *L. tri-alata* var. *asiatica* Chiovenda.

Herbs, annual, 10–50(–60) cm tall. Stems erect, 3-angular, winged, glabrous, branched. Leaves alternate; petiole 1–4 mm, winged; blade broadly deltoid-ovate, 0.8–2.5 × 0.4–2.5 cm, upper ones smaller and more narrow, abaxially glabrous, adaxially sparsely puberulent, base truncate or shallowly cordate, often decurrent, apex rounded or acute. Flowers solitary, axillary at leaflike bracts, often forming a raceme; bracts narrowly elliptic, shorter than pedicels; pedicels 1–1.5(–2) cm, slender,

**2. *Lobelia chinensis*** Loureiro, *Fl. Cochinch.* 2: 514. 1790.半边莲 *ban bian lian*

*Lobelia caespitosa* Blume; *L. campanuloides* Thunberg; *L. chinensis* var. *albiflora* (F. E. Wimmer) F. E. Wimmer; *L. radicans* Thunberg; *L. radicans* var. *albiflora* F. E. Wimmer; *Pratia thunbergii* G. Don.

Herbs, perennial. Stems decumbent, slender, 6–30 cm tall, glabrous, lower nodes rooted. Leaves alternate, sessile or petiole to 1 mm; blade narrowly elliptic, elliptic, or lanceolate, 7–26 × 1.5–7 mm, glabrous, base rounded, obtuse, or broadly cuneate, margin entire or obviously serrate at upper part, apex acute or acuminate. Flowers usually solitary, axillary at upper leaves of branches; pedicels slender, 1.2–2.5(–3.5) cm; bracteoles 2 at base, ca. 1 mm, glabrous, or absent. Hypanthium narrowly obconical, base attenuate, not well distinguished from pedicel, 3–5 mm, glabrous; calyx lobes lanceolate, ± as long as tube, margin entire or with a pair of denticles. Corolla rose, white, or bluish, 10–15 mm, divided to base at back, white villous below throat; lobes all spreading in a plane on anterior side; lateral 2 lobes lanceolate or oblanceolate, longer than others, central 3 elliptic. Filament tube 6–8 mm, connate above middle, glabrous; anther tube 2–2.5 mm, back glabrous or sparsely villous. Capsule obconic, 6–7 mm. Seeds broadly elliptic, compressed, pitted. Fl. and fr. May–Oct.

By paddy fields, streams, among wet grasses. Anhui, Fujian, Guangdong, Guangxi, Guizhou, Hainan, Hubei, Hunan, Jiangsu, Jiangxi, Sichuan, Taiwan, Yunnan, Zhejiang [Bangladesh, Cambodia, India, Japan (including Ryukyu Islands), Korea, Laos, Malaysia, Nepal, Sri Lanka, Thailand, Vietnam].

with 2 bracteoles at base; bracteoles subulate, less than 1 mm, often caducous. Hypanthium campanulate, 1–2 mm, glabrous; calyx lobes longer than hypanthium at anthesis, but shorter than tube after anthesis, subulate, 2–3 mm, entire. Corolla pale purple, 3–5 mm, inside sparsely puberulent; limb 2-lipped, upper lobes erect, linear, less than 1 mm; lower lobes spreading, elliptic to suborbicular, ca. 2 mm. Stamens connate into tube above middle of filaments; anther tube ca. 1 mm, lower 2 anthers barbate at top. Capsule oblong or obovoid-oblong, 4–5 × 2–4 mm. Seeds pale red-brown, ellipsoid, slightly compressed, smooth. Fl. and fr. Jan–Dec.

Moist places; 500–2700 m. Taiwan, Yunnan [Bhutan, India, Indonesia, Laos, Myanmar, Nepal, New Guinea, Philippines, Sri Lanka, Thailand, Vietnam; Africa].

**4. *Lobelia hainanensis*** F. E. Wimmer, Ann. Naturhist. Mus. Wien 56: 348. 1948.

海南半边莲 hai nan ban bian lian

Stems 4-angular, ascending or erect, up to 20 cm tall, glabrous. Leaves alternate, denser at upper part of stems, subsessile; blade oblong or elliptic, ca.  $15 \times 7$  mm, glabrous, base cuneate, margin cartilaginous-crenulate, apex obtuse. Flowers solitary, axillary at leaves; pedicels ca. 12 mm, glabrous,  $\pm$  as long as leaves. Hypanthium broadly top-shaped, ca.  $2 \times 2$  mm;

calyx lobes sublinear, ca. 3 mm, glabrous, margin entire, apex acute. Corolla 2-lipped, blue, ca. 1 cm, glabrous; upper lobes spatulate, shorter than lower ones; lower lobes obovate, ca.  $4 \times 2$  mm, base with a pale black spot, apex rounded, mucronate. Filament tube ca. 5 mm, glabrous; anther tube gray-brown and black striate, ca. 2 mm, back puberulent at apex; lower 2 anthers barbate at top.

• Hainan.

No specimens have been examined by us, but based on the original description, we judge it to be distinct from its allies.

**3. *Lobelia* sect. *Delostemon*** (F. E. Wimmer) Murata, J. Fac. Sci. Univ. Tokyo, Sect. 3, Bot. 15: 356. 1995.

翅茎半边莲组 chi jing ban bian lian zu

*Lobelia* subsect. *Delostemon* F. E. Wimmer, Ann. Naturhist. Mus. Wien 56: 359. 1948.

Plants perennial or annual, 6–60 cm tall. Stems slender, herbaceous or sometimes subshrubby, prostrate, decumbent, ascending, or erect, simple to branched, sometimes stoloniferous, caespitose, or radicant. Leaves sessile or petiolate. Flowers solitary in axils of upper leaves or these much reduced, creating a terminal sometimes secund raceme; pedicels bibracteolate at or below middle. Corolla bilabiate, typically some shade of blue or purple, less often pink or white, 5–20(–32) mm; lobes strongly dimorphic, spreading. Anthers bearded with tufts of filiform hairs at apex on all 5 (those on ventral pair sometimes longer). Fruit a capsule. Seeds ovoid to oblong, trigonous or lenticular; testa striate.

Forty-four species: S Hemisphere, north to Senegal, Ethiopia, India, Japan, Colombia, and Hispaniola; three species in China.

**5. *Lobelia zeylanica*** Linnaeus, Sp. Pl. 2: 932. 1753.

*Lobelia affinis* Wallich ex G. Don (1834), not Mirbel (1805); *L. affinis* var. *lobbiana* (J. D. Hooker & Thomson) C. B. Clarke; *L. barbata* Warburg (1891), not Cavanilles (1800); *L. hirta* Linnaeus; *L. lobbiana* J. D. Hooker & Thomson; *L. subcuneata* Miquel; *L. succulenta* Blume; *L. succulenta* var. *lobbiana* (J. D. Hooker & Thomson) F. E. Wimmer; *L. zeylanica* var. *hirta* (Linnaeus) Martyn; *L. zeylanica* var. *lobbiana* (J. D. Hooker & Thomson) Y. S. Lian.

Herbs, succulent. Stems prostrate, 4-angular, 20–60 cm, glabrous or puberulent, laxly branched, lower nodes rooted. Leaves spirally alternate; petiole 3–12 mm, puberulent; blade broadly deltoid-ovate or ovate,  $1.5\text{--}4 \times 0.8\text{--}3$  cm, abaxially sparsely scaberrulose along veins, adaxially glabrescent, base truncate, shallowly cordate, or broadly cuneate, margin serrulate, apex acute or obtuse. Flowers solitary and axillary; pedicels 0.5–2.8 cm, sparsely puberulent, bracteoles 2 at base, 1–2 mm, sometimes caducous. Calyx campanulate, 2–5 mm, puberulent; lobes linear, narrowly triangular, or narrowly oblong,  $3\text{--}7 \times 0.5\text{--}1$  mm, ciliate. Corolla 2-lipped, purple, pale purple, or white, 5–15 mm, posterior side divided to base, lobes of upper lip obovate-oblong, those of lower lip broadly elliptic, abaxially sparsely villous along middle ribs. Filaments connate into a tube at 2/3; anther tube 1–1.8 mm, abaxially puberulent, anthers all barbate at top. Ovary inferior. Capsule broadly ellipsoid, obovoid, or oblong,  $4\text{--}7 \times 2\text{--}4$  mm, obviously veined. Seeds 3-angular, red-brown. Fl. and fr. whole year round.

By water and streams in ravines; below 1500(–2000) m. Fujian, Guangdong, Guangxi, Hainan, Taiwan, Yunnan [Bangladesh, Bhutan, India, Indonesia, Laos, Malaysia, Myanmar, Nepal, New Guinea, Philippines, Sri Lanka, Thailand, Vietnam].

**6. *Lobelia alsinoides*** Lamarck, Dict. Bot. 3: 588. 1791.

短柄半边莲 duan bing ban bian lian

Herbs, annual, 10–30 cm tall. Stems succulent, decumbent to ascending, laxly branched, glabrous, angular. Leaves alternate, sparse; petiole 1–3 mm, glabrous; blade suborbicular, broadly ovate, elliptic, or lanceolate,  $7\text{--}14 \times 4\text{--}6$  mm, both surfaces scabrous but glabrous, base cuneate or broadly cuneate, margin crenate or crenulate, apex rounded, obtuse, acute, or acuminate. Flowers axillary at leaflike bracts forming a lax raceme; pedicels (1–)2–2.7 cm, slender, glabrous; base with 2 lanceolate bracteoles ca. 3 mm. Hypanthium funnellform-campanulate, 2–3 mm, glabrous; calyx lobes linear or subulate, slightly longer than tube at anthesis, but shorter than tube in fruit, glabrous, entire. Corolla 2-lipped, pale blue or white, 4–8 mm; upper lobes erect, oblong-oblancheolate; lower lobes spreading, oblong-elliptic. Stamens connate above middle of filaments; filament tube glabrous; anther tube 1–1.5 mm, back glabrous, anthers all barbate at top. Capsule oblong or ovoid,  $4\text{--}5 \times 3\text{--}4$  mm. Seeds numerous, 3-angular, dark brown. Fl. and fr. Jan–Dec.

Paddy fields, by water or among wet grasses in forests, wet places; below 800 m. Guangdong, Guangxi, Hainan, Taiwan, Xizang, Yunnan [Bangladesh, India, Japan (including Ryukyu Islands), Laos, Malaysia, Myanmar, Nepal, New Guinea, Sri Lanka, Thailand, Vietnam].

Two subspecies are recognized.

- 1a. Leaves suborbicular,  $\pm$  as long as broad, margin serrate ..... 6a. subsp. *alsinoides*
- 1b. Leaves ovate to ovate-lanceolate, longer than broad, margin less prominently toothed ..... 6b. subsp. *hancei*

山梗菜组 shan geng cai zu

*Rhynchopetalum* Fresenius, Flora 21: 603. 1838.

Plants perennial or pliestesial, shrubs, treelets, or trees, 0.5–9 m tall. Stems robust, typically pachycaul, herbaceous, subshrubby, or woody, prostrate, decumbent, ascending, or erect, simple, often apically rosulate. Leaves sessile (very rarely petiolate). Flowers in a terminal raceme or panicle. Corolla sub-bilabiate or unilabiate, various shades of blue, purple, red, yellow, green, or white, (12–) 22–50 mm; tube curved or arcuate; lobes spreading or deflexed, as long as tube or longer. Anthers bearded with tufts of filiform hairs at apex of ventral pair or all anthers nude at apex. Fruit a capsule. Seeds ovoid, lenticular, commonly winged; testa striate-reticulate.

Sixty-one species: tropical Africa, SE Asia, South America (SE Brazil); 13 species (four endemic) in China.

**8. *Lobelia melliana* F. E. Wimmer, Anz. Akad. Wiss. Wien, Math.-Naturwiss. Kl. 61: 111. 1924.**

Herbs, perennial, 80–150 cm tall. Stems glabrous, simple or branched. Leaves alternate, subsessile or shortly petiolate,  $\pm$  falcate-ovate to falcate-lanceolate, 6–15  $\times$  1.5–4 cm, thinly papery, glabrous, base broadly cuneate, margin ciliate-denticulate, apex caudate-acuminate. Racemes terminal, 15–40 cm, lax, lower bracts conformable with leaves, upper ones narrowed to linear, longer than flowers, margin ciliate-denticulate; pedicels compressed, 3–5 mm, with 2 subulate bracteoles at middle. Hypanthium semiellipsoid, 3–4 mm, glabrous; calyx lobes filiform, 13–21  $\times$  less than 1 mm, margin entire, spreading at fruiting. Corolla reddish, 12–17 mm; limb 2-lipped; upper lobes ascending, linear-lanceolate, as long as tube, inside villous; lower ones lanceolate-elliptic, ca. 2/3 as long as tube, inside densely villous, spreading. Stamens densely villous at base, connate into tube above base; filament tube glabrous; anther tube ca. 4 mm, back sparsely villous, only lower anthers barbate at top. Capsule erect, subglobose, 5–6 mm wide, glabrous. Seeds

顶花半边莲 ding hua ban bian lian

*Lobelia thorelii* F. E. Wimmer.Herbs, annual, slender. Stems ascending or erect, 10–20(–40) cm tall, branched, angular but wingless, puberulent. Leaves spirally and laxly arranged; petiole 1–3 mm, hairy; blade suborbicular to elliptic, 6–10(–15)  $\times$  6–10 mm, both surfaces puberulent, base truncate, subcordate, or rounded, margin subentire for lower several, but obviously serrate for rest, apex rounded. Flowers solitary, axillary at upper leaflike bracts, forming a lax raceme or corymb; bracts ovate-lanceolate, margin serrate, hairy; pedicels slender, 1.5–4 cm, sparsely puberulent; bracteoles 2, persistent or caducous. Hypanthium obovoid or semiglobose, ca. 2 mm, puberulent; calyx lobes linear-subulate, 2–3  $\times$  ca. 0.5 mm, entire. Corolla 2-lipped, pale purple, 4–5(–8) mm; tube 2-divided to base at back, glabrous; upper lobes erect, oblong-linear, lower lobes oblong, slightly shorter than upper ones. Stamens connate into a tube above middle of filaments; filament tube glabrous; anther tube ca. 1 mm, back sparsely villous, apex shortly barbate. Capsule obovoid, 4–5  $\times$  ca. 3 mm, sparsely puberulent. Seeds numerous, brown-yellow, 3-angular. Fl. Nov.

Wet places in forests; 200–900 m. S Yunnan [India, Laos, Thailand, Vietnam].

oblong, slightly compressed, ca. 0.6 mm, foveolate. Fl. and fr. Aug–Oct.

*Lobelia pyramidalis* var. *wallichiana* (C. Presl) Steudel; *L. wallichiana* (C. Presl) J. D. Hooker & Thomson; *Rapuntium wallichianum* C. Presl.

Herbs, shrubby, 0.4–3 m tall. Stems glabrous. Leaves alternate, subleathery, sessile or shortly petiolate; basal leaves spatulate; lower ones oblong, up to 25 cm; middle and upper ones narrowly elliptic or narrowly oblong, 12–31 × 1–4 cm, both surfaces glabrous, base attenuate, margin serrulate, apex acuminate. Racemes terminal, paniculate; flowers dense, oriented toward one side. Pedicels 0.6–2.4 cm, arched, bibracteolate or sometimes ebracteolate; bracts linear, often shorter than flowers, entire. Hypanthium campanulate or broadly ellipsoid (rarely obconic), length slightly greater than width, 2–4 × 2–4 mm, glabrous; calyx lobes subulate or linear-triangular, 8–16 × 1–1.8 mm, margin entire. Corolla white, rose, or bluish, 1.1–2.1 cm, outside glabrous, inside tube densely villous, nearly 2-lipped; lobes of upper lip linear, ca. 2/3 as long as total length of corolla; those of lower lip elliptic or lanceolate, ca. 1/3 as long as total length of corolla. Stamens connate into tube above base; filament tube glabrous; anther tube ca. 5 mm, densely villous along sutures, lower 2 anthers barbate at top. Capsule subglobose, oblate, or broadly ovoid, 3.5–6.5 mm in diam., glabrous, often pendulous. Seeds elliptic, obviously compressed, margin pale in color. Fl. Jan–May.

Grassy slopes, scrub, roadsides; 1200–2500 m. W Guangxi, SW Guizhou, Xizang (?Lhasa), Yunnan [Bhutan, N India, N Myanmar, Nepal, N Thailand].

*Lobelia seguinii* f. *brevisepala* F. E. Wimmer; *L. seguinii* f. *longisepala* F. E. Wimmer.

Herbs, subshrubby, 0.9–2.5(–5) m tall. Stems much branched, glabrous. Leaves alternate, thickly papery, lower leaves long petiolate, blade narrowly oblong, up to 25 cm; middle and upper ones sessile or shortly petiolate, lanceolate or elliptic (rarely oblanceolate), 6–35 × 0.6–6 cm, both surfaces glabrous, base attenuate or cuneate, margin serrulate, apex acuminate. Racemes terminal, paniculate, densely flowered; flow-

ers oriented to one side; lower bracts linear-lanceolate, longer than flowers, margin denticulate; upper ones lanceolate or linear, shorter than flowers, entire or serrulate; pedicels 3–16 mm, slightly compressed, curved backward, with 2 linear bracteoles. Hypanthium campanulate, oblong, or obconic, 3–8 mm, glabrous; calyx lobes subulate, linear, or linear-triangular, (8–)16–20(–27) × 0.9–2.5 mm, glabrous, entire (rarely with 1 or 2 teeth per side). Corolla purple-red, purple-blue, pale blue, or pinkish, 2–3(–3.5) cm, inside densely villous below throat; upper lobes ascending or spreading, linear, 0.8–1.3 mm wide, ca. 2/3 as long as total length of corolla; lower ones spreading, lanceolate, ca. 1/2 as long as total length of corolla. Stamens connate into tube; filament tube nearly as long as corolla tube, glabrous except at base; anther tube 4.5–7 mm, glabrous or base with several tufts of short hairs, lower 2 anthers barbate at top. Capsule pendent, oblong or ellipsoid, 10–16 × 5–9 mm, glabrous. Seeds ellipsoid, finely striate. Fl. and fr. Aug–Oct.

Grassy slopes, forest margins, roadsides; 500–3000 m. Chongqing (Fengjie, Wushan, Wuxi), W Guangxi, Guizhou (Anlong, Ceheng), Hubei (Badong, Zigui), SW Sichuan, Taiwan, Yunnan [N Thailand, N Vietnam].

**12. *Lobelia doniana* Skottsberg, Acta Horti Gothob. 4: 19. 1928.**

微齿山梗菜 wei chi shan geng cai

*Lobelia seguinii* H. Léveillé & Vaniot var. *doniana* (Skottsberg) F. E. Wimmer.

Herbs, perennial, 0.3–2.4 m tall. Stems erect, up to 1.5 cm in diam., branched above, glabrous or variously shortly pubescent above. Cauline leaves alternate, at least lower ones petiolate; petiole cuneate-winged, up to 3 cm; blade elliptic to linear-elliptic, 6–33 × 1–6 cm, abaxially sparsely hispidulous, adaxially glabrous or sparsely minutely pubescent, base cuneate, margin serrulate, apex acuminate. Racemes terminal, paniculate; lower bracts leaflike, gradually smaller up stems; pedicels 3–15 mm, usually bibracteolate, densely hispidulous. Hypanthium campanulate, oblong, or obconic, scaberrulose; calyx lobes linear or linear-triangular, 7–22 mm, with (1–)4–7 teeth on each side. Corolla bilabiate, purple, purple-red, rose-purple, or blue-purple, 20–31 mm, outside scaberrulose below, inside villous; upper 2 lobes linear, slightly longer than lower 3. Filaments connate above base, filament tube glabrous or sparsely shortly pubescent; anther tube glabrous or white hirsute only at base; lower 2 anthers barbate at top. Capsule oblong or ellipsoid, 8–16 × 4–9 mm. Seeds ellipsoid, finely striate. Fl. and fr. Sep–Nov.

Grassy slopes, forest margins, glades; (800–)1400–3200 m. Xizang (Nyalam), Yunnan [Bhutan, N India, N Myanmar, Nepal].

This species is very similar to *Lobelia seguinii*, differing primarily in its increased pubescence and toothed calyx lobes.

**13. *Lobelia clavata* F. E. Wimmer, Repert. Spec. Nov. Regni Veg. 38: 78. 1935.**

密毛山梗菜 mi mao shan geng cai

Herbs, subshrubby, 0.5–3.7 m. Stems terete, fistulose, tomentose. Cauline leaves alternate, sessile; blade oblanceolate or oblong (uppermost often narrowly elliptic or lanceolate), 7–33

× 2.2–8.4 cm, thickly papery, both surfaces hispidulous, base cuneate or attenuate into a petioloid base, margin serrulate or crenulate, apex acuminate, acute, or obtuse. Racemes densely paniculate; flowers oriented toward one side, erect; bracts lanceolate, narrowly elliptic, narrowly oblong, or linear, 10–30 mm, shortly pannose; pedicels 5–12 mm, terete, pannose, twisted toward posterior side, usually bibracteolate near base (rarely at middle). Hypanthium campanulate or hemispherical, 3–6.5 × 3–6 mm, densely pannose, base rounded or truncate (rarely obtuse); calyx lobes linear-triangular, 7–16 × 0.7–2.5 mm, margin entire or with 1–4 denticles per side. Corolla sub-bilabiate, white (rarely tinged pale pink or pale blue), 2–3.4 cm, outside shortly pannose, inside villous; upper lobes linear, ca. 2/3 as long as total length of corolla; lower lobes wider, ca. 1/3 as long as total length of corolla. Stamens connate into tube above base; filament tube densely puberulent; anther tube 5–7.5 mm, densely villous along sutures; lower 2 anthers barbate at top. Capsule pendulous, subovoid or broadly ellipsoid, 6–13 × 5–9 mm, densely puberulent. Seeds elliptic, compressed, finely striate, margin pale in color. Fl. and fr. Nov–Apr.

Grassy slopes, forests, roadsides; 700–1800 m. SW Guizhou (Anlong), S Yunnan [NE India, Laos, N Myanmar, N Thailand, Vietnam].

This species is closely related to *Lobelia rosea* Wallich of the E Himalaya, which differs in its narrowly elliptic leaves only 2–3.5 cm wide; typically ebracteolate pedicels; pink, pale rose, or mauve corolla; and shorter staminal column (filament tube 10–15 mm, anther tube 3–5 mm).

**14. *Lobelia iteophylla*** C. Y. Wu, Rep. Yunnan Trop. Subtrop. Fl. Res. Rep. 1: 93. 1965.

柳叶山梗菜 liu ye shan geng cai

Herbs, perennial, up to 85 cm tall. Stems erect, often purplish, terete, simple, glabrous, lower part often leafless. Cauline leaves alternate, sessile; blade linear-lanceolate, 6.5–11 × 1.3–1.6 cm, both surfaces glabrous, base cuneate, margin glandular-serrate, apex acuminate. Racemes lax; flowers almost oriented toward one side; bracts conformable to leaves, 2.5–5.5 × 0.5–1 cm, longer than flowers; pedicels 5–10 mm, straight, puberulent; bracteoles 2, subulate. Hypanthium semiglobose, 2.5–4 mm, glabrous or sparsely puberulent; calyx lobes linear-lanceolate, 11–15 × 1.5–2 mm, glabrous, margin glandular-denticulate. Corolla nearly 2-lipped, purple-blue, 17–25 mm, glabrous; upper 2 lobes ascending, ca. 13 mm; lower lobes spreading, narrowly oblong, ca. 8 mm, acute. Stamens connate into tube; filament tube ca. 12 mm, glabrous; anther tube gray-blue, 5–6 mm, back sparsely setulose; lower 2 anthers barbate at top. Fl. and fr. Sep–Oct.

• Forests, forest margins and grassy slopes by streams; 800–2500 m. Yunnan.

**15. *Lobelia foliiformis*** T. J. Zhang & D. Y. Hong, Acta Phytotax. Sin. 30: 155. 1992.

苞叶山梗菜 bao ye shan geng cai

Subshrubs, 1–2 m tall, branched, glabrous. Cauline leaves sessile or shortly petiolate; blade oblong to broadly lanceolate, up to 25 × 3.5 cm, papery, abaxially often puberulent, adaxially

glabrous or sparsely puberulent, base cuneate, margin glandular-serrate, apex acuminate. Racemes terminal, densely flowered, 5–20 cm, often pendulous; bracts linear-lanceolate, usually entire; pedicels ca. 5 mm, with 2 bracteoles at top; bracteoles leaflike, 6–12 × ca. 1 mm, margin glandular-denticulate. Hypanthium obconic, ca. 6 × 4 mm, glabrous to puberulent; calyx lobes erect or spreading, linear, 12–16 mm, usually denticulate. Corolla blue-purple or purple-red, 20–30 cm, puberulent; upper 2 lobes ca. 17 mm; lower 3 lobes ovate-lanceolate, ca. 8 mm. Filaments 12–15 mm, puberulent below; anther tube gray-blue, ca. 5 mm, back densely setulose; lower 2 anthers sparsely barbate at top. Capsule oblong, ca. 12 × 8–10 mm. Seeds dark brown, ellipsoid. Fl. and fr. Aug.

• Sunny slopes; 2300–3000 m. Yunnan (Dali).

**16. *Lobelia colorata*** Wallich, Pl. Asiat. Rar. 2: 42. 1831.

狭叶山梗菜 xia ye shan geng cai

*Lobelia colorata* var. *baculus* F. E. Wimmer; *L. colorata* var. *dsolinhoensis* F. E. Wimmer; *L. colorata* subsp. *guizhouensis* T. J. Zhang & D. Y. Hong; *L. palustris* Kerr.

Herbs, perennial, 30–100 cm tall. Stems erect, terete, simple, glabrous or puberulent near axils. Cauline leaves alternate, subsessile or winged-petiolate; blade obovate-oblong to linear-lanceolate, 3.5–11 × 0.5–3 cm, glabrous, base cuneate, apex rounded but mucronate. Racemes terminal, 15–30 cm, lax; flowers oriented toward one side; bracts lanceolate to linear, shorter or longer than flowers; pedicels 4–7 mm, glabrous or sparsely setulose, with 2 bracteoles at or below middle. Hypanthium semiellipsoid, 2–4 mm, glabrous or puberulent; calyx lobes linear, 5–12 × ca. 1 mm, margin with 2–4 pairs of glandular denticles. Corolla nearly 2-lipped, purple-blue or blue, rarely white, 12–20 mm, glabrous; upper 2 lobes linear, 11–15 mm; lower ones ovate-oblong, 4–8 mm. Filament tube glabrous, 7–11 mm; anther tube 5–6 mm, glabrous or sparsely villous; lower 2 anthers barbate at top. Capsule ovoid-globose, ca. 6 × 4–6 mm. Seeds ellipsoid, slightly compressed. Fl. and fr. Sep–Oct.

Thickets in ravines, moist meadows; 1000–3000 m. Guizhou, Yunnan [NE India, N Thailand].

"*Lobelia purpurascens*" (Wallich, Numer. List, no. 1307. 1829) belongs here but is a nomen nudum and was therefore not validly published (*Vienna Code*, Art. 32.1(d)).

**17. *Lobelia taliensis*** Diels, Notes Roy. Bot. Gard. Edinburgh 5: 170. 1912.

大理山梗菜 da li shan geng cai

峨嵋紫锤草 e mei zi chui cao

*Pratia fangiana* F. E. Wimmer, Repert. Spec. Nov. Regni Veg. 38: 3. 1935; *Lobelia omeiensis* F. E. Wimmer.

Herbs, perennial, up to 1.5 m tall, simple. Stems erect, terete, sparsely to densely puberulent toward apex. Leaves sessile; blade elliptic, narrowly elliptic, narrowly oblong, or lanceolate, 5.5–16 × 1.2–3 cm, both surfaces glabrous, base cuneate, margin glandular-serrulate or -crenulate, apex acuminate. Flowers solitary in axils of little-reduced or unreduced leaves, and uppermost 10–25 often aggregated into a terminal raceme; pedicels 12–38 mm, densely puberulent. Hypanthium obconic or campanulate, 3–5(–7) mm, puberulent on veins or sometimes glabrous; calyx lobes erect, narrowly triangular or triangular, 3–7 mm, glabrous, margin entire or with 1–3 teeth per side. Corolla red-purple or greenish with lip purple spotted, 18–23 mm, both sides sparsely pubescent; dorsal lobes linear or linear-triangular; ventral lobes lanceolate, acuminate. Filament tube glabrous, ca. 2 × as long as anther tube; anther tube gray, 5–6 mm, glabrous; ventral anthers barbate at apex with white hairs ca. 1 mm or smaller. Berry dry, globose or obovoid, 7–17 mm. Seeds amber-colored, dull, broadly ellipsoid, 0.6–0.7 × 0.3–0.4 mm, subterete. Fl. and fr. Aug–Sep.

• Grassy slopes, forests, moist thickets on slopes and riverbanks; 1700–3000 m. SC Sichuan.

**22. *Lobelia montana*** Reinwardt ex Blume, Bijdr. 728. 1826.

山紫锤草 shan zi chui cao

*Lobelia brevisepala* (Y. S. Lian) Lammers; *L. reflexisepala* Lammers; *L. wardii* C. E. C. Fischer; *Pratia brevisepala* Y. S. Lian; *P. montana* (Reinwardt ex Blume) Hasskarl; *P. reflexa* Y. S. Lian; *P. wardii* (C. E. C. Fischer) F. E. Wimmer; *Speirema montanum* (Reinwardt ex Blume) J. D. Hooker & Thomson.

Herbs, perennial, up to 2 m tall. Stems erect, arching, or sprawling, terete, commonly branched from base and sometimes above, upper internodes zigzag, glabrous (rarely sparsely scabrous, or puberulent when young). Leaves petiolate; blade elliptic, ovate, or lanceolate, 3.5–13 × 1.2–4.6 cm, papery, glabrous (rarely puberulent when young, or sparsely scabrous on midrib), base cuneate, obtuse, or rounded, margin glandular-serrulate, -denticulate, or -crenulate, apex caudate or sometimes merely acuminate; petiole 0.3–1.3 cm. Flowers solitary and

axillary; pedicels slender, 24–55 mm, glabrous. Hypanthium globose or campanulate (rarely obconic), 3–6 mm, glabrous; calyx lobes spreading, recurved, or rarely reflexed, linear-triangular or linear, 2–14 mm, margin entire. Corolla dark violet to bluish lilac, lip often paler, or striped, margined, or blotched with white, 15–26 mm, outside glabrous, inside villous; dorsal lobes linear; ventral lobes elliptic, apex caudate. Filament tube glabrous, up to 2.5 × as long as anther tube; anther tube light gray, 4.8–7 mm, dorsal surface sparsely shortly pubescent at least toward apex; lower 2 anthers barbate at apex with tufts of white hairs up to 2 mm. Berry violet to black-purple, globose, 6–15 mm. Seeds amber-colored, shiny, broadly ellipsoid, slightly compressed, 0.5–0.8 × 0.3–0.5 mm. Fl. Jul–Nov, fr. Aug–Apr.

Moist ravines, glades, meadows, scrub, forest margins; 1000–4000 m. Xizang, SE Yunnan [Bhutan, India, Indonesia, Malaysia, Myanmar, Nepal, Vietnam].

**23. *Lobelia deleiensis*** C. E. C. Fischer, Bull. Misc. Inform. Kew 1940: 297. 1941.

滇紫锤草 dian zi chui cao

*Pratia montana* (Reinwardt ex Blume) Hasskarl var. *deleiensis* (C. E. C. Fischer) F. E. Wimmer.

Herbs, rhizomatous, up to 2 m tall. Stems erect or arching, often branched from base and sometimes above, glabrous. Leaves petiolate; blade elliptic or lanceolate, 6–14 × 1.4–4.2 cm, papery or somewhat leathery, both surfaces glabrous, base cuneate to obtuse, margin glandular-serrulate, -crenulate, or -denticulate, apex caudate; petiole 0.3–1.8 cm. Flowers solitary and axillary; pedicels slender, 1.6–4.5 cm. Hypanthium campanulate or obovoid, 4–7 mm, glabrous; calyx lobes spreading or recurved, linear or linear-triangular, 5–17 mm, glabrous, entire. Corolla cream-colored or greenish with purple or blue markings on lip, 1.2–1.8 cm, outside glabrous, inside pubescent; dorsal lobes linear or linear-spatulate; ventral lobes narrowly elliptic, apex caudate. Filament tube glabrous or sparsely pubescent, ± equaling anther tube; anther tube cream-colored, 6–8 mm, glabrous or sparsely shortly pubescent toward apex; ventral anthers bearded at apex with tufts of white hairs up to 2 mm. Berry greenish, globose, 8–11 mm. Seeds tan, dull, broadly ellipsoid, slightly compressed, ca. 0.6 × 0.4 mm. Fl. Jul–Nov, fr. Aug–Apr.

Evergreen broad-leaved forests; 1500–2400 m. SW Yunnan [NE India].

## 16. HIPPOBROMA G. Don, Gen. Hist. 3: 698, 717. 1834.

马醉草属 ma zui cao shu

Hong Deyuan (洪德元); Laura L. Klein, Thomas G. Lammers

Herbs, perennial. Roots coarse, thickened, fascicled. Leaves alternate, margin repand-dentate or repand-serrate, sometimes

merely sinuate, teeth apiculate. Flowers large, fragrant, solitary, axillary; pedicels with 2 filiform bracteoles at base. Corolla salverform, white; tube entire; lobes monomorphic. Filament tube adnate to corolla; all anthers with apical tufts of stiff hairs; anther tube scarcely exserted. Fruit pendent, capsular, 2-locular, apically dehiscent by 2 valves.  $2n = 28$ .

One species: native to Jamaica; widely introduced and naturalized in tropics and subtropics, including China.

**1. *Hippobroma longiflora*** (Linnaeus) G. Don, Gen. Hist. 3: 717. 1834.

马醉草 ma zui cao

*Lobelia longiflora* Linnaeus, Sp. Pl. 2: 930. 1753; *Isotoma longiflora* (Linnaeus) C. Presl; *Laurentia longiflora* (Linnaeus) Petermann; *Solenopsis longiflora* (Linnaeus) M. R. Almeida.

Stems erect, 9–35 cm tall, simple or branching at base, glabrous or increasingly villous toward apex. Leaves sessile or shortly petiolate; blade  $7\text{--}16 \times 1\text{--}3.7$  cm, oblanceolate or elliptic, glabrous or sometimes sparsely villous, base attenuate, apex

acute or acuminate. Pedicels 3–10 mm, densely villous. Corolla white; tube 6.5–10 cm, villous, entire; lobes elliptic, narrowly elliptic, or linear, 1.8–2.5 cm. Hypanthium campanulate, obconic, or ellipsoid, 6–9 mm, densely villous; calyx lobes linear, 8–19 mm, villous, margin denticulate. Anther tube ca. 7 mm. Capsule obconic, campanulate, broadly ellipsoid, or obovoid,  $11\text{--}15 \times 8\text{--}12$  mm, densely villous. Seeds light brown to red-brown, broadly ellipsoid, terete or slightly compressed, ca. 0.7 mm, reticulate.  $2n = 28$ .

Guangdong, Taiwan [native to Jamaica; widely introduced and naturalized in tropics and subtropics].

## PENTAPHRAGMATACEAE

五膜草科 wu mo cao ke

Hong Deyuan (洪德元)<sup>1</sup>; Nicholas J. Turland<sup>2</sup>

Herbs perennial, ± succulent, without latex. Rhizome elongate, robust, often ± woody. Leaves alternate; leaf blade large, asymmetric at base. Inflorescence an axillary cyme or cincinnus, solitary or 2 or 3 together; pedicels short or absent. Flowers bisexual, actinomorphic except calyx. Calyx tube campanulate or tubular; calyx lobes 5, persistent, often white, unequal in width, often 2 wider and other 3 narrower. Corolla adnate to calyx as far as distal part of calyx, 5-cleft for more than halfway, or nearly fully divided and appearing petaloid, often white. Stamens 5, alternate with corolla lobes, inserted at proximal part of corolla tube; filament glabrous; anther ovoid or long ellipsoid, introrse or almost lateral due to connective being developed and exerted higher than anther cells. Ovary inferior, 2-loculed; ovules numerous; stigma capitate or conic, entire. Fruit an indehiscent berry. Seeds numerous, minute, ovoid or ovoid-globose; testa obviously reticulate.

One genus and ca. 25 species: S China, Indonesia, Malaysia, Papua New Guinea, Philippines, Singapore, Thailand, Vietnam; two species (one endemic) in China.

Pentaphragmataceae and Campanulaceae are not immediately related, although both are in the Asterales. *Pentaphragma* has quite different flowers, with no hint of the secondary pollen presentation that occurs throughout Campanulaceae s.l. Thus the inflorescence is cymose, usually scorpioid; the sepals are petaloid, with two large ones and three small ones; the corolla is ± deeply lobed; there are nectariferous cavities between septa joining hypanthium to ovary (unique in flowering plants); and the anthers are extrorse (introrse in all Campanulaceae s.l.). In addition, there is no latex; the leaves are distichous, with leaf blades strongly asymmetric; and the endosperm is starchy, the latter condition being extremely uncommon in Campanulaceae s.l.

Hong De-yuan. 1983. Campanulaceae (Pentaphragmatoideae). In: Hong De-yuan, ed., Fl. Reipubl. Popularis Sin. 73(2): 174–176.

### 1. PENTAPHRAGMA Wallich ex G. Don, Gen. Hist. 3: 731. 1834.

五膜草属 wu mo cao shu

Morphological characters and geographic distribution are the same as those of the family.

- 1a. Calyx longer than corolla; inflorescence strongly curved; flowers 2 in axil of bract ..... 1. *P. sinense*  
1b. Calyx shorter than corolla; inflorescence straight; flower 1 in axil of bract ..... 2. *P. spicatum*

**1. *Pentaphragma sinense*** Hemsley & E. H. Wilson, Bull. Misc. Inform. Kew 1906: 160. 1906.

五膜草 wu mo cao

Plants covered with glandular hairs and these mixed with stellate hairs on young stems, petioles, abaxial surface of leaf blade, inflorescence axis, bracts, pedicels, and calyx. Rhizome to 30 × 1 cm, ± woody. Fibrous roots ca. 3 mm in diam. Stem short but robust, with leaves borne at one side. Leaves petiolate; petiole 3–10 cm; leaf blade ovate, asymmetric, 10–20 × 5–12 cm, main veins arcuate, margin entire or obscurely verrucose denticulate. Inflorescences solitary or 2 together, pedunculate, strongly curved, bracteate; peduncle 2–4 cm; bracts ovate, with 2 flowers at axil; pedicels 1–2 mm. Calyx tube campanulate; calyx lobes broadly elliptic or linear-oblong, ca. 6 × 2–3 mm. Corolla white, 6–7 mm, cleft for more than halfway; lobes long elliptic. Stamens: connective higher than anther cells; anther cells long ellipsoid, almost laterally longitudinally dehiscent. Stigma conic, almost smooth. Berry obovoid, ca. 9 mm. Seeds ovoid, ca. 0.3 mm; testa yellow, obviously reticulate. Fl. and fr. May–Nov.

Forests, by streams, moist shady banks of ravines; [200–1500 m]. S Yunnan (Hekou, Pingbian, Xishuangbanna) [N Vietnam].

**2. *Pentaphragma spicatum*** Merrill, Philipp. J. Sci. 21: 511. 1922.

直序五膜草 zhi xu wu mo cao

*Pentaphragma corniculatum* Chun & F. Chun.

Plants rather densely covered with glandular hairs and these mixed with stellate hairs on young stems, petioles, abaxial surface of leaves, inflorescence axis, bracts, and abaxial surface of calyx. Rhizome oblique, elongate, robust, to 15 × 1.5 cm, ± woody. Fibrous roots ca. 2 mm in diam. Stem short, often with leaves at one side, usually with remains of petioles. Leaves petiolate; petiole 5–15 cm; leaf blade ovate or ovate-orbicular, asymmetric, 10–30 × 6–20 cm, margin entire or verrucose denticulate. Inflorescences solitary or 2 together, pedunculate, straight; peduncle with an involucre of bracts much smaller than leaves; bracts obovate, ca. 4 mm, with 1 flower at axil; pedicels 1–2 mm. Flowers ca. 1.6 cm. Calyx tube campanulate; calyx lobes ca. 5 mm, 3-veined, broader 2 ovate-orbicular, ca. 4 mm wide, other 3 long oblong, ca. 2 mm wide. Corolla white or yellow-green, ca. 9 mm, cleft for more than halfway; lobes slightly incurved, lanceolate, glabrous. Stamens: connective higher than anther cells. Stigma

conic, almost without ribs. Berry ellipsoid, ca. 8 mm. Seeds ovoid, ca. 0.3 mm; testa dark brown, obviously reticulate. Fl. May–Jul, fr. Oct–Nov.

- Tropical forests in ravines, dense forests; ca. 1400 m. SW

Guangdong (Xinyi), S Guangxi (Daxin, Dongxing, Shiwan Dashan), Hainan (Baisha, Baoting).

*Pentaphragma spicatum* should be expected in N Vietnam. The type locality (Dongxing in Guangxi Province) is close to the border.

## STYLIDIACEAE

花柱草科 hua zhu cao ke

Hong Deyuan (洪德元)<sup>1</sup>; Juliet A. Wege<sup>2</sup>

Herbs [rarely small shrubs or cushion plants], without laticifers. Stipules absent. Leaves in rosettes or alternate [rarely whorled or imbricate], simple. Inflorescences terminal, cymes, lax spikes [racemes, panicles, pseudoheads, or corymbs], or with flowers solitary. Flowers perfect [rarely unisexual by abortion], usually zygomorphic. Calyx synsepalous; tube adnate to ovary; limb with 5[–9] distinct or partly connate lobes, occasionally 2-labiate. Corolla sympetalous, [4 or]5[–9]-lobed; lower lobe (labellum) often smaller and reflexed [rarely hooded]. Stamens 2, adnate with style, forming a gynostemium (column); gynostemium often irritable, normally bent to labellar side but snapping to an oppositely bent position when touched; anthers extrorse, 2-celled, protandrous. Ovary inferior, incompletely 2-locular [occasionally 1-locular due to reduction of septum]; ovules few to numerous, on axile or free central placentas, anatropous; stigma entire or 2-cleft. Fruit a capsule, usually septicidal. Seeds minute; seed coat thin; embryo small, embedded in copious endosperm.

Four genera and ca. 320 species: Australia, New Zealand, S end of South America, with only *Stylidium* extending into tropical Asia; one genus and two species in China.

Hong De-yuan. 1983. Stylidiaceae. In: Hong De-yuan, ed., Fl. Reipubl. Popularis Sin. 73(2): 180–182.

### 1. *STYLIDIUM* Swartz ex Willdenow, Sp. Pl. 4: 7, 146. 1805, nom. cons., not Loureiro (1790).

花柱草属 hua zhu cao shu

Herbs [rarely small shrubs or cushion plants], annual [or perennial], bearing glandular [and/or non-glandular] trichomes [seldom completely glabrous]. Leaves cauline or in a basal rosette [rarely whorled or imbricate]. Inflorescences lax spikes, cymes [racemes, panicles, pseudoheads, or corymbs], or with flowers solitary. Flowers perfect, zygomorphic. Calyx lobes 5, [distinct or] with 3 distinct and 2 connate [occasionally 2-labiate]. Corolla 5-merous, irregular; throat appendages (paracorolla) often present; lobes 5 but lowest (labellum) much smaller, usually reflexed, simple [or appendiculate]. Gynostemium usually exerted from corolla, bent and irritable [rarely erect and immobile]; anthers 2-locular; stigma entire [or 2-cleft]. Ovary incompletely 2-locular [or 1-locular due to reduction of septum]; ovules few to more often numerous.

About 300 species: tropical Asia, Australia, New Zealand; two species in China.

Almost all species occur in Australia with Asia only having seven species, six of which are endemic to Asia.

- 1a. Leaves basal, with a short petiole; leaf blade ovate-orbicular, ovate, or obovate; capsule ca. 0.8 cm ..... 1. *S. uliginosum*  
1b. Leaves cauline, sessile or subsessile; leaf blade oblong-obovate to lanceolate; capsule to 2 cm ..... 2. *S. tenellum*

**1. *Stylidium uliginosum*** Swartz ex Willdenow, Sp. Pl. 4: 147. 1805.

花柱草 hua zhu cao

*Stylidium sinicum* Hance.

Herbs 5–13 cm tall, annual. Stems compressed. Leaves in a basal rosette, with a short petiole; leaf blade ovate-orbicular, ovate, or obovate, 5–8 mm, glabrous, veins obscure, base cuneate, margin entire, apex obtuse to rounded. Inflorescences lax spikes; scapes 1–3, simple or dichotomously branched, covered with sparse short glandular trichomes; bracts ovate, less than 1 mm. Flowers sessile. Calyx tube (hypanthium) linear, with sparse glandular trichomes; lobes partly connate, with 3 distinct and 2 connate into a shallowly 2-lobed segment. Corolla white, ca. 2 mm, glabrous; tube slightly shorter than [or ca. equal to] calyx lobes; throat appendages minute [or absent]; labellum minute, ovate; lower pair of lobes much longer than upper pair,

lobe apices shallowly 2-lobed [or entire]. Gynostemium ca. 3.5 mm. Capsule columnar, ca. 8 mm. Fl. Oct–Nov.

Moist grassy places by streams in coastal hilly areas. Guangdong, Hainan [Cambodia, Sri Lanka, Thailand, Vietnam].

**2. *Stylidium tenellum*** Swartz ex Willdenow, Sp. Pl. 4: 146. 1805.

狭叶花柱草 xia ye hua zhu cao

Herbs 5–20[–27] cm tall, annual. Stems slender, simple or laxly dichotomously branched, glabrous. Leaves alternate, sessile or subsessile; leaf blade oblong-obovate to oblanceolate, 6–10 mm, apical ones smaller and grading into bracts, glabrous, veins 3, base cuneate, margin entire, apex obtuse. Inflorescences dichotomously branched lax spikes or with flowers solitary; scapes absent; bracts linear, ca. 2 mm. Flowers sessile. Calyx tube (hypanthium) linear, with sparse glandular trichomes

<sup>1</sup> State Key Laboratory of Systematic and Evolutionary Botany, Institute of Botany, Chinese Academy of Sciences, 20 Nanxincun, Xiangshan, Beijing 100093, People's Republic of China.

<sup>2</sup> Western Australian Herbarium, Department of Environment & Conservation, Locked Bag 104, Bentley Delivery Centre, Western Australia 6983, Australia.

or glabrous; lobes partly connate, with 3 distinct and 2 connate into a shallowly 2-lobed segment. Corolla white or rose-purple, less than 2 mm, with sparse glandular trichomes; tube slightly longer than calyx lobes; throat appendages minute; labellum minute, subulate; lower pair of lobes longer than upper pair,

lobe apices shallowly 2-lobed. Gynostemium 4–5 mm. Capsule thinly columnar, to 2 cm. Fl. and fr. Oct.

Paddy fields, swamps; below 1000 m. SE Fujian, Guangdong, Hainan, S Yunnan (Xishuangbanna) [Bangladesh, Cambodia, India, Indonesia, Laos, Malaysia, Myanmar, Thailand, Vietnam].

## GOODENIACEAE

草海桐科 *cao hai tong ke*

Hong Deyuan (洪德元)<sup>1</sup>; Dianella G. Howarth<sup>2</sup>

Herbs, shrubs, or rarely small trees [or vines], without laticifers. Stipules absent. Leaves alternate, rarely opposite or whorled, simple. Inflorescences a cyme, raceme, head, or sometimes single flowered in axils. Flowers perfect, protandrous. Calyx epigynous, tubular, mostly (3–)5-lobed. Corolla sympetalous, irregular, 2-lipped or sometimes 1-labiate due to 2-segmentation of posterior lip to base; lobes 5, valvate, often induplicate. Stamens 5, alternate with corolla lobes, free from corolla or adnate to base of corolla tube; anthers 4-sporangiate and dithecal, introrse, longitudinally dehiscent. Ovary inferior, semi-inferior [or rarely (*Velleia* Smith) essentially superior], (1 or)2-locular [occasionally 4-locular (*Scaevola porocarya* F. Mueller)]; ovules 1 to many per locule, on axile or basal-axile placentas, anatropous. Fruit usually a capsule, less often a drupe or a small nut, often with persistent calyx. Seeds with a straight embryo embedded in copious endosperm.

Twelve genera and ca. 400 species: pantropical and extending into subtropics; two genera and three species in China.

The greatest diversity of the family is in Australia.

Pollen presentation mechanism in the family is complex. The anthers are connivent or connate to form a tube into which pollen grains shed. The style, with a cupular indusium below the small stigma, grows up through the anther tube and collects the pollen grains, which are subsequently deposited or brushed onto visiting insects.

Hong De-yuan. 1983. Goodeniaceae. In: Hong De-yuan, ed., Fl. Reipubl. Popularis Sin. 73(2): 177–180.

1b. Fruit a capsule; herbs ..... 2. *Goodenia*

### 1. SCAEVOLA Linnaeus, Mant. Pl. 2: 145. 1771, nom. cons.

草海桐属 *cao hai tong shu*

*Lobelia* Miller (1754), not Linnaeus (1753).

Shrubs or small trees [or herbs]. Leaves alternate and spirally arranged, or opposite. Flowers in axillary cymes, or solitary and axillary; bracts opposite; bracteoles opposite. Calyx epigynous; tube adnate to ovary; limb cupular, short, 5-dentate or 5-lobed. Corolla zygomorphic, posterior side longitudinally divided to near base; lobes 5, subequal in size. Ovary 2-locular; each locule with 1 upright ovule on axile placenta [or 1-locular, with 1 or 2 ovules also on axile placenta]; stigma 2-cleft. Drupe often fleshy; endocarp hard; each locule with 1 seed.

About 80 species: pantropical but mainly in Australia; two species in China.

- 1a. Flowers in an inflorescence; leaf blade spatulate to obovate, 10–22 × 4–8 cm ..... 1. *S. taccada*  
1b. Flowers solitary, axillary; leaf blade linear-spatulate, 1–2.5 × 0.2–0.5 cm ..... 2. *S. hainanensis*

**1. *Scaevola taccada*** (Gaertner) Roxburgh, Hort. Bengal. 15. 1814.

草海桐 *cao hai tong*

*Lobelia taccada* Gaertner, Fruct. Sem. Pl. 1: 119. 1788;  
*Scaevola frutescens* Krause, nom. illeg. superfl.; *S. koenigii* Vahl; *S. sericea* Vahl.

Shrubs or small trees, to 7 m tall, erect or diffuse. Twigs 5–10 mm in diam., sometimes rooting, hollow, usually glabrous but axils with a tuft of dense white barbate trichomes. Leaves spirally arranged, mostly aggregated at apex of branches, sessile or shortly petiolate; leaf blade spatulate to obovate, 10–22 × 4–8 cm, slightly succulent, glabrous or abaxially sparsely villous, base cuneate, apex rounded, truncate, or emarginate. Cymes axillary; bracts and bracteoles small, with a tuft of barbate trichomes in axils. Pedicel with a joint at apex. Calyx glabrous;

tube obovoid; lobes linear-lanceolate, ca. 2.5 mm. Corolla white to pale yellow or purple, ca. 2 cm; tube thinly tubular, posterior side divided to base, outside glabrous, inside densely white villous; limb patent; lobes lanceolate, thickened at center, each side with a wide membranous and induplicate wing above middle, margin sparsely ciliate. Anthers connivent into a tube with basal part of indusium, becoming free after anthesis; connective longer than cells, becoming lamellar at apex. Drupe white, ovoid-globose, 7–10 mm in diam., divided longitudinally by furrows into 2 parts each 4-ribbed, 2-locular; locules each with 1 seed. Fl. and fr. Apr–Dec.  $2n = 16$ .

Open coastal sands or rocks; near sea level. Dongsha Qundao, SE Fujian, Guangdong, Guangxi, Hainan, Nansha Qundao, Taiwan, Xisha Qundao [India, Indonesia, S Japan, Malaysia, Myanmar, Papua New Guinea, Pakistan, Philippines, Sri Lanka, Thailand, Vietnam; E Africa, tropical Australia, Indian Ocean islands, Madagascar, Pacific islands].

<sup>1</sup> State Key Laboratory of Systematic and Evolutionary Botany, Institute of Botany, Chinese Academy of Sciences, 20 Nanxincun, Xiangshan, Beijing 100093, People's Republic of China.

<sup>2</sup> St. Albert Hall, Room 272, Department of Biological Sciences, St. John's University, 8000 Utopia Parkway, Queens, New York 11439, U.S.A.

*Scaevola taccada* is naturalized in some coastal areas of tropical and subtropical America. It likely occurs in coastal Cambodia and the SE coast of Bangladesh, although these potential distributions need to be confirmed. For a discussion of the nomenclatural problems concerning the Indo-Pacific species *S. taccada* and the Indo-Atlantic species *S. plumieri* (Linnaeus) Vahl see P. S. Green (Taxon 40: 118–122. 1991), C. Jeffrey (Kew Bull. 34: 537–545. 1980), and R. K. Shannon et al. (Taxon 46: 801–802. 1997). The *Vienna Code*, Art. 33.3 Ex. 8, explains why the new combination as *S. taccada* was validly published by Roxburgh in 1814 due to reference to the published illustration by Rheede (Hort. Malab. 4: t. 59. 1683) which was also cited by Gaertner in his 1788 publication.

**2. *Scaevola hainanensis*** Hance, J. Bot. 16: 229. 1878.

小草海桐 xiao cao hai tong

Shrubs, small, diffuse. Old twigs elongate, glabrous; young shoots numerous, short, scaberulose, with a tuft of

woolly trichomes in axils. Leaves spirally arranged, aggregated at apex of branches, sometimes branches undeveloped and becoming extremely short and thus leaves appearing fascicled, sessile or shortly petiolate; leaf blade linear-spatulate, 1–2.5 × 0.2–0.5 cm, succulent, glabrous, only 1 main vein visible on abaxial side, margin entire. Flowers axillary, solitary. Pedicel ca. 1 mm; bracteoles opposite, at apex of pedicels, broadly linear, 3–4 mm, with a tuft of woolly trichomes. Calyx glabrous; tube obovoid-oblong, ca. 2 mm; limb shallowly cupular, apex sinuously 5-lobed. Corolla pale blue, ca. 8 mm, posterior side divided to base, remaining parts divided to middle, outside glabrous, inside of tube densely villous; lobes linear-elliptic, patent into 1 direction, with broad and membranous wings; wing margin basally ± fimbriate. Connective exerted beyond anther cells. Ovary 2-locular. Fl. and fr. Mar–Dec.

Coastal salt marshes, mangroves; near sea level. Dongsha Qundao, SE Fujian, Guangdong, Hainan, Taiwan [Vietnam].

**2. GOODENIA** Smith, Spec. Bot. New Holland 1: 15, t. 5. 1793.

离根香属 li gen xiang shu

*Balingayum* Blanco; *Calogyne* R. Brown.

Herbs, perennial [or more often annual], erect [or diffuse]. Leaves variable. Flowers axillary, inflorescence variable; both bracts and bracteoles present or absent. Calyx tube adnate to ovary or free; limb 5-lobed. Corolla usually cleft over 1/2 at posterior side; lobes patent toward anterior side, with a broad wing on each side; posterior 2 lobes with asymmetrical wings. Stamens free, epigynous. Ovary inferior, incompletely 2-locular; locules each with several ovules; style with 2 or 3 segments from middle; indusium cupular, shallowly 2-lobed, margin densely ciliate; stigma lamellar, entire. Fruit usually a capsule, 2-valvate. Seeds compressed, slightly thickened on margins, usually winged.

About 180 species: E and SE Asia, Australia; one species in China.

**1. *Goodenia pilosa*** (R. Brown) Carolin subsp. **chinensis** (Benth.) D. G. Howarth & D. Y. Hong, **comb. nov.**

离根香 li gen xiang

Basionym: *Calogyne chinensis* Benth., J. Proc. Linn. Soc., Bot. 5: 78. 1860; *Calogyne pilosa* R. Brown subsp. *chinensis* (Benth.) H. S. Kiu.

Herbs, perennial, erect. Stems slender, branched, single or several and caespitose, 5–15 cm tall but sometimes decumbent after anthesis, basally glabrous, apically sparsely hirsute. Basal leaves several; petiole to 1.5 cm; leaf blade long elliptic to linear-oblong, 2–5 × 0.3–0.6 cm, sparsely hirsute only along main vein on abaxial side and on margin, margin sparsely triangular serrate. Basal cauline leaves with a shorter petiole; leaf blade similar to but smaller than basal leaves. Apical cauline

leaves sessile; leaf blade similar in shape to but smaller than more basal leaves, often less than 1 cm. Flowers axillary, solitary, each cauline leaf with a flower but sometimes branches short and multiflowered to almost becoming a raceme. Pedicel 2–8 mm, slender, sparsely hirsute. Calyx tube ca. 2 mm, densely hirsute; lobes linear-lanceolate, ca. 4 mm. Corolla purple outside with bright brownish shade and inside yellow with orange spots, ca. 8 mm. Stamens ca. 3 mm; anthers mucronate at apex. Capsule ovoid-globose, ca. 3 mm in diam., with 5 seeds. Seeds ovoid, ca. 4 × 2 mm. Fl. and fr. Nov–Mar.

Paddy fields, grassy areas in forests or on hillsides; below 100 m. Fujian (Jinmen Dao, Xiamen), Guangdong (Huilai, Raoping), Guangxi (Fangcheng, Hepu), Hainan (Ding'an, Qionghai, Sanya) [Vietnam].

The typical subspecies is an annual herb that occurs in tropical Australia, Indonesia, Papua New Guinea, and the Philippines.

## ADOXACEAE

五福花科 wu fu hua ke

Yang Qiner (杨亲二)<sup>1</sup>, Hong Deyuan (洪德元)<sup>2</sup>; Valéry Malécot<sup>3</sup>, David E. Boufford<sup>4</sup>

Shrubs, less frequently perennial herbs, or small trees. Leaves opposite, simple or compound; ternate, biternate, ternate-pinnate, biternate-pinnate, or odd-pinnate. Inflorescences terminal panicles or umbellate, spicate, or capitate cymes. Flowers bisexual; calyx and corolla both connate, (3–)5-merous. Stamens 5 (*Sambucus*, *Viburnum*) or 5, 4, or 3 (*Adoxa*, *Sinadoxa*), alternate corolla lobes, inserted on corolla tube; filaments cleft into 2 semi-stamens (in *Adoxa*, *Sinadoxa*); anthers 1-celled, peltate, extrorse, longitudinally dehiscent; staminodes 5, 4, or 3, in inner whorl, opposite corolla lobes. Ovary semi-inferior to inferior, 1- or 3–5-loculed; styles 5, 4, or 3, connate or free, or absent; stigmas capitate or 2- or 3-fid. Fruit drupes; seeds 1 or 3–5.

Four genera and ca. 220 species: mainly in the N Hemisphere; four genera (one endemic) and 81 species (49 endemic) in China.

Chiu Lien-ching. 1986. ADOXACEAE. In: Lu An-ming & Chen Shu-kun, eds., Fl. Reipubl. Popularis Sin. 73(1): 1–5; Hu Jia-qi & Hsu Ping-sheng. 1988. *Sambucus* and *Viburnum*. In: Hsu Ping-sheng, ed., Fl. Reipubl. Popularis Sin. 72: 4–104.

- 1a. Leaves simple; ovary 1-loculed; drupes 1-seeded; shrubs or small trees ..... 1. *Viburnum*
- 1b. Leaves compound; ovary 3–5-loculed; drupes usually 3–5-seeded; shrubs, perennial herbs, or small trees.
  - 2a. Shrubs or small trees, rarely coarse perennial herbs more than 0.5 m tall; stamens 5, undivided ..... 2. *Sambucus*
  - 2b. Perennial herbs less than 30 cm tall; fertile stamens 5, 4, or 3, cleft into 2 semi-stamens, anthers 2-celled.
    - 3a. Basal and cauline leaves pinnately compound; inflorescence of several condensed cymes in an interrupted spike ..... 3. *Sinadoxa*
    - 3b. Basal leaves simple, 3-cleft, or ternately or biternately compound; cauline leaves simple and 3-cleft or ternate; inflorescences condensed capitate, several flowered cymes or racemelike ..... 4. *Adoxa*

### 1. VIBURNUM Linnaeus, Sp. Pl. 1: 267. 1753.

荚蒾属 jia mi shu

Yang Qiner (杨亲二); Valéry Malécot

*Actinotinus* Oliver, p.p.

Shrubs or small trees, deciduous or sometimes evergreen. Branchlets glabrous or pubescent with simple, fascicled or stellate hairs, rarely lepidote hairs; winter buds perulate or naked. Leaves usually opposite, rarely ternate, simple, petiolate, entire, dentate, or 3–5-lobed; stipules usually small or absent. Inflorescence terminal or at apices of short branches with 1- or 2-jugate leaves, compound, corymbose- or paniculate-cymose. Flowers small, actinomorphic, but sometimes marginal flowers of inflorescence enlarged, somewhat zygomorphic and sterile, rarely entire inflorescence consisting of such sterile flowers; bracts and bracteoles usually small and caducous. Calyx small, 5-toothed. Corolla white, rarely reddish, pinkish, or greenish, rotate, campanulate, hypocrateriform, or tubular, 5-lobed. Stamens 5; filaments filiform; anthers medifixed, longitudinally dehiscent, introrse. Ovary semi-inferior, 3-loculed, 1 locule fertile with a single ovule, and 2 sterile; styles short; stigmas slightly capitate to 3-lobed. Fruit a 1-seeded drupe with a ± compressed pyrene, red, purplish, black, or rarely yellow when mature.

About 200 species: mostly in temperate and subtropical regions of Asia and South America; 73 species (45 endemic) in China.

We were unable to check the original material of *Viburnum nervosum* var. *hassianum* Loesener (Beih. Bot. Centralbl., Abt. 2, 37: 185. 1920; Shandong: *Forstamt* 114, 596; *Krug* 236, 561, 305; *Zimmermann* 531). The loci typici are temples where the plant was cultivated (“Kap Yatau: angepflanz in der Tempelanlagen von Huayenan und Taitschingkung”) and are clearly outside the known distribution of *V. nervosum*; additionally, the provided description is quite vague (“a typo indumento parciore recedens”), while the phenological information provided (“mit länglichen Früchten im Mai”) does not match the known phenology of *V. nervosum*.

*Viburnum wrightii* Miquel (Ann. Mus. Bot. Lugduno-Batavi 2: 267. 1866) was recorded in FRPS (72: 88. 1988) as occurring in Anhui and Zhejiang, but we could not satisfactorily identify this species. Material from Anhui (*Feng* 1046, LBG – sheet no. 00081428) may belong to *V. betulifolium*, as well as material from Jiangxi (*Xiang* 8234, LBG – sheet no. 0029514) and that reported in Fl. Zhejiang (6: 150. 1986).

*Viburnum chinense* Hooker & Arnott (Bot. Beechey Voy. 190. 1833, not *V. sinense* Zeyher ex Colla, 1824) is a synonym of *Premna integrifolia* Linnaeus (Lamiaceae), according to FRPS (72: 104. 1988), which is treated in Fl. China (17:26. 1994) as a synonym of *P. serratifolia* Linnaeus. *Viburnum dielsii* H. Léveillé (Repert. Spec. Nov. Regni Veg. 9: 443. 1911, not Graebner, 1901) is a synonym of *Callicarpa rubella* Lindley var. *rubella* (see Fl. China 17: 13. 1994). *Viburnum versatile* R. H. Miao, W. B. Liao & Q. Y. Sun (Acta Sci. Nat. Univ. Sunyatseni 38(6): 129. 1999) apparently belongs to the Rubiaceae (Malécot, Hommes & Pl. 49: 22–27. 2004). *Actinotinus* was based on a mixed gathering comprising an inflorescence of *Viburnum* inserted on the terminal bud of a leafy shoot of *Aesculus chinensis* var. *wilsonii* (Rehder) Turland & N. H. Xia (see Fl. China 12: 3. 2007).

<sup>4</sup> Harvard University Herbaria, 22 Divinity Avenue, Cambridge, Massachusetts 02138-2094, U.S.A.

- 1a. Inflorescence a panicle, sometimes densely clustered, rarely a corymblike panicle, rays opposite, decussate, first node of inflorescence with 2 rays; pyrenes with a deep ventral groove (if first node of panicle-like inflorescence with 4–6 rays and pyrenes with 2 deep dorsal grooves and 1 shallow ventral groove then see *V. pyramidatum*) (4. *V.* sect. *Solenotinus*).
- 2a. Corolla rotate, lobes as long as or longer than tube.
- 3a. Leaves papery, abaxially with red-brown glandular dots; inflorescence a corymblike panicle ..... 38. *V. yunnanense*
- 3b. Leaves thickly papery to leathery, abaxially without red-brown glandular dots; inflorescence a corymblike or pyramidal panicle.
- 4a. Panicle corymblike ..... 24. *V. corymbiflorum*
- 4b. Panicle pyramidal.
- 5a. Lateral veins at least partly directly ending in teeth; inflorescence axes glabrous or subglabrous; calyx reddish ..... 28. *V. henryi*
- 5b. Lateral veins arched and anastomosing near margin, not directly ending in teeth; inflorescence axes glabrous or stellate-pubescent; calyx green.
- 6a. Leaves thickly papery; pyrenes ca.  $4 \times 3.5$  mm ..... 36. *V. tengyuehense*
- 6b. Leaves leathery; pyrenes  $7-8 \times 4-5$  mm.
- 7a. Calyx and corolla glabrous; flowers fragrant; pyrenes ovoid or ovoid-ellipsoid, apex rounded ..... 30. *V. odoratissimum*
- 7b. Calyx and corolla, or at least calyx, stellate-pubescent outside; flowers not fragrant; pyrenes ovoid or narrowly ovoid, apex acuminate ..... 21. *V. brachybotryum*
- 2b. Corolla funnellform or hypocrateriform, very rarely rotate-campanulate, lobes shorter than tube.
- 8a. Stamens inserted at or above middle of corolla tube, generally at different heights; flowers opening before leaves; leaves papery.
- 9a. Leaves abaxially slightly pubescent on veins, veins 5–7-jugate, apex acute; inflorescence a panicle, at apices of short branchlets with young leaves; bracts ciliate, subglabrous ..... 26. *V. farreri*
- 9b. Leaves abaxially densely pubescent, veins 6–10-jugate, apex acuminate; inflorescence densely clustered at apices of leafless short branchlets; bracts densely silvery sericeous initially ..... 27. *V. grandiflorum*
- 8b. Stamens inserted at apex of corolla tube; flowers opening after leaves; leaves papery to leathery.
- 10a. Leaves abaxially with sparse red-brown glandular dots, orbicular or broadly elliptic ..... 34. *V. subalpinum*
- 10b. Leaves abaxially without red-brown glandular dots, broadly elliptic to linear.
- 11a. Both surfaces of leaf blade glabrous.
- 12a. Leaf margin remotely crenulate except at base, apex acute; corolla tube ca. 3.5 mm ..... 32. *V. omeiense*
- 12b. Leaf margin remotely and shallowly serrate above base, apex abruptly narrowed or acuminate to long acuminate, shortly or long caudate; corolla tube 6–8 mm.
- 13a. Leaves subleathery to leathery, rarely thickly papery, midvein adaxially obviously raised, petiole purple-red; inflorescence peduncle (1.2–)2.5–7 cm; anthers purple-reddish; fruit 6–7 mm ..... 31. *V. oliganthum*
- 13b. Leaves papery, midvein adaxially not obviously raised, petiole green; inflorescence peduncle (3.5–)6–9 cm; anthers yellow-whitish; fruit 8–10 mm ..... 29. *V. longipedunculatum*
- 11b. Leaf blade abaxially stellate-pubescent in axils of veins at least, sometimes also along veins, adaxially glabrous or sparsely pubescent.
- 14a. Petiole glabrous, 2.5–5 cm; leaf blade 14–20 cm ..... 37. *V. trabeculosum*
- 14b. Petiole stellate-pubescent, sparsely stellate-pubescent, or glabrous, less than 2.5 cm; leaf blade 2–14 cm.
- 15a. Petiole less than 10 mm.
- 16a. Inflorescence  $4-5 \times 3-4$  cm, rays sparsely stellate-pubescent, immediately glabrescent; anthers purple-brownish; plant deciduous ..... 22. *V. brevitubum*
- 16b. Inflorescence ca.  $3 \times 2$  cm, rays stellate-pubescent; anthers yellow-whitish; plant evergreen ..... 35. *V. taitoense*
- 15b. Petiole 10–25 mm.
- 17a. Lateral veins mostly anastomosing near margin; leaves subleathery ..... 23. *V. chingii*
- 17b. Lateral veins mostly directly ending in teeth; leaves papery.
- 18a. Corolla hypocrateriform, tube 5–6(–8) mm; stamens slightly exceeding corolla tube; flowers fragrant; leaf petiole purple ..... 25. *V. erubescens*
- 18b. Corolla rotate-campanulate, tube ca. 3 mm; stamens obviously exceeding corolla tube; flowers not fragrant; leaf petiole green or reddish ..... 33. *V. shweliense*
- 1b. Inflorescence compound and umbel-like, rarely pyramidal panicle consisting of umbels; rays whorled, first node of inflorescence with 4–8 rays, (if first node of corymblike inflorescence with 2 rays and pyrenes with a deep ventral groove then see *V. yunnanense* and *V. corymbiflorum*); pyrenes with 1 shallow ventral, or with both ventral and dorsal grooves.

- 19a. Winter buds naked; young branchlets and young leaves densely stellate-tomentose, fruit maturing from green, to red then black.
- 20a. Stipules 2 subulate, sometimes absent; inflorescence not pedunculate; pyrenes with 1 shallow dorsal groove and 1 deep ventral groove (2. *V. sect. Pseudotinus*).
- 21a. Inflorescence without large sterile flowers, inflorescence rays and calyx tube with small red-brownish glands; anthers purple; style exceeding calyx lobes ..... 14. *V. nervosum*
- 21b. Inflorescence with large sterile flowers on margin, inflorescence rays and calyx tube without small red-brownish glands; anthers yellow; style not exceeding calyx lobes ..... 15. *V. sympodiale*
- 20b. Stipules always absent; inflorescence pedunculate; pyrenes usually with 2 dorsal grooves and (1–)3 ventral grooves (1. *V. sect. Viburnum*).
- 22a. Shrubs or small trees, evergreen or semievergreen; leaf margin entire or indistinctly dentate, rarely serrulate; lateral veins often anastomosing near margin, not directly ending in teeth.
- 23a. Calyx tube glabrous; leaves 2–6(–8.5) cm, veins adaxially not impressed.
- 24a. Corolla campanulate-funnelform, lobes shorter than tube; old leaves abaxially evenly stellate-pubescent, hairs not totally covering leaf surface; flowers fragrant; leaf lateral veins 3 or 4 pairs ..... 5. *V. congestum*
- 24b. Corolla rotate, lobes as long as or slightly longer than tube; stellate hairs totally covering abaxial surfaces of old leaves; flowers not fragrant; leaf lateral veins 5 or 6 pairs ..... 13. *V. utile*
- 23b. Calyx tube ± stellate-pubescent; leaves 5–25 cm.
- 25a. Leaf blade adaxially densely stellate-pubescent, margin serrulate, apex acute to shortly acuminate, rarely obtuse to rounded ..... 1. *V. buddleifolium*
- 25b. Leaf blade adaxially glabrous or glabrescent, sparsely stellate-pubescent when young particularly on midvein and lateral veins, margin entire or rarely inconspicuously dentate, apex slightly acute or obtuse.
- 26a. Leaves lanceolate-oblong to narrowly oblong, usually 5–15 × 1.5–4.5 cm, thickly papery when old; lateral veins and veinlets adaxially slightly impressed, not obviously rugose; petioles 1–2 cm; corolla outside sparsely stellate-pubescent; flowers on rays of 2nd order ..... 4. *V. chinshanense*
- 26b. Leaves ovate-lanceolate to ovate-oblong, usually 8–25 × 2.5–8 cm, leathery; midvein, lateral veins, and veinlets adaxially deeply impressed, strongly rugose; petioles 1.5–4 cm; corolla outside subglabrous; flowers on rays of 3rd order ..... 10. *V. rhytidophyllum*
- 22b. Leaves deciduous in winter, margin often dentate.
- 27a. Lateral veins directly ending in teeth, not anastomosing, or at least mostly so.
- 28a. Calyx tube glabrous; corolla lobes shorter than tube; stamens shorter than corolla; style exceeding calyx lobes; leaf margin serrulate or entire ..... 6. *V. cotinifolium*
- 28b. Calyx tube stellate-tomentose; corolla lobes nearly as long as or less than 2 × as long as tube; stamens slightly exceeding corolla lobes; style not exceeding calyx lobes; leaf margin dentate ..... 7. *V. glomeratum*
- 27b. Lateral veins anastomosing near margin, not directly ending in teeth, or at least mostly so.
- 29a. Inflorescence with large sterile radiant flowers ..... 8. *V. macrocephalum*
- 29b. Inflorescence with only fertile flowers, without large sterile radiant flowers.
- 30a. Corolla rotate, tube shorter than lobes.
- 31a. Branchlets of previous year gray-brownish; leaves apically obtuse or rounded, sometimes emarginate or slightly acute; flowers mostly on rays of 3rd and 4th orders, flowers appearing with leaves; pyrenes dorsally raised or indistinctly 2-grooved ..... 11. *V. schensianum*
- 31b. Branchlets of previous year yellow-white; leaves apically usually acute, rarely slightly obtuse; flowers mostly on rays of 2nd order, flowers appearing after leaves; pyrenes with 2 dorsal grooves ..... 2. *V. burejaeticum*
- 30b. Corolla tubular-campanulate, rarely hypocrateriform, tube obviously longer than lobes.
- 32a. Corolla hypocrateriform ..... 3. *V. carlesii*
- 32b. Corolla tubular-campanulate.
- 33a. Leaves broadly ovate or elliptic to rarely suborbicular, 2.5–5(–6) cm, apex acute or obtuse; petioles 4–10 mm; flowers usually on rays of 1st order; corolla yellow-white ..... 9. *V. mongolicum*
- 33b. Leaves ovate-lanceolate or ovate-oblong, 7–15(–18) cm, apex acuminate to narrowly caudate; petioles 1–4 cm; flowers on rays from 3rd to 4th order; corolla purple outside ..... 12. *V. urceolatum*
- 19b. Winter buds with 1 or 2 (very rarely 3 or more) pairs of scales (rarely winter bud naked, and if such, buds, young branchlets, abaxial surfaces of leaves, inflorescences, calyces, corollas, and fruit with lepidote scales, see *V. punctatum*); young branchlets and young leaves stellate-pubescent, bristlelike hairy, or glabrous, fruit maturing from green to red (*V. sect. Odontotinus* and *V. sect. Opulus*) or from green to blue-black (*V. sect. Tinus* and *V. sect. Megalotinus* p.p.), rarely maturing from green, to red then black (*V. sect. Tomentosa* and *V. sect. Megalotinus* p.p.).

- 34a. Pyrenes globose, ovoid, or ellipsoid, with or without a shallow and narrow ventral groove, absolutely not compressed; fruit blue-black or turning from blue to black; leaves evergreen, glabrous or subglabrous (3. *V.* sect. *Timus*).  
 35a. Leaves pinnateveined ..... 16. *V. atrocyanum*  
 35b. Leaves triplinerved.  
 36a. Leaves apically obtuse to rounded, 2–6(–7.5) cm, margin entire; inflorescence peduncle ca. 1 cm ..... 20. *V. triplinerve*  
 36b. Leaves apically acute to acuminate, margin entire or remotely serrate; inflorescence peduncle 1–3.5(–4) cm.  
 37a. Corolla white; old leaves thickly leathery; veinlets adaxially deeply impressed, obviously rugose; anthers red-blackish ..... 18. *V. davidii*  
 37b. Corolla greenish white or yellowish green; old leaves leathery; veinlets adaxially sometimes slightly impressed, not obviously rugose; anthers yellow.  
 38a. Shrubs 1–2 m tall; inflorescence 2–7 cm in diam., glabrous; leaves 3–9(–11) cm, margin usually remotely serrate ..... 19. *V. propinquum*  
 38b. Shrubs or small trees 3–6 m tall; inflorescence 6–15 cm in diam.; leaves 6–13(–18) cm, margin entire or occasionally remotely serrate toward apex ..... 17. *V. cinnamomifolium*  
 34b. Pyrenes not as above; if ellipsoid then pyrenes with a deep ventral groove wide in upper part yet narrow in lower part; fruit red when mature, or turning from red to black, rarely yellow.  
 39a. Winter buds surrounded by 2 pairs of connate scales; leaves 3–5-lobed; petiolar apex or leaf base adaxially with 1–4 conspicuous glands (8. *V.* sect. *Opulus*).  
 40a. Inflorescence without large sterile flowers; leaves 3–5-lobed; petioles not longer than 2.5 cm ..... 72. *V. koreanum*  
 40b. Inflorescence with large sterile flowers on margin; leaves usually 3-lobed or those in upper part of branchlets undivided; petioles 1–5 cm ..... 73. *V. opulus*  
 39b. Winter buds with 1 or 2 pairs of separate scales; glands absent at petiolar apex or leaf base adaxially, but abaxially sometimes with circular glands on both sides of midvein near base.  
 41a. Leaves palmately 3–5-lobed, palmatinerved (7. *V.* sect. *Odontotinus*, p.p.) ..... 62. *V. kansuense*  
 41b. Leaves not divided or 2- or 3-lobed, mostly pinnateveined, sometimes 2 lateral veins at base appearing triplinerved.  
 42a. Inflorescence with large sterile flowers; fruit maturing from green to red then black; pyrenes with 1 ventral groove broad in upper part yet narrow in lower part (5. *V.* sect. *Tomentosa*).  
 43a. Leaves with more than 10 pairs of lateral veins; peduncle with 6–8 rays; inflorescences at apices of short lateral branches ..... 40. *V. plicatum*  
 43b. Leaves with 5–7(–9) pairs of lateral veins; peduncle usually with 5 rays; inflorescence terminal ..... 39. *V. hanceanum*  
 42b. Inflorescence without large sterile flowers; fruit maturing from green to red, rarely to black (if so see *V. cylindricum*, *V. lutescens*, and *V. punctatum*); pyrenes usually compressed, usually with shallow ventral and dorsal grooves.  
 44a. Shrubs or small trees evergreen, rarely deciduous (if so see *V. ternatum*); stipules usually absent (but present in *V. ternatum* and *V. inopinatum*); winter buds with a pair of separate scales, very rarely naked (if so see *V. punctatum*) (6. *V.* sect. *Megalotinus*).  
 45a. Winter buds naked; winter buds, abaxial leaf surfaces, inflorescences, and outside of corollas with lepidote scales ..... 47. *V. punctatum*  
 45b. Winter buds 2-perulate; plant not lepidote.  
 46a. Lateral veins totally or at least partly ending in teeth; inflorescence at apices of lateral short branchlets with 1-jugate leaves.  
 47a. Young branchlets, petioles, and inflorescences yellow-brown stellate-tomentose; first node of inflorescence with 6 or 7 rays ..... 41. *V. amplifolium*  
 47b. Plant glabrous throughout; first node of inflorescence with 4 or 5 rays ..... 44. *V. laterale*  
 46b. Lateral veins arched and anastomosing near margin, not directly ending in teeth; inflorescences at apices of branchlets with 1 to several pairs of leaves.  
 48a. Corolla campanulate; lobes short, erect; leaves abaxially with reddish or yellow glandular dots ..... 42. *V. cylindricum*  
 48b. Corolla rotate.  
 49a. Leaf margin serrate, or sometimes serrate except at base, base not glandular spotted; stamens slightly exceeding corolla, filaments not folded in bud.  
 50a. Branchlets and abaxial leaf surfaces sparsely stellate-pubescent, glabrescent; plant elsewhere subglabrous; leaves leathery; inflorescence a compound umbel-like or panicle-like cyme, fragrant ..... 46. *V. lutescens*

- 50b. Branchlets, abaxial leaf surfaces, petioles, peduncles, pedicels, and calyces yellow-brown stellate-tomentose; leaves papery; inflorescence a pyramidal panicle composed of 2–4 layers of umbels, not fragrant ..... 48. *V. pyramidatum*
- 49b. Leaf margins entire or sometimes slightly dentate at apex, base often glandular spotted on midvein; stamens obviously exceeding corolla, filaments folded in bud.
- 51a. Leaves often whorled, 3 per whorl; stipules 2, persistent; inflorescence peduncle nearly absent ..... 49. *V. ternatum*
- 51b. Leaves opposite; stipules absent or 2, caducous; inflorescence peduncle (1–)1.5–3 cm, rarely absent.
- 52a. Leaves pubescent or only so on veins, papery; calyx tube glabrous ..... 45. *V. leiocarpum*
- 52b. Leaves thickly stellate-tomentose, leathery; calyx tube stellate-tomentose ..... 43. *V. inopinatum*
- 44b. Shrubs, rarely small trees, deciduous, rarely evergreen; stipules sometimes present; winter buds with 2 pairs of separate scales (7. *V.* sect. *Odontotinus*, p.p.).
- 53a. Leaf blade oblong-lanceolate, lanceolate, or linear-lanceolate, 9–19(–27) × 1–4 cm, irregularly or remotely serrate, sometimes subentire; pyrenes compressed, subquadrangular or slightly rectangular.
- 54a. Young branchlets, leaves, petioles, and inflorescence axes glabrous; leaves with ca. 6 pairs of lateral veins ..... 71. *V. squamulosum*
- 54b. Young branchlets, veins on abaxial leaf surfaces, petioles, and inflorescence axes stellate-pubescent; leaves with 7–12 pairs of lateral veins ..... 63. *V. lancifolium*
- 53b. Leaf blade orbicular, ovate to elliptic-oblong, obovate, or rhombic-ovate, rarely broadly oblong-lanceolate, generally less than 10 cm, margin dentate, serrate, denticulate, or entire, if more than 10 cm then more than 4 cm wide and with margin dentate, or less than 4 cm wide and with margin entire (see *V. integrifolium*); pyrenes obovoid, ovoid, ellipsoid-ovoid, or ellipsoid.
- 55a. Leaf margin entire, possibly remotely serrate or remotely dentate above middle part.
- 56a. Shrubs deciduous; inflorescence peduncle more than 2 cm.
- 57a. Leaves glabrous on both sides, margin entire, apex abruptly narrowed and long caudate, petiole green; style not exceeding calyx lobes ..... 61. *V. integrifolium*
- 57b. Leaves stellate-pubescent at least abaxially, margin subentire, apex acute to shortly acuminate, petiole reddish purple; style exceeding calyx lobes ..... 56. *V. foetidum*
- 56b. Shrubs evergreen; inflorescence peduncle less than 2 cm or nearly absent.
- 58a. Leaves abaxially with both golden yellow glandular dots and red-brown to black-brown glandular dots, adaxially usually not nigrescent when dry ..... 51. *V. chunii*
- 58b. Leaves with black or brown glandular dots, nigrescent when dry.
- 59a. Calyx tube stellate-pubescent; leaves subleathery; fruit acute at apex ..... 59. *V. hainanense*
- 59b. Calyx tube glabrous; leaves leathery; fruit rounded at apex ..... 69. *V. sempervirens*
- 55b. Leaf margin dentate, serrate, or denticulate, sometimes only so above 1/3 from base.
- 60a. Leaves with 2–4 pairs of lateral veins, basal pair often appearing triplinerved.
- 61a. Leaf blade 0.8–3 cm, apex rounded or slightly acute; inflorescence ca. 2.5 cm in diam., peduncles ca. 5 mm; pyrenes with 1 ventral groove ..... 68. *V. parvifolium*
- 61b. Leaf blade 4–10 cm, apex acute to shortly acuminate; inflorescence 5–8 cm in diam., peduncles 2–5 cm; pyrenes with 3 ventral grooves ..... 56. *V. foetidum*
- 60b. Leaves with more than 5 pairs of pinnate lateral veins.
- 62a. Corolla outside glabrous or subglabrous, very rarely hairy in bud but later glabrescent (cf. *V. betulifolium*).
- 63a. Inflorescence or infructescence nodding; leaves nigrescent or slightly pale black when dry ..... 70. *V. setigerum*
- 63b. Inflorescence or infructescence not nodding; leaves not nigrescent when dry.
- 64a. Inflorescence peduncles (5–)6–10(–12.5) cm ..... 60. *V. hengshanicum*
- 64b. Inflorescence peduncles shorter than 5 cm.
- 65a. Petioles more than 1 cm; inflorescence 4–12 cm in diam.
- 66a. Stipules caducous, or absent; first node of inflorescence usually with 5 rays; flowers on rays of 2nd and 3rd orders; fruit dark purple-red, maturing black, ellipsoid; branchlet of current year grayish black ..... 66. *V. melanocarpum*
- 66b. Stipules persistent, often present; first node of inflorescence usually with 7 rays; flowers on rays from 3rd to 5th orders; fruit red, globose; branchlet of current year purple-brown ..... 50. *V. betulifolium*

- 65b. Petiole less than 15 mm, inflorescence less than 4 cm in diam.  
 67a. Stipules absent, petiole 5–15 mm, leaf blade ovate, apex caudate ..... 58. *V. formosanum*  
 67b. Stipules present or absent, petiole 3–5 mm, leaf blade ovate-lanceolate, ovate-oblong, narrowly ovate, elliptic, or oblong-lanceolate, apex acuminate or acute ..... 55. *V. erosum*
- 62b. Corolla sparsely or densely stellate-pubescent.  
 68a. Leaves abaxially with yellow or yellowish or nearly colorless transparent glandular dots.  
 69a. Petiole 1–3 cm, stellate pubescent or simple hairs less than 1 mm; calyx tube stellate-pubescent, flowers fragrant; plant 2.5–5 m tall ..... 54. *V. dilatatum*  
 69b. Petiole 0.5–1 cm, densely yellowish brown bristlelike hairy; calyx tube with simple hairs, flowers not fragrant; plant 1–2 m tall ..... 52. *V. corylifolium*
- 68b. Leaves abaxially without glandular dots.  
 70a. Leaves adaxially with transparent or dispersed red-brown glandular dots.  
 71a. Leaf blade abaxially densely stellate-pubescent, adaxially with dispersed red-brown glandular dots; inflorescence peduncle 1–3.5 cm or very rarely nearly absent; pyrenes compressed, ovoid, ca.  $6 \times 4$  mm, with 1 dorsal groove and 2 ventral grooves ..... 57. *V. fordiae*  
 71b. Leaf blade abaxially sparsely stellate-pubescent or forklike pubescent, adaxially with transparent glandular dots; inflorescence peduncle usually very short or nearly absent, very rarely to 1.5 cm; pyrenes very compressed, ovoid,  $4\text{--}5 \times 3\text{--}4$  mm, with 3 shallow dorsal grooves and 2 shallow ventral grooves ..... 65. *V. luzonicum*
- 70b. Leaves adaxially without glandular dots.  
 72a. Leaf blade abaxially glabrous except midvein and lateral veins yellow-brown bristlelike hairy; lateral veins 8–12-jugate ..... 53. *V. dalzielii*  
 72b. Leaf blade abaxially stellate-pubescent, or only so in vein axils; lateral veins 5–9-jugate.  
 73a. Styles very short, shorter than calyx lobes; corolla lobes nearly as long as tube; stamens shorter than corolla; pyrenes 4–6 mm; leaf margin serrate ..... 67. *V. mullaha*  
 73b. Styles exceeding calyx lobes; corolla lobes longer than tube; stamens equaling or slightly exceeding corolla; pyrenes 6–7.5 mm; leaf margin crenate ..... 64. *V. longiradiatum*

### 1. *Viburnum* sect. *Viburnum*

裸芽组 *luo ya zu*

Winter buds naked. Inflorescence a compound umbel-like cyme, without large sterile radiant flowers, pedunculate. Corolla rotate, hypocrateriform or tubular. Fruit initially turning red, maturing black; pyrenes with 2 dorsal grooves and 3 ventral grooves; albumen solid.

About 20 species: mostly in temperate Asia and Europe; 13 species (seven endemic) in China.

This section was divided into three subsections by H. Hara (Ginkgoana 5: 204–213. 1983): *Viburnum* subsect. *Solenolantana* (Nakai) H. Hara for *V. carlesii*, *V.* subsect. *Urceolata* Nakai for *V. urceolatum*, and *V.* subsect. *Viburnum* for the remaining species. Recent phylogenetic work shows that *V. subsect. Urceolata* may be separated from the remainder of *V. sect. Viburnum*. *Viburnum* subsect. *Lantana* and *V. subsect. Solenolantana* form a monophyletic group, and the recognition of *V. subsect. Solenolantana* makes *V. subsect. Lantana* paraphyletic.

**1. *Viburnum buddleifolium*** C. H. Wright, Gard. Chron. 33: 257. 1903.

醉鱼草状荚蒾 *zui yu cao zhuang jia mi*

Shrubs, semievergreen, to 5 m tall. Bark gray-brownish. Branchlets of current year whitish stellate-tomentose; branchlets of previous year gray-brownish, terete, glabrous, with dispersed, small, rounded lenticels. Winter buds naked, whitish stellate-tomentose. Leaves always opposite, not clustered at apices of branchlets; stipules absent; petiole green, robust, 1–2(–4) cm, gray-whitish or whitish stellate-pubescent; leaf blade whitish green when young, lanceolate or lanceolate-oblong, rarely ovate-lanceolate,  $9\text{--}13\text{--}(18) \times 4\text{--}5\text{--}(7.5)$  cm, papery, abaxially gray-whitish stellate-pubescent, adaxially densely stel-

late-pubescent, midvein raised abaxially, lateral veins 7–9-jugate, pinnate, arched, branched, ending in teeth, raised abaxially, slightly impressed adaxially, veinlets transverse, slightly raised or inconspicuous abaxially, inconspicuous adaxially, not lobed, base rounded, frequently unequal, rarely cordate, without glands, margin serrulate, apex acute to shortly acuminate, rarely obtuse to rounded. Flowers appearing after leaves; inflorescence a compound umbel-like cyme, terminal, 9–12 cm in diam.; rays whorled; first node of inflorescence usually with 5 rays, dense, gray-whitish stellate-tomentose, without large sterile radiant flowers; peduncle 1–3 cm; bracts caducous, leaflike, green, linear-lanceolate, stellate-pubescent; bracteoles scalelike. Flowers on rays of 3rd order, not fragrant, subsessile or shortly pedicellate. Calyx greenish; tube tubular-campanulate, 2–3 mm,

gray-whitish stellate-pubescent; lobes broadly triangular-ovate, very small, 0.5–1 mm, stellate-tomentose, apex obtuse, ciliate. Corolla white, rotate, ca. 7 mm in diam., outside sparsely stellate-hairy; tube 3–4 mm; lobes spreading, orbicular-ovate, 2–3 mm, equaling tube, apex rounded, margin entire. Stamens slightly exceeding corolla lobes, inserted near base of corolla tube; filaments ca. 6 mm; anthers yellow, broadly elliptic, ca. 1 mm. Styles slightly exceeding or subequaling calyx lobes; stigmas capitate. Fruit initially turning red, maturing black, oblong, ca. 9 × 7 mm, base rounded, apex rounded, glabrous or sparsely stellate-pubescent; pyrenes compressed, oblong, 6–8 × 5–6 mm, with 2 dorsal grooves and 3 ventral grooves, apex rounded. Fl. Apr–May, fr. Jul.  $2n = 20^*$ .

• Forests; 1000–2000 m. W Hubei.

**2. *Viburnum burejaeticum*** Regel & Herder, *Gartenflora* 11: 407. 1862.

修枝荚蒾 xiu zhi jia mi

*Viburnum arcuatum* Komarov; *V. burejanum* Herder; *V. davuricum* Maximowicz (1859), not Pallas (1789).

Shrubs, deciduous, to 5 m tall. Bark dark grayish. Branchlets of current year gray-whitish stellate-tomentose; branchlets of previous year yellow-whitish, terete, glabrous, with dispersed, small, rounded lenticels. Winter buds naked, gray-whitish stellate-tomentose. Leaves always opposite, not clustered at apices of branchlets; stipules absent; petiole green, robust, 5–12 mm, gray-whitish stellate-tomentose; leaf blade greenish white when young, broadly ovate to elliptic-obovate, (3–)4–6(–10) × 2–3 cm, papery, abaxially at first densely stellate pubescent but later only midvein and lateral veins hairy, adaxially sparsely stellate-pubescent or glabrous at first, later stellate-pubescent on midvein and lateral veins only, midvein raised abaxially, lateral veins 5- or 6-jugate, pinnate, arched, branched, anastomosing near margin, or some ending in teeth, raised abaxially, slightly impressed adaxially, veinlets transverse, slightly raised or inconspicuous abaxially, inconspicuous adaxially, not lobed, base obtuse or rounded, both sides often unequal, without glands, margin serrulate, apex acute, rarely slightly obtuse. Flowers appearing after leaves; inflorescence a compound umbel-like cyme, terminal, 4–5 cm in diam.; rays whorled; first node of inflorescence usually with 5 rays, dense, gray-whitish stellate-tomentose, without large sterile radiant flowers; peduncle to 2 cm or nearly absent; bracts caducous, leaflike, green, linear to linear-lanceolate, stellate-pubescent; bracteoles linear. Flowers mostly on rays of 2nd order, not fragrant, sessile. Calyx greenish; tube oblong-tubular, ca. 4 mm, glabrous or rarely sparsely stellate-pubescent; lobes triangular, small, 1–2 mm, glabrous or with few stellate ciliate hairs, apex obtuse. Corolla white, rotate, ca. 7 mm in diam., glabrous; tube 1–2 mm; lobes spreading, broadly ovate, 2.5–3 mm, nearly 2 × as long as tube, apex rounded, margin entire. Stamens slightly exceeding corolla lobes, inserted near base of corolla tube; filaments ca. 3 mm; anthers yellow, broadly ellipsoid, ca. 1 mm. Styles taller than calyx lobes; stigmas capitate. Fruit initially turning red, maturing black, ellipsoid to oblong, ca. 1 cm, base rounded, apex rounded, glabrous or sparsely stellate pubescent; pyrenes compressed, oblong, 9–10 × 4–5 mm, with

2 dorsal grooves and 3 ventral grooves, apex rounded. Fl. May–Jun, fr. Aug–Sep.

Needle-leaved and broad-leaved mixed forests; 600–1400 m. Heilongjiang, Jilin, Liaoning [N Korea, Mongolia, Russia].

**3. *Viburnum carlesii*** Hemsley var. ***bitchiuense*** (Makino) Nakai, *Bot. Mag. (Tokyo)* 28: 295. 1914.

备中荚蒾 bei zhong jia mi

*Viburnum bitchiuense* Makino, *Bot. Mag. (Tokyo)* 16: 156. 1902.

Shrubs, deciduous, to 3 m tall. Bark gray-brownish. Branchlets of current year grayish stellate-pubescent; branchlets of previous year grayish, terete, glabrous, with dispersed, small, rounded lenticels. Winter buds naked, grayish stellate-pubescent. Leaves always opposite, not clustered at apices of branchlets; stipules absent; petiole green, robust, 4–12 mm, grayish stellate-pubescent; leaf blade greenish white when young, ovate to elliptic-ovate, 4–10 × 2–6 cm, papery, abaxially stellate-pubescent particularly along veins, adaxially sparsely simple hairy and stellate-pubescent, glabrescent, midvein raised abaxially, lateral veins 4- or 5-jugate, pinnate, slightly arched, branched, anastomosing near margin, or rarely ending in teeth, raised abaxially, impressed adaxially, veinlets transverse, conspicuous abaxially, inconspicuous adaxially, not lobed, base rounded to slightly cordate, without glands, margin denticulate, apex acute. Flowers appearing after leaves; inflorescence a compound umbel-like cyme, terminal, ca. 6 cm in diam.; rays whorled; first node of inflorescence usually with 4–7 rays, dense, gray-whitish stellate-pubescent, without large sterile radiant flowers; peduncle 1–4 cm; bracts caducous, leaflike, green, ovate to elliptic, stellate-pubescent; bracteoles scalelike. Flowers on rays of 2nd or 3rd order, fragrant, subsessile or shortly pedicellate. Calyx greenish or reddish; tube oblong-tubular, 0.7–1 mm, glabrous; lobes ovate, very small, 0.5–1 mm, glabrous, apex obtuse. Corolla pinkish, hypocrateriform, ca. 1 cm in diam., glabrous; tube 8–10 mm; lobes spreading, broadly ovate, 5–6 × 3–5 mm, apex rounded, margin entire. Stamens inserted at or below middle of corolla tube, ca. 5 mm; filaments 2–4 mm; anthers yellow, oblong, ca. 2 mm. Styles nearly as long as calyx lobes; stigmas capitate. Fruit initially turning red, maturing black, elliptic, 1.1–1.4 cm, base rounded, apex rounded, glabrous; pyrenes compressed, ellipsoid, 6–8 × ca. 4 mm, with 2 dorsal grooves and 3 ventral grooves, apex rounded. Fl. Mar–May, fr. Jun–Sep.  $2n = 18(16)$ .

Forests; 700–1300 m. W Anhui [Japan, Korea].

The typical variety, var. *carlesii*, occurs in Japan and Korea.

**4. *Viburnum chinshanense*** Graebner, *Bot. Jahrb. Syst.* 29: 585. 1901.

金佛山荚蒾 jin fo shan jia mi

*Viburnum cavaleriei* H. Léveillé; *V. hypoleucum* Rehder; *V. rosthornii* Graebner; *V. utile* Hemsley var. *elaeagnifolium* Rehder.

Shrubs, semievergreen, to 5 m tall. Bark gray-brownish or gray-whitish. Branchlets of current year yellow-whitish or

brownish stellate-tomentose; branchlets of previous year brownish, terete, glabrous, with dispersed, small, rounded lenticels. Winter buds naked, yellow-whitish or brownish stellate-tomentose. Leaves always opposite, not clustered at apices of branchlets; stipules absent; petiole green, robust, 1–2 cm, gray-whitish or yellow-whitish stellate-tomentose; leaf blade greenish white when young, dark green when mature, lanceolate-oblong or narrowly oblong, 5–10(–15) × 1.5–4.5 cm, papery to thickly leathery, abaxially gray-whitish or yellow-whitish stellate-pubescent (particularly on young leaves), on old leaves gray-brownish, adaxially glabrous, or with sparse short hairs on midvein and lateral veins when young, midvein raised abaxially, lateral veins 7–10-jugate, pinnate, arched, branched, anastomosing near margin, raised abaxially, slightly (more conspicuously on young leaves) raised adaxially, veinlets transverse, conspicuous abaxially, slightly impressed or inconspicuous adaxially, not lobed, base rounded or slightly cordate, without glands, margin entire or rarely inconspicuously dentate, apex slightly acute or obtuse. Flowers appearing after leaves; inflorescence a compound umbel-like cyme, terminal, 4–6(–8) cm in diam.; rays whorled; first node of inflorescence with 5–7 rays, subequal in length, dense, gray-whitish or yellow-whitish stellate-tomentose, without large sterile radiant flowers; peduncle 1–2.5 cm; bracts caducous, leaflike, green, linear-lanceolate, stellate-pubescent; bracteoles scalelike. Flowers usually on rays of 2nd order, not fragrant, shortly pedicellate. Calyx greenish; tube oblong-ovate, ca. 2.5 mm, ± stellate-hairy; lobes broadly ovate, very small, 0.5–1 mm, sparsely stellate-pubescent, apex obtuse. Corolla white, rotate, ca. 7 mm in diam., outside sparsely stellate-hairy; tube ca. 3 mm; lobes spreading, orbicular-ovate or suborbicular, ca. 2 mm, apex rounded, margin entire. Stamens slightly exceeding corolla lobes, inserted near base of corolla tube; filaments ca. 5 mm; anthers yellow, broadly elliptic, ca. 1 mm. Styles slightly exceeding or subequaling calyx lobes; stigmas capitate. Fruit initially turning red, maturing black, oblong-ovoid, base rounded, apex rounded, sparsely stellate-pubescent; pyrenes very compressed, oblong, 8–9 × 4–5 mm, with 2 dorsal grooves and 3 ventral grooves, apex rounded. Fl. Apr–May, fr. Jul.

• Sparse forests, thickets; 100–1900 m. Chongqing, Gansu, Guizhou, Shaanxi, Sichuan, E Yunnan (Luoping).

**5. *Viburnum congestum*** Rehder in Sargent, *Trees & Shrubs* 2: 111. 1908.

绣球荚蒾 xiu qiu jia mi

*Viburnum macrocephalum* var. *sterile* Dippel.

Shrubs, deciduous or semievergreen, to 4 m tall. Bark gray-brownish or gray-whitish. Branchlets of current year densely gray-whitish or yellow-whitish stellate-pubescent, glabrescent; branchlets of previous year gray-brownish or gray-whitish, terete, glabrous, with dispersed, small, rounded lenticels. Winter

buds naked, densely gray-whitish or yellow-whitish stellate-pubescent. Leaves always opposite, not clustered at apices of branchlets; stipules absent; petiole green, robust, 1–1.5 cm, gray-whitish or yellow-whitish stellate-pubescent; leaf blade greenish white when young, ovate to elliptic or ovate-elliptic, 5–11 × 2–5 cm, papery, abaxially stellate-pubescent, adaxially densely stellate-pubescent at first, later only so on midvein, midvein raised abaxially, lateral veins 5- or 6-jugate, pinnate, arched, branched, anastomosing near margin, raised abaxially, slightly impressed adaxially, veinlets transverse, slightly raised or inconspicuous abaxially, inconspicuous adaxially, not lobed, base rounded or sometimes slightly cordate, without glands, margin denticulate, apex obtuse or slightly acute. Flowers appearing after leaves; inflorescence a compound umbel-like cyme, terminal, 8–15 cm in diam.; rays whorled; first node of inflorescence with 5 rays, dense, gray-whitish or yellow-whitish stellate-pubescent, totally composed of large sterile flowers, or of fertile flowers yet with 8–18 large sterile radiant flowers; peduncle 1–2 cm; bracts caducous, leaflike, green, linear-lanceolate, stellate-pubescent; bracteoles linear. Flowers on rays of 3rd order, not fragrant, sessile or shortly pedicellate. Sterile flowers: calyx like fertile flowers; corolla white, rotate, 1.5–4 cm in diam., glabrous; lobes orbicular-obovate, apex rounded; stamens and pistils not developed. Fertile flowers: calyx greenish; tube tubular, ca. 2.5 mm, glabrous; lobes oblong, small, ca. 2 mm, nearly as long as calyx tube, glabrous, apex obtuse; corolla white, rotate, 10–12 mm in diam., glabrous; tube ca. 1 mm; lobes spreading, orbicular-obovate, ca. 2 mm, longer than tube, apex rounded, margin entire; stamens slightly taller than corolla lobes, inserted near base of corolla tube; filaments ca. 3 mm; anthers yellow, subglobose, small; styles slightly exceeding or subequaling calyx lobes; stigmas capitate. Fruit initially turning red, maturing black, elliptic, ca. 12 mm, base rounded, apex rounded, glabrous; pyrenes compressed, oblong, 10–12 × 6–8 mm, with 2 shallow dorsal grooves and 3 shallow ventral grooves, apex rounded. Fl. Apr–May, fl. Sep–Oct.  $2n = 18^*$ .

• Forests, thickets on mountain slopes; 400–1000 m. W Anhui, Henan, W Hubei, Hunan, S Jiangsu, NW Jiangxi, S Shandong, Zhejiang; also commonly cultivated.

Two forms may be recognized as follows. The typical form (*f. macrocephalum*) has its inflorescence totally composed of large sterile flowers (without anthers) and is known from cultivation only, while *f. keteleeri* (Carrière) Rehder (Bibl. Cult. Trees, 603. 1949; *Viburnum keteleeri* Carrière, Rev. Hort. 1863: 269. 1863; *V. arborescens* Hemsley; *V. macrocephalum* var. *keteleeri* (Carrière) G. Nicholson; *V. macrocephalum* var. *indutum* Handel-Mazzetti) is the wild-related taxa and has its inflorescence with 8–18 large sterile radiant flowers (without anthers) only at margin and fertile flowers (with stamens) at center. Also commonly cultivated, the latter also occurs in forests, thickets on mountain slopes, at 400–1000 m, in W Anhui, W Hubei, Hunan, S Jiangsu, NW Jiangxi, and Zhejiang.

**9. *Viburnum mongolicum*** (Pallas) Rehder in Sargent, Trees & Shrubs 2: 111. 1908.

蒙古荚蒾 *meng gu jia mi*

*Lonicera mongolica* Pallas, Reise Russ. Reich. 3: 721. 1771; *Viburnum davuricum* Pallas.

Shrubs, deciduous, to 2 m tall. Bark gray-yellowish. Branchlets of current year yellow-whitish stellate-tomentose; branchlets of previous year yellow-whitish, very rounded, glabrous, with dispersed, small, rounded lenticels. Winter buds naked, yellow-whitish stellate-tomentose. Leaves always opposite, not clustered at apices of branchlets; stipules absent; petiole green, robust, 4–10 mm, yellow-whitish stellate-tomentose; leaf blade abaxially gray-greenish and adaxially yellowish green when young, broadly ovate to elliptic, rarely suborbicular, 2.5–5(–6) × 1.5–3 cm, papery, abaxially stellate-pubescent, adaxially stellate-pubescent or forked-hairy, midvein raised abaxially, lateral veins 4- or 5-jugate, pinnate, arched, branched, anastomosing near margin, raised abaxially, slightly impressed adaxially or inconspicuous, veinlets transverse, inconspicuous on both surfaces, not lobed, base rounded or cuneate-rounded, without glands, margin crenulate, with tips of teeth mucronate, apex acute or obtuse. Flowers appearing after leaves; inflorescence a compound umbel-like cyme, terminal, 1.5–3.5 cm in diam.; rays whorled; first node of inflorescence with 5 or fewer rays, few flowered, yellow-whitish stellate-tomentose, without large sterile radiant flowers; peduncle 5–10 mm; bracts caducous, leaflike, green, linear to linear-lanceolate, stellate-pubescent; bracteoles linear. Flowers mostly on rays of 1st order, not fragrant, sessile. Calyx greenish; tube oblong-tubular, 3–5 mm, glabrous; lobes repand, very small, 0.5–1 mm, glabrous, apex obtuse. Corolla yellowish whitish, tubular-campanulate, ca. 3 mm in diam., glabrous; tube 5–7 mm; lobes spreading, orbicular-ovate, ca. 1.5 mm, shorter than tube, apex rounded, margin entire. Stamens nearly as long as corolla, inserted near base of corolla tube; filaments ca. 6 mm; anthers yellow, oblong, ca. 2 mm. Styles taller than calyx lobes; stigmas capitate. Fruit initially turning red, maturing black, ellipsoid, ca. 1 cm, base rounded, apex rounded, glabrous; pyrenes compressed, oblong, ca. 8 × 5–6 mm, with 2 shallow dorsal grooves and 3 shallow ventral grooves, apex rounded. Fl. May–Jul, fr. Jul–Sep.  $2n = 18(16)$ .

Sparse forests; 800–2700 m. S Gansu, Hebei (Neiqiu), Henan, Nei Mongol, S Ningxia, NE Qinghai, Shaanxi, Shanxi [Mongolia, Russia].

**10. *Viburnum rhytidophyllum*** Hemsley, J. Linn. Soc., Bot. 23: 355. 1888.

皱叶荚蒾 *zhou ye jia mi*

*Callicarpa vastifolia* Diels.

Shrubs or small trees, evergreen, to 4 m tall. Bark gray-brownish. Branchlets of current year robust, thickly yellow-whitish, yellow-brownish, or red-brownish stellate-tomentose; branchlets of previous year red-brownish or gray-blackish, terete, glabrous, with dispersed, small, rounded lenticels. Winter buds naked, yellow-brownish, or red-brownish stellate-tomentose. Leaves always opposite, not clustered at apices of branchlets; stipules absent; petiole green, robust, 1.5–3(–4) cm, thickly yellow-whitish, yellow-brownish, or red-brownish stellate-tomentose; leaf blade yellow-whitish, yellow-brownish, or red-brownish when young, becoming intense green adaxially, ovate-oblong to ovate-lanceolate, rarely lanceolate, 8–18(–25) × (1.5–)2.5–8 cm, leathery, abaxially strongly rugose, obviously reticulate, adaxially lustrous, sparsely stellate-pubescent when

young, glabrescent, midvein raised abaxially, lateral veins 6–8(–12)-jugate, pinnate, arched, branched, anastomosing near margin, very rarely ending in teeth, raised abaxially, slightly raised adaxially, veinlets transverse, conspicuous abaxially, inconspicuous adaxially, not lobed, base rounded or slightly cordate, without glands, margin entire or inconspicuously dentate, apex slightly acute or obtuse. Flowers appearing after leaves; inflorescence a compound umbel-like cyme, terminal, 7–12 cm in diam.; rays whorled; first node of inflorescence usually with 7 rays, dense, yellow-whitish, yellow-brownish, or red-brownish stellate-tomentose, without large sterile radiant flowers; peduncle robust, 1.5–4(–7) cm; bracts caducous, leaflike, green, linear to linear-lanceolate, stellate-pubescent; bracteoles linear. Flowers on rays of 3rd order, not fragrant, subsessile or shortly pedicellate. Calyx greenish; tube tubular-campanulate, 2–3 mm, yellow-whitish stellate-tomentose; lobes broadly triangular-ovate, very small, 0.5–1 mm, sparsely stellate-pubescent, apex obtuse, slightly ciliate. Corolla white, pinkish in bud and outside, rotate, 5–7 mm in diam., subglabrous; tube 3–4 mm; lobes spreading, orbicular-ovate, 2–3 mm, apex rounded, margin entire. Stamens exceeding corolla, inserted near base of corolla tube; filaments ca. 6 mm; anthers yellow, broadly elliptic, ca. 1 mm. Styles slightly exceeding calyx lobes; stigmas capitate. Fruit initially turning red, maturing black, broadly elliptic, 6–8 mm, base rounded, apex rounded, glabrous or sparsely stellate-pubescent; pyrenes compressed, broadly elliptic, 6–7 × 4–5 mm, with 2 dorsal grooves and 3 ventral grooves, apex rounded. Fl. Apr–May, fr. Sep–Oct.  $2n = 18^*$ .

• Forests, thickets; 700–2400 m. Guizhou, W Hubei, S Shaanxi, Sichuan.

**11. *Viburnum schensianum*** Maximowicz, Bull. Acad. Imp. Sci. Saint-Petersbourg 26: 480. 1880.

陕西荚蒾 shan xi jia mi

*Viburnum dielsii* Graebner (1901), not H. Léveillé (1911); *V. giraldii* Graebner; *V. schensianum* subsp. *chekiangense* P. S. Hsu & P. L. Chiu; *V. schensianum* var. *chekiangense* (P. S. Hsu & P. L. Chiu) Y. Ren & W. Z. Di.

Shrubs, deciduous, to 3 m tall. Bark gray-brownish. Branchlets of current year yellow-whitish stellate-tomentose; branchlets of previous year gray-brownish, slightly rectangular or terete, glabrous, with dispersed, small, rounded lenticels. Winter buds naked, often rusty-brownish stellate-pubescent. Leaves always opposite, not clustered at apices of branchlets; stipules absent; petiole green, robust, 7–10(–15) mm, yellow-whitish stellate-tomentose; leaf blade greenish white when young, ovate-elliptic, broadly ovate, or suborbicular, 3–6(–8) × 2–4.5 cm, papery, abaxially stellate-pubescent, adaxially sparsely stellate-pubescent at first, later almost glabrous, midvein raised abaxially, lateral veins 5–7-jugate, pinnate, arched, branched, anastomosing near margin, or some ending in teeth, raised abaxially, impressed adaxially, veinlets transverse, slightly raised on both surfaces, not lobed, base rounded, without glands, margin denticulate, apex obtuse or rounded, sometimes emarginate or slightly acute. Flowers appearing with leaves; inflorescence a compound umbel-like cyme, terminal, (4–)6–7(–8) cm in diam., to 9 cm at fruiting stage; rays

whorled; first node of inflorescence with (3–)5 rays, 1–2 cm, dense, yellow-whitish stellate-tomentose, without large sterile radiant flowers; peduncle 1–1.5(–7) cm or very short; bracts caducous, leaflike, green, linear-lanceolate, stellate-pubescent; bracteoles linear. Flowers mostly on rays of 3rd order, not fragrant, sessile or shortly pedicellate. Calyx greenish; tube cylindrical, 3.5–4 mm, glabrous or rarely stellate-tomentose; lobes ovate, very small, 0.5–1 mm, glabrous or with few stellate ciliate hairs, apex obtuse. Corolla white, rotate, ca. 6 mm in diam., glabrous; tube ca. 1 mm; lobes spreading, orbicular-ovate, ca. 2 mm, longer than tube, apex rounded, margin entire. Stamens ca. as long as or slightly longer than corolla, inserted near base of corolla tube; filaments ca. 2 mm; anthers yellow, globose, ca. 1 mm. Styles slightly exceeding or subequaling calyx lobes; stigmas capitate. Fruit initially turning red, maturing black, elliptic, ca. 8 mm, base rounded, apex rounded, glabrous; pyrenes ovoid-globose, 6–8 × 4–5 mm, dorsally raised and grooves absent, or indistinctly 2-grooved, ventrally 3-grooved, apex rounded. Fl. May–Jul, fr. Aug–Sep.

• Mixed forests, *Pinus* forests, thickets; 500–3200 m. Anhui, S and SE Gansu, Hebei (Neiqiu), Henan, Hubei, S Jiangsu, S Shaanxi, Shandong (Jinan), Shanxi, N Sichuan (Songpan), Zhejiang.

**12. *Viburnum urceolatum*** Siebold & Zuccarini, Abh. Math.-Phys. Cl. Königl. Bayer. Akad. Wiss. 4(3): 172. 1846.

壶花荚蒾 hu hua jia mi

*Viburnum furcatum* Blume ex J. D. Hooker & Thomson var. *melanophyllum* (Hayata) H. Hara; *V. martini* H. Léveillé; *V. melanophyllum* Hayata.

Shrubs or small trees, deciduous, to 10 m tall. Bark gray-brownish. Branchlets of current year yellow-brownish lepidote or furfuraceous stellate-pubescent; branchlets of previous year red-brownish or gray-brownish, terete, glabrous, with dispersed, small, rounded lenticels. Winter buds naked, furfuraceous stellate-pubescent. Leaves often clustered at apices of branchlets; stipules 2, subulate, 2–9 mm, bases often adnate to petioles, sometimes absent; petiole green, robust, 1.5–3(–4.5) cm, yellow-brownish stellate-pubescent; leaf blade greenish brown when young, ovate to elliptic-ovate or orbicular-ovate, 6–13

(–15) × 3–9(–11) cm, papery, abaxially yellow-brownish lepidote or furfuraceous stellate-pubescent particularly along veins, adaxially glabrous or stellate-pubescent on veins, midvein raised abaxially, lateral veins 6–8-jugate, pinnate, arched, branched, anastomosing near margin, raised abaxially, slightly impressed adaxially, veinlets transverse, conspicuous on both surfaces, not lobed, base rounded, rarely shallowly cordate, without glands, margin irregularly serrate, apex acuminate or acute. Flowers appearing with leaves; inflorescence a compound umbel-like cyme, terminal, 5–9 cm in diam.; rays whorled; first node of inflorescence usually with 5 rays, dense, subglabrescent or yellow-brownish lepidote or furfuraceous stellate-pubescent, with large white sterile radiant flowers on margin; peduncles absent; bracts caducous, leaflike, green, ovate to elliptic, stellate-pubescent; bracteoles scalelike. Flowers on rays of 3rd order, fragrant, subsessile or shortly pedicellate. Sterile flowers: calyx like fertile flowers, 2.5–3 cm in diam.; corolla lobes obovate, often unequal in size; stamens and pistils not developed. Fertile flowers: calyx greenish; tube subglobose, ca. 2 mm, glabrous; lobes ovate-orbicular, very small, 0.5–1 mm, sparsely stellate-pubescent, apex obtuse; corolla white or reddish, rotate, 5–6 mm in diam., glabrous; tube ca. 2 mm; lobes spreading, ovate, ca. 2 × as long as tube, apex rounded, margin entire; stamens shorter than corolla, inserted near base of corolla tube; filaments ca. 1 mm; anthers yellow, ovoid, ca. 1 mm; styles not exceeding calyx lobes; stigmas capitate. Fruit initially turning yellow, then red, maturing purple-nigrescent, ovoid, 8–9 mm, base rounded, apex rounded, glabrous; pyrenes slightly compressed, oblong, ca. 7 × 5 mm, with 1 shallow dorsal groove and 1 deep ventral groove, apex rounded. Fl. Apr–May, fr. Aug–Sep.

• Forests, thickets; 800–2600 m. S Anhui, N Fujian, S Gansu, N Guangdong, NE Guangxi, Guizhou, Henan, Hubei, Hunan, Jiangxi, S Shaanxi, Sichuan, Taiwan, Yunnan, Zhejiang.

### 3. *Viburnum* sect. *Tinus* (Miller) C. B. Clarke, Fl. Brit. India 3: 6. 1880.

球核组 *qiu he zu*

*Tinus* Miller, Gard. Dict. Abr., ed. 4. 1754.

Winter buds with 1 pair of separate scales. Inflorescence a compound umbel-like cyme, without large sterile radiant flowers, pedicellate or subsessile. Corolla rotate. Fruit not turning red, maturing blue-blackish; pyrenes with 1 very shallow ventral groove or without groove; albumen deeply ruminant.

Six to nine species: temperate and subtropical Asia and temperate Europe; five species (four endemic) in China.

Recent phylogenetic work shows that this section is clearly monophyletic and related to New World representatives of *Viburnum* sect. *Odontotinus* and *V.* sect. *Oreiotinus* (Oersted) Benth. & J. D. Hooker.

**16. *Viburnum atrocyaneum*** C. B. Clarke in J. D. Hooker, Fl. Brit. India 3: 7. 1880.

蓝黑果荚蒾 *lan hei guo jia mi*

*Viburnum calvum* Rehder; *V. schneiderianum* Handel-Mazzetti.

Shrubs, evergreen, to 3 m tall. Bark gray-brownish. Branchlets of current year purplish at first, later grayish yellowish, stellate-pubescent or subglabrous; branchlets of previous year gray or gray-brownish, terete, glabrous, with dispersed, small, rounded lenticels. Winter buds ovoid-oblong,

with one pair of separate scales; scales reddish brown, ciliate, apex acute. Leaves generally opposite, sometimes in whorls of 3, not clustered at apices of branchlets; stipules absent; petiole green, slender, 6–12 mm, glabrous; leaf blade purplish when young, becoming abaxially pale greenish and adaxially intense green and lustrous, broadly ovate or ovate to ovate-lanceolate or rhombic-elliptic, rarely orbicular, (0.8–)3–6(–10) × 1.5–3(–6.5) cm, leathery, both surfaces glabrous, midvein raised abaxially, lateral veins 5–8-jugate, pinnate, arched, branched, anastomosing near margin, inconspicuous abaxially, impressed adaxially, veinlets transverse, inconspicuous abaxially, slightly impressed adaxially, not lobed, base broadly cuneate, both sides

often slightly asymmetric, without glands, margin often remotely irregularly denticulate, rarely entire, apex obtuse, mucronate, rarely acute or emarginate. Flowers appearing after leaves; inflorescence a compound umbel-like cyme, terminal, 2–6 cm in diam.; rays whorled; first node of inflorescence usually with 5–7 rays, lax, glabrous, without large sterile radiant flowers; peduncles 0.6–6 cm; bracts caducous, leaflike, green, linear to linear-lanceolate, glabrous; bracteoles scalelike. Flowers usually on rays of 2nd order, not fragrant; pedicel 2–3 mm. Calyx greenish; tube obconical, ca. 1 mm, glabrous; lobes broadly triangular, broader than long, very small, ca. 0.5 mm, nearly 1/2 as long as calyx tube, glabrous, apex obtuse. Corolla white, rotate, ca. 5 mm in diam., glabrous; tube ca. 1 mm; lobes spreading, ovate-orbicular, ca. 1.5 mm, slightly longer than tube, apex rounded, margin entire. Stamens slightly shorter than corolla, inserted near base of corolla tube; filaments ca. 2 mm; anthers yellow, ovoid, ca. 1 mm. Styles nearly as long as calyx lobes; stigmas subsessile. Fruit not turning red, maturing blue-blackish, ovoid or globose, 5–6 mm, base rounded, apex acute, glabrous; pyrenes globose, ca. 5 mm in diam., with 1 very shallow ventral groove, apex rounded. Fl. Apr–Jun, fr. Jul–Oct.

Forests, scrub; 1000–3200 m. NW Guangxi, Guizhou, Sichuan, SE Xizang, Yunnan [Bhutan, N India, Myanmar, N Thailand].

Two forms may be recognized as follows: the typical form (*V. atrocyaneum* f. *atrocyaneum*) has leaves always opposite, leaf blade broadly ovate or ovate to ovate-lanceolate or rhombic-elliptic, whereas *V. atrocyaneum* f. *harryanum* (Rehder) P. S. Hsu (Acta Phytotax. Sin. 13(1): 120. 1975; *V. harryanum* Rehder, Mitt. Deutsch. Dendrol. Ges. 22: 263. 1913; *V. atrocyaneum* subsp. *harryanum* (Rehder) P. S. Hsu; *V. atrocyaneum* var. *puberulum* (C. K. Schneider) P. S. Hsu; *V. calvum* Rehder var. *kwapiense* Handel-Mazzetti; *V. calvum* var. *puberulum* C. K. Schneider) has leaves in whorls of 3, leaf blade orbicular.

**17. *Viburnum cinnamomifolium*** Rehder in Sargent, Trees & Shrubs 2: 31. 1907.

樟叶荚蒾 zhang ye jia mi

Shrubs or small trees, evergreen, to 6 m tall. Bark gray-brownish. Branchlets of current year purple-brownish, with many conspicuous lenticels, subglabrous; branchlets of previous year purple-brownish, terete, glabrous, with numerous, large, rounded lenticels. Winter buds ovoid, with 1 pair of separate scales; scales reddish brown, glabrous, apex acute. Leaves always opposite, not clustered at apices of branchlets; stipules absent; petiole green, robust, 1.5–3.5 cm, glabrous; leaf blade purplish when young, elliptic-oblong, 6–13(–18) × 3–5(–7) cm, leathery, abaxially often yellowish stellate-pubescent in axils of veins, adaxially glabrous, midvein raised abaxially, triplinerved, veins pinnate, arched, rarely branched, anastomosing near margin, raised abaxially, impressed adaxially, veinlets transverse, conspicuous abaxially, slightly impressed but not conspicuously rugose adaxially, not lobed, base cuneate to broadly cuneate, without glands, margin entire or occasionally remotely serrate near apex, apex acute. Flowers appearing after leaves; inflorescence a compound umbel-like cyme, terminal, 6–15 cm in diam.; rays whorled; first node of inflorescence with 6–8 rays, lax, large, glabrous, without large sterile radiant flowers; peduncles 1.5–3.5 cm; bracts caducous, leaflike, green, linear to linear-lanceolate, glabrous; bracteoles scalelike. Flow-

ers on rays of 2nd and 3rd orders, not fragrant; pedicels 2–3 mm, slender. Calyx greenish; tube obconical, 1–2 mm, glabrous; lobes suborbicular or triangular, very small, ca. 0.5 mm, glabrous, apex obtuse. Corolla white, rotate, 4–5 mm in diam., glabrous; tube ca. 1 mm; lobes recurved, broadly ovate, ca. 1 mm, nearly as long as tube, apex rounded, margin entire. Stamens longer than corolla, inserted near base of corolla tube; filaments ca. 3 mm; anthers yellow, subglobose, ca. 1 mm. Styles nearly as long as calyx lobes; stigmas subsessile. Fruit not turning red, maturing blue-blackish, subglobose, ca. 4 mm in diam., base rounded, apex acute, glabrous; pyrenes globose, ca. 3 mm in diam., with 1 very small and shallow ventral groove or without groove, apex rounded. Fl. May, fr. Jun–Jul.  $2n = 18^*$ .

• Thickets; 1000–1500(–1800) m. Sichuan, SE Yunnan.

**18. *Viburnum davidii*** Franchet, Nouv. Arch. Mus. Hist. Nat., sér. 2, 8: 251. 1885 [*"davidii"*].

川西荚蒾 chuan xi jia mi

Shrubs, evergreen, to 10 m tall. Bark gray-brownish. Branchlets of current year purple-brownish, with raised lenticels, subglabrous; branchlets of previous year gray-whitish, terete, glabrous, with numerous, large, rounded lenticels. Winter buds ovoid, with 1 pair of separate scales; scales reddish brown, glabrous, apex acute. Leaves always opposite, not clustered at apices of branchlets; stipules absent; petiole purplish, robust, 0.8–2.5(–3) cm, glabrous; leaf blade purplish when young, elliptic-obovate to elliptic, 6–14 × 4–7 cm, thickly leathery, lustrous and conspicuously rugose, abaxially yellowish stellate-pubescent only in axils of veins, adaxially glabrous, midvein raised abaxially, triplinerved, veins pinnate, arched, rarely branched, anastomosing near margin, raised abaxially, impressed adaxially, veinlets transverse, conspicuous abaxially, deeply impressed and conspicuously rugose adaxially, not lobed, base broadly cuneate to subrounded, without glands, margin entire or sometimes with few irregular teeth above middle part, apex shortly acuminate. Flowers appearing after leaves; inflorescence a compound umbel-like cyme, terminal, 4–6 cm in diam.; rays whorled; first node of inflorescence with 5 or 6 rays, 1–3 cm, dense, glabrous, without large sterile radiant flowers; peduncles (1–)1.5–3(–3.5) cm; bracts caducous, leaflike, green, linear to linear-lanceolate, glabrous; bracteoles scalelike. Flowers on rays of 2nd order, not fragrant, with very short pedicels. Calyx greenish; tube campanulate, ca. 1 mm, glabrous; lobes lanceolate, very small, ca. 1/2 as long as tube, glabrous, apex acute. Corolla white, rotate, ca. 5 mm in diam., glabrous; tube ca. 1 mm; lobes spreading, orbicular, ca. 2 mm in diam., 2–4 × as long as tube, apex rounded, margin entire. Stamens ca. 1/2 as long as corolla, inserted near base of corolla tube; filaments ca. 2 mm; anthers red-blackish, subglobose, less than 1 mm. Styles nearly as long as calyx lobes; stigmas subsessile. Fruit not turning red, maturing blue-blackish, ovoid or ellipsoid-oblong, ca. 6 × 4 mm, base rounded, apex acute, glabrous; pyrenes globose, 4–5 mm in diam., with 1 small and shallow ventral groove, apex rounded. Fl. Jun, fr. Sep–Oct.  $2n = 18^*$ .

• Mountains; 1800–2400 m. W Sichuan.

**19. *Viburnum propinquum*** Hemsley, J. Linn. Soc., Bot. 23: 355. 1888.

球核荚蒾 *qiu he jia mi*

Shrubs, evergreen, to 2 m tall. Bark gray-brownish. Branchlets of current year red-brownish, lustrous, with small prominent lenticels, glabrous; branchlets of previous year grayish, terete, glabrous, with dispersed, small, rounded lenticels. Winter buds ovoid-oblong, with 1 pair of separate scales; scales reddish brown, glabrous, apex acute. Leaves always opposite, not clustered at apices of branchlets; stipules absent; petiole green, slender, 1–2 cm, glabrous; leaf blade purplish when young, ovate to ovate-lanceolate or elliptic to elliptic-oblong, or linear-lanceolate or oblanceolate, 3–9(–11) × 1–4.5 cm, leathery, abaxially sometimes stellate-pubescent in axils of veins, adaxially glabrous, midvein raised abaxially, triplinerved, veins reaching to middle of leaves or above, pinnate, arched, branched, anastomosing near margin, raised abaxially, impressed adaxially, veinlets transverse, conspicuous abaxially, inconspicuous adaxially, not lobed, base subrounded or cuneate, both sides slightly asymmetric, without glands, margin usually remotely serrate, apex acuminate or acute. Flowers appearing after leaves; inflorescence a compound umbel-like cyme, terminal, (2–)4–7 cm in diam.; rays whorled; first node of inflorescence usually with 7 rays, lax, glabrous, without large sterile radiant flowers; peduncles 1.5–2.5(–4) cm, slender; bracts caducous, leaflike, green, linear to linear-lanceolate, glabrous; bracteoles scalelike. Flowers on rays of 3rd order, not fragrant; pedicels 1–2 mm, slender. Calyx greenish; tube obconical, ca. 0.6 mm, glabrous; lobes broadly triangular-ovate, very small, ca. 0.4 mm, glabrous, apex obtuse. Corolla greenish white, rotate, ca. 4 mm in diam., outside glabrous, inside with long hairs at base; tube ca. 1 mm; lobes spreading, broadly ovate, ca. 1 mm, nearly as long as tube, apex rounded, margin entire. Stamens usually slightly longer than corolla, inserted near base of corolla tube; filaments 2–3 mm; anthers yellow, subglobose, ca. 1 mm. Styles nearly as long as calyx lobes; stigmas subsessile. Fruit not turning red, maturing blue-blackish, lustrous, subglobose or ovoid, (3–)5–6 × (3–)3.5–4 mm, base rounded, apex acute, glabrous; pyrenes globose, ca. 4 × 3 mm, with 1 very small and shallow ventral groove or without groove, apex rounded. Fl. Mar–May, fr. May–Oct.

**20. *Viburnum triplinerve*** Handel-Mazzetti, Sinensia 5: 15. 1934.

三脉叶荚蒾 *san mai ye jia mi*

Shrubs, evergreen, to 2 m tall. Bark gray-brownish. Branchlets of current year brownish, slender, sometimes with dense lenticels, glabrous; branchlets of previous year gray-whitish, terete, glabrous, with dispersed, small, rounded lenticels. Winter buds ovoid-oblong, with 1 pair of separate scales; scales reddish brown, glabrous, apex acute. Leaves often clustered at apices of branchlets; stipules absent; petiole green, slender, 7–15 mm, glabrous; leaf blade purplish when young, elliptic, elliptic-ovate, or suborbicular, 2–6(–7.5) × 1–3 cm, leathery, both surfaces glabrous, midvein raised abaxially, triplinerved, veins reaching 3/4 length of leaves, pinnate, arched, rarely branched, anastomosing near margin, conspicuously raised abaxially, impressed adaxially, veinlets transverse, inconspicuous abaxially, slightly impressed adaxially, not lobed, base obtuse or rounded, without glands, margin entire, apex obtuse or rounded. Flowers appearing after leaves; inflorescence a compound umbel-like cyme, terminal, 1.5–10 cm in diam.; rays whorled; first node of inflorescence with 6–8 rays, lax, glabrous, without large sterile radiant flowers; peduncle ca. 1 cm, slender; bracts caducous, leaflike, green, linear to linear-lanceolate, glabrous; bracteoles scalelike. Flowers usually on rays of 2nd order, not fragrant; pedicels 1–2 mm, slender. Calyx greenish; tube broadly campanulate, less than 1 mm, glabrous; lobes broadly triangular or broadly ovate, very small, ca. 0.5 mm, nearly 1/2 as long as calyx tube, glabrous, apex obtuse. Corolla greenish white, rotate, ca. 4 mm in diam., glabrous; tube ca. 1 mm; lobes spreading, suborbicular, ca. 1 mm in diam., ca. 2 × as long as tube, apex rounded, margin entire. Stamens nearly as long as corolla, inserted near base of corolla tube; filaments ca. 3 mm; anthers yellow, globose, ca. 1 mm. Styles nearly as long as calyx lobes; stigmas subsessile. Fruit not turning red, maturing purple-blackish, suborbicular, 4–5 mm in diam., base rounded, apex acute, glabrous; pyrenes globose, ca. 4 mm in diam., with 1 very small and shallow ventral groove, apex rounded. Fl. Apr–May, fr. Jun–Oct.

• Mountains; 500–600 m. Guangxi.

This species is perhaps conspecific with *Viburnum propinquum*.

4. *Viburnum* sect. *Solenotinus* Candolle, Prodr. 4: 328. 1830.

圆锥组 yuan zhui zu

*Microtinus* Oersted; *Solenotinus* (Candolle) Spach; *Thyrsosma* Rafinesque.

Winter buds with 2 or 3 pairs of separate scales. Inflorescence paniculate, usually pyramidal, without large sterile radiant flowers, pedicellate or subsessile. Corolla rotate, tubular-campanulate, funnelform-hypocrateriform, or hypocrateriform. Fruit maturing red or purple-reddish and later nigrescent; pyrenes with 1 deep ventral groove; albumen solid.

About 20 species: temperate and subtropical Asia; 18 species (13 endemic) in China.

This section was divided into four subsections by H. Hara (Ginkgoana 5: 190–204. 1983): *Viburnum* subsect. *Loniceroides* (Oersted) H. Hara for *V. farreri* and *V. grandiflorum*, *V.* subsect. *Microtinus* (Oersted) H. Hara for *V. odoratissimum* and ca. six other species, *V.* subsect. *Sieboldiana* (Nakai) H. Hara for *V. sieboldii* and probably the Chinese *V. yunnanense* and *V. shweliense*, and *V.* subsect. *Solenotinus* for ca. ten species. Recent phylogenetic work shows that this section is clearly monophyletic (excluding the Bornean *V. clemensiae*) and sister to *V.* sect. *Tomentosa*. Current sampling does not allow a more precise discussion regarding the monophyly of subsections.

**21. *Viburnum brachybotryum*** Hemsley, J. Linn. Soc., Bot. 23: 349. 1888.

短序荚蒾 duan xu jia mi

Shrubs or small trees, evergreen, to 8 m tall. Bark light brown. Branchlets of current year yellow-whitish or sometimes gray-brownish, yellow-brownish stellate-pubescent, with sparse raised lenticels; branchlets of previous year gray-brownish, terete, glabrous, with dispersed, small, rounded lenticels. Winter buds ovoid-lanceolate, with 2 pairs of separate scales; scales yellow-brownish stellate-pubescent. Leaves always opposite, not clustered at apices of branchlets; stipules absent; petiole green, robust, 1–2(–3) cm, sparsely stellate-pubescent, glabrescent; leaf blade green when young, obovate, obovate-oblong, or oblong, 7–20 × (2–)3–7 cm, leathery, abaxially sparsely yellow-brownish stellate-pubescent or subglabrous, adaxially glabrous, intense green and lustrous, midvein raised abaxially, lateral veins 5–7-jugate, pinnate, arched, rarely branched, anastomosing near margin, conspicuously raised abaxially, slightly impressed adaxially, veinlets transverse, conspicuous abaxially, inconspicuous adaxially, not lobed, base broadly cuneate to subrounded, without glands, margin remotely serrate except at base, sometimes subentire, apex acuminate or acute. Flowers appearing after leaves; inflorescence paniculate, usually pyramidal, terminal or axillary on short branches, erect or nodding, 5–11(–22) × 2.5–8.5(–15) cm; rays opposite, decussate; first node of inflorescence with 2 rays, lax, large, yellow-brownish stellate-pubescent, without large sterile radiant flowers; peduncles 3–10 cm; bracts and bracteoles persistent, leaflike, yellowish green, lanceolate, yellow-brownish stellate-pubescent. Flowers on rays of 2nd and 3rd orders, not fragrant, sessile or shortly pedicellate. Calyx green; tube tubular-campanulate, ca. 1.5 mm, sparsely yellow-brownish stellate-pubescent; lobes ovate, ca. 1 mm, sparsely yellow-brownish stellate-pubescent, apex obtuse. Corolla white, rotate, 4–5(–6) mm in diam., sparsely stellate-pubescent; tube very short, ca. 1 mm; lobes spreading, ovate to oblong-ovate, ca. 1.5 mm, ca. 2 × as long as tube, apex obtuse, margin entire. Stamens slightly shorter than corolla, inserted at apex of corolla tube; filaments ca. 2 mm; anthers yellow-whitish, ellipsoid, ca. 1 mm. Styles slightly obviously exceeding calyx lobes; stigmas capitate, 3-lobed. Fruit initially turning yellow, maturing red, ovoid, ca. 1 cm × 6 mm, base rounded, apex acuminate, often stellate-pubescent; pyrenes slightly compressed, ovoid or narrowly ovoid, ca. 8 × 5 mm, with a deep ventral groove, apex acuminate. Fl. Nov–Feb, fr. May–Aug.

• Dense forests, scrub; (400–)600–1900 m. Guangxi, Guizhou, W Hubei, Hunan, Jiangxi, Sichuan, Yunnan.

Winter buds ovoid-oblong, with 2 pairs of separate scales; scales reddish brown, stellate-pubescent, apex acute. Leaves always opposite, not clustered at apices of branchlets; stipules absent; petiole purplish, robust, 1–2.5 cm, stellate-pubescent or glabrous; leaf blade green when young, elliptic or oblong-lanceolate to narrowly oblong, rarely ovate-cordate or slightly obovate,  $(2-6-14) \times 1-9$  cm, papery, abaxially stellate-pubescent on midvein and lateral veins, adaxially glabrous or pubescent on midvein, midvein raised abaxially, lateral veins 4–9-jugate, pinnate, slightly arched, branched, mostly ending in teeth, raised abaxially, impressed adaxially, veinlets transverse,

slightly impressed on both surfaces, not lobed, base cuneate or obtuse to rounded or cordate, without glands, margin serrulate except at base, apex acuminate or acute to obtuse. Flowers appearing with leaves; inflorescence paniculate, at apices of short branchlets with 1-jugate leaves, usually nodding,  $(5-7.5-10) \times 3-4$  cm; rays opposite, decussate; first node of inflorescence with 2 rays, lax, stellate-pubescent or subglabrous, without large sterile radiant flowers; peduncles 2–6 cm; bracts caducous, leaflike, reddish, linear to linear-lanceolate, glabrous; bracteoles linear. Flowers on rays from 1st to 3rd orders, fragrant, sessile or shortly pedicellate. Calyx reddish; tube tubular, 2.5–3 mm, usually glabrous, sometimes with tiny red-brown glands; lobes ovate-triangular, very small, ca. 0.5 mm, glabrous or stellate-pubescent, apex obtuse. Corolla white tinted pink outside, or pink, hypocrateriform, ca. 8 mm in diam., glabrous; tube 5–6 mm; lobes spreading, ovate, 2–3.5 mm, apex rounded, margin entire. Stamens shorter than corolla, inserted at apex of corolla tube; filaments very short; anthers yellow-whitish, slightly exserted, ca. 1 mm. Styles exceeding calyx lobes; stigmas capitate. Fruit maturing purple-reddish, later nigrescent, ellipsoid,  $6.5-8.5 \times 4.5-6$  mm, base rounded, apex rounded, glabrous; pyrenes compressed, obovoid,  $7-9 \times 4-5$  mm, with 1 broad and deep ventral groove, apex rounded. Fl. Apr–Jun, fr. Aug.  $2n = 48, 64$ .

Forests, scrub; (1500–)2400–3500 m. Gansu, Guizhou, Hubei, Shaanxi, Sichuan, SE Xizang, Yunnan [Bhutan, N India, N Myanmar, Nepal].

This taxon shows a complex variation pattern. The number of flowers in the inflorescence and the number of lateral veins have been used to recognize separate taxa such as *Viburnum burmanicum*, *V. erubescens* var. *parvum*, or *V. prattii*.

In Fl. Xizang (4: 483. 1985), “*Viburnum burmanicum* var. *medogense* P. S. Hsu” was written instead of *Viburnum burmanicum* var. *motoense* P. S. Hsu.

**26. *Viburnum farreri* Stearn, Taxon 15: 22. 1966.**

香荚蒾 xiang jia mi

*Lonicera mongolica* Gmelin; *Viburnum farreri* var. *stellipilum* D. Z. Ma & H. L. Liu; *V. fragrans* Bunge (1833), not Loisel (1824).

Shrubs, deciduous, to 5 m tall. Bark gray-brownish. Branchlets of current year green, subglabrous; branchlets of previous year red-brownish, later gray-brownish or gray-whitish, terete, glabrous, with sparse, dispersed, small, rounded lenticels. Winter buds ellipsoid, with 2 or 3 pairs of separate scales; scales reddish brown, ciliate, apex acute. Leaves always opposite, not clustered at apices of branchlets; stipules absent; petiole purplish, robust,  $(1-1.5-3)$  cm, adaxially pubescent on margin when young; leaf blade purplish green when young, elliptic or rhombic-obovate,  $4-8 \times 1-2.5$  cm, papery, abaxially slightly pubescent on veins, adaxially sparsely pubescent with fine and short hairs when young, later glabrous on both surfaces but stellate-pubescent in axils of veins, midvein raised abaxially, lateral veins 5–7-jugate, pinnate, straight or slightly arched, branched, ending in teeth, raised abaxially, impressed adaxially, veinlets transverse, inconspicuous or slightly impressed on both sur-

faces, not lobed, base cuneate to broadly cuneate, without glands, margin triangular-serrate except at base, apex acute. Flowers appearing before leaves; inflorescence paniculate, at apices of short branchlets that can produce new leaves, 3–5 × 2.5–3.5 cm; rays opposite, decussate; first node of inflorescence with 2 rays, many flowered, sparsely pubescent when young, glabrescent, without large sterile radiant flowers; peduncles very short when flowers just open, later gradually elongated; bracts caducous, leaflike, reddish, linear-lanceolate, ciliate, subglabrous; bracteoles linear. Flowers on rays from 1st to 3rd orders, fragrant, sessile. Calyx reddish; tube tubular-obconical, ca. 2 mm, glabrous; lobes ovate, very small, ca. 0.5 mm, glabrous, apex obtuse. Corolla pink in bud, white when open, hypocrateriform, ca. 1 cm in diam., glabrous; tube 7–10 mm, slightly spreading in upper part; lobes spreading, broadly ovate, ca. 4 × 3 mm, apex rounded, margin entire. Stamens shorter than corolla, inserted above middle of corolla tube generally at different heights; filaments very short or absent; anthers yellow-whitish, subglobose, ca. 1.5 mm. Styles not exceeding calyx lobes; stigmas 3-lobed. Fruit initially turning yellow, maturing purple-reddish, oblong, 8–10 × ca. 6 mm, base rounded, apex rounded, glabrous; pyrenes compressed, oblong, ca. 7 × 5 mm, with 1 deep ventral groove, apex rounded. Fl. Apr–May, fr. Jun–Jul.  $2n = 16^*$ ,  $32^*$ .

• Forests; 1600–2800 m. Gansu, Qinghai, Xinjiang; commonly cultivated in Gansu, Hebei, Henan, Qinghai, Shandong.

**27. *Viburnum grandiflorum*** Wallich ex Candolle, Prodr. 4: 329. 1830.

大花荚蒾 da hua jia mi

Shrubs or small trees, deciduous, to 5 m tall. Bark gray-brownish. Branchlets of current year green, glabrous or sometimes pubescent; branchlets of previous year gray or brown, trabeculate, glabrous, with sparse, dispersed, small, rounded lenticels. Winter buds ellipsoid, with 2 or 3 pairs of separate scales; scales reddish brown, ciliate, apex acute. Leaves always opposite, not clustered at apices of branchlets; stipules absent; petiole purplish, robust, 1–1.5 cm, sparsely stellate-pubescent or glabrous; leaf blade purplish green when young, elliptic-oblong, rarely elliptic or obovate-elliptic, 6–10 × 2.5–4 cm, papery, abaxially densely pubescent, adaxially sparsely pubescent, later pubescent only on veins and in axils of veins abaxially, midvein raised abaxially, lateral veins 6–10-jugate, pinnate, straight or slightly arched, branched, ending in teeth, raised abaxially, impressed adaxially, veinlets transverse, inconspicuous or slightly impressed on both surfaces, not lobed, base cuneate, without glands, margin crenate-serrate except at base, apex acuminate. Flowers appearing before leaves; inflorescence paniculate, densely clustered at apices of leafless short branchlets, 2–7 × 3–4 cm; rays opposite, decussate; first node of inflorescence with 2 rays, lax, sericeous, without large sterile radiant flowers, subtended by ovate to orbicular-ovate scales; outer scales nearly leaflike, to ca. 1 cm, intense brown, pubescent or glabrous; inner scales tomentose on margins of both sides; scales deciduous when inflorescence opens; peduncles very short when flowers just open, later gradually elongated; bracts caducous, leaflike, reddish, oblong to linear, to 1 cm, silvery

sericeous at first, later glabrous; bracteoles oblong to linear. Flowers on rays from 1st to 3rd orders, fragrant, sessile. Calyx reddish; tube tubular, ca. 3 mm, glabrous; lobes triangular, small, ca. 1 mm, glabrous, apex obtuse. Corolla pink outside, white inside, hypocrateriform, ca. 1 cm in diam., glabrous; tube to 1 cm; lobes spreading, broadly ovate, 4–5 mm, apex rounded, margin entire. Stamens shorter than corolla, inserted at or above middle of corolla tube, generally at different heights; filaments ca. 3 mm; anthers yellow, elliptic-oblong, ca. 2 mm. Styles exceeding calyx lobes; stigmas discoid, 2-lobed. Fruit initially turning yellow, maturing purple-reddish, ellipsoid or oblong-ellipsoid, ca. 12 × 8 mm, usually only 1 infructescence mature, base rounded, apex rounded, glabrous; pyrenes slightly compressed, oblong, 9–11 × 5–6 mm, with 1 deep ventral groove, apex rounded. Fl. May, fr. Jun–Jul.  $2n = 16$ .

Forests; 2800–4300 m. Xizang [Bhutan, India (Sikkim), Kashmir, Nepal, Pakistan].

In China, only *Viburnum grandiflorum* f. *grandiflorum* is reported. A glabrous form, with pure white or pink-tinged corolla, known as *V. grandiflorum* f. *foetens* (Decaisne) N. P. Taylor & Zappi, occurs in India, Nepal, and Pakistan.

**28. *Viburnum henryi*** Hemsley, J. Linn. Soc., Bot. 23: 353. 1888.

巴东荚蒾 ba dong jia mi

*Viburnum rosthornii* Graebner var. *xerocarpum* Graebner.

Shrubs or small trees, evergreen or semievergreen, to 7 m tall. Bark light brown. Branchlets of current year purplish brown or green, glabrous; branchlets of previous year gray-brownish, terete, glabrous, with dispersed, small, rounded lenticels. Winter buds oblong, with 2 pairs of separate scales; scales yellow stellate-pubescent. Leaves always opposite, not clustered at apices of branchlets; stipules absent; petiole green or reddish, robust, 1–2 mm, glabrous; leaf blade purplish green when young, obovate-oblong to oblong or narrowly oblong, 5–10(–13) × 2–4 cm, subleathery, abaxially stellate-pubescent in axils of veins, and with pedate holes in axils of veins, adaxially glabrous and lustrous, midvein raised abaxially, lateral veins 5–7-jugate, pinnate, slightly arched, rarely branched, partly ending in teeth, raised abaxially, impressed adaxially, veinlets transverse, inconspicuous on both surfaces, not lobed, base cuneate to rounded, without glands, margin serrate above middle part, apex acute to acuminate. Flowers appearing after leaves; inflorescence paniculate, terminal, 4–9 × 5–8 cm; rays opposite, decussate; first node of inflorescence with 2 rays, lax, glabrous, without large sterile radiant flowers; peduncles 2–4 cm, slender; bracts and bracteoles late deciduous or persistent and conspicuous, leaflike, green-whitish, linear-lanceolate, glabrous. Flowers on rays of 2nd and 3rd orders, fragrant, sessile. Calyx reddish; tube tubular to obconical-tubular, ca. 2 mm, glabrous; lobes broadly triangular, ca. 1 mm, glabrous, apex obtuse. Corolla white, rotate, ca. 6 mm in diam., glabrous or subglabrous; tube ca. 1 mm; lobes spreading, ovate-orbicular, ca. 2 mm, apex rounded, margin entire. Stamens equaling or slightly exceeding corolla lobes, inserted at apex of corolla tube; filaments ca. 2 mm; anthers yellow-whitish, oblong, ca. 1 mm. Styles nearly as long

as calyx lobes; stigmas capitate. Fruit initially turning red, maturing purple-blackish, ellipsoid,  $8-9 \times$  ca. 6 mm, base rounded, apex rounded, glabrous; pyrenes slightly compressed, ellipsoid,  $7-8 \times$  ca. 4 mm, with a deep ventral groove, apex rounded. Fl. Jun, fr. Aug–Sep.  $2n = 48^*$ .

• Dense forests, moist grassy slopes; 900–2600 m. N Fujian, Guangxi, SE Guizhou, W Hubei, W Jiangxi, S Shaanxi, Sichuan, S Zhejiang.

**29. *Viburnum longipedunculatum*** (P. S. Hsu) P. S. Hsu, Acta Phytotax. Sin. 17(2): 78. 1979.

长梗荚蒾 *chang geng jia mi*

*Viburnum corymbiflorum* P. S. Hsu & S. C. Hsu var. *longipedunculatum* P. S. Hsu, Acta Phytotax. Sin. 13(1): 115. 1975.

Shrubs, deciduous, total size unknown. Bark unknown. Branchlets of current year grayish yellow, with dispersed, rounded lenticels; branchlets of previous year gray-brownish, terete, glabrous, with dispersed, small, rounded lenticels. Winter buds ovoid-oblong, with 2 pairs of separate scales; scales brownish, yellow-brownish stellate-pubescent, apex acute. Leaves always opposite, not clustered at apices of branchlets; stipules absent; petiole green, robust, 1–2 cm, glabrous; leaf blade green when young, becoming dark green adaxially, oblong to obovate-oblong,  $(4-5)-14 \times (1.5-2.5)-6$  cm, papery, both surfaces glabrous, midvein raised abaxially but not adaxially, lateral veins 4- or 5-jugate, pinnate, arched, branched, anastomosing near margin, conspicuously raised abaxially, inconspicuous adaxially, veinlets transverse, inconspicuous on both surfaces, not lobed, base broadly cuneate, without glands, margin remotely and shallowly serrate above  $1/5-1/3$  from base, apex abruptly narrowed and caudate. Flowers appearing after leaves; inflorescence paniculate, at apices of short branchlets with 1-jugate leaves,  $2.5-4.5 \times 2-4$  cm; rays opposite, decussate; first node of inflorescence with 2 rays, lax, with dispersed small glands, without large sterile radiant flowers; peduncles  $(3.5)-6-9$  cm, nodding at fruiting stage; bracts persistent, leaflike, reddish, linear to linear-lanceolate, large and conspicuous, sparsely glandular hairy; bracteoles persistent, scalelike. Flowers on rays of 1st and 2nd orders, not fragrant, sessile. Calyx reddish; tube obconical, ca. 3 mm, outside with few small glands; lobes orbicular-ovate to ovate-triangular, ca. 1 mm, glabrous, apex slightly acute or obtuse. Corolla white, tubular-funnelform, ca. 8 mm in diam., glabrous; tube ca. 7 mm; lobes spreading, orbicular-ovate, ca. 3 mm, apex rounded, margin entire. Stamens shorter than corolla, inserted at apex of corolla tube; filaments very short; anthers yellow-whitish, elliptic-oblong, ca. 1.7 mm. Styles nearly as long as calyx lobes; stigmas slightly 3-lobed. Fruit initially turning red, maturing intense red, ellipsoid or oblong-ellipsoid,  $8-10 \times 5-6$  mm, base rounded, apex rounded, glabrous; pyrenes compressed, ellipsoid, ca.  $7.5 \times 5$  mm, with 1 deep ventral groove, apex rounded. Fl. Apr–May, fr. Jul–Aug.

• Dense forests; 1400–1600 m. Guangxi, SE Yunnan (Xichou).

**30. *Viburnum odoratissimum*** Ker Gawler, Bot. Reg. 6: t. 456. 1820.

珊瑚树 *shan hu shu*

Shrubs or small trees, evergreen, to 10(–15) m tall. Bark gray-brownish. Branchlets of current year green or reddish, glabrous or sometimes sparsely yellow-brownish stellate-pubescent; branchlets of previous year gray or gray-brownish, terete, glabrous, with dispersed, small, raised lenticels. Winter buds ovoid-lanceolate, with 2–4 pairs of separate scales; scales glabrous. Leaves always opposite, not clustered at apices of branchlets; stipules absent; petiole green or reddish, robust, 1–2(–3) cm, glabrous or stellate-pubescent; leaf blade green when young, becoming intense green and lustrous adaxially, elliptic to oblong or oblong-obovate to obovate, sometimes suborbicular,  $7-20 \times (3-4)-9$  cm, leathery, abaxially sometimes with sparse, dispersed dark red minute glands, both surfaces glabrous or sparsely stellate-pubescent on veins, midvein raised and conspicuous abaxially, lateral veins 4–9-jugate, pinnate, arched, branched, anastomosing near margin, conspicuously raised abaxially, slightly impressed adaxially, veinlets transverse, slightly raised abaxially, inconspicuous adaxially, not lobed, base broadly cuneate, rarely rounded, without glands, margin irregularly serrate except at base or subentire, apex shortly acute to obtusely acute and mucronate, sometimes obtuse or subrounded. Flowers appearing after leaves; inflorescence paniculate, pyramidal, terminal or at apices of short lateral branchlets with 1-jugate leaves,  $(3.5)-6-13.5 \times (3-4.5)-6$  cm; rays opposite, decussate; first node of inflorescence with 2 rays, lax, large, glabrous or stellate-pubescent, without large sterile radiant flowers; peduncles 4–10 cm; bracts caducous, leaflike, greenish, less than 1 cm  $\times$  2 mm, lanceolate to ovate, sparsely hairy; bracteoles scalelike. Flowers usually on rays of 2nd and 3rd orders, fragrant, sessile or shortly pedicellate. Calyx green; tube tubular-campanulate, 1.5–4 mm, glabrous; lobes broadly triangular, ca. 1 mm, glabrous, apex obtuse. Corolla white, later yellow-whitish, sometimes reddish, rotate, ca. 7 mm in diam., glabrous; tube ca. 2 mm; lobes reflexed, orbicular-ovate, 2–3 mm, apex rounded, margin entire. Stamens slightly exceeding corolla lobes, inserted at apex of corolla tube; filaments 2.5–3 mm; anthers yellow, oblong, nearly 2 mm. Styles not exceeding calyx lobes; stigmas capitate or slightly 3-lobed. Fruit initially turning red, maturing nigrescent, ovoid or ovoid-ellipsoid, ca.  $8 \times 5-6$  mm, base rounded, apex rounded, glabrous; pyrenes compressed, ovoid or ovoid-ellipsoid, ca.  $7 \times 4$  mm, with a deep ventral groove, apex rounded. Fl. Mar–May, fr. Jun–Sep.  $2n = 40$ .

• Forests, scrub; sea level to 2500 m. SE Fujian, Guangdong, Guangxi, ?Guizhou, Hainan, Hebei, Henan, Hunan, Taiwan, Yunnan, Zhejiang [E India, Japan, Korea, N Myanmar, ?Philippines, Thailand, Vietnam].

少花荚蒾 shao hua jia mi

*Viburnum stapfianum* H. Léveillé.

Shrubs or small trees, evergreen, to 6 m tall. Bark gray-brownish. Branchlets of current year brown, with rounded lenticels; branchlets of previous year gray-brownish or black, terete, glabrous, with dispersed, small, rounded lenticels. Winter buds oblong, with 2 pairs of separate scales; scales brownish, stellate-pubescent, apex acute. Leaves always opposite, not clustered at apices of branchlets; stipules absent; petiole purple-

reddish, robust, 5–15 mm, stellate-pubescent or glabrous; leaf blade green when young, becoming intense green and lustrous adaxially, oblanceolate to linear-ob lanceolate or obovate-oblong to oblong, rarely obovate, 5–10(–13) × (1.5–)2–3.5 cm, subleathery or leathery, very rarely thickly papery, both surfaces glabrous, midvein raised on both surfaces, particularly so adaxially, lateral veins 5- or 6-jugate, pinnate, arched, branched, anastomosing near margin, slightly conspicuous abaxially, slightly impressed adaxially, veinlets transverse, inconspicuous on both surfaces, not lobed, base cuneate to obtuse, rarely subrounded, without glands, margin remotely and shallowly serrate above 1/3–1/2 from base, apex abruptly narrowed and acuminate to long acuminate, shortly or long caudate. Flowers appearing after leaves; inflorescence paniculate, at apices of short branchlets with 1-jugate leaves, 2.5–4.5(–10) × 2–4 cm; rays opposite, decussate; first node of inflorescence with 2 rays, lax, glabrous, without large sterile radiant flowers; peduncles (1.2–)2.5–7 cm, slender and compressed, purple-reddish, sparsely yellow-brownish stellate-pubescent; bracts persistent, leaflike, purple-reddish, linear to linear-lanceolate, glabrous; bracteoles persistent, scalelike. Flowers on rays of 1st and 2nd orders, not fragrant, sessile. Calyx purple-reddish; tube tubular-obconical, ca. 2 mm, glabrous; lobes triangular-ovate, ca. 0.5 mm, glabrous, apex acute. Corolla white or reddish, funnelform, ca. 6 mm in diam., glabrous; tube 6–8 mm; lobes spreading, broadly ovate, ca. 2 mm, apex rounded, margin entire. Stamens shorter than corolla, inserted at apex of corolla tube; filaments very short; anthers purple-reddish, oblong, ca. 1.5 mm. Styles exceeding calyx lobes; stigmas capitate. Fruit initially turning red, maturing nigrescent, ellipsoid, 6–7 × 4–5 mm, base rounded, apex rounded, glabrous; pyrenes compressed, ellipsoid, ca. 6 × 4 mm, with 1 broad and deep ventral groove, apex rounded. Fl. Apr–Jun, fr. Jun–Aug.

• Forests, scrub; 1000–2200 m. Guizhou, W Hubei, Sichuan, Xizang, NE Yunnan.

**32. *Viburnum omeiense* P. S. Hsu, Acta Phytotax. Sin. 11: 67. 1966.**

峨眉荚蒾 e mei jia mi

Shrubs, deciduous, ca. 75 cm tall. Bark unknown. Branchlets of current year gray-yellowish, with dispersed, raised lenticels; branchlets of previous year gray-yellowish, terete, glabrous, with dispersed, small, raised lenticels. Winter buds oblong, with 2 pairs of separate scales; scales reddish brown, glabrous, apex acute. Leaves always opposite, not clustered at apices of branchlets; stipules absent; petiole reddish, robust, 5–10 mm, glabrous; leaf blade purplish green when young, oblong, 3–7 × 1.5–3 cm, thickly papery, both surfaces glabrous, midvein raised on both surfaces, lateral veins ca. 4-jugate, pinnate, arched, rarely branched, anastomosing near margin, slightly raised abaxially, inconspicuous or slightly impressed adaxially, veinlets transverse, inconspicuous or slightly impressed on both surfaces, not lobed, base cuneate, without glands, margin remotely crenulate except at base, apices of teeth slightly mucronate, apex acute. Flowers appearing with leaves; inflorescence paniculate, terminal or at apices of short lateral branchlets with 1 pair of leaves, ca. 3.5 × 4.5 cm; rays

opposite, decussate; first node of inflorescence with 2 rays, dense, glabrous, without large sterile radiant flowers; peduncle 2–3 cm; bracts caducous, leaflike, green, oblong or linear, ca.  $1.8 \times 0.8$  mm, midvein red at base, lateral veins inconspicuous, apex obtuse, sparsely stellate-pubescent or sometimes sparsely ciliate; bracteoles scalelike. Flowers on rays of 1st and 2nd orders, not fragrant, sessile. Calyx reddish; tube tubular-obconical, ca. 1.8 mm, glabrous; lobes broadly ovate, short, ca. 0.8 mm, glabrous, apex acute. Corolla white, hypocrateriform, less than 5 mm in diam., glabrous; tube ca. 3.5 mm; lobes ?spreading, broadly ovate, ca. 1 mm, 1 slightly larger than others, apex rounded, margin entire. Stamens shorter than corolla, inserted at apex of corolla tube; filaments very short; anthers yellow-whitish, elliptic-oblong, ca. 1 mm. Styles slightly exceeding calyx lobes or not; stigmas 3-lobed. Fruit unknown. Fl. Nov–May.

- Mountains; ca. 1300 m. Sichuan (Emei Shan).

This species is represented by the type collection, which appears to have a premature inflorescence, and an additional collection with old flowers. Field work is needed to determine the identity of these plants.

**33. *Viburnum shweliense*** W. W. Smith, Notes Roy. Bot. Gard. Edinburgh 12: 227. 1920.

瑞丽荚蒾 rui li jia mi

Shrubs or small trees, deciduous, to 3 m tall. Bark light brown. Branchlets of current year reddish green, glabrous, with dispersed, gray lenticels; branchlets of previous year gray-brownish, terete, glabrous, with dispersed, small, rounded lenticels. Winter buds oblong, with 2 pairs of separate scales; scales reddish brown, stellate-pubescent, apex acute. Leaves always opposite, not clustered at apices of branchlets; stipules absent; petiole green or reddish, robust, 2–2.5 cm, sparsely stellate-pubescent or glabrous; leaf blade purplish green when young, broadly elliptic or oblong-elliptic, 8–12.5 cm, papery, abaxially stellate-pubescent on midvein and lateral veins, adaxially glabrous, midvein raised abaxially, lateral veins 6- or 7-jugate, pinnate, slightly arched, branched, ending in teeth, raised abaxially, impressed adaxially, veinlets transverse, slightly raised abaxially, slightly impressed adaxially, not lobed, base nearly broadly cuneate, without glands, margin conspicuously serrulate, apex obtuse or mucronate. Flowers appearing with leaves; inflorescence panicle, at apices of short branchlets with 1-jugate leaves, ca.  $5 \times 5$  cm; rays opposite, decussate; first node of inflorescence with 2 rays, lax, densely whitish stellate-pubescent or subglabrous, without large sterile radiant flowers; peduncles 3–4 cm, sparsely pubescent; bracts caducous, leaflike, green, ovate to elliptic, ciliate; bracteoles linear. Flowers on rays of 2nd and 3rd orders, not fragrant, shortly pedicellate. Calyx reddish; tube obconical, ca. 3 mm, usually glabrous, sometimes with few hairs; lobes ovate-triangular, very small, less than 1 mm, glabrous, apex acute. Corolla whitish, rotate-campanulate, ca. 6 mm in diam., glabrous; tube ca. 3 mm; lobes recurved, broadly ovate, 1.5–2 mm, apex rounded. Stamens obviously exceeding corolla tube, inserted at apex of corolla tube; filaments ca. 3 mm; anthers yellow, elliptic-oblong, ca. 1 mm. Styles exceeding calyx lobes; stigmas capitate. Fruit unknown. Fl. Jul.

- Forests; ca. 800 m. W Yunnan [?Myanmar].

**34. *Viburnum subalpinum*** Handel-Mazzetti, Symb. Sin. 7: 1034. 1936.

亚高山荚蒾 ya gao shan jia mi

Shrubs, deciduous, very rarely to 1 m tall. Bark light brown. Branchlets of current year sparsely or densely yellow-brownish stellate-pubescent or subglabrous; branchlets of previous year gray-yellowish, terete, glabrous, with dispersed, rounded lenticels. Winter buds oblong, with 2 pairs of separate scales; scales reddish brown, glabrous, apex acute. Leaves always opposite, not clustered at apices of branchlets; stipules absent; petiole purple-reddish, robust, 5–13 mm, sparsely yellow-brownish stellate-pubescent, glabrescent; leaf blade purplish green when young, orbicular or broadly elliptic, 1.5–4(–5)  $\times$  1.5–4.5 cm, papery, abaxially with sparse red-brownish tiny glands, sparsely stellate-pubescent on veins, adaxially sparsely pubescent or glabrous, midvein raised on both surfaces, lateral veins 3–5-jugate, pinnate, arched, rarely branched, mostly anastomosing near margin, conspicuously raised abaxially, slightly impressed adaxially, veinlets transverse, inconspicuous on both surfaces, not lobed, base truncate to broadly cuneate, without glands, margin remotely serrate except at base, apex obtuse or rounded and mucronate, rarely acuminate. Flowers appearing with leaves; inflorescence panicle, at apices of lateral branchlets with 1-jugate leaves, 2–4  $\times$  2–3 cm; rays opposite, decussate; first node of inflorescence with 2 rays, lax, glabrous, without large sterile radiant flowers; peduncles nodding, 1.2–3.7 cm, slender, stellate-pubescent; bracts persistent, leaflike, purple-reddish, linear to linear-lanceolate, glabrous; bracteoles scalelike. Flowers on rays of 1st and 2nd orders, not fragrant, shortly pedicellate. Calyx reddish; tube tubular-obconical, ca. 2 mm, glabrous; lobes broadly triangular, ca. 0.7 mm, glabrous, apex acute. Corolla pinkish in bud, white when open, funnelform, ca. 6 mm in diam., glabrous; tube 4–5 mm; lobes recurved, broadly ovate, ca. 2 mm, apex rounded, margin papillose-ciliate. Stamens longer than corolla, inserted at apex of corolla tube; filaments ca. 2 mm; anthers purple-reddish, elliptic, ca. 0.8 mm. Styles exceeding calyx lobes; stigmas capitate. Fruit maturing red, ellipsoid, 5–7  $\times$  4–5 mm, base rounded, apex rounded, glabrous; pyrenes compressed, ellipsoid, ca. 5  $\times$  4 mm, with 1 deep ventral groove, apex rounded. Fl. May–Jul, fr. Jul.

Bamboo forests, *Abies* forests; 1600–3800 m. NW and W Yunnan [N Myanmar].

台东荚蒾 tai dong jia mi

*Viburnum tubulosum* P. S. Hsu.

Shrubs, evergreen, to 2 m tall. Bark gray-brownish. Branchlets of current year purple-brownish, densely or sparsely stellate-pubescent; branchlets of previous year gray-yellowish or gray-whitish, terete, glabrous, with conspicuously raised lenticels. Winter buds lanceolate, with 2 pairs of separate scales; scales glabrous. Leaves always opposite, not clustered at apices of branchlets; stipules absent; petiole green, robust, 6–10(–15)

mm, stellate-pubescent; leaf blade green when young, becoming intense green and lustrous adaxially, oblong, oblong-lanceolate, or ovate-oblong, 5–9 × 2–3 cm, thickly papery or slightly leathery, abaxially stellate-pubescent in axils of veins, adaxially glabrous, midvein raised abaxially, lateral veins 5- or 6-jugate, pinnate, arched, branched, anastomosing near margin, conspicuously raised abaxially, impressed adaxially, veinlets transverse, slightly raised abaxially, inconspicuous adaxially, not lobed, base broadly cuneate or subrounded, without glands, margin serrate except at base, apex shortly acute or subrounded. Flowers appearing after leaves; inflorescence paniculate, terminal, ca. 3 × 2 cm; rays opposite, decussate; first node of inflorescence with 2 rays, few flowered, stellate-pubescent, without large sterile radiant flowers; peduncles ca. 2 cm, slender; bracts and bracteoles late deciduous, leaflike, greenish, linear-lanceolate, stellate pubescent. Flowers on rays of 1st and 2nd orders, not fragrant; pedicels 3–4 mm. Calyx reddish; tube tubular-campanulate, ca. 2 mm, glabrous or sparsely stellate-pubescent; lobes triangular, ca. 1 mm, with few stellate ciliate hairs, apex obtuse. Corolla white, funnelform, ca. 6 mm in diam., glabrous; tube 5–9 mm; lobes spreading, ovate to suborbicular, 2–3 mm, apex rounded, margin entire. Stamens shorter than corolla, inserted at apex of corolla tube; filaments very short; anthers yellow-whitish, oblong, ca. 1 mm. Styles long, slender, obviously exceeding calyx lobes; stigmas capitate. Fruit maturing red, ovoid-ellipsoid, 7–9 × ca. 6 mm, base rounded, apex rounded, glabrous; pyrenes compressed, ellipsoid, ca. 7 × 5 mm, with a deep ventral groove, apex rounded. Fl. Mar–Apr, fr. Sep–Nov.

Lateral veins  $6\text{--}9$ -jugate. Inflorescence with 3–5 rays, densely yellowish brown stellate-pubescent, composed of fertile flowers yet with 3–5 large sterile radiant flowers. Calyx tube stellate-hairy.

• Mixed forests; 1800–3000 m. N Taiwan.

**6. *Viburnum* sect. *Megalotinus*** (Maximowicz) Rehder in Sargent, Trees & Shrubs 2: 112. 1908.

大叶组 da ye zu

*Viburnum* subser. *Megalotinus* Maximowicz, Bull. Acad. Imp. Sci. Saint-Petersbourg 26: 476. 1880.

Winter buds with 1 or 2 pairs of separate scales, rarely naked. Inflorescence a compound umbel-like cyme, pedicellate, with large sterile radiant flowers. Corolla rotate, campanulate, or tubular. Fruit maturing red or black; pyrenes with 1 or 2 shallow dorsal grooves and 1–3 shallow ventral grooves; albumen solid.

About 18 species: subtropical Asia; nine species (four endemic) in China.

Kern (Reinwardtia 1. 112. 1951) and H. Hara (Ginkgoana 5: 181–182. 1983) recognized four subsections on the basis of corolla shape, stamen aestivation, pubescence, and leaf margin indentation. In recent phylogenetic work, this section is represented by a single species, *Viburnum cylindricum*, which is sister to Old World members of *V.* sect. *Odontotinus*.

**41. *Viburnum amplifolium*** Rehder in Sargent, *Trees & Shrubs* 2: 112. 1908.

广叶荚蒾 guang ye jia mi

Shrubs, deciduous, to 4 m tall. Bark gray-brownish. Branchlets of current year yellowish green or yellowish brown stellate-pubescent; branchlets of previous year yellowish brown, terete, glabrous, with sparse, dispersed, small, rounded lenticels. Winter buds ovoid-lanceolate, with 2 pairs of separate scales; scales yellowish green or yellowish brown stellate-pubescent. Leaves always opposite, not clustered at apices of branchlets; stipules absent; petiole green, slender, 1.2–2 cm, yellowish green or yellowish brown stellate-pubescent; leaf blade yellowish green when young, becoming intense yellow-green adaxially when dry, ovate to elliptic-ovate, (4–)6–12(–14) × (2–)4–7(–8.5) cm, papery, both surfaces verrucose, abaxially stellate-pubescent only on veins, adaxially forklike pubescent, more densely so on midvein, immediately glabrescent, midvein raised abaxially, lateral veins 7–9-jugate, pinnate, slightly arched, branched, mostly ending in teeth, raised abaxially, slightly impressed adaxially, veinlets transverse, parallel, conspicuous abaxially, inconspicuous adaxially, not lobed, base rounded to cuneate, without glands, margin serrate, apex acuminate. Flowers appearing after leaves; inflorescence a compound umbel-like cyme, at apices of lateral short branchlets with 1-jugate leaves, 3–6 cm in diam.; rays whorled; first node of inflorescence with 6 or 7 rays, dense, yellowish green or yellowish brown stellate-pubescent, without large sterile radiant flowers; peduncles 3–5.5 cm, slender; bracts caducous, leaflike, yellowish green, linear-lanceolate, stellate pubescent; bracteoles scalelike. Flowers on rays of 2nd order, not fragrant, sessile. Calyx yellowish green; tube tubular, ca. 0.5 mm, glabrous; lobes narrowly ovate, ca. 2/3 as long as tube, sparsely stellate-pubescent, ciliolate, apex rounded or obtuse. Corolla white, rotate, ca. 3 mm in diam., glabrous; tube less than 1 mm; lobes spreading, orbicular-ovate, ca. 1 mm, apex obtuse, margin entire. Stamens subequalling corolla, inserted near base of corolla; filaments ca. 2 mm, ca. 1.5 × as long as anthers; anthers yellow, broadly elliptic, ca. 1 mm. Styles exceeding calyx lobes; stigmas capitate. Fruit maturing red, obovoid-oblong, ca. 8 × 5 mm, base rounded, apex rounded, glabrous; pyrenes compressed, ovoid, ca. 7 × 4 mm, with 1 shallow dorsal groove and 2 shallow ventral grooves, apex rounded. Fl. May–Jun, fr. Sep–Oct.

• Mixed forests, scrub; 1000–1700(–2000) m, SE Yunnan.

**42. *Viburnum cylindricum*** Buchanan-Hamilton ex D. Don, *Prodr. Fl. Nepal*. 142. 1825.

水红木 shui hong mu

*Viburnum coriaceum* Blume; *V. crassifolium* Rehder; *V. cylindricum* Buchanan-Hamilton ex D. Don var. *crassifolium* (Rehder) C. K. Schneider.

Shrubs or small trees, evergreen, to 8(–15) m tall. Bark light brown. Branchlets of current year greenish, glabrous, or initially sparsely stellate-pubescent; branchlets of previous year gray-brownish, terete, glabrous, with sparse, small, rounded lenticels. Winter buds lanceolate-triangular, with a pair of separate scales; scales glabrous or stellate pubescent. Leaves always opposite, not clustered at apices of branchlets; stipules absent; petiole green, robust, 1–3.5(–5) cm, glabrous or stellate-pubescent; leaf blade green when young, elliptic to oblong or ovate-oblong, 8–16(–24) × 3–10 cm, leathery, abaxially usually glabrous, with dispersed reddish or yellow tiny glandular dots (sometimes compressed to appear like lepidote scales), adaxially glabrous, midvein raised abaxially, lateral veins 3–5(–8)-jugate, pinnate, arched, rarely branched, anastomosing near margin, or some ending in teeth, raised abaxially, slightly impressed adaxially, veinlets transverse, conspicuous abaxially, inconspicuous adaxially, not lobed, base gradually angustate to rounded, with 1 to several glands on both sides of midvein near base, margin entire or irregularly shallowly dentate, apex acuminate or acute. Flowers appearing after leaves; inflorescence a compound umbel-like cyme, terminal, 4–10(–18) cm in diam.; rays whorled; first node of inflorescence usually with 7 rays, lax, glabrous or stellate-pubescent, sometimes with tiny glands, without large sterile radiant flowers; peduncles 1–6 cm; bracts usually caducous, leaflike, whitish green, linear-lanceolate, ca. 3 × < 1 mm, glabrous; bracteoles scalelike. Flowers usually on rays of 3rd order, not fragrant, sessile or shortly pedicellate. Calyx greenish; tube ovoid-orbicular or obconical, ca. 1.5 mm, sometimes with tiny glandular dots; lobes very small and inconspicuous, glabrous, apex rounded. Corolla white or reddish, campanulate, 4–6 mm, with tiny lepidote glands; tube 3–5 mm; lobes erect, orbicular-ovate, ca. 1 mm, apex rounded, margin entire. Stamens longer than corolla, inserted near base of corolla; filaments 3–4 mm; anthers purple, oblong, 1–1.8 mm. Styles exceeding calyx lobes; stigmas capitate. Fruit initially turning red, maturing blue-black, ovoid, ca. 5 mm, base rounded, apex rounded, glabrous; pyrenes compressed ovoid, ca. 4 × 3.5–4 mm, with 2 shallow dorsal grooves and 1 shallow ventral groove, apex rounded. Fl. Jun–Jul, fr. Aug–Oct. 2n = 18.

Sparse forests, scrub; 500–3300 m. Gansu (Wenxian), N Guangdong, Guangxi, Guizhou, W Hubei, W Hunan, Sichuan, SE Xizang, Yunnan [Bhutan, India, Indonesia, N Myanmar, Nepal, Pakistan, Thailand, Vietnam].

**43. *Viburnum inopinatum*** Craib, *Bull. Misc. Inform. Kew* 1911: 385. 1911.

厚绒荚蒾 hou rong jia mi

Shrubs or small trees, evergreen, to 10 m tall. Bark gray-brownish. Branchlets of current year yellow-white or yellow-brown stellate-tomentose; branchlets of previous year gray-brownish, terete, glabrous, with sparse, small, rounded lenticels. Winter buds lanceolate, with a pair of separate scales; scales densely yellowish brown stellate pubescent. Leaves always opposite, not clustered at apices of branchlets; stipules 2, caducous; petiole green, slender, 2–5 cm, yellow-white or yellow-brown stellate-tomentose; leaf blade yellowish green when young, elliptic-oblong to oblong-lanceolate, (12–)15–20(–25) × (4–)5–10(–11.5) cm, leathery, abaxially thickly tomentose and mixed with glandular dots, adaxially yellow-brown stellate-tomentose, later only hairy on midvein, with 1 to several large impressed glands on both sides of midvein near base, midvein raised abaxially, lateral veins 5- or 6-jugate, pinnate, arched, rarely branched, anastomosing near margin, conspicuously raised abaxially, slightly impressed adaxially, veinlets transverse, raised abaxially, slightly impressed adaxially, not lobed, base cuneate to obtuse, with 0–2 circular glands on both sides of midvein near base, margin entire or sometimes slightly dentate at apex, apex acuminate. Flowers appearing after leaves; inflorescence a compound umbel-like cyme, terminal, 12–20 cm in diam.; rays whorled; first node of inflorescence with 5–7 rays, to 6.5 cm, lax, densely yellowish brown stellate-pubescent, without large sterile radiant flowers; peduncles robust, (1–)1.5–2 cm, rarely absent; bracts caducous, leaflike, yellowish green, linear-lanceolate, stellate pubescent; bracteoles scalelike. Flowers on rays from 3rd to 6th orders, not fragrant, sessile. Calyx yellowish green; tube obconical, ca. 1 mm, stellate-tomentose; lobes ovate-triangular, very small, ca. 0.25 mm, ciliate, apex obtuse. Corolla white, rotate, orbicular in bud, ca. 3.5 mm in diam., glabrous; tube 1–1.5 mm; lobes spreading, ovate, ca. 1 mm, slightly shorter than tube, apex rounded, margin entire. Stamens obviously exceeding corolla, inserted at base of corolla; filaments filiform, folded in bud, ca. 5 mm; anthers yellow-whitish, broadly elliptic, ca. 1 mm. Styles exceeding calyx lobes; stigmas capitate. Fruit maturing red, ovoid-globose to ellipsoid, 4–5 × 3–4 mm, base rounded, apex acute, yellow-brown forklike pubescent or stellate-pubescent; pyrenes compressed, ellipsoid, ca. 4 × 3 mm, with 2 dorsal grooves and 3 ventral grooves, apex rounded. Fl. Apr–May, fr. Jun–Oct.

Dense forests; 700–1400 m. SW Guangxi, S Yunnan [Laos, Myanmar, Thailand, N Vietnam].

**44. *Viburnum laterale*** Rehder in Sargent, Pl. Wilson. 1: 311. 1912.

侧花荚蒾 *ce hua jia mi*

Shrubs, deciduous, total size unknown. Bark gray-brownish. Branchlets of current year brownish, glabrous; branchlets of previous year gray-brownish, terete, glabrous, with sparse, small, rounded lenticels. Winter buds ovoid-lanceolate, with 2 pairs of separate scales; scales glabrous. Leaves always opposite, not clustered at apices of branchlets; stipules absent; petiole green, slender, 1–2 cm, glabrous; leaf blade green when young, ovate, elliptic, ovate-oblong, or narrowly elliptic-oblong, 7–12 × 4–7 cm, papery, abaxially glabrous,

adaxially lustrous, midvein raised abaxially, lateral veins 6–9-jugate, pinnate, arched, rarely branched, ending in teeth, raised abaxially, slightly impressed adaxially, veinlets transverse, inconspicuous on both surfaces, not lobed, base rounded or broadly cuneate, without glands, margin serrate, apex acuminate. Flowers appearing after leaves; inflorescence a compound umbel-like cyme, at apices of lateral short branchlets with 1-jugate leaves, 4–5 cm in diam.; rays whorled; first node of inflorescence with 4 or 5 rays, dense, glabrous, without large sterile radiant flowers; peduncles 5–6 cm, slender; bracts and bracteoles late deciduous or persistent, leaflike, green, linear-lanceolate, ca. 3 × < 1 mm, glabrous. Flowers on rays of 2nd and 3rd orders, not fragrant, sessile or shortly pedicellate. Calyx greenish; tube oblong-ovoid, ca. 1 mm, glabrous; lobes triangular-ovate, very small, glabrous, apex ± acute or obtuse. Corolla white, rotate, ca. 3 mm in diam., glabrous; tube ca. 4 mm; lobes spreading, ovate, ca. as long as tube, apex rounded, margin entire. Stamens exceeding corolla, inserted at apex of corolla tube; filaments ca. 3 × as long as anthers; anthers yellow, ellipsoid, ca. 1 mm. Styles exceeding calyx lobes; stigmas capitate. Fruit unknown. Fl. Jun.

• ?Forests; 800–900 m. Fujian.

This species is known only from the type collection.

**45. *Viburnum leiocarpum*** P. S. Hsu, Acta Phytotax. Sin. 11: 76. 1966.

光果荚蒾 *guang guo jia mi*

Shrubs or small trees, evergreen, to 10(–15) m tall. Bark gray-brownish. Branchlets of current year sparsely yellow-brownish stellate-pubescent or glabrescent; branchlets of previous year black-brownish, terete, glabrous, with sparse, small, rounded lenticels. Winter buds lanceolate-triangular, with a pair of separate scales; scales sparsely yellow-brownish stellate pubescent or glabrescent. Leaves always opposite, not clustered at apices of branchlets; stipules absent; petiole green, slender, 2.5–5 cm, sparsely pubescent; leaf blade yellowish green when young, elliptic-oblong to obovate-oblong, 10–18(–25) cm, thickly papery, abaxially sparsely pubescent on midvein and lateral veins, with or without glandular spots, adaxially lustrous, sparsely pubescent only on midvein, or stellate-pubescent or forklike pubescent throughout, with or without raised dots, midvein raised abaxially, lateral veins 5–7-jugate, pinnate, arched, rarely branched, anastomosing near margin, conspicuously raised abaxially, slightly impressed adaxially, veinlets transverse, conspicuously raised abaxially, slightly impressed adaxially, not lobed, base cuneate to obtuse, with 0 or 1 circular gland on both sides of midvein near base, margin entire, slightly involute when dry, apex abruptly and shortly acuminate. Flowers appearing after leaves; inflorescence a compound umbel-like cyme, terminal, ca. 9 cm in diam.; rays whorled; first node of inflorescence with 4 or 5 rays, 2–3 cm, lax, sparsely yellow-brown stellate-pubescent, without large sterile radiant flowers; peduncles 1.5–3 cm; bracts caducous, leaflike, yellowish green, linear-lanceolate, stellate pubescent; bracteoles scalelike. Flowers on rays from 3rd to 6th orders, not fragrant, sessile or shortly pedicellate. Calyx yellowish green; tube tubular-obconic-

cal, ca. 1 mm, glabrous; lobes broadly triangular, very small, glabrous, apex rounded. Corolla white, rotate, ca. 3.5 mm in diam., glabrous; tube 1–1.5 mm; lobes spreading, orbicular-ovate, ca. 1 mm, slightly shorter than tube, apex rounded, margin entire. Stamens obviously exceeding corolla, inserted at base of corolla; filaments slightly compressed, folded in bud, ca. 5 mm; anthers yellow-whitish, oblong, ca. 1 mm. Styles slightly exceeding calyx lobes; stigmas capitate. Fruit maturing red, ovoid-globose, 5–7 × ca. 5 mm, base rounded, apex acute, glabrous; pyrenes broadly ellipsoid, ca. 6 × 5 mm, with 2 dorsal grooves and 3 ventral grooves, apex rounded. Fl. May–Jul, fr. Aug–Oct.

锥序荚蒾 zhui xu jia mi

Shrubs or small shrubs, evergreen, to 7 m tall. Bark gray-brownish. Branchlets of current year brownish, sparsely lenticellate; branchlets of previous year gray-yellowish, terete, subglabrous, with sparse, small, rounded lenticels. Winter buds ovoid-lanceolate, with a pair of separate scales; scales yellow-brown stellate-tomentose. Leaves always opposite, not clustered at apices of branchlets; stipules absent; petiole green, slender, 1.5–3 cm, yellow-brown stellate-tomentose; leaf blade yellowish green when young, ovate-oblong to oblong or broadly elliptic, 8–16(–20) × 4–8 cm, thickly papery, abaxially yellow-brown stellate-tomentose, adaxially lustrous, glabrous throughout except on midvein sparsely stellate-pubescent, midvein raised abaxially, lateral veins 6- or 7-jugate, pinnate, arched, rarely branched, anastomosing near margin, raised abaxially, slightly impressed adaxially, veinlets transverse, inconspicuous or slightly conspicuous abaxially, inconspicuous adaxially, not lobed, base narrowed or subrounded, without glands, margin serrate, apex acuminate. Flowers appearing after leaves; inflorescence a pyramidal panicle, terminal, 5–10 × 5–10 cm; rays whorled; first node of inflorescence with 4–6 rays, dense, densely yellowish brown stellate-pubescent, without large ster-

ile radiant flowers; peduncles 2–4 cm; bracts caducous, leaflike, green, linear-lanceolate, stellate pubescent; bracteoles scalelike. Flowers on rays of 3rd order, not fragrant, sessile or shortly pedicellate. Calyx yellowish green; tube obconical, ca. 1.5 mm, glabrous; lobes triangular, ca. 1/3 as long as calyx tube, sparsely ciliate, apex obtuse. Corolla white, rotate, ca. 4 mm in diam., sparsely stellate-pubescent; tube ca. 1 mm; lobes spreading, ovate, ca. 2 × as long as tube, apex rounded, margin entire. Stamens slightly shorter than corolla, inserted at base of corolla; filaments ca. 2 mm; anthers yellow, broadly elliptic, ca. 1 mm. Styles exceeding calyx lobes; stigmas capitate. Fruit maturing intense red, oblong or broadly ellipsoid to obovoid-oblong, 7–10 × 4–5 mm, base rounded, apex acute, glabrous; pyrenes slightly compressed, oblong, ca. 7 × 4 mm, with 2 deep dorsal grooves and 1 shallow ventral groove, apex rounded. Fl. Nov–Dec, fr. Mar–Oct.

Sparse forests, scrub; 100–1400 m. SW Guangxi, SE Yunnan [N Vietnam].

**49. *Viburnum ternatum* Rehder in Sargent, Trees & Shrubs 2: 37. 1907.**

三叶荚蒾 san ye jia mi

*Viburnum chaffanjonii* H. Léveillé.

Shrubs or small trees, deciduous, to 6 m tall. Bark gray-brownish. Branchlets of current year brownish, yellow stellate-pubescent; branchlets of previous year black-brownish, terete, glabrous, with sparse, small, rounded lenticels. Winter buds lanceolate-triangular, with a pair of separate scales; scales yellow stellate-pubescent. Leaves in whorls of 3, or opposite on relatively slender branchlets; stipules 2, persistent, lanceolate, 4–5 mm, pubescent; petiole green, slender, 2–6 cm, stellate-pubescent; leaf blade green when young, ovate-elliptic or elliptic to oblong-obovate, sometimes obovate-lanceolate, 8–24 × 4–7(–9.5) cm, papery, abaxially stellate-pubescent and mixed with forklike or simple hairs only on midvein and lateral veins, adaxially usually sparsely forklike pubescent, more densely so on midvein, glabrescent, with large glandular spots on both sides of midvein at base, midvein raised abaxially, lateral veins 6- or 7-jugate, pinnate, arched, rarely branched, anastomosing near margin, conspicuously raised abaxially, slightly impressed adaxially, veinlets transverse, conspicuously raised abaxially, slightly impressed adaxially, not lobed, base cuneate, with 0 or 1 circular gland on both sides of midvein near base, margin entire or dentate at apex, apex acute or shortly acuminate. Flowers appearing after leaves; inflorescence a compound umbel-like cyme, terminal, 12–14(–18) cm in diam.; rays whorled; first node of inflorescence with 5–7(–10) rays, lax, sparsely stellate-pubescent, without large sterile radiant flowers; peduncles nearly absent; bracts caducous, greenish, linear-lanceolate, glabrous; bracteoles scalelike. Flowers on rays from 2nd to 6th orders, not fragrant, sessile or shortly pedicellate. Calyx greenish; tube obconical, ca. 1.8 mm, glabrous; lobes very small and inconspicuous, ciliate, apex rounded. Corolla white, rotate, ca. 3 mm in diam., glabrous; tube 1–1.5 mm; lobes spreading, suborbicular, ca. 1.3 mm, slightly shorter than tube, apex rounded, margin entire. Stamens much exceeding corol-

la, inserted near base of corolla; filaments folded in bud, ca. 6 mm; anthers yellow-whitish, broadly elliptic, ca. 1 mm. Styles slightly exceeding calyx lobes; stigmas capitate. Fruit maturing red, broadly ellipsoid-oblong, ca.  $7 \times 5$  mm, base rounded, apex acute, glabrous; pyrenes compressed, broadly ellipsoid-oblong

or ovoid,  $5-6 \times 3-4$  mm, with 2 shallow dorsal grooves and 1 ventral groove, apex rounded. Fl. Jun–Jul, fr. Sep.

• Forests; 600–1400 m. Guizhou, SW Hubei, NW Hunan, Sichuan, Yunnan.

**7. *Viburnum* sect. *Odontotinus*** Rehder in Sargent, *Trees & Shrubs* 2: 113. 1908.

齿叶组 *chi ye zu*

Winter buds with 2 or 3 pairs of separate scales. Inflorescence a compound umbel-like cyme, usually pedicellate, without large sterile radiant flowers. Corolla rotate or campanulate-rotate. Fruit maturing red, rarely maturing black; pyrenes with 1 or 2 deep or shallow dorsal grooves, and 1–3 ventral grooves, endocarp solid.

About 30 species; temperate Asia and North America, only one species in the European Caucasus; 22 species (15 endemic) in China.

H. Hara (*Ginkgoana* 5: 229–267. 1983) recognized three subsections: *Viburnum* subsect. *Odontotinus* for Asiatic species with entire leaves, *V.* subsect. *Dentata* (Maximowicz) H. Hara for North American species, and *V.* subsect. *Lobata* (Oersted) H. Hara for species with 3–5-lobed leaf blades. Recent phylogenetic work shows that this section is polyphyletic, with two distinct clades. The first one consists of New World species together with South American species from *V.* sect. *Oreiotinus* (Oersted) Benth. & J. D. Hooker and a second clade for Old World species. This Old World clade can be further split into species with 3–5-lobed leaf blades (“*Lobata*” clade) and the remaining species (“*Succodontotinus*” clade). Old World *V.* sect. *Odontotinus* are sister to *V. cylindricum* (i.e., *V.* sect. *Megalotinus*).

Shrubs or small trees, deciduous, to 5(–7) m tall. Bark light brown. Branchlets of current year purple-brownish, glabrous or yellow-brownish stellate-pubescent; branchlets of previous year purple-brown or black-brown, terete, glabrous, with dispersed, small, rounded lenticels. Winter buds ovoid-oblong, with 2 pairs of separate scales; scales  $\pm$  hairy outside. Leaves always opposite, not clustered at apices of branchlets; stipules 2, persistent, subulate, small; petiole green, slender, 1–2(–3.5) cm, sparsely long hairy or glabrous; leaf blade green when young, broadly ovate to rhombic-ovate or broadly obovate, rarely elliptic-oblong,  $3.5-8.5(-12) \times 3-5.5(-9)$  cm, thickly papery or slightly leathery, abaxially pubescent on midvein and lateral veins and stellate-pubescent in vein axils, or stellate-pubescent throughout, with or without glandular dots, adaxially glabrous or pubescent on midvein, midvein raised abaxially, lateral veins (4 or) 5 or 6(or 7)-jugate, pinnate, straight or slightly arched, branched, ending in teeth, conspicuously raised abaxially, impressed adaxially, veinlets transverse, slightly raised abaxially, impressed adaxially, not lobed, base broadly cuneate to rounded, rarely truncate, with 0–3 circular glands on both sides of midvein near base, margin crenate above 1/3–1/2 from

base, apex abruptly and shortly acuminate to acuminate. Flowers appearing after leaves; inflorescence a compound umbel-like cyme, terminal or at apices of lateral short branchlets with 1 pair of leaves, 5–12 cm in diam.; rays whorled; first node of inflorescence usually with 7 rays, dense, usually densely or sparsely yellow-brown stellate-pubescent, without large sterile radiant flowers; peduncles usually less than 1 cm; bracts and bracteoles deciduous, leaflike, green, lanceolate, sparsely hairy. Flowers on rays from 3rd to 5th orders, not fragrant, shortly pedicellate or sessile. Calyx green; tube tubular-obconical, ca. 1.5 mm, with yellow-brown glandular dots and sparsely or densely stellate-pubescent; lobes broadly ovate-triangular, ca. 1.5 mm, ciliate, apex obtuse. Corolla white, rotate, ca. 4 mm in diam., glabrous or stellate-pubescent; tube 1–2 mm; lobes spreading, orbicular-ovate, exceeding tube, apex rounded, margin entire. Stamens usually exceeding corolla, inserted at base of corolla; filaments 4–5 mm; anthers yellow-whitish, broadly elliptic, ca. 1 mm. Styles exceeding calyx lobes; stigmas capitate. Fruit maturing red, subglobose, ca. 6 mm, base rounded, apex rounded, glabrous; pyrenes compressed, ovoid,  $3.5-5 \times 3-4$  mm, with 2 deep dorsal grooves, and 1–3 ventral grooves, apex acute. Fl. Jun–Jul, fr. Sep–Oct.  $2n = 18^*, 20^*, 22^*$ .

• Forests, scrub; 1300–3500 m. Anhui, Gansu, Guangxi, Guizhou, W Henan, W Hubei, S Ningxia, S Shaanxi, Sichuan, Taiwan, SE Xizang, Yunnan, NW Zhejiang.

This is a most polymorphic species, perhaps including many geographic races. There exists a very complicated variation pattern among the different geographic races in the absence or presence and density of the pubescence on the winter bud, calyx tube, and corolla, and in the size of the corolla and fruit, in the texture and shape of the leaf, in the presence or absence of pubescence on the adaxial leaf surface, and in the presence or absence of glandular dots and of stellate pubescence on the abaxial leaf surface. Thus, it is very difficult to identify the different geographic races. These features may be used to recognize *Viburnum hupehense*, *V. lobophyllum*, or *V. wilsonii* among others.

*Viburnum betulifolium* f. *aurantiacum* Rehder (*J. Arnold Arbor.* 9: 116. 1928) is a yellow/orange-fruited variant described from Chinese material.

**51. *Viburnum chunii*** P. S. Hsu, Acta Phytotax. Sin. 11: 82. 1966.

金腺荚蒾 jin xian jia mi

*Viburnum chunii* subsp. *chengii* P. S. Hsu; *V. chunii* var. *piliferum* P. S. Hsu.

Shrubs, evergreen, to 2 m tall. Bark gray-brownish. Branchlets of current year quadrangular, glabrous or yellow-brown adpressed pubescent; branchlets of previous year gray-brownish, slightly quadrangular, glabrous, with dispersed, small, rounded lenticels. Winter buds lanceolate, with 2 pairs of separate scales; scales yellow-brown adpressed pubescent. Leaves always opposite, not clustered at apices of branchlets; stipules absent; petiole reddish purple, slender, 4–8 mm, sparsely or densely yellow-brown adpressed pubescent; leaf blade yellowish green when young, ovate-rhombic to rhombic or elliptic-oblong, 5–7(–11) × 2–4 cm, thickly papery to thinly leathery, abaxially glabrous or stellate-pubescent in vein axils, with denser glandular dots, adaxially often with dispersed golden or dark glandular dots, midvein raised abaxially, lateral veins 3–5-jugate, lowest pair sometimes elongating to upper part of blade, thus appearing ± triplinerved, pinnate, arched, rarely branched, anastomosing near margin, slightly raised abaxially, slightly impressed adaxially, veinlets transverse, inconspicuous or slightly conspicuous abaxially, inconspicuous adaxially, not lobed, base cuneate, without glands, margin entire, usually remotely serrate above middle part, apex caudate-acuminate. Flowers appearing after leaves; inflorescence a compound umbel-like cyme, terminal, 1.5–2 cm in diam.; rays whorled; first node of inflorescence with 4 or 5 rays, dense, sparsely or densely yellow-brown adpressed hairy and with glandular dots, without large sterile radiant flowers; peduncles 5–18 mm; bracts and bracteoles persistent, leaflike, green, linear to linear-lanceolate, glabrous. Flowers on rays of 1st order, not fragrant, shortly pedicellate. Calyx green; tube campanulate, ca. 1 mm, glabrous; lobes ovate-triangular, very short, glabrous, apex obtuse. Corolla reddish in bud, later white, campanulate, ca. 4 mm in diam., glabrous; tube ca. 2.5 mm; lobes spreading, broadly obovate, 1–2 mm, apex rounded, margin entire. Stamens slightly shorter than corolla, inserted at base of corolla; filaments ca. 2 mm; anthers yellow-whitish, broadly elliptic, ca. 1 mm. Styles slightly exceeding calyx lobes; stigmas capitate. Fruit maturing red, globose, (7–) 8–9(–10) mm in diam., base rounded, apex acute, glabrous; pyrenes compressed, ovoid, 5–8(–9) × 5–6 mm, without conspicuous grooves, apex acute. Fl. May, fr. Nov–Dec.

• Dense or sparse forests, scrub; 100–1900 m. S Anhui, Fujian, Guangdong, Guangxi, SE Guizhou, N Hunan, Jiangxi, SE Sichuan, Zhejiang.

**52. *Viburnum corylifolium*** J. D. Hooker & Thomson, J. Proc. Linn. Soc., Bot. 2: 174. 1858.

榛叶荚蒾 zhen ye jia mi

*Viburnum barbigerrum* H. Léveillé; *V. dunnianum* H. Léveillé.

Shrubs, deciduous, to 2 m tall. Bark light brown. Branchlets of current year yellowish brown, densely bristlelike hairy; branchlets of previous year brown, terete, sparsely hairy or sub-

glabrous, with dispersed, small, rounded lenticels. Winter buds ovoid, with 2 pairs of separate scales; scales densely bristlelike hairy. Leaves always opposite, not clustered at apices of branchlets; stipules absent; petiole green, robust, 0.5–1 cm, densely yellowish brown bristlelike hairy; leaf blade yellowish green when young, ovate or broadly obovate, 3.5–6 × 2–4.5 cm, papery, abaxially yellowish brown bristlelike hairy, usually with dispersed yellowish transparent glandular dots, adaxially sparingly simple hairy, midvein raised abaxially, lateral veins 6–8-jugate, pinnate, straight or slightly arched, branched, ending in teeth, conspicuously raised abaxially, impressed adaxially, veinlets transverse, slightly raised abaxially, impressed adaxially, not lobed, base rounded to obtuse or slightly cordate, with 0–2 circular glands on both sides of midvein near base, margin serrate, apex abruptly narrowed, acute. Flowers appearing after leaves; inflorescence a compound umbel-like cyme, at apices of short branchlets with a pair of leaves, 5–7 cm in diam.; rays whorled; first node of inflorescence usually with 5 rays, dense, densely yellowish brown bristlelike hairy, without large sterile radiant flowers; peduncles 1.5–2 cm; bracts and bracteoles deciduous, leaflike, green, lanceolate, hairy. Flowers on rays of 2nd and 3rd orders, not fragrant, shortly pedicellate or sessile. Calyx green; tube tubular, ca. 1.2 mm, with simple hairs; lobes ovate, ca. 0.5 mm, ciliate, apex obtuse. Corolla white, rotate, 5–8 mm in diam., stellate-pubescent; tube ca. 1 mm; lobes spreading, orbicular-ovate, exceeding tube, apex rounded, margin entire. Stamens exceeding corolla, inserted at base of corolla; filaments 4–5 mm; anthers yellow-whitish, broadly elliptic, small, ca. 1 mm. Styles slightly exceeding calyx lobes; stigmas capitate. Fruit maturing red, ovoid, ca. 8 × 6 mm, base rounded, apex rounded, glabrous; pyrenes compressed, ovoid, ca. 6 × 5 mm, with 2 shallow dorsal grooves, and 3 shallow ventral grooves, apex rounded. Fl. Mar–Apr, fr. May–Sep.

Forests, scrub; ca. 2100 m. Guangxi, NE Guizhou, Hubei, S and W Shaanxi, Sichuan, Xizang, Yunnan [NE India].

**53. *Viburnum dalzielii*** W. W. Smith, Notes Roy. Bot. Gard. Edinburgh 9: 137. 1916.

粤赣荚蒾 yue gan jia mi

Shrubs, deciduous, to 3 m tall. Bark light brown. Branchlets of current year with dense yellow-brown stellate bristlelike hairs; branchlets of previous year gray-brown, terete, glabrous, with dispersed, small, rounded lenticels. Winter buds ovoid, with 2 pairs of separate scales; scales with dense yellow-brown stellate bristlelike hairs. Leaves always opposite, not clustered at apices of branchlets; stipules absent; petiole green, slender, 1(–2) cm, with dense yellow-brown stellate bristlelike hairs; leaf blade yellowish green when young, ovate-lanceolate or ovate-elliptic, 8–17 × 4–7 cm, papery to thickly papery, both surfaces glabrous throughout except midvein and lateral veins yellow-brown bristlelike hairy, midvein raised abaxially, lateral veins 8–12-jugate, pinnate, straight or slightly arched, rarely branched, ending in teeth, raised abaxially, slightly impressed adaxially, veinlets transverse, slightly raised abaxially, impressed adaxially, not lobed, base shallowly cordate or subrounded, with 0–2 circular glands on both sides of midvein near base, margin remotely denticulate, entire or slightly crenate at base, apex long acuminate or abruptly caudate. Flow-

ers appearing after leaves; inflorescence a compound umbel-like cyme, terminal, 5–6 cm in diam.; rays whorled; first node of inflorescence usually with 5 rays, lax, with dense yellow-brown stellate bristlelike hairs, without large sterile radiant flowers; peduncle 1–4 cm; bracts and bracteoles deciduous, leaflike, green, linear-lanceolate, hairy. Flowers on rays of 2nd and 3rd orders, not fragrant, shortly pedicellate or sessile. Calyx yellowish green; tube obconical, ca. 1.5 mm, with yellow-brown stellate bristlelike hairs; lobes triangular-ovate, very short, ca. 0.5 mm, ciliate, apex obtuse. Corolla white, rotate, ca. 4 mm in diam., outside with few yellow-brown stellate bristlelike hairs; tube ca. 1.5 mm; lobes spreading, suborbicular, slightly exceeding tube, apex rounded, margin entire. Stamens slightly exceeding corolla, inserted at base of corolla; filaments ca. 3 mm; anthers yellow-whitish, elliptic, ca. 1 mm. Styles slightly exceeding calyx lobes; stigmas capitate. Fruit maturing red, ovoid-ellipsoid, compressed, 8–10 × 6–7 mm, base rounded, apex rounded, glabrous; pyrenes ovoid, 7–8 × 5–6 mm, with 2 dorsal grooves and 3 ventral grooves, apex rounded. Fl. May, fr. Aug–Nov.

- Thickets, forests; 400–1100 m. Guangdong, Jiangxi.

莢蒾 jia mi

*Viburnum brevipes* Rehder; *V. dilatatum* var. *fulvotomentosum* (P. S. Hsu) P. S. Hsu; *V. dilatatum* var. *macrophyllum* P. S. Hsu; *V. fulvotomentosum* P. S. Hsu.

Shrubs, deciduous, to 5 m tall. Bark light brown. Branchlets of current year grayish brown, densely bristlelike hairy and stellate-pubescent; branchlets of previous year dark purple-brown, terete, sparsely hairy or subglabrous, with dispersed, small, rounded lenticels. Winter buds ovoid, 3–5 mm, acute, with 2 pairs of separate scales; scales densely bristlelike hairy and stellate-pubescent. Leaves always opposite, not clustered at apices of branchlets; stipules absent; petiole green, robust, (2–) 10–30 mm, stellate pubescent or simple hairs less than 1 mm; leaf blade green when young, broadly obovate, obovate, or broadly ovate, 3–10(–13) × 2–7(–11) cm, papery, abaxially yellowish forklike pubescent and stellate-pubescent, usually with dispersed yellowish or nearly colorless transparent glandular dots, adaxially adpressed hairy, midvein raised abaxially, lateral veins 6–8-jugate, pinnate, straight or slightly arched, branched, ending in teeth, conspicuously raised abaxially, impressed adaxially, veinlets transverse, slightly raised abaxially, not lobed, base rounded to obtuse or slightly cordate, sometimes cuneate, with 1–3 circular glands on both sides of midvein near base, margin serrate, apex acute. Flowers appearing after leaves; inflorescence a compound umbel-like cyme, at apices of short branchlets with a pair of leaves, 4–10 cm in diam.; rays whorled; first node of inflorescence with 5 rays, dense, densely bristlelike hairy and stellate-pubescent, without large sterile radiant flowers; peduncles 1–2(–4) cm; bracts and bracteoles deciduous, leaflike, green, lanceolate, hairy. Flowers on rays of 3rd and 4th orders, fragrant, shortly pedicellate or sessile. Calyx green; tube narrowly tubular, ca. 1 mm, stellate-pubescent; lobes ovate, ca. 0.5 mm, ciliate, apex

obtuse. Corolla white, rotate, 5–8 mm in diam., stellate-pubescent; tube ca. 1.5 mm; lobes spreading, orbicular-ovate, 1.5–2.5 mm, ca. as long as wide, apex rounded, margin entire. Stamens conspicuously exceeding corolla, inserted at base of corolla; filaments 4–6 mm; anthers yellow-whitish, broadly elliptic, small, ca. 1 mm. Styles exceeding calyx lobes; stigmas 3-lobed. Fruit maturing red, ellipsoid-ovoid, 6–8 × 4.5–6.5 mm, base rounded, apex rounded, glabrous; pyrenes compressed, ovoid, 5–6 × 4–5 mm, with 2 shallow dorsal grooves, and 3 shallow ventral grooves, apex rounded. Fl. May–Jul, fr. Sep–Nov. *2n* = 18\*.

Sparse forests, forest margins, scrub; 100–1000 m. Anhui, Fujian, N Guangdong, N Guangxi, Guizhou, S Hebei, S Henan, Hubei, Hunan, Jiangsu, Jiangxi, S Shaanxi, Sichuan, Taiwan, Yunnan, Zhejiang [Japan, Korea].

**55. *Viburnum erosum*** Thunberg in Murray, Syst. Veg., ed. 14, 295. 1784.

宜昌莢蒾 yi chang jia mi

Shrubs, deciduous, to 3 m tall. Bark light brown. Branchlets of current year densely stellate-pubescent and mixed with simple long hairs; branchlets of previous year gray-brownish, terete, glabrous, with sparse, small, rounded lenticels. Winter buds ovoid-oblong, with 2 pairs of separate scales; scales densely yellowish brown stellate-pubescent and mixed with simple long hairs. Leaves always opposite, not clustered at apices of branchlets; stipules 2, subulate, small, persistent, or absent; petiole green, robust, 3–5 mm, with coarse short hairs; leaf blade yellowish green when young, ovate-lanceolate, ovate-oblong, narrowly ovate, elliptic, or oblong-lanceolate, 3.5–6 × 1.5–3.5 cm, papery, abaxially densely stellate-pubescent, adaxially glabrous or sparsely stellate-pubescent, midvein raised abaxially, lateral veins 7–10(–14)-jugate, pinnate, straight or slightly arched, rarely branched, ending in teeth, conspicuously raised abaxially, impressed adaxially, veinlets transverse, slightly raised abaxially, impressed adaxially, not lobed or sometimes almost 3-lobed, base rounded, broadly cuneate, or slightly cordate, or sometimes shallowly 2-lobed, with 0 or 1 circular gland on both sides of midvein near base, margin serrate, apex acute or acuminate. Flowers appearing after leaves; inflorescence a compound umbel-like cyme, at apices of short lateral branchlets with a pair of leaves, 2–4 cm in diam.; rays whorled; first node of inflorescence usually with 5 rays, dense, densely stellate-pubescent and mixed with simple long hairs, without large sterile radiant flowers; peduncle 1–2.5 cm; bracts and bracteoles deciduous, leaflike, green, linear-lanceolate, hairy. Flowers on rays of 2nd and 3rd orders, not fragrant, often long pedicellate. Calyx yellowish green; tube tubular, ca. 1.5 mm, stellate-pubescent; lobes ovate-triangular, ca. 0.5 mm, ciliate, apex obtuse. Corolla white, rotate, ca. 6 mm in diam., glabrous or subglabrous; tube ca. 2 mm; lobes spreading, orbicular-ovate, ca. 2 mm, apex rounded, margin entire. Stamens slightly shorter to longer than corolla, inserted at base of corolla; filaments ca. 2.5 mm; anthers yellow-whitish, suborbicular, ca. 0.7 mm. Styles exceeding calyx lobes; stigmas capitate. Fruit maturing red, broadly ovoid, 6–7(–9) mm, base rounded, apex rounded, glabrous; pyrenes compressed, ovoid, ca. 6 × 5 mm, with 2 shallow dorsal grooves and 3 shallow ventral grooves, apex rounded. Fl. Apr–May, fr. Aug–Oct.

台中莢蒾(原亞種) tai zhong jia mi (yuan ya zhong)

*Viburnum erosum* Thunberg var. *formosanum* Hance, Ann. Sci. Nat., Bot., sér. 5, 5: 216. 1866; *V. dilatatum* Thunberg var. *formosanum* (Hance) Maximowicz; *V. formosanum* f. *subglabrum* (Hayata) Nakai; *V. luzonicum* Rolfe var. *formosanum* (Hance) Rehder; *V. luzonicum* f. *oblongum* Kanehira & Sasaki; *V. luzonicum* var. *oblongum* (Kanehira & Sasaki) Li; *V. luzonicum* f. *subglabrum* (Hayata) Kanehira & Sasaki; *V. subglabrum* Hayata.

Young branchlets glabrous. Petiole sparsely simple hairy. Inflorescence sparsely stellate-pubescent. Calyx tube stellate-pubescent.

• Forests. Taiwan.

**58b. *Viburnum formosanum* var. *pubigerum* P. S. Hsu, Ann. Bot. Fenn. 44: 154. 2007.**

毛枝台中莢蒾 mao zhi tai zhong jia mi

Young branchlets, petioles, and inflorescences densely yellow-brown stellate pubescent. Calyx tube stellate-pubescent.

• Sparse or dense forests, scrub; 100–1000 m. N Guangdong, S Hunan, Jiangxi.

**58c. *Viburnum formosanum* subsp. *leiogynum* P. S. Hsu, Acta Phytotax. Sin. 11: 81. 1966.**

光萼莢蒾 guang e jia mi

Young branchlets and petioles glabrous or stellate-pubescent. Inflorescence stellate-pubescent. Calyx tube glabrous.

• Forests; 700–1100 m. N Fujian, Guangxi, Sichuan, S Zhejiang.

**59. *Viburnum hainanense* Merrill & Chun, Sunyatsenia 5: 193. 1940.**

海南莢蒾 hai nan jia mi

*Viburnum tsangii* Rehder; *V. tsangii* f. *xanthocarpum* Rehder.

Shrubs, evergreen, to 3 m tall. Bark gray-brownish. Branchlets of current year quadrangular, yellow-brown stellate-pubescent; branchlets of previous year purple-brownish or gray-brownish, slightly quadrangular, glabrous, with dispersed, small, rounded lenticels. Winter buds lanceolate, with 2 pairs of separate scales; scales yellow-brown stellate-pubescent. Leaves always opposite, not clustered at apices of branchlets; stipules absent; petiole reddish purple, slender, 3–6(–10) mm, yellow-brown stellate-pubescent; leaf blade yellowish green when young, oblong, broadly oblong-lanceolate, or elliptic, 3.5–

7(–10) × 1.5–4 cm, subleathery, adaxially slightly shiny, both surfaces glabrous or stellate-pubescent on midvein and lateral veins, with black or castaneous-brown glandular dots, midvein raised abaxially, lateral veins 4- or 5-jugate, lowest pair elongating to upper part of blade, thus appearing triplinerved, pinnate, arched, rarely branched, anastomosing near margin, raised abaxially, impressed adaxially, veinlets subtransverse, conspicuous adaxially, inconspicuous abaxially, not lobed, base broadly cuneate or sometimes rounded, without glands, margin entire or remotely dentate above middle part, apex shortly acuminate or acute. Flowers appearing after leaves; inflorescence a compound umbel-like cyme, terminal, 2–4 cm in diam.; rays whorled; first node of inflorescence with (3 or)4 or 5 rays, ca. 1 cm, dense, yellow-brown stellate-pubescent, or mixed with forklike or simple hairs, without large sterile radiant flowers; peduncles 4–10 mm or nearly absent; bracts caducous, leaflike, green, linear-lanceolate, stellate pubescent; bracteoles scalelike. Flowers on rays of 2nd and 3rd orders, not fragrant, shortly pedicellate. Calyx green; tube obconical, ca. 1 mm, sparsely stellate-pubescent; lobes broadly ovate, very short, sparsely ciliate, apex obtuse, ciliate. Corolla white, rotate, ca. 4 mm in diam., glabrous; tube ca. 1 mm; lobes spreading, suborbicular, subequaling tube, apex rounded, margin entire. Stamens erect, exceeding corolla, inserted at base of corolla; filaments ca. 2 mm; anthers yellow-whitish, broadly elliptic, ca. 1 mm. Styles slightly exceeding calyx lobes; stigmas capitate. Fruit maturing red, compressed ovoid, ca. 6 mm in diam., base rounded, apex acute, glabrous; pyrenes compressed, orbicular, raised on dorsal side, deeply impressed on ventral side, apex rounded. Fl. Apr–Jul, fr. Aug–Dec.

Forests, scrub; 600–1400 m. S Guangdong, S Guangxi, Hainan [N Vietnam].

**60. *Viburnum hengshanicum* Tsiang ex P. S. Hsu in Chen et al., Observ. Fl. Hwangshan. 178. 1965.**

衡山莢蒾 heng shan jia mi

Shrubs, deciduous, to 2.5 m tall. Bark light brown. Branchlets of current year grayish brown, glabrous; branchlets of previous year gray-white, terete, glabrous, with dispersed, small, rounded lenticels. Winter buds ovoid-oblong, 8–10 mm, acute, with 2 pairs of separate scales; scales outer ones ca. 1/2 as long as inner ones. Leaves always opposite, not clustered at apices of branchlets; stipules absent; petiole green, slender, (1–)2–4.5 cm, glabrous; leaf blade green when young, broadly ovate or orbicular-ovate, rarely obovate, 9–14(–18) × 5–13 cm, papery, abaxially sparsely adpressed hairy on midvein and lateral veins or glabrous and stellate-pubescent in vein axils, adaxially glabrous, midvein raised abaxially, lateral veins 5–7-jugate, lowest pair elongating to upper part of blade, thus appearing ± triplinerved, pinnate, straight or slightly arched, branched, ending in teeth, conspicuously raised abaxially, slightly impressed adaxially, veinlets transverse, slightly raised abaxially, impressed adaxially, not lobed, base rounded or shallowly cordate, sometimes truncate, without glands, margin remotely irregularly dentate, apex abruptly and shortly acuminate or abruptly narrowed and long mucronate, sometimes (2 or)3-lobed. Flowers appearing after leaves; inflorescence a compound umbel-like cyme, terminal, 5(–9) cm in diam.; rays

whorled; first node of inflorescence with (6 or) 7 rays, dense, pubescent, without large sterile radiant flowers; peduncles (5–) 6–10(–12.5) cm; bracts and bracteoles deciduous, leaflike, green, lanceolate, sparsely hairy. Flowers on rays of 3rd and 4th orders, not fragrant, shortly pedicellate or sessile. Calyx green; tube cylindric, ca. 1 mm, glabrous; lobes broadly ovate, ca. 1.5 mm, ciliate, apex obtuse. Corolla white, rotate, ca. 5 mm in diam., glabrous; tube ca. 1.2 mm; lobes spreading, suborbicular, ca. 1 mm, apex rounded, margin entire. Stamens obviously exceeding corolla, inserted at base of corolla; filaments 4–5 mm; anthers yellow-whitish, broadly oblong-elliptic, ca. 1 mm. Styles exceeding calyx lobes; stigmas capitate. Fruit maturing red, narrowly orbicular to orbicular, ca. 9 × 6 mm, base rounded, apex rounded, glabrous; pyrenes compressed, obovoid, 6–8 × 5–6 mm, with 2 shallow dorsal grooves and 3 shallow ventral grooves, apex rounded. Fl. May–Jul, fr. Sep–Oct.

• Forests, thickets; 600–1300 m. Anhui, Guangxi, Guizhou, Hunan, N Jiangxi, NW Zhejiang.

**61. *Viburnum integrifolium*** Hayata, J. Coll. Sci. Imp. Univ. Tokyo 30(1): 132. 1911.

全叶荚蒾 *quan ye jia mi*

*Viburnum foetidum* Wallich f. *integrifolium* (Hayata) Nakai; *V. foetidum* var. *integrifolium* (Hayata) Kanehira & Hatusima.

Shrubs, deciduous, to 4 m tall. Bark light brown. Branchlets of current year gray-brown, quadrangular, yellowish stellate-pubescent, glabrescent, with small lenticels; branchlets of previous year gray-yellowish, terete, glabrous, with sparse, small, rounded lenticels. Winter buds oblong-ovoid, with 2 pairs of separate scales; scales ovate-lanceolate, glabrescent. Leaves always opposite, not clustered at apices of branchlets; stipules absent; petiole green, robust, 5–10 cm, stellate-pubescent; leaf blade green when young, black-brown when dry, oblong or oblong-lanceolate to linear-lanceolate, 5–11 × 1.5–2.8 cm, thickly papery, abaxially with dispersed small brown dots, both surfaces glabrous, midvein raised abaxially, lateral veins 4–6-jugate, pinnate, arched, rarely branched, anastomosing near margin, raised abaxially, impressed adaxially, veinlets transverse, slightly raised abaxially, impressed adaxially, not lobed, base cuneate, without glands, margin irregularly repand, not dentate, apex abruptly narrowed and long caudate. Flowers appearing after leaves; inflorescence a compound umbel-like cyme, terminal or at apices of branchlets with 1 pair of leaves, 2.5–5 cm in diam.; rays whorled; first node of inflorescence with 5 rays; rays of different orders slender, dense, stellate-pubescent and with red-brown glandular dots, without large sterile radiant flowers; peduncles 2–2.5 cm; bracts and bracteoles caducous, green, linear-lanceolate, membranous, glabrous. Flowers on rays of 2nd and 3rd orders, not fragrant, long pedicellate or sessile. Calyx green; tube tubular, ca. 1 mm, with few red-brown glandular dots; lobes ovate, ca. 0.8 mm, glabrous, apex acute. Corolla white, rotate, ca. 4 mm in diam., glabrous; tube ca. 1 mm; lobes spreading, ovate, ca. 1.2 mm, exceeding tube, apex rounded, margin entire. Stamens subequalling corolla, inserted at base of corolla; filaments ca. 3 mm; anthers yellow-whitish, broadly elliptic, ca. 1 mm. Styles not exceeding calyx

lobes; stigmas capitate. Fruit maturing red, ovoid, ca. 7.5 mm, base rounded, apex rounded, glabrous; pyrenes compressed, ovoid, ca. 6 × 4 mm, raised on dorsal side, slightly impressed on ventral side, apex rounded. Fl. Jun, fr. Aug–Sep.

• Mountains; 1600–2000 m. Taiwan.

**62. *Viburnum kansuense*** Batalin, Trudy Imp. S.-Peterburgsk. Bot. Sada 13: 372. 1894.

甘肃荚蒾 *gan su jia mi*

Shrubs, deciduous, to 3 m tall. Bark light brown. Branchlets of current year pale brown, glabrous; branchlets of previous year gray or gray-brownish, terete, glabrous, with dispersed, small, rounded lenticels. Winter buds ovoid, with 2 pairs of separate scales; scales glabrous. Leaves always opposite, not clustered at apices of branchlets; stipules 2, subulate, small, persistent, or absent; petiole green, slender, 1–2.5(–4.5) cm, glabrous; leaf blade green when young, broadly ovate to oblong-ovate or obovate, 3–8 × 3–7 cm, papery, abaxially adpressed long hairy, densely stellate-pubescent in vein axils, adaxially sparsely stellate-pubescent throughout or only on veins, midvein raised abaxially, 3–5-palmatinerved, veins straight or slightly arched, branched, ending in teeth, raised abaxially, impressed adaxially, veinlets transverse, inconspicuous on both surfaces, 3–5-lobed, base truncate to subcordate or broadly cuneate, with 0 or 1 circular gland on both sides of midvein near base, middle lobe largest, margin irregularly dentate, apex acuminate or acute. Flowers appearing after leaves; inflorescence a compound umbel-like cyme, terminal, 2–4 cm in diam.; rays whorled; first node of inflorescence with 5–7 rays, dense, pubescent, without large sterile radiant flowers; peduncle 2.5–3.5 cm; bracts and bracteoles deciduous, leaflike, green, linear-lanceolate, hairy. Flowers on rays of 2nd and 3rd orders, not fragrant, shortly pedicellate or sessile. Calyx purple-red; tube obconical, ca. 1 mm, glabrous; lobes ovate-triangular, ca. 0.5 mm, glabrous, apex obtuse. Corolla reddish, rotate, ca. 6 mm in diam., glabrous; tube ca. 2 mm; lobes spreading, suborbicular, ca. 2.5 × 2.5 mm, slightly exceeding tube, apex rounded, margin slightly erose. Stamens slightly longer than corolla, inserted at base of corolla; filaments ca. 2.5 mm; anthers red-brown, globose, ca. 0.8 mm. Styles slightly exceeding calyx lobes; stigmas 2-lobed. Fruit maturing red, ellipsoid or subglobose, 8–10(–12) × 7–8 mm, base rounded, apex rounded, glabrous; pyrenes compressed, ellipsoid, 7–9 × ca. 5 mm, with 2 shallow dorsal grooves and 3 shallow ventral grooves, apex rounded. Fl. Jun–Jul, fr. Sep–Oct.

• *Abies* forests, mixed forests; 2400–3600 m. Gansu, Shaanxi, Sichuan, Xizang, Yunnan.

**63. *Viburnum lancifolium*** P. S. Hsu, Acta Phytotax. Sin. 11: 81. 1966.

披针形荚蒾 *pi zhen xing jia mi*

Shrubs, evergreen, to 2 m tall. Bark light brown. Branchlets of current year purplish brown, yellow-brown stellate-pubescent, or mixed with forklike or simple hairs, terete; branchlets of previous year gray-brownish, terete, glabrous, with sparse, small, rounded lenticels. Winter buds ovoid-lanceolate,

with 2 pairs of separate scales; scales ovate-lanceolate, stellate-pubescent. Leaves always opposite, not clustered at apices of branchlets; stipules absent; petiole green, robust, 8–15(–25) mm, yellow-brown stellate-pubescent, or mixed with forklike or simple hairs; leaf blade green when young, oblong-lanceolate to lanceolate, 9–19(–27) × 1–4 cm, papery, abaxially yellow-brown stellate-pubescent, or mixed with forklike or simple hairs, adaxially shiny, without glands, midvein raised abaxially, lateral veins 7–12-jugate, lowest pair sometimes elongating to upper part of blade, thus appearing nearly triplinerved, pinnate, slightly arched, rarely branched, ending in teeth or anastomosing near margin, raised abaxially, impressed adaxially, veinlets transverse, slightly raised abaxially, inconspicuous adaxially, not lobed, base rounded or obtuse, without glands, margin remotely serrate above 1/3 from base, apex long acuminate. Flowers appearing after leaves; inflorescence a compound umbel-like cyme, terminal, ca. 4 cm in diam., to 5 cm at fruiting stage; rays whorled; first node of inflorescence with 5 rays, dense, yellow-brown stellate-pubescent, or mixed with forklike or simple hairs, without large sterile radiant flowers; peduncles 1.5–4 cm, slender; bracts and bracteoles caducous, green, linear-lanceolate, membranous, sparsely ciliate. Flowers on rays of 3rd and 4th orders, not fragrant, sessile or shortly pedicellate. Calyx green; tube tubular, ca. 1 mm, yellow-brown stellate-pubescent, or mixed with forklike or simple hairs; lobes broadly ovate or broadly triangular-ovate, ca. 1/2 as long as tube, glabrous, apex obtuse, slightly ciliate. Corolla white, rotate, ca. 4 mm in diam., glabrous; tube ca. 1 mm; lobes spreading, orbicular-ovate, slightly exceeding tube, ca. 1.8 mm wide, apex obtuse, margin entire. Stamens slightly exceeding corolla, inserted at base of corolla; filaments ca. 3 mm; anthers yellow-whitish, broadly elliptic, ca. 1 mm. Styles exceeding calyx lobes; stigmas capitate, 3-lobed. Fruit maturing red, subglobose, 7–8 mm in diam., base rounded, apex rounded, glabrous; pyrenes compressed, often slightly rectangular, 5–6 × 5–6 mm, raised and without groove on dorsal side, impressed on ventral side, with 2 shallow grooves, apex rounded. Fl. Apr–May, fr. Jul–Oct.

• Sparse forests, forest margins, scrub, sometimes bamboo forests; 200–600 m. Fujian, ?Guangdong, Jiangxi, Zhejiang.

**64. *Viburnum longiradiatum*** P. S. Hsu & S. W. Fan, Acta Phytotax. Sin. 11: 78. 1966.

长伞梗荚蒾 cháng sǎn gēng jiǎ mǐ

Shrubs or small trees, deciduous, to 4 m tall. Bark light brown. Branchlets of current year brown, with dense, yellow-greenish, simple, long hairs; branchlets of previous year purple-brown, terete, glabrous, with dispersed, small, rounded lenticels. Winter buds ovoid, with 2 pairs of separate scales; scales with dense, yellow-green, simple, long hairs. Leaves always opposite, not clustered at apices of branchlets; stipules subulate, ca. 2 mm, caducous, or absent; petiole green, slender, 1–3 cm, with dense, yellow-green, simple, long hairs; leaf blade yellowish green when young, ovate, broadly ovate, obovate-orbicular, or oblong, 5–10 × 4–5.5 cm, papery, abaxially stellate-pubescent, adaxially with sparse, simple hairs, later only hairy on veins, midvein raised abaxially, lateral veins (6 or) 7–9-jugate,

pinnate, straight or slightly arched, branched, ending in teeth, conspicuously raised abaxially, slightly impressed adaxially, veinlets transverse, slightly raised abaxially, impressed adaxially, not lobed, base broadly obtuse to rounded, with 0–2 circular glands on both sides of midvein near base, margin crenate, apex abruptly narrowed and caudate. Flowers appearing after leaves; inflorescence a compound umbel-like cyme, terminal, 4–8(–14) cm in diam.; rays whorled; first node of inflorescence with 5–7 rays, lax, with yellow-green, simple, long hairs, without large sterile radiant flowers; peduncle 1.5–4 cm; bracts and bracteoles deciduous, leaflike, green, lanceolate, hairy. Flowers on rays of 2nd and 3rd orders, not fragrant, shortly pedicellate or sessile. Calyx green; tube cylindric, ca. 2 mm, with simple hairs; lobes triangular to orbicular, ca. 0.5 mm, ciliate, apex obtuse. Corolla white or reddish, rotate, ca. 6 mm in diam., outside with simple hairs; tube ca. 2 mm; lobes spreading, ovate, ca. 3 mm, exceeding tube, apex rounded, margin entire. Stamens exceeding corolla, inserted at base of corolla; filaments ca. 3 × as long as anthers; anthers yellow-whitish, elliptic, ca. 1 mm. Styles slightly exceeding calyx lobes; stigmas capitate. Fruit maturing red, ellipsoid-ovoid, 7–10 × 6–7 mm, base rounded, apex rounded, glabrous; pyrenes compressed, ellipsoid-ovoid, ca. 7.5 × 5 mm, with 2 dorsal grooves and 3 ventral grooves, base rounded to broadly cuneate, apex acute. Fl. May–Jun, fr. Jul–Sep.

• Forests, scrub; 900–2300 m. Sichuan, Yunnan.

**65. *Viburnum luzonicum*** Rolfe, J. Linn. Soc., Bot. 21: 310. 1884.

吕宋荚蒾 lǚ sòng jiǎ mǐ

*Viburnum foochowense* W. W. Smith; *V. formosanum* (Hance) Hayata f. *mushanense* (Hayata) Nakai; *V. luzonicum* var. *mushanense* (Hayata) Kanehira & Sasaki; *V. mushanense* Hayata; *V. parvifolium* W. W. Smith (1917), not Hayata (1911); *V. smithianum* H. L. Li; *V. smithii* F. P. Metcalf.

Shrubs or small trees, deciduous, to 3 m tall. Bark light brown. Branchlets of current year yellow-brown stellate-pubescent; branchlets of previous year dark purple-brownish, terete, sparsely stellate-pubescent, with dispersed, small, rounded lenticels. Winter buds ovoid-oblong, with 2 pairs of separate scales; scales yellow-brown stellate-pubescent. Leaves always opposite, not clustered at apices of branchlets; stipules absent; petiole green, slender, usually 3–10(–15) mm, yellow-brown stellate-pubescent; leaf blade yellowish green when young, ovate, elliptic-ovate, or ovate-lanceolate to oblong, sometimes subrhombic, 4–9(–11) × 2–5 cm, papery to thickly papery, abaxially sparsely stellate-pubescent or forklike pubescent, adaxially with transparent glandular dots and forklike pubescent on midvein, midvein raised abaxially, lateral veins 5–9-jugate, pinnate, straight or slightly arched, rarely branched, ending in teeth, conspicuously raised abaxially, impressed adaxially, veinlets transverse, slightly raised abaxially, impressed adaxially, not lobed, base broadly cuneate to subrounded, with 0–2 circular glands on both sides of midvein near base, margin serrate, ciliate, apex acuminate to acute. Flowers appearing after leaves; inflorescence a compound umbel-like cyme, usually at apices of short lateral branchlets with a pair of leaves or terminal on

branchlets, 3–5 cm in diam.; rays whorled; first node of inflorescence with 5 rays, dense, yellow-brown stellate-pubescent, or mixed with forklike or simple hairs, without large sterile radiant flowers; peduncle usually very short or nearly absent, very rarely to 1.5 cm; bracts and bracteoles deciduous, leaflike, green, lanceolate, hairy. Flowers on rays of 3rd and 4th orders, not fragrant, sessile or shortly pedicellate. Calyx yellowish green; tube ovoid-orbicular, ca. 1 mm, yellow-brown stellate-pubescent; lobes ovate-lanceolate, ca. 0.5 mm, ciliate, apex obtuse. Corolla white, rotate, 4–5 mm in diam., outside stellate-pubescent; tube ca. 1.5 mm; lobes spreading, ovate, exceeding tube, apex rounded, margin entire. Stamens shorter or slightly longer than corolla, inserted at base of corolla; filaments ca. 2 mm; anthers yellow-whitish, broadly elliptic, ca. 0.8 mm. Styles slightly exceeding calyx lobes; stigmas indistinctly 3-lobed. Fruit maturing red, ovoid, 5–6 mm, base rounded, apex rounded, glabrous; pyrenes very compressed, ovoid, 4–5 × 3–4 mm, with 3 shallow dorsal grooves and 2 shallow ventral grooves, base truncate, apex acute. Fl. Apr–Jun, fr. Aug–Oct.

Sparse forests, scrub, roadsides; 100–700 m. Fujian, Guangdong, Guangxi, SE Jiangxi, Taiwan, Yunnan, S Zhejiang [?Indonesia, Malaysia, Philippines].

**66. *Viburnum melanocarpum*** P. S. Hsu in Chen et al., *Observ. Fl. Hwangshan*. 181. 1965.

黑果荚蒾 *hei guo jia mi*

Shrubs, deciduous, to 3.5 m tall. Bark light brown. Branchlets of current year grayish black, sparsely yellowish stellate-pubescent; branchlets of previous year red-brown, terete, glabrous, with dispersed, small, rounded lenticels. Winter buds ovoid-oblong, ca. 6 mm, with 2 pairs of separate scales; scales densely yellow-white pubescent. Leaves always opposite, not clustered at apices of branchlets; stipules 2, subulate, ca. 3 mm, caducous, or absent; petiole green, slender, 1–2(–4) cm, sparsely yellowish stellate-pubescent; leaf blade green when young, obovate, orbicular-obovate, or broadly elliptic, rarely rhombic-elliptic, 6–10(–12) × 3–6 cm, papery, abaxially sparsely adpressed long hairy on midvein and lateral veins and sparsely stellate-pubescent in vein axils, adaxially shiny, often stiffly hairy on midvein, later subglabrous, midvein raised abaxially, lateral veins 6- or 7-jugate, pinnate, straight or slightly arched, branched, ending in teeth, conspicuously raised abaxially, impressed adaxially, veinlets transverse, slightly raised abaxially, impressed adaxially, not lobed, base rounded, shallowly cordate, or broadly cuneate, with 0 or 1 circular gland on both sides of midvein near base, margin denticulate, apex often abruptly and shortly acuminate. Flowers appearing after leaves; inflorescence a compound umbel-like cyme, at apices of short branchlets with 1 pair of leaves, ca. 5 cm in diam.; rays whorled; first node of inflorescence usually with 5 rays, dense, with dispersed small glandular dots, without large sterile radiant flowers; peduncles 1.5–3 cm, slender; bracts and bracteoles deciduous, leaflike, green, lanceolate, glabrous. Flowers on rays of 2nd and 3rd orders, not fragrant, shortly pedicellate or sessile. Calyx green; tube tubular-obconical, ca. 1.5 mm, sparsely stellate-pubescent or glabrous; lobes broadly ovate, ca. 1.5 mm, glabrous, apex obtuse. Corolla white, rotate, ca. 5 mm in diam., glabrous; tube 1–2 mm; lobes spreading, broadly ovate, slightly

exceeding tube, apex rounded, margin entire. Stamens exceeding or slightly shorter than corolla, inserted at base of corolla; filaments ca. 4 mm; anthers yellow-whitish, broadly elliptic, ca. 1 mm. Styles exceeding calyx lobes; stigmas capitate. Fruit initially turning dark purple-red, maturing black, shiny, ellipsoid, 8–10 mm, base rounded, apex rounded, glabrous; pyrenes compressed, ovoid, ca. 8 × 6 mm, longitudinally raised on ventral side, apex rounded. Fl. Apr–May, fr. Sep–Oct.

• Forests, scrub; ca. 1000 m. Anhui, Henan, S Jiangsu, Jiangxi, Zhejiang.

**67. *Viburnum mullaha*** Buchanan-Hamilton ex D. Don, *Prodr. Fl. Nepal*. 141. 1825.

西域荚蒾 *xi yu jia mi*

Shrubs or small trees, deciduous, to 4 m tall. Bark light brown. Branchlets of current year densely gray-brown stellate-tomentose, mixed with long hairs, or subglabrous; branchlets of previous year purple-brownish, terete, glabrous, with dispersed, small, rounded lenticels. Winter buds ovoid, ca. 5 mm, with 2 pairs of separate scales; scales adpressed pubescent outside. Leaves always opposite, not clustered at apices of branchlets; stipules absent; petiole green, slender, 1–2.5 cm, densely stellate-pubescent; leaf blade green when young, ovate to ovate-lanceolate, 3.5–10 × 1.8–6 cm, papery, abaxially densely stellate-pubescent, or only so in vein axils, adaxially with sparse, simple, forklike, or stellate hairs, or hairy only on midvein, midvein raised abaxially, lateral veins 5- or 6(–8)-jugate, pinnate, arched, branched, ending in teeth, raised abaxially, impressed adaxially, veinlets transverse, slightly raised abaxially, impressed adaxially, not lobed, base broadly cuneate to rounded or slightly cordate, with 0 or 1 circular gland on both sides of midvein near base, margin remotely serrate except at base, apex caudate-acuminate. Flowers appearing after leaves; inflorescence a compound umbel-like cyme, terminal, ca. 6 cm in diam.; rays whorled; first node of inflorescence with 5–7 rays, dense, gray-brown stellate-tomentose, mixed with long hairs, without large sterile radiant flowers; peduncle (0.4–)1.5–2.5 cm; bracts and bracteoles deciduous, leaflike, green, lanceolate, hairy. Flowers on rays from 2nd to 4th order, not fragrant, sessile or shortly pedicellate. Calyx green; tube obconical, ca. 1 mm, outside sparsely or densely stellate-pubescent and with dense glandular dots; lobes triangular-ovate, very small, stellate-pubescent, apex obtuse. Corolla white, rotate, 4–5 mm in diam., outside sparsely or densely stellate-pubescent; tube ca. 1.5 mm; lobes spreading, orbicular-ovate, subequaling tube, apex rounded, margin entire. Stamens shorter than corolla, inserted at base of corolla; filaments ca. 1.5 mm; anthers yellow-whitish, elliptic, ca. 1 mm. Styles very short, shorter than calyx lobes; stigmas capitate. Fruit maturing red, broadly ellipsoid, 5–7 mm in diam., base rounded, apex rounded, glabrous; pyrenes ovoid, 4–6 mm, with 2 shallow dorsal grooves and 1 shallow ventral groove, apex rounded. Fl. Jul, fr. Sep–Oct.  $2n = 18^*$ .

Needle-leaved and broad-leaved mixed forests; 2200–2700 m. Xizang, Yunnan [Bhutan, India, Kashmir, Nepal].

小叶荚蒾 xiao ye jia mi

*Viburnum yamadae* Bartlett & Yamamoto.

Shrubs, deciduous, to 2 m tall. Bark light brown. Branchlets of current year densely yellow-brownish stellate-pubescent, with minute brownish glandular dots; branchlets of previous year dark brown, terete, glabrous, with dispersed, bright, rounded lenticels. Winter buds oblong-ovoid, with 2 pairs of separate scales; scales ovate-lanceolate, stellate-pubescent. Leaves always opposite, not clustered at apices of branchlets; stipules absent; petiole reddish purple, robust, 4–6 mm, densely stellate-pubescent, with minute brownish glandular dots; leaf blade green when young, oblong or orbicular, very rarely ovate, 0.8–3 × 0.7–2 cm, thickly papery, abaxially sparsely stellate-pubescent and with minute brownish glandular dots, more densely hairy on veins, adaxially stellate-pubescent only on veins, midvein raised abaxially, lateral veins 3- or 4-jugate, lowest pair elongating to upper part of blade, thus appearing ± triplinerved, pinnate, arched, branched, ending in teeth, conspicuously raised abaxially, impressed adaxially, veinlets transverse, slightly raised abaxially, impressed adaxially, not lobed, base broadly cuneate to rounded, without glands, margin remotely serrate except at base, apex rounded or slightly acute.

Flowers appearing after leaves; inflorescence a compound umbel-like cyme, terminal or at apices of branchlets with 1 pair of leaves, ca. 2.5 cm in diam., to 6 cm at fruiting stage; rays whorled; first node of inflorescence with 5 rays, dense, densely stellate-pubescent and with minute brownish glandular dots, without large sterile radiant flowers; peduncle ca. 5 mm; bracts and bracteoles caducous, greenish brown, linear-lanceolate, membranous, sparsely ciliate. Flowers on rays of 1st and 2nd orders, not fragrant, sessile or shortly pedicellate. Calyx green; tube tubular, ca. 1 mm, with few hairs and brownish glandular dots; lobes broadly triangular, ca. 1/2 as long as tube, glabrous, with minute brownish glandular dots, apex obtuse. Corolla white, rotate, 5–6 mm in diam., glabrous; tube ca. 1 mm; lobes spreading, orbicular, ca. 2 mm, exceeding tube, apex rounded, margin entire. Stamens subequaling corolla, inserted at base of corolla; filaments ca. 2.5 mm; anthers yellow-whitish, broadly elliptic, ca. 1 mm. Styles exceeding calyx lobes; stigmas capitate, 3-lobed. Fruit maturing red, compressed, oblong or orbicular, 8–10 × 5–7 mm, base rounded, apex rounded, glabrous or with glandular dots; pyrenes compressed, ovoid, ca. 6.5 × 4 mm, ventral side slightly impressed and with 1 shallow groove, apex slightly mucronate. Fl. Jun–Jul, fr. Nov.

• Mountains; 2200–3300 m. Taiwan.

**69. *Viburnum sempervirens*** K. Koch, Hort. Dendrol. 300. 1853.

常绿荚蒾 chang lü jia mi

Shrubs, evergreen, to 4 m tall. Bark gray-brownish. Branchlets of current year quadrangular, yellowish or gray-yellowish sparsely or densely stellate-pubescent or subglabrous; branchlets of previous year purple-brownish or gray-brownish, slightly quadrangular, glabrous, with dispersed, small, rounded lenticels. Winter buds ovoid-lanceolate, with 2 pairs of separate scales; scales ovate-lanceolate, glabrescent. Leaves always opposite, not clustered at apices of branchlets; stipules absent; petiole reddish purple, robust, 5–15 mm, glabrous or stellate-pubescent; leaf blade green when young, black to black-brown or gray-black when dry, elliptic to elliptic-ovate, rarely broadly ovate, sometimes oblong or oblanceolate, 4–12(–16) × 2.5–5(–6.5) cm, leathery, abaxially with tiny brown glandular dots throughout, often sparsely adpressed pubescent on midvein and lateral veins, adaxially shiny, midvein raised abaxially, lateral veins 3–6-jugate, lowest pair elongating to upper part of blade, thus appearing ± triplinerved, pinnate, slightly arched, branched, ending in teeth or anastomosing near margin, conspicuously raised abaxially, deeply impressed adaxially, veinlets transverse, inconspicuous or slightly conspicuous abaxially, inconspicuous adaxially, not lobed, base acuminate to obtuse, sometimes subrounded, without glands, margin entire or serrate in upper part, apex acute or shortly acuminate. Flowers appearing after leaves; inflorescence a compound umbel-like cyme, terminal, 3–5 cm in diam.; rays whorled; first node of inflorescence with (4 or) 5 rays, dense, glabrous, subglabrous, or densely stellate-pubescent, with red-brown glandular dots, without large sterile radiant flowers; peduncles less than 1 cm, or nearly absent; bracts caducous, leaflike, green, linear to linear-lanceolate, glabrous; bracteoles scalelike. Flowers on rays of 3rd and 4th orders, not fragrant, shortly pedicellate or sessile. Calyx green; tube tubu-

lar-obconical, ca. 1 mm, glabrous; lobes broadly ovate, shorter than tube, glabrous, apex obtuse, slightly ciliate. Corolla white, rotate, ca. 4 mm in diam., glabrous; tube ca. 1 mm; lobes spreading, suborbicular, subequalling tube, apex rounded, margin entire. Stamens slightly exceeding corolla, inserted at base of corolla; filaments ca. 3 × as long as anthers; anthers yellow-whitish, broadly elliptic, ca. 1 mm. Styles slightly exceeding calyx lobes; stigmas capitate. Fruit maturing red, ovoid, ca. 8 mm, base rounded, apex rounded, glabrous; pyrenes compressed, orbicular, 3–6 mm in diam., obviously or slightly convex on dorsal side, concave or not on ventral side, apex rounded. Fl. Apr–May, fr. Jul–Dec.

• Sparse or dense forests, scrub; 100–1800 m. Anhui, Fujian, Guangdong, Guangxi, Guizhou, ?Hainan, S Hunan, Jiangxi, SE Sichuan, Yunnan, Zhejiang.

瑶山荚蒾 yáo shān jiā mi

Shrubs, evergreen, total size unknown. Bark unknown. Branchlets of current year brownish, quadrangular, glabrous; branchlets of previous year black-brownish, slightly quadrangular, glabrous, with dispersed, small, rounded lenticels. Winter buds ovoid-lanceolate, with 2 pairs of separate scales; scales ?glabrous. Leaves always opposite, not clustered at apices of branchlets; stipules absent; petiole green, robust, 1–1.5 cm, glabrous; leaf blade green when young, linear-lanceolate, 11–17 × 1.5–2 cm, thickly papery, abaxially glabrous, with red-brown glandular dots, adaxially shiny, with red-brown glandular dots, midvein raised abaxially, lateral veins ca. 6-jugate, pinnate, slightly arched, rarely branched, ending in teeth or anastomosing near margin, raised abaxially, slightly impressed adaxially,

ally, veinlets transverse, inconspicuous on both surfaces, not lobed, base cuneate to obtuse, without glands, margin irregularly serrate or subentire, apex long acuminate. Flowers appearing after leaves; inflorescence a compound umbel-like cyme, terminal, to 6 cm in diam. at fruiting stage; rays whorled; first node of inflorescence with 5 rays, 1–2 cm, dense, glabrous, without large sterile radiant flowers; peduncles ca. 2 cm, slender, stellate-pubescent; bracts and bracteoles unknown, caducous. Flowers on rays of 2nd and 3rd orders, not fragrant, sessile or shortly pedicellate. Calyx green; tube broadly ovoid,

ca. 1 mm, glabrous; lobes broadly triangular-ovate, ca. 1/2 as long as tube, glabrous, apex obtuse. Corolla ?rotate, unknown. Styles exceeding calyx lobes; stigmas capitate, 3-lobed. Fruit color unknown, subglobose, 7–7 mm in diam., base rounded, apex rounded, glabrous or with glandular dots; pyrenes compressed, subquadrangular, ca. 5 × 5 mm, raised on dorsal side, impressed on ventral side, apex rounded. Fr. Aug.

• Dense forests. Guangxi (Yaoshan).

This species is known only from the type collection.

## 8. *Viburnum* sect. *Opulus* (Miller) Candolle, Prodr. 4: 328. 1830.

裂叶组 lie ye zu

*Opulus* Miller, Gard. Dict. Abr., ed. 4. 1754.

Winter buds with 2 pairs of separate scales. Inflorescence a compound umbel-like cyme, usually pedicellate, with or without large sterile radiant flowers. Corolla rotate. Fruit maturing red; pyrenes without grooves or with 2 shallow dorsal grooves and 1 broad ventral groove, albumen solid.

Three species: temperate Asia, Europe, and North America; two species in China.

Recent phylogenetic work shows that this section is monophyletic, sister to a large clade consisting of *Viburnum* sect. *Megalotinus*, *V.* sect. *Odontotinus*, *V.* sect. *Oreinothus* (Oersted) Benth & J. D. Hooker, and *V.* sect. *Tinus*.

朝鲜荚蒾 chao xian jia mi

Shrubs, deciduous, to 2 m tall. Bark light brown. Branchlets of current year green-brown, later gray-brown, glabrous; branchlets of previous year gray-brownish, terete, glabrous, with dispersed, small, rounded lenticels. Winter buds ovoid, with a pair of connate scales; scales glabrous. Leaves always opposite, not clustered at apices of branchlets; stipules 2, subulate; petiole green, slender, 0.5–2(–2.5) cm, sparsely pubescent, glabrescent; leaf blade green when young, suborbicular or broadly ovate, 3–13 × 2–10 cm, papery, abaxially with minute glandular dots and yellowish pubescent on veins and in vein axils, adaxially glabrous or sparsely pubescent when young, glabrescent, midvein raised abaxially, 3–5-palmatinerved, veins straight or slightly arched, branched, ending in teeth, conspicuously raised abaxially, impressed adaxially, veinlets transverse, slightly raised abaxially, impressed adaxially, 3(–5)-lobed, leaves at apices of branches sometimes undivided, base rounded, truncate, or shallowly cordate, with 1 gland on each side near petiole, margin irregularly dentate, apices of lobes acute. Flowers appearing after leaves; inflorescence a compound umbel-like cyme, at apices of short branchlets, with a pair of leaves, 2–4 cm in diam.; rays whorled; first node of inflorescence with 5–7 rays, dense, 5–30-flowered, glabrous, often minutely gland-dotted, without large sterile radiant flowers; peduncle 1.5–4 cm, slender; bracts and bracteoles deciduous, leaflike, green, linear-lanceolate, glabrous. Flowers on rays of 1st order, not fragrant, very shortly pedicellate. Calyx green; tube obconical, ca. 1 mm, glabrous; lobes triangular, ca. 0.6 mm, glabrous, apex obtuse. Corolla white, rotate, 6–8 mm in diam., glabrous; tube ca. 1.2 mm; lobes spreading, ovate to elliptic, 2.5–3 mm, exceeding tube, apex rounded, margin entire. Stamens shorter than corolla, inserted near base of corolla; filaments 1–1.3 mm; anthers yellow-whitish, elliptic, 0.6–0.8

mm. Styles slightly exceeding calyx lobes; stigmas 2-lobed. Fruit maturing yellow-red or dark red, subellipsoid, 7–11 × 5–7 mm, base rounded, apex rounded, glabrous; pyrenes ovoid-oblong, ca. 7 × 5.5 mm, with 2 shallow dorsal grooves and 1 broad ventral groove, apex rounded. Fl. Jun–Jul, fr. Aug–Sep.

Needle-leaved forests, forest margins; ca. 1400 m. Jilin [Japan, Korea].

**73. *Viburnum opulus*** Linnaeus, Sp. Pl. 1: 268. 1753.

欧洲荚蒾 ou zhou jia mi

Shrubs, deciduous, to 6 m tall. Bark dark gray, thin or thick, corky or not. Branchlets of current year green-brownish, sometimes reddish, glabrous or pubescent, with conspicuously raised lenticels; branchlets of previous year yellowish or red-brown, terete, glabrous, with dispersed, small, rounded lenticels. Winter buds ovoid, stipitate, 4–6 mm, with 2 pairs of connate scales, inner scales membranous, base connate into a tube; scales glabrous. Leaves always opposite, not clustered at apices of branchlets; stipules 2, persistent, subulate, 1–5 mm; petiole green or reddish, robust, 1–5 cm, glabrous or pubescent, with 2–4 or more discoid glands near apex; leaf blade green when young, orbicular-ovate to broadly ovate or obovate, 6–12 × 5–10 cm, papery, abaxially spreading hairy especially on veins and vein axils, adaxially almost glabrous, midvein raised abaxially, 3-palmatinerved, veins straight or slightly arched, branched, ending in teeth, conspicuously raised abaxially, impressed adaxially, veinlets transverse, slightly raised abaxially, impressed adaxially, usually 3-lobed, leaves at apices of branches sometimes undivided, base rounded, truncate, or shallowly cordate, without glands, middle lobe often largest, margin irregularly dentate, apices of lobes acute, lateral lobes present, sometimes slightly spreading toward outside. Leaves on upper part of branchlets often narrow and longer, elliptic to oblong-lanceolate and not divided, margin sparsely crenate or shallowly 3-lobed; lobes entire or subentire, lateral lobes short,

middle lobes elongated. Flowers appearing after leaves; inflorescence a compound umbel-like cyme, terminal, 5–12 cm in diam.; rays whorled; first node of inflorescence with 6–8 rays, dense, glabrous or with simple hairs, with 5–10 large sterile radiant flowers, or totally composed of large sterile flowers; peduncle robust, 2–5 cm, glabrous or pubescent; bracts and bracteoles deciduous, leaflike, green, lanceolate, glabrous or sparsely hairy. Flowers on rays of 2nd and 3rd orders, not fragrant, very shortly pedicellate. Sterile flowers: calyx like fertile flowers, corolla white, 1.3–2.5 cm in diam., long pedicellate; lobes broadly obovate, apex rounded, unequally shaped; stamens and pistils not developed. Fertile flowers: calyx green; tube obconical, ca. 1 mm, glabrous; lobes triangular, ca. 0.6 mm, glabrous, apex obtuse; corolla white, rotate, 4–5 mm in diam., outside glabrous, inside pubescent; tube 1–2 mm; lobes spreading or reflexed, suborbicular, 1–1.5 mm, slightly unequal in size, apex rounded, margin entire; stamens conspicuously exceeding corolla, inserted near base of corolla; filaments ca. 4 mm; anthers yellow-whitish, or purple, ca. 1 mm; styles slightly exceeding calyx lobes; stigmas 2-lobed. Fruit initially turning yellow, maturing red, suborbicular, 8–10(–12) mm in diam., base rounded, apex rounded, glabrous; pyrenes compressed, subglobose, 7–9 mm in diam., without grooves, apex rounded. Fl. May–Jun, fr. Sep–Oct.  $2n = 18^*$ .

Forests, scrub, thickets; 1000–2200 m. Anhui, S Gansu, N Hebei, Heilongjiang, W Henan, Hubei, Jiangsu, Jiangxi, Jilin, Liaoning, S Shaanxi, Shandong, Shanxi, Sichuan, NW Xinjiang, NW Zhejiang [Japan, Korea, Mongolia, Russia; Europe].

Bark thick, corky. Inflorescence with 5–10 large sterile radiant flowers. Anthers purple.  $2n = 18$ .

Forests, scrub, thickets; 1000–2200 m. Anhui, S Gansu, N Hebei, Heilongjiang, W Henan, Hubei, Jiangsu, Jiangxi, Jilin, Liaoning, S Shaanxi, Shandong, Shanxi, Sichuan, NW Zhejiang [Japan, Korea, Mongolia, Russia].

*Viburnum opulus* f. *flavum* (Rehder) H. Hara (Ginkgoana 5: 274. 1983; *V. sargentii* f. *flavum* Rehder, J. Arnold Arbor. 3: 224. 1922; *V. sargentii* var. *flavum* (Rehder) Rehder) is a yellow-fruited form of this taxon known from China, Korea, and Japan (rare).

## 2. **SAMBUCUS** Linnaeus, Sp. Pl. 1: 269. 1753.

接骨木属 jie gu mu shu

Yang Qiner (杨亲二); David E. Boufford

Shrubs, small trees, or perennial herbs, gynodioecious or hermaphroditic, deciduous, whole plant sometimes with extrafloral nectariferous glands. Branches smooth, striate, or warty, with stout pith. Leaves with or without stipules, imparipinnate, or incompletely bipinnate, rarely lacinate; leaflets serrate or divided, opposite or alternate. Inflorescences terminal, flat or convex corymbs or panicles, pedunculate or sessile. Flowers actinomorphic or sometimes dimorphic, sometimes with glandular nectaries, articulate with pedicel; bracts mostly absent; bracteoles 1 or absent. Calyx tube: limb 3–5-parted; corolla rotate, white, lobes 3–5. Stamens 5, inserted at base of corolla; filaments erect, filiform; anthers 2-celled, oblong, cells free, attached at middle. Ovary locules 3–5, ovules 1 per locule; style cushionlike; stigmas 3 or 5. Fruit berrylike, 3–5-seeded; seeds triquetrous or ellipsoid; embryo ca. as long as seed.

About ten species: temperate to subtropical regions and tropical mountains; four species (one endemic) in China.

See Bolli, Diss. Bot. 223: 1–227. 1994; Eriksson and Donoghue, Syst. Bot. 22: 555–573. 1997.

*Sambucus nigra* Linnaeus (Sp. Pl. 1: 269. 1753) is occasionally cultivated in China.

In some species, the vegetative parts of the plant when bruised and the flowers have a fetid odor.

- 1a. Perennial herbs or shrubs; lenticels absent or inconspicuous; young branches striate; inflorescences flat topped, umbellate cymes.

- 2a. All flowers hermaphroditic, rotate; lenticels inconspicuous or absent; lateral leaflets without glandular teeth; terminal leaflet narrowly cuneate, often decurrent and connected to next lower leaflet pair; pith of roots red or white; pyrenes rugose or smooth ..... 1. *S. adnata*
- 2b. Some flowers sterile, urceolate; lenticels inconspicuous; lateral leaflets with 2–4 glandular teeth below middle and at base; terminal leaflet rounded to cuneate at base, not or only slightly decurrent; pith of roots white; pyrenes tuberculate ..... 2. *S. javanica*
- 1b. Shrubs or small trees; lenticels conspicuous; young branches rounded; inflorescences and infructescences pyramidal paniculate cymes.
- 3a. Petiolules, foliar axis, and abaxial surface of leaflets glabrous ..... 3. *S. williamsii*
- 3b. Petiolules, foliar axis, and veins at base of abaxial surface of leaflets hairy ..... 4. *S. sibirica*

**1. *Sambucus adnata* Wallich ex Candolle, Prodr. 4: 322. 1830.**

血满草 xue man cao

*Sambucus schweriniana* Rehder.

Herbs, suffrutescent, or low shrubs, 1–2 m tall, rhizomatous. Pith of roots and rhizomes white or red. Stem herbaceous, obviously striate; pith white or red; lenticels absent. Leaves imparipinnate; stipules bladelike or linear; leaflets 3–5 pairs, narrowly elliptic to narrowly ovate or lanceolate, 4–15 × 1.5–2.5 cm, abaxially sparsely pubescent, more densely pubescent on veins, base obtuse and oblique, margin serrate, apex acuminate; terminal pair of leaflets often connate at base along rachis, sometimes connected also with terminal leaflet, remaining leaflets alternate or sometimes subopposite; stipules of leaflets reduced to urceolate glands. Inflorescences terminal, pedunculate, with 3–5 rays, umbellate cymes, 12–15 cm broad and tall, with dense yellow pubescence when young and ± glandular hairy. Flowers all normal, not reduced to glands, 4–5 mm in diam.; calyx urceolate, pubescent; corolla white; filaments dilated at base, anthers yellow; ovary locules 3; styles short or nearly absent; stigma 3-lobed. Fruit orange or red, becoming black on drying, globose, 3–4 mm in diam.; pyrenes ovoid, ca. 2 × 1.5 mm, rugose or smooth. Fl. May–Jul(–Sep), fr. Sep–Oct. 2n = 36\*.

Forests, thickets, streamsides, moist shaded mountain slopes, alpine grasslands; 1600–3600 m. Gansu, Guizhou, Hubei, Ningxia, Qinghai, Shaanxi, Sichuan, Xizang, Yunnan [Bhutan, India (Darjeeling, Sikkim)].

**2. *Sambucus javanica* Blume, Bijdr. 657. 1825.**

接骨草 jie gu cao

*Ebulus chinensis* (Lindley) Nakai; *E. formosana* (Nakai) Nakai; *Sambucus argyi* H. Léveillé; *S. chinensis* Lindley; *S. chinensis* var. *formosana* (Nakai) H. Hara; *S. chinensis* var. *pinnatilobata* G. W. Léveillé) Rehder; *S. javanica* subsp. *chinensis* (Lindley) Fukuoka.

Herbs, suffrutescent, or low shrubs, 1–2 m tall. Stem obviously striate; pith white; lenticels inconspicuous. Leaves imparipinnate; stipules leaflike or sometimes reduced to blue glands; lateral leaflets 2 or 3 pairs, alternate or opposite, narrowly ovate, 6–13 × 2–3 cm, adaxially sparsely pubescent when young, base obtuse and oblique, margin serrulate, often with 1 to several glandular teeth from below middle nearly to base, apex long acuminate; terminal leaflet ovate or obovate, base cuneate, sometimes connected with next lower leaflets, basal

pair of leaflets shortly petiolulate; stipules of leaflets absent. Inflorescences terminal, compound umbellate cymes, lax, pedunculate, with leaflike bracts at base of peduncle, with 3–5 slender rays, with sparse yellow pubescence. Some flowers modified into persistent urceolate nectaries. Flowers: calyx tube urceolate, lobes triangular; corolla white, connate at base; anthers yellow or purple; ovary locules 3; styles short or nearly absent; stigma 3-lobed. Fruit red, subglobose, 3–4 mm in diam.; pyrenes 3 or 4, ovoid, ca. 2.5 mm, verrucate. Fl. Apr–May(–Aug), fr. Aug–Sep.

Mountain slopes, forests, streamsides, grasslands; 300–2600 m. Anhui, Fujian, Gansu, Guangdong, Guangxi, Guizhou, Hainan, Henan, Hubei, Hunan, Jiangsu, Jiangxi, Shaanxi, Sichuan, Taiwan, Xizang, Yunnan, Zhejiang [India, Indonesia, Japan, Laos, Malaysia, Myanmar, Philippines, Thailand, Vietnam].

*Sambucus javanica* often has abundant extrafloral nectaries on the petioles, branchlets, young stems, peduncle, and inflorescence branches.

**3. *Sambucus williamsii* Hance, Ann. Sci. Nat., Bot., sér. 5, 5: 217. 1866.**

接骨木 jie gu mu

*Sambucus barbinervis* Nakai; *S. buergeriana* (Nakai) Blume ex Nakai; *S. buergeriana* f. *cordifoliata* Skvortsov & W. Wang; *S. foetidissima* Nakai; *S. junmanica* J. J. Vassiljev; *S. latipinna* Nakai var. *pendula* Skvortsov; *S. manshurica* Kitagawa; *S. peninsularis* Kitagawa; *S. potaninii* J. J. Vassiljev; *S. racemosa* Linnaeus subsp. *manshurica* (Kitagawa) Voroschilov; *S. sieboldiana* (Miquel) Blume ex Schwerin var. *buergeriana* Nakai.

Shrubs or small trees, 5–6 m tall. Old branches reddish brown, with conspicuous, narrowly elliptic lenticels; pith brownish. Leaves imparipinnate; leaflets (1 or) 2- or 3(–5)-jugate; lateral leaflets ovate-orbicular or narrowly elliptic to oblong-oblancheolate, 5–15 × 1.2–7 cm, base cuneate or rounded, sometimes cordate, asymmetrical, margin irregularly serrate, sometimes with 1 to several glandular teeth at base or below middle, apex acute to acuminate or caudate; lowest pair of leaflets sessile or petiole to ca. 0.5 cm; terminal leaflet ovate or obovate, adaxially sparsely pubescent when young, glabrescent, petiolule ca. 2 cm, base cuneate, apex acuminate or caudate; stipules narrowly linear or reduced to bluish protrusions. Inflorescences terminal cymose panicles, 5–11 × 4–14 cm, pedunculate, sometimes sparsely pubescent, soon glabrescent. Flowers appearing simultaneously with leaves, dense; calyx tube urceolate, ca. 1 mm, lobes triangular-lanceolate, slightly shorter than tube; corolla pinkish in bud, white or yellowish when open; tube short; lobes oblong or narrowly ovate-orbicular, ca. 2 mm; stamens spreading, ca. as long as corolla lobes; filaments

slightly dilated at base; anthers yellow; ovary 3-loculed; styles short; stigmas 3-lobed. Fruit red, rarely bluish or purplish black, ovoid or subglobose, 3–5 mm in diam.; pyrenes 2 or 3, ovoid to ellipsoid, 2.5–3.5 mm, slightly rugose. Fl. Apr–May, fr. Sep–Oct.  $2n = 36^*$ .

• Mountain slopes, scrub, streamsides, roadsides, beside houses; 500–1600 m. Anhui, Fujian, Gansu, Guangdong, Guangxi, Guizhou, Hebei, Heilongjiang, Henan, Hubei, Hunan, Jiangsu, Jilin, Liaoning, Shaanxi, Shandong, Shanxi, Sichuan, Yunnan, Zhejiang.

*Sambucus williamsii* was treated as a synonym of a highly variable, circumboreal *S. racemosa* Linnaeus by Bolli (Diss. Bot. 223: 187–197. 1994). The black fruit and dark green leaves (Bolli, loc. cit.) distinguish *S. williamsii* and *S. melanocarpa* A. Gray of W North America from other members of the *S. racemosa* complex. *Sambucus williamsii* also has a more pronounced fetid odor. Because of the high degree of variation and the pronouncement by Bolli (loc. cit.) that the variation within his circumscription of *S. racemosa* should be further evaluated in a geographic context through field, cytological, and biochemical methods, for the time being, we prefer to maintain *S. williamsii*, and, with less certainty, the following species, *S. sibirica*, as distinct.

**4. *Sambucus sibirica* Nakai, Bot. Mag. (Tokyo) 40: 478. 1926.**

西伯利亚接骨木 xi bo li ya jie gu mu

*Sambucus buergeriana* (Nakai) Blume ex Nakai var. *mi-*

*quellii* Nakai; *S. racemosa* Linnaeus subsp. *sibirica* (Nakai) H. Hara; *S. williamsii* Hance var. *miquelii* (Nakai) Y. C. Tang ex J. Q. Hu.

Shrubs, 2–4 m tall, densely branched. Bark reddish brown, longitudinally sulcate, with elliptic lenticels; pith brownish; young branches yellowish white hirsute, sometimes papillose. Leaflets 2-jugate, abaxially pale, adaxially green, ovate-lanceolate to lanceolate, 5–14 × 1.6–5.5 cm, midvein long hirsute, base cordate and oblique, margin irregularly acutely toothed, apex long acuminate; petiolule and leaf rachis yellow hirsute; stipules glandular. Inflorescence an erect cymose panicle, 3.5–5 cm; peduncle papillose. Flowers opening with leaves; calyx tube urceolate, ca. 1 mm, lobes triangular-lanceolate, slightly shorter than tube; corolla greenish or yellowish, lobes oblong; stamens yellowish brown; anthers yellow; ovary 3-loculed; styles short; stigmas 3-lobed. Fruit red, ovoid or subglobose, 3–5 mm in diam.; pyrenes 2 or 3, ovoid to ellipsoid, 2.5–3.5 mm, slightly rugose. Fr. Jul–Aug.  $2n = 18, 36, 38^*$ .

Rocky mountain slopes, rock crevices along rivers. Heilongjiang, Jilin, Liaoning, Xinjiang [Mongolia, Russia].

*Sambucus sibirica* should perhaps be included within *S. williamsii*. The differences separating them, i.e., young branches, petiolule, and leaf rachis slightly pubescent vs. glabrous in *S. williamsii*, are minor.

**3. *SINADOXA* C. Y. Wu, Z. L. Wu & R. F. Huang, Acta Phytotax. Sin. 19: 207. 1981.**

华福花属 hua fu hua shu

Hong Deyuan (洪德元); David E. Boufford

Herbs, perennial. Rhizomes erect. Roots fibrous. Stems 2–4, caespitose, glabrous. Basal leaves ca. 10; cauline leaves 2, opposite, both basal and cauline leaves ternate or biternate. Cymes with 3–5 flowers in an interrupted spike; lowest cymes long pedunculate, in axils of cauline leaves; flowers small. Calyx cup-shaped, fleshy, often 3-lobed; lobes saccate and closed, narrowly winged on ridge. Corolla rotate, 3- or 4-lobed; tube short. Fertile stamens equal to corolla lobes in number, inserted at throat of corolla, alternate with corolla lobes, 2-fid to base; anthers 1-celled, extrorse; staminodes equal to fertile ones in number, opposite to corolla lobes. Carpels 2; ovary ovoid-globose, semi-inferior, 1-loculed; ovules solitary, pendulous; styles absent; stigmas solitary, dotted.

• One species: China.

**1. *Sinadoxa corydalifolia* C. Y. Wu, Z. L. Wu & R. F. Huang, Acta Phytotax. Sin. 19: 208. 1981.**

华福花 hua fu hua

Herbs, perennial, caespitose, glabrous throughout. Stems 1–4, erect or ascending, green, 10–25 cm tall, 3–5 mm in diam. Basal leaves ca. 10, ternate-pinnate or biternate-pinnate; petiole to 10 cm; terminal leaflet ovate or ovate-oblong, 3–10 cm, irregularly lobed or pinnatifid to pinnatisect; segments 3-lobed to multi-lobed or cleft; lateral leaflets ovate, 1.5–2 cm, 3-lobed. Cauline leaves 2, opposite, ternate, 2.5–5 cm; petiole 1–2

cm; leaf blade ovate-deltoid; terminal leaflet ovate, 1.5–3.5 cm, irregularly lobed; lateral leaflets ovate-elliptic or ovate, 0.8–1.8 cm, 3- or 5–10-lobed. Spikes to 8 cm; flowers yellowish green. Calyx cup-shaped, fleshy, (2 or) 3(or 4)-lobed. Corolla yellowish brown, 2–3 mm in diam., 3- or 4-lobed; lobes oblong-ovate, inside glandular-punctate near top, base with a nectary. Fertile stamens 3 or 4; filaments filiform, ca. 1.5 mm; anthers yellow, spherical, ca. 0.5 mm in diam. Stigma solitary. Fl. Jun–Jul; fruit not seen.

• Rock shelters, moist ravines, alpine debris slopes; 3900–4800 m. S Qinghai (Nangqên, Yushu).

**4. *ADOXA* Linnaeus, Sp. Pl. 1: 367. 1753.**

五福花属 wu fu hua shu

Hong Deyuan (洪德元); David E. Boufford

*Moscatella* Adanson; *Moschatellina* Miller; *Tetradoxa* C. Y. Wu.

Herbs, perennial. Rhizomes creeping, filiform, terminated by a tuber; tuber white, giving rise to following year's plant. Stems 1

or 2, glabrous. Basal leaves 1–3, ternate to biternate; cauline leaves 2, opposite, rarely alternate; all leaves petiolate, 3-cleft or compound. Inflorescences cymes, terminal, in headlike clusters, or racemelike. Flowers yellowish green, sessile, 4- or 5-merous. Calyx shallowly cup-shaped; lobes of terminal flower 2, lobes of lateral flowers 3. Corolla rotate; tube short; lobes 3–6 in terminal flower, 4–6 in lateral flowers, lobes papillate adaxially. Fertile stamens 4 or 5, inserted on corolla tube; filaments 2-fid to middle or to base; anthers 1-celled, peltate, extrorse, longitudinally dehiscent; inner stamens reduced to glandular papillae. Ovary inferior to semi-inferior; carpels 4 or 5, locules 4 or 5; styles 4 or 5, connate at base; stigmas capitate. Fruit berrylike, fleshy.  $x = 9$ ,  $2n = 36, 54, 108$ .

Three or four species: circumpolar; three species (two endemic) in China.

- 1a. Inflorescence racemelike; basal leaves simple, 3-cleft; cauline leaves simple, 3-cleft; flowers 3–5, corolla of lateral flowers 4-merous, corolla of terminal flower 5-merous; pedicels 5–10 mm; filaments 2-fid to middle ..... 1. *A. omeiensis*
- 1b. Inflorescence a condensed capitate, several flowered cyme; basal leaves ternate or biternate; cauline leaves simple and 3-cleft or ternate; flowers 3–9, corolla of lateral flowers usually 5-merous, corolla of terminal flower 4-merous, subsessile or shortly pedicellate; filaments bifid to base.
  - 2a. Peduncle in flower and fruit straight, erect, ascending, or arching, held above leaves; corolla lobes broadly ovate to orbicular ..... 2. *A. moschatellina*
  - 2b. Peduncle in flower and fruit recurved or coiled, nearly always held below leaves; corolla lobes lanceolate to ovate ..... 3. *A. xizangensis*

**1. *Adoxa omeiensis*** H. Hara, J. Jap. Bot. 56: 271. 1981.

四福花 si fu hua

*Tetradoxa omeiensis* (H. Hara) C. Y. Wu.

Rhizomes not seen. Stems 10–20 cm tall. Basal leaves 1–3; petiole 3–12 cm; leaf blade ovate or deltoid-ovate, 1–3 × 1–3 cm, 3-cleft; segments narrowly ovate, 2–5-lobed, apex of lobes mucronate. Cauline leaves 2, opposite, similar to those of basal leaves; petiole 0.4–2 cm. Inflorescences racemelike, flowers 3–5; pedicels 0.5–1 cm; flowers yellowish green, 5–8 mm in diam. Calyx discoid, 4-lobed; lobes persistent, narrowly triangular-lanceolate, 2–3 mm. Corolla subrotate, 4- or 5-cleft; lobes narrowly ovate, 2.5–4 mm, inside densely glandular papillate, with papillate glands in center at base, apex acuminate. Outer (fertile) stamens 4, 0.4–1 mm; filaments incurved, divergent and stamens T-shaped apically; anthers ca. 0.6 mm. Styles slightly recurved; stigmas punctiform. Fl. May–Jun, fr. Aug.

• Wet places in forests, sometimes on rocks; ca. 2300 m. Sichuan (Emei Shan, Ya'an).

Donoghue et al. (Harvard Pap. Bot. 6: 459–479. 2001) recognized *Tetradoxa* as a distinct, monospecific genus.

**2. *Adoxa moschatellina*** Linnaeus, Sp. Pl. 1: 367. 1753.

五福花 wu fu hua

*Adoxa inodora* (Falconer ex C. B. Clarke) Nepomnja-szaja; *A. moschatellina* var. *inodora* Falconer ex C. B. Clarke.

Rhizomes 2.5–25 cm. Stems 8–15 cm tall, glabrous. Basal leaves 1–3; petiole 4–9 cm; leaflets broadly ovate or orbicular, 1–2 cm, 3-cleft; petiolules 0.6–1.2 cm. Cauline leaves 2, oppo-

site, 3-cleft or ternate, segments 3-lobed; petiole ca. 1 cm. Peduncle erect in flowers and fruit, inflorescence held above leaves. Inflorescences compact headlike cymes of 5–9 flowers. Flowers sessile or pedicels 0.5–1.5 mm, yellowish green, 4–7 mm in diam. Calyx lobes rectangular, broadly elliptic to ovate, 1.5–3 × ca. 1 mm, apex obtuse. Corolla lobes broadly ovate to orbicular or rectangular, 1.75–3.25 × 2–2.5 mm, apex rounded to obtuse. Ovary semi-inferior to inferior, 4- or 5-loculed. Fruit not seen. Fl. Apr–Jul, fr. Jul–Aug.  $2n = 36$ .

Rich soils, forests, forest margins, meadows; below 4000 m. Hebei, Heilongjiang, Liaoning, Nei Mongol, Qinghai, Shanxi, Sichuan, Xinjiang, Xizang, Yunnan [India, Japan, Korea, Nepal, Pakistan, Russia; NW Africa, Europe, North America].

**3. *Adoxa xizangensis*** G. Yao, Acta Phytotax. Sin. 30: 179. 1992.

西藏五福花 xi zang wu fu hua

Rhizomes 4–15 cm. Stems 5–10 cm tall, glabrous. Basal leaves 1–3, ternate to biternate; petiole of basal leaves 2–12 cm; leaflets elliptic, ovate, orbicular, or obovate, 1–2.5 × 1–3 cm, 3-cleft; petiolules 0.6–1.2 cm. Cauline leaves 2, opposite, ternate or rarely biternate, 3-cleft, segments 3-lobed, lobes apiculate; petiole 0.5–2 cm. Peduncle coiled in flower and fruit. Inflorescences often held at or below level of leaves, compact headlike cymes of 5–9 flowers. Flowers sessile or subsessile, yellowish green, 2.5–5 mm in diam. Calyx lobes lanceolate to narrowly rectangular, 1.2–2 × ca. 1 mm, apex obtuse. Corolla lobes lanceolate to ovate, ca. 2 × 0.9–1.2 mm. Fruit 5–8 mm in diam. Fl. Jun–Aug, fr. Jul–Sep.

• Stony or rocky limestone soils, forests, forest margins, meadows, shaded slopes; 3400–3900 m. Sichuan, Xizang, Yunnan.

## DIERVILLACEAE

锦带花科 jin dai hua ke

Yang Qiner (杨亲二)<sup>1</sup>; Fred R. Barrie<sup>2</sup>, Charles D. Bell<sup>3</sup>

Shrubs, deciduous. Winter buds with several scales. Leaves opposite, simple, margins serrate, estipulate. Inflorescence apical, axillary, or on short lateral shoots, cymose, flowers 2–6, or flowers solitary. Calyx tube narrowly cylindric; limb 5-lobed, incised to middle or base. Corolla 5-lobed, irregular or subregular; tube longer than limb. Stamens 5, inserted at middle of corolla tube; anthers included to exserted. Ovary inferior, with a globose gland on one side of upper part, 2-loculed; ovules numerous; style 1, slender, exserted; stigma capitate. Fruit a 2-valved dehiscent capsule; seeds numerous, small.

Two genera and ca. 15 species: E Asia and NE North America; one genus and two species in China.

Hu Jia-qi. 1988. *Weigela*. In: Hsu Ping-sheng, ed., Fl. Reipubl. Popularis Sin. 72: 131–134.

### 1. WEIGELA Thunberg, Kongl. Vetensk. Acad. Nya Handl. 1: 137, t. 5. 1780.

锦带花属 jin dai hua shu

Young branches slightly quadrangular, variously pubescent. Leaves petiolate or sessile. Flowers solitary or 2–6 in cymes, on lateral short branches borne on previous year's growth or at apices of branches. Calyx tube narrowly cylindric; limb 5-lobed, free to middle or nearly to base. Corolla white or pink to crimson, campanulate-funnelform; tube narrow basally, expanding abruptly; limb subregular, 5-lobed; anthers at mouth of tube or weakly exserted; style slender, strongly exserted; stigma capitate or 2-lobed. Fruit leathery or woody, central axis and style bases persistent; seeds wingless or narrowly winged.

About ten species: NE Asia; two species in China.

- 1a. Calyx divided to middle, lobes lanceolate; seeds wingless ..... 1. *W. florida*  
1b. Calyx divided nearly to base, lobes linear; seeds ± winged ..... 2. *W. japonica*

Fang; *W. florida* f. *albiflora* Y. C. Chu; *W. florida* var. *praecox* (Lemoine) Y. C. Chu; *W. pauciflora* Candolle; *W. rosea* Lindley.

Shrubs 1–3 m tall. Young branches with 2 bilateral lines of short, minute hairs along internodes; bark gray; winter buds acute, scales 3 or 4, often smooth. Leaves sessile or with petiole to 3 mm; blade oblong or elliptic to obovate-elliptic, 5–10 cm, abaxially densely pubescent or tomentose, adaxially sparsely pubescent, more densely so on veins, base broadly cuneate to rounded, margin serrate, apex acuminate. Flowers solitary or in cymes; peduncles and pedicels glabrous to hirsute. Calyx ca. 2 cm; tube narrowly cylindric, ca. 1 cm, sparsely pubescent; lobes lanceolate, ca. 1 cm, unequal. Corolla purple-red or rose, 3–4 × ca. 2 cm, outside sparsely pubescent; lobes spreading, irregular, inside reddish; filaments shorter than corolla; anthers yellow. Ovary with a yellow-green gland in upper part; stigma 2-lobed. Fruit 1.5–2.5 cm, crowned with a short beak, sparsely pubescent; seeds wingless. Fl. Apr–Aug, fr. Oct. 2n = 36.

Mixed forests, scrub; 100–1500 m. ?Hebei, Heilongjiang, Henan, N Jiangsu, Jilin, Liaoning, Nei Mongol, Shaanxi, N Shandong, Shanxi [Japan, Korea].

**2. *Weigela japonica*** Thunberg, Kongl. Vetensk. Acad. Nya Handl. 1: 137. 1780.

半边月 ban bian yue

*Diervilla japonica* (Thunberg) Candolle.

Shrubs to 6 m tall. Petiole 8–12 mm, pubescent; leaf blade abaxially greenish, adaxially intense green, narrowly ovate to ovate-elliptic, rarely obovate, 5–15 × 3–8 cm, abaxially densely pubescent, adaxially sparsely pubescent, more densely so on veins, base broadly cuneate to rounded, margin serrate, apex acuminate to long acuminate. Flowers solitary or in threes in cymes. Calyx 1–1.2 cm, pubescent; tube 1–5 mm; lobes linear, 5–10 mm, pubescent. Corolla white or reddish, gradually turning red at anthesis, funnelform-campanulate, 2.5–3.5 cm, outside sparsely pubescent or subglabrous; base of tube narrowly tubular, abruptly enlarged above middle; lobes spreading, subregular, glabrous. Filaments white; anthers yellow-brown. Stigma discoid. Fruit 1.5–2 cm, crowned with a short beak, sparsely pubescent; seeds narrowly winged. Fl. Apr–May, fr. Aug–Sep.

Forests, scrub; 400–1800 m. Anhui, Fujian, Guangdong, Guangxi, Guizhou, ?Hainan, Hubei, Hunan, Jiangxi, Sichuan, Zhejiang [Japan, Korea].

Chinese populations are often segregated as *Weigela japonica* var. *sinica* (Rehder) Bailey (Gent. Herb. 2: 49. 1929; *Diervilla japonica* var. *sinica* Rehder, Mitt. Deutsch. Dendrol. Ges. 22: 264. 1913) primarily on the shape of the corolla, in which the lower half is narrowly tubular. In the typical variety, found in Japan and Korea, the corolla expands abruptly nearer to the base.

## CAPRIFOLIACEAE

忍冬科 ren dong ke

Yang Qiner (杨亲二)<sup>1</sup>; Sven Landrein<sup>2</sup>, Joanna Osborne<sup>2</sup>, Renata Borosova<sup>2</sup>

Shrubs or woody climbers, rarely small trees or herbs. Leaves opposite, rarely whorled, simple or pinnatifid, conduplicate or involute in veneration; interpetiolar stipules absent or rarely well developed. Inflorescence thyrsoid, axillary or terminal, compact or lax, cymes 1-, 2-, or 3-flowered; paired flowers sometimes with ovaries  $\pm$  fused. Cymes with a pair of bracts and 2 pairs of bracteoles, located at base of ovaries,  $\pm$  fused, occasionally accrescent in fruit, rarely absent. Flowers bisexual, actinomorphic or zygomorphic. Calyx 4- or 5-lobed. Corolla epigynous, gamopetalous; lobes 4 or 5, spreading, sometimes bilabiate, aestivation imbricate. Stamens (4 or) 5, didynamous, alternating with corolla lobes, sometimes exserted; anthers free, 2-celled, opening by longitudinal slits, introrse. Ovary inferior, carpels 2–8, fused; placenta axile; ovules 1 to many per locule, some of which can be abortive, pendulous; style solitary; stigmas capitate or lobed. Fruit a berry, a drupe with 2–5 pyrenes, or a leathery achene. Seeds 1 to many; embryo small, straight; endosperm copious.

Five genera and ca. 207 species: mostly in temperate regions of E Asia and E North America; five genera (one endemic) and 66 species (25 endemic) in China.

Following recent phylogenetic studies (Bell et al., Harvard Pap. Bot. 6(2): 481–499. 2001; Donoghue et al., Harvard Pap. Bot. 6(2): 459–479. 2001; W. H. Zhang et al., Molec. Phylogen. Evol. 26: 176–189. 2002), Caprifoliaceae is now thought to include Caprifoliaceae, Diervilleae, Linnaeae, Morinaceae, Dipsacaceae, and Valerianaceae. However, Blacklund and Pyck (Taxon 47: 657–661. 1998) preferred to retain Caprifoliaceae as a distinct family and raise Linnaeae and Diervilleae as new families, and this system is followed in the *Flora of China*.

Hsu Ping-sheng, Hu Jia-qi & Wang Han-jin. 1988. Caprifoliaceae (excluding *Sambucus* and *Viburnum*). In: Hsu Ping-sheng, ed., Fl. Reipubl. Popularis Sin. 72: 104–259.

### Key to flowering material

*Echium connatum* H. Léveillé; *Triosteum erythrocarpum* Harry Smith; *T. fargesii* Franchet; *T. himalayanum* var. *chinense* Diels & Graebner.

Herbs, perennial, 40–60 cm tall, branched below terminal inflorescence after anthesis, densely hirsute, glandular hairy, faintly aromatic. Leaves obovate-elliptic to obovate-oblong, ca.  $11 \times 7$  cm, abaxially long hirsute on veins, interspersed with glandular hairs, adaxially densely long hirsute, lower part narrowed to a broadly perfoliate base, margin entire or occasionally lobed, apex acute to acuminate. Inflorescence of 2–5 whorls, at apex of stem. Sepals to 1 mm. Corolla lobes purple-brown with paler flecks; tube yellow-green, ca. 1.5 cm, outside glandular hairy; tube curved at base and shallowly spurred, spur pointing downward to below apex of ovary. Drupe ripening from white to red, subglobose, 10–12 mm in diam., hirsute and glandular hairy, crowned with a persistent calyx. Pyrenes 3–5, without ribs. Fl. May–Jul, fr. Jul–Sep.

Mountain slopes, coniferous forests, streamsides, grasslands; 1800–4100 m. ?Henan, Hubei, Hunan, Shaanxi, Sichuan, Xizang, Yunnan [Bhutan, India, Nepal].

The names *Triosteum hirsutum* Wallich and *T. hirsutum* Roxburgh have sometimes been applied to this species. Some confusion has arisen from different print versions of Roxburgh, Fl. Ind. 2: 180. 1824. The original descriptions of *T. himalayanum* Wallich and *T. hirsutum* Roxburgh can be found in only one of these print versions. The other print version includes the description of *T. hirsutum* Wallich, which appears to be a printing error. *Triosteum hirsutum* Roxburgh is attributed to a specimen collected in Chittagong, Bangladesh, now the basionym of *Lasianthus hirsutus* in the Rubiaceae (see p. 192).

**2. *Triosteum pinnatifidum*** Maximowicz, Bull. Acad. Imp. Sci. Saint-Petersbourg 27: 476. 1881.

莲子藤 ting zi biao

*Triosteum intermedium* Diels & Graebner; *T. rosthornii* Diels & Graebner.

Herbs, perennial, to 60 cm tall, branched below terminal inflorescence after anthesis, hirsute and glandular hairy. Leaves subsessile; leaf blade ca.  $11 \times 10$  cm, abaxially with domatia along main vein, adaxially sparsely hirsute, more densely so on veins and margin, base cuneate, pinnatifid to occasionally entire toward apex, deeply lobed to more than half width of leaf blade; lobes elliptic, acuminate. Inflorescence of 2 or 3 6-flowered whorls at apex of stem. Sepals ca. 2 mm. Corolla yellow-green, ca. 1 cm; lobes purple-brown with paler flecks; tube curved at base, glandular hairy. Drupe white, subglobose, ca. 12 mm, hirsute and glandular hairy, crowned with a persistent calyx. Pyrenes 3–5, without ribs. Fl. May–Jun, fr. Jul–Sep.  $2n = 18^*$ , 36.

Coniferous forests, sunny places on streamsides; 1800–2900 m. Gansu, Hebei, Henan, Hubei, Ningxia, Qinghai, Shaanxi, Shanxi, Sichuan [Japan].

**3. *Triosteum sinuatum*** Maximowicz, Bull. Acad. Imp. Sci. Saint-Petersbourg 15: 373. 1871.

腋花莲子藤 ye hua ting zi biao

Herbs, perennial, to 90 cm tall, unbranched, densely hirsute and glandular hairy. Leaf blade orbicular-ovate or oblong, ca.  $14 \times 7$  cm, lower third abruptly narrowed, sparsely to densely hirsute, ciliate and glandular on veins and margin, base amplexicaul to perfoliate, margin entire to sinuous or shallowly lobed, apex acuminate. Inflorescence of 2 or 3 6-flowered whorls, at apex of stem. Sepals lanceolate, 6–10 mm, subequaling ovary, outside densely glandular hairy. Corolla ca. 1 cm; lobes purple-brown with paler flecks; tube yellow-green with a shallow spur at base; spur pointing outward, not reaching apex of ovary. Stamens: 2 longer, other 3 subequal in length; anthers narrowly elliptic. Style filiform; stigmas exerted. Drupe sessile, greenish, dry, pyriform with persistent calyx, 1–1.5 cm in diam., densely glandular hairy. Pyrenes 3, with 5 or 6 prominent ribs. Fl. Jun, fr. Sep–Oct.  $2n = 18$ .

Forests, streamsides; 800–900 m. Jilin, Liaoning, Xinjiang [Japan, Russia (Primorsky Krai)].

## 2. HEPTACODIUM Rehder in Sargent, Pl. Wilson. 2: 617. 1916.

七子花属 qi zi hua shu

Shrubs or small trees, deciduous. Winter buds with several pairs of scales. Leaves opposite, entire, triplinerved, estipulate. Inflo-

rescence a terminal panicle composed of numerous capitula. Capitulum of a single sessile whorl of opposite 3-flowered cymes and a terminal bud of bracts and a whorl often not developed. Capitulum with 2 pairs of involucrel decussate bracts and 12 bracts (bracts of each cyme spatulate and often fused together, bracts of secondary flowers smaller and often missing). Involucrel bracts ovate and persistent in fruit, glabrous to sericeous, longer and covering bracts and ovaries. Sepals 5, slightly protruding from involucre. Corolla tubular-funnelform; tube strongly curved at base with a nectary inside and shallowly gibbous, 5-lobed and regular. Stamens 5, exserted; filaments inserted at middle of corolla tube. Ovary 3-locular, 2 locules with numerous sterile ovules, remaining locule with 1 fertile ovule. Stigmas discoid. Fruit a leathery achene, cylindrical, crowned with a persistent and enlarged calyx. Achene 1-seeded, pericarp membranous; endosperm fleshy.

● One species: China.

**1. *Heptacodium miconioides*** Rehder in Sargent, Pl. Wilson. 2: 618. 1916.

七子花 qī zǐ huā

*Heptacodium jasminoides* Airy Shaw.

Shrubs, to 7 m tall. Young branches red-brown, sparsely pubescent. Petiole ca. 10 mm; leaf blade ovate, 8–15 × 5–9 cm, leathery, abaxially sparsely pubescent on veins, base obtuse to subcordate, apex acuminate to long acuminate. Inflorescence a subpyramidal panicle of capitula, 5–15 × 5–9 cm. Capitulum

with involucrel bracts and bracts variously shaped, unequal in size, pair of involucrel bracts often emarginate. Flowers white, fragrant. Sepals 2–2.5 mm, equaling ovary at anthesis. Style hairy. Corolla 1–1.5 cm, densely adpressed hairy. Achene ca. 10 mm, protruding from involucre, striate, hirsute-sericeous; persistent calyx with spreading sepals to 7–10 mm; seeds 5–6 mm. Fl. Jul–Sep, fr. Sep–Nov.

● Cliffs, scrub, forests; 600–1000 m. Anhui, Hubei, Zhejiang.

This is a rare species.

### 3. *SYMPHORICARPOS* Duhamel du Monceau, *Traité Arbr. Arbust.* 2: 295. 1755.

毛核木属 mao hé mù shù

Shrubs, deciduous. Winter buds with several pairs of scales. Leaves opposite, entire or sometimes sinuous, shortly petiolate, estipulate. Flowers forming a spike at apices of lateral branches, sometimes solitary in axils of upper leaves. Calyx cupular, 4- or 5-lobed. Corolla reddish or white, campanulate to funnelform or hypocrateriform, 4- or 5-lobed, regular; tube slightly gibbous at base, inside long pubescent or glabrous. Stamens 4 or 5, inserted in corolla tube, included or slightly exserted; anthers introrse. Ovary 4-locular, 2 locules with several sterile ovules, remaining 2 each with 1 fertile ovule; style slender; stigmas capitate or slightly 2-lobed. Fruit a berrylike drupe, white, red, or bluish black, globose, ovoid, or ellipsoid; pyrenes 2, ovoid, ± compressed; seeds with endosperm, embryo small.

Sixteen species: 15 in North America and Mexico; one species (endemic) in China.

**1. *Symphoricarpos sinensis*** Rehder in Sargent, Pl. Wilson. 1: 117. 1911.

毛核木 mao hé mù

Shrubs erect, 1–2.5 m tall. Young branches glabrous to pubescent. Bark fibrous. Petiole 1–2 mm; leaf blade abaxially glaucescent, adaxially green, rhombic to ovate, 1.5–2.5 × 1.2–1.8 cm, both surfaces glabrous, lateral veins inconspicuous, base cuneate and narrowed to petiole, margin entire, apex obtuse to acute. Inflorescence a terminal, pedunculate spike of paired flowers at ends of axillary branches. Paired flowers 3–6, decussate, with conspicuous internodes; each flower with 1 small

subulate bract and 2 shorter ones. Sepals to 1 mm, glabrous, acute. Corolla white, campanulate, 5–7 mm; lobes ovate, slightly shorter than tube, both sides glabrous; tube slightly gibbous at base. Stamens inserted at middle of corolla tube, equaling or slightly exceeding corolla; anthers white, ca. 2 mm. Style 6–7 mm, glabrous; stigmas capitate. Drupe bluish black, pruinose, ovoid, ca. 7 mm, crowned with a short beak. Pyrenes 2, densely pilose. Fl. Jul–Sep, fr. Sep–Nov.

● Scrub; 600–2300 m. S Gansu, Guangxi, W Hubei, Shaanxi, E Sichuan, N Yunnan.

This is rather rare and local species.

### 4. *LEYCESTERIA* Wallich in Roxburgh, *Fl. Ind.* 2: 181. 1824.

鬼吹箫属 guǐ chuī xiāo shù

Shrubs, deciduous; branches hollow or with solid pith. Leaves simple, opposite, margin entire or serrate, occasionally sinuate; stipules present or absent. Inflorescence a spike or flowers in sessile whorls of 6, terminal or axillary, often with conspicuous leaflike involucrel bracts. Sepals 5. Corolla 5-lobed, white, pink, purple-red, or orange-yellow, funnelform, regular; tube gibbous at base. Stamens 5; anthers dorsifixed. Ovary 5-, 7-, or 8-locular, with numerous ovules per locule; style long, slender; stigmas peltate or capitate. Fruit a berry, with persistent calyx; seeds minute, numerous.

Five species: Sino-Himalayan region; four species in China.

1a. Inflorescence a spike with flowers in pairs.

- 2a. Interpetiolar stipules absent; petioles 5–10 mm; ovary glabrous, usually 7- or 8-locular ..... 3. *L. gracilis*  
 2b. Interpetiolar stipules present; petioles 2–4 mm; ovary pubescent at anthesis, usually 5-locular ..... 4. *L. glaucophylla*  
 1b. Inflorescence with flowers in whorls of 6.  
 3a. Interpetiolar stipules absent; branches hollow; abaxial leaf surfaces, petioles, and inflorescences sparsely adpressed pubescent or subglabrous ..... 1. *L. formosa*  
 3b. Interpetiolar stipules present; branches with solid pith; abaxial leaf surfaces, petioles, and inflorescences densely lanate ..... 2. *L. stipulata*

**1. *Leycesteria formosa*** Wallich in Roxburgh, Fl. Ind. 2: 182. 1824.

鬼吹箫 *gui chui xiao*

*Leycesteria formosa* var. *brachysepala* Airy Shaw; *L. formosa* var. *glandulosissima* Airy Shaw; *L. formosa* var. *stenosepala* Rehder; *L. limprichtii* H. Winkler; *L. sinensis* Hemsley.

Shrubs, 1–5 m tall. Branches hollow, branchlets, petioles, peduncles, bracts, and sepals adpressed pubescent and sometimes glandular hairy. Petiole 5–15 mm; leaf blade ovate to lanceolate, 4–13 × 2–6 cm, both surfaces glabrescent to sparsely adpressed pubescent, base cuneate to subcordate, margin entire to dentate, occasionally irregularly sinuate, apex acuminate to caudate. Inflorescence terminal or axillary; peduncle 6–30 mm. Whorls 1–10, each whorl composed of 2 opposite sessile, 3-flowered cymes subtended by green, purplish, or purple-red leaflike involucre bracts and bracts; involucre pair of bracts up to 2.5 cm, 4 outer bracts narrower and shorter, 8 inner bracts very small. Ovary oblong, 3–4 mm, densely glandular hairy. Calyx shortly fused at base, sometimes to half way; lobes lanceolate to linear, sometimes deltoid, 1–9 mm. Corolla white to pink, sometimes purple-red, funnelform, 1.2–1.8 cm, outside pubescent; lobes orbicular-ovate, ca. 5 mm. Stamens subequaling corolla. Ovary 5-locular; style slightly exceeding corolla, glabrous. Berry red, turning black-purple, ovoid or subglobose, with persistent calyx, 5–7 mm in diam.; seeds minute, numerous, brownish, broadly ellipsoid to oblong, slightly compressed, ca. 1 mm. Fl. (May–)Jun–Sep(–Oct), fr. (Aug–)Sep–Oct.  $2n = 18$ .

Forests, forest margins, scrub; 1100–3500 m. W Guizhou, W Sichuan, Xizang, Yunnan [Bhutan, India, Kashmir, Myanmar, Nepal, Pakistan; widely cultivated and naturalized in Australia, Europe, North America, and Pacific islands (New Zealand)].

The name *Leycesteria sinensis* was published by Hemsley in Hooker's Icon. Pl. (27: t. 2633. 1900). It is based on a single specimen collected by Henry (9692c) in Yunnan (mountains north of Mengtze, 2130 m) and does not appear to have been collected since then. This specimen has inflorescences with a single whorl, outer bracts broadly ovate, and calyx fused up to the middle with deltoid lobes; it falls within the variation of *L. formosa*.

**2. *Leycesteria stipulata*** (J. D. Hooker & Thomson) Fritsch in Engler & Prantl, Nat. Pflanzenfam. 4(4): 169. 1891.

绵毛鬼吹箫 *mian mao gui chui xiao*

*Lonicera stipulata* J. D. Hooker & Thomson, J. Proc. Linn. Soc., Bot. 2: 165. 1858; *Pentaptyxis stipulata* (J. D. Hooker & Thomson) J. D. Hooker ex C. B. Clarke.

Shrubs, ca. 3 m tall. Branches with solid pith. Branchlets, abaxial leaf surfaces, petioles, and inflorescences densely gray-

white lanate. Interpetiolar stipules conspicuous, suborbicular, 6–20 mm, persistent. Petiole 5–10 mm; leaf blade shiny adaxially, oblong-lanceolate, 8–15 × 3.5–7 cm, glabrescent adaxially, venation reticulate, midvein and lateral veins raised abaxially, veins conspicuously impressed adaxially, base rounded, margin slightly involute, remotely dentate, apex acuminate to long acuminate. Inflorescences axillary, shortly pedunculate, with 1–3 whorls of opposite 3-flowered cymes and 14 leaflike bracts and bracteoles per whorl; involucre bracts orbicular-ovate to lanceolate, 3–5 mm, exceeding or as long as ovaries. Corolla white, ca. 1 cm, outside tomentose, inside glabrous. Style glabrous. Berry ca. 1.9 cm, lanate to glabrescent; seeds brownish yellow, ellipsoid or subglobose, ca. 1 mm. Fl. Mar–Apr, fr. Oct–Nov.

Broad-leaved forests, grassy places; 1300–2000 m. Yunnan [Bhutan, India, Myanmar].

**3. *Leycesteria gracilis*** (Kurz) Airy Shaw, Hooker's Icon. Pl. 32: t. 3166. 1932.

纤细鬼吹箫 *xian xi gui chui xiao*

*Lonicera gracilis* Kurz, J. Asiat. Soc. Bengal, Pt. 2, Nat. Hist. 39: 77. 1870.

Shrubs, 1.5–3 m tall. Branches hollow. Interpetiolar stipules absent; petiole 5–10 mm, glabrescent; leaf blade ovate-lanceolate, 7–12 × 2.5–6.5 cm, abaxially glaucous, sparsely pubescent on midvein and lateral veins, adaxially glabrous, base rounded to subcordate, margin slightly involute, remotely dentate, apex acuminate to caudate. Inflorescence a ± pendent axillary pedunculate spike of paired flowers; pairs 2–6, with 3 bracts per flower; involucre bracts ovate-lanceolate or lanceolate, 1/3–1/2 as long as ovaries, glandular ciliate. Ovary 5–6 mm, with a short beak at apex. Sepals connate and shallowly cupular in lower part; lobes linear-lanceolate to lanceolate, 1.5–2 mm, often glandular ciliate. Corolla white, funnelform, 1–2 cm, glabrous; lobes ovate to orbicular-ovate, 5–7 mm. Stamens slightly shorter than corolla. Ovary (5–)7- or 8(–10)-locular, with numerous ovules; style protruding from corolla. Berry red, turning blue-purple, oblong or ellipsoid, 1–1.3 cm; seeds numerous, subglobose, minute, ca. 1 mm in diam. Fl. (Sep–)Oct–Nov(–Dec), fr. (Mar–)Apr–May.

Forests, thickets; 2000–3800 m. Xizang, Yunnan [Bhutan, India, Myanmar, Nepal].

**4. *Leycesteria glaucophylla*** (J. D. Hooker & Thomson) C. B. Clarke in J. D. Hooker, Fl. Brit. India 3: 16. 1880.

西域鬼吹箫 *xi yu gui chui xiao*

*Lonicera glaucophylla* J. D. Hooker & Thomson, J. Proc. Linn. Soc., Bot. 2: 165. 1858; *Leycesteria glaucophylla* var. *thibetica* (H. J. Wang) J. F. Huang; *L. thibetica* H. J. Wang.

Shrubs, 1–2 m tall. Branches hollow. Interpetiolar stipules variously developed, reniform to suborbicular, 1–10 mm, abaxially densely pubescent; petiole 2–4 mm, pubescent; leaf blade ovate-lanceolate, 4–10 × 1–6 cm, abaxially densely gray-white pubescent, adaxially sparsely pubescent, base rounded, margin slightly involute, sparsely serrate, apex acuminate to caudate. Inflorescence a pedunculate spike of paired flowers; peduncle 5–20 mm, pairs 1 or 2, with 3 bracts per flower; 2 involucre bracts leaflike, ovate to lanceolate, 5–20 mm, as long as or longer than ovaries; bracts ovate. Ovary ca. 5 mm with a short beak at apex, densely long hairy, interspersed with shorter glandular hairs.

Sepals shortly fused at base; lobes lanceolate, 4–7 mm. Corolla greenish or pale yellow to white, funnelform, 1–2 cm, outside hairy; lobes ovate, ca. 4 mm. Stamens slightly shorter than corolla; filaments hairy in lower half. Ovary 5-locular, with numerous ovules; style as long as corolla and hairy in lower half. Berry yellow-green, ovoid-ellipsoid, ca. 1.5 × 1 cm, long strigose and shortly glandular hairy, 5-locular; seeds numerous, yellowish brown, ovoid, small, ca. 1 mm. Fl. Mar–Sep, fr. May–Nov.

Margins of *Tsuga* forests; 1800–2600 m. SE Xizang [Bhutan, India, Myanmar, Nepal].

## 5. LONICERA Linnaeus, Sp. Pl. 1: 173. 1753.

忍冬属 ren dong shu

*Caprifolium* Miller; *Euchylia* Dulac; *Xylosteon* Miller.

Shrubs erect or dwarf, rarely small trees, sometimes climbers, deciduous or evergreen. Branches hollow or solid with white or brown pith; winter buds with 1 to several pairs of scales, rounded or acutely 4-angular, inner scales sometimes accrescent and reflexed. Accessory buds sometimes present, occasionally terminal buds reduced and substituted by 2 lateral buds. Leaves opposite, rarely whorled, margin entire, rarely dentate or divided; leaves usually estipulate, occasionally with interpetiolar stipules or a swollen interpetiolar line; sometimes 1 or 2 pairs of leaves below inflorescence connate and forming involucre bracts. Inflorescence thyrsoid, terminal or axillary, cymes opposite and usually reduced to paired flowers, rarely 1-, sometimes 3-flowered. Inflorescence occasionally pedunculate; cymes sessile, sometimes forming a capitulum, or cymes pedunculate with a pair of bracts and 2 pairs of bracteoles; bracts usually small, sometimes leaflike; bracteoles usually free, sometimes ± fused and cupular occasionally enclosing ovaries, sometimes absent. Paired flowers with free or partially to completely fused ovaries. Calyx 5-lobed, rarely 4-lobed, sometimes truncate, base occasionally with a collarlike emergence. Corolla white, yellow, reddish, or purple-red, often changing color after anthesis, campanulate, funnelform, regularly or subregularly 5(or 4)-lobed, or bilabiate and upper lip 4-lobed; tube long or short, often shallowly to deeply gibbous on ventral side toward base, rarely spurred. Nectary of compact sessile glandular hairs on ventral side toward base of corolla tube, occasionally in 5 regular lines, rarely swollen at base of style. Stamens 5; anthers dorsifixed. Ovary 2 or 3(–5)-locular; style slender, hairy or glabrous; stigmas capitate. Fruit a berry, red, blue-black, black, green, or white sometimes pruinose, bracteoles occasionally accrescent in fruit and enclosing paired berries. Seeds 1 to numerous, smooth, pitted or granular, with rounded embryo.

About 180 species: N Africa, Asia, Europe, North America; 57 species (23 endemic) in China.

See Rehder, Rep. (Annual) Missouri Bot. Gard. 14: 27–232, t. 1–20. 1903.

The identities of *Lonicera confusa* var. *glabrocalyx* Miao & X. J. Liu (Acta Sci. Nat. Univ. Sunyatseni 28(4): 78. 1989), *L. fengkaiensis* Miao & X. J. Liu (Acta Sci. Nat. Univ. Sunyatseni 28(4): 78. 1989), *L. stenantha* Pojarkova var. *angustifolia* C. Y. Yang & J. H. Fan (J. Aug. 1st Agric. Coll. 18(2): 7. 1995), and *L. subrotundata* C. Y. Yang & J. H. Fan (J. Aug. 1st Agric. Coll. 18(2): 8. 1995) cannot be determined because of the unavailability of the type specimens for examination or the original publications. One North American species, *L. sempervirens* Linnaeus, is occasionally cultivated.

- 1a. Flowers in 3-flowered cymes forming whorls at ends of branches.
  - 2a. Involucre bracts not connate; cymes pedunculate ..... 14. *L. hypoleuca*
  - 2b. Involucre bracts usually connate; cymes sessile.
    - 3a. Corolla funnelform, lobes regular ..... 55. *L. subaequalis*
    - 3b. Corolla bilabiate.
      - 4a. Corolla 1.5–2.5 cm; bracts lanceolate ..... 56. *L. yunnanensis*
      - 4b. Corolla 5–9 cm; bracts ovate ..... 57. *L. tragophylla*
- 1b. Flowers paired (occasionally single), axillary, paniculate or forming thyrses at ends of branches; involucre bracts not connate.
  - 5a. Shrubs; corolla actinomorphic, tube not gibbous and nectary of compact sessile glandular hairs in 5 regular lines; branches with solid pith; accessory buds absent.
    - 6a. Style as long as or longer than corolla tube.
      - 7a. Anthers and stigmas exerted; branches often with leafless spinelike apex; berries pale violet to white; dwarf shrubs 30–60 cm tall ..... 5. *L. spinosa*
      - 7b. Anthers and stigmas not exerted; branches not spinelike at apex; berries blue-black with glaucous bloom; shrubs 200–400 cm tall ..... 3. *L. tomentella*
    - 6b. Style ca. 1/2 length of corolla tube.

- 8a. Leaves sometimes whorled; flowers at bases of branches; branches often becoming spinelike at apex; stems sympodial; ovary 3-locular ..... 4. *L. rupicola*
- 8b. Leaves not whorled; flowers on short lateral branches or along monopodial stems; branches not spinelike at apex; ovary 2-locular.
  - 9a. Ovaries fused above middle or throughout; corolla tubular-campanulate, lobes usually more than 1.5 mm; flowers 4- or 5-merous ..... 2. *L. angustifolia*
  - 9b. Ovaries free; corolla narrowly tubular, lobes usually ca. 1.5 mm; flowers 5-merous ..... 1. *L. tubuliflora*
- 5b. Shrubs or climbers; corolla zygomorphic (sometimes only at base), tube gibbous at base or not and nectary of compact sessile glandular hairs on ventral side toward base of corolla tube; branches solid or hollow; accessory buds often present.
  - 10a. Climbers, sometimes sprawling.
    - 11a. Corolla with a ca. 12 mm spur toward base, neighboring 2 ovaries connate ..... 42. *L. calcarata*
    - 11b. Corolla not spurred, sometimes shallowly gibbous, neighboring 2 ovaries free.
      - 12a. Corolla less than 3 cm.
        - 13a. Corolla tube broadly funnelform, shallowly gibbous toward base ..... 45. *L. acuminata*
        - 13b. Corolla tube narrowly funnelform, not gibbous.
          - 14a. Corolla densely yellow-brown strigose; leaves abaxially densely yellow-brown strigose, margins conspicuously ciliate ..... 46. *L. ferruginea*
          - 14b. Corolla with spreading or adpressed hairs and minute glandular hairs, glabrous, or strigose; leaves abaxially not densely yellow-brown strigose, margins not conspicuously ciliate ..... 47–51. *L. macrantha* species complex
      - 12b. Corolla more than 3 cm.
        - 15a. Bracts leaflike.
          - 16a. Bracts ovate to elliptic, 10–30 mm; leaves abaxially sparsely to densely hairy but not obscuring leaf surface ..... 44. *L. japonica*
          - 16b. Bracts linear-lanceolate, 5–14 mm; leaves abaxially white velutinous with indumentum obscuring leaf surface ..... 47–51. *L. macrantha* species complex
        - 15b. Bracts not leaflike, linear or subulate.
          - 17a. Corolla 9–12 cm, tube broadly funnelform; berries green when ripe ..... 53. *L. hildebrandiana*
          - 17b. Corolla 3–9 cm, tube narrowly funnelform; berries white, red, or black when ripe.
            - 18a. Corolla 5–9 cm; leaves glabrous; berries white or black ..... 52. *L. longiflora*
            - 18b. Corolla 3–7 cm; leaves abaxially hirsute mixed with short glandular hairs, pubescent, shortly white velutinous or glaucous with large sessile orange glands, occasionally subglabrous; berries white, red, or black.
              - 19a. Corolla 3–4.5 cm, lip less than 1/5 as long as tube; berries red ..... 54. *L. bournei*
              - 19b. Corolla 3–7 cm, lip more than 1/4 as long as tube; berries white or black ..... 47–51. *L. macrantha* species complex
    - 10b. Upright shrubs, sometimes compact or prostrate with upright shoots.
      - 20a. Branches with pith becoming brown and later hollow.
        - 21a. Peduncles 10 mm or less.
          - 22a. Calyx scarious and campanulate, splitting; corolla 1.2–1.5 cm; winter bud scales hairy inside ..... 41. *L. trichosantha*
          - 22b. Calyx not scarious, tubular at base but lobed at apex; corolla ca. 2 cm; winter bud scales glabrous inside ..... 40. *L. maackii*
        - 21b. Peduncle 10 mm or more.
          - 23a. Inner winter bud scales densely hairy and ciliate outside, ovaries  $\pm$  glandular hairy ..... 39. *L. chrysantha*
          - 23b. Inner winter bud scales glabrous to sparsely hairy outside, ovaries glabrous.
            - 24a. Upper corolla lip 4-lobed, 2 lateral lobes reaching base and spreading, tube shallowly gibbous toward base; leaf margin ciliate ..... 37. *L. tatarica*
            - 24b. Upper corolla lip 4-lobed, 2 lateral lobes reaching 1/2–3/4 and slightly spreading, tube deeply gibbous toward base; leaf margin sometimes dentate ..... 38. *L. ruprechtiana*
      - 20b. Branches with solid pith.
        - 25a. Bracteoles fused into a cupule enclosing ovaries at anthesis (note that this can give appearance of fused ovaries and absent bracteoles); bracteoles sometimes accrescent and enclosing paired berries in fruit.
          - 26a. Calyx forming a collarlike emergence at base; bracteoles not accrescent in fruit.
            - 27a. Corolla bilabiate; style stiffly hairy to apex; leaves usually with tufted hairs at base of midvein abaxially ..... 11. *L. gynochlamydea*
            - 27b. Corolla lobes regular; style villous at base only; leaves usually without tufted hairs at base of midvein abaxially ..... 12. *L. ligustrina*

- 26b. Calyx not forming a collarlike emergence at base; bracteoles accrescent in fruit sometimes enclosing paired berries.
- 28a. Inflorescence not terminal, paired flowers axillary; corolla lobes regular; cupule glabrous, tightly enclosing paired ovaries and forming a compound fruit ..... 10. *L. caerulea*
- 28b. Inflorescence terminal; corolla bilabiate; cupule pubescent, loosely enclosing paired berries, berries often exserted from cupule in fruit.
- 29a. Cupule usually glandular pubescent, accrescent to 1/2 length of berries; inflorescence terminal, of 3–8 whorls; winter buds glabrous inside; seeds shallowly pitted; leaf apex obtuse or rounded ..... 14. *L. hypoleuca*
- 29b. Cupule villous, enclosing paired berries, sometimes splitting at maturity; inflorescence terminal, of 1–3 whorls; winter buds densely villous inside; seeds deeply pitted with orange glands; leaf apex acuminate or acute ..... 13. *L. ferdinandi*
- 25b. Bracteoles absent or shorter than ovaries, free, fused in pairs, sometimes fused into a cupule but not enclosing ovaries.
- 30a. Winter bud acutely 4-angular.
- 31a. Ovaries free or fused only at base; bracteoles free or fused into a cupule; berries black ..... 31–33. *L. nigra* species complex
- 31b. Ovaries half to completely fused, bracteoles fused into a cupule; berries red or black.
- 32a. Peduncle to 7 mm; berries red ..... 30. *L. modesta*
- 32b. Peduncles 5–30 mm; berries red or black.
- 33a. Berries red; leaf blade ovate, 4–12 × 1.5–3.5 cm ..... 34–36. *L. maximowiczii* species complex
- 33b. Berries black; leaf blade usually obovate, 1–2.5 × 0.7–1.8 cm, abaxially often pruinose, apex retuse to obtuse ..... 31–33. *L. nigra* species complex
- 30b. Winter bud not acutely 4-angular.
- 34a. Ovaries connate to ca. 1/2 or more.
- 35a. Corolla with regular erect lobes; stamens inserted or partially exserted ..... 6–8. *L. tangutica* species complex
- 35b. Corolla bilabiate, lobes recurved; stamens fully exserted.
- 36a. Bracteoles present, free or sometimes fused into a cupule; inner winter bud scales long accrescent; peduncle 0.5–9 cm, usually thickened toward apex ..... 27–28. *L. alpigena* species complex
- 36b. Bracteoles absent; inner winter bud scales long accrescent or not; peduncle 0.5–1.5 cm, not thickened toward apex.
- 37a. Flowering Apr–Jun; inner winter bud scales not accrescent; berry globose ..... 9. *L. microphylla*
- 37b. Flowering Jan–Apr; inner winter bud scales long accrescent; berry oblong.
- 38a. Deciduous shrubs; leaves ovate to lanceolate, acute to acuminate, 3–8.5 cm ..... 15. *L. fragrantissima*
- 38b. Evergreen shrubs; leaves broadly obovate, obtuse and mucronate, 1–2 cm ..... 16. *L. mucronata*
- 34b. Ovaries free.
- 39a. Corolla hypocrateriform, densely hairy at mouth; style ca. 1/2 length of corolla tube; flowers appearing before leaves ..... 18. *L. setifera*
- 39b. Corolla not hypocrateriform; style subequaling or longer than corolla tube; flowers appearing before or after leaves.
- 40a. Corolla bilabiate.
- 41a. Bracteoles absent; bracts leaflike, ovate to lanceolate ..... 26. *L. humilis*
- 41b. Bracteoles present, free or fused in pairs or into a cupule; bracts linear-subulate.
- 42a. Prostrate shrubs with evergreen leathery leaves; corolla tube longer than lobes ..... 43. *L. crassifolia*
- 42b. Erect shrubs with deciduous leaves; corolla tube shorter than lobes.
- 43a. Bracteoles free or fused in pairs; peduncle 0.5–9 cm, usually thickened toward apex; leaves ovate-elliptic to ovate-lanceolate, longer than wide, apex apiculate to long acuminate ..... 27–28. *L. alpigena* species complex
- 43b. Bracteoles fused into a cupule shorter than ovaries; peduncle 0.7–1 cm, not thickened toward apex; leaves broadly rhombic, as long as wide, apex cuspidate and mucronate or obtuse ..... 29. *L. oblata*
- 40b. Corolla funnellform, lobes subregular.
- 44a. Cymes reduced to a single flower, sometimes with a second partially developed ..... 25. *L. subhispida*
- 44b. Cymes of paired flowers.
- 45a. Inner winter bud scales not accrescent and covered by a single outer pair of keeled scales; bracts usually 1 cm or more ..... 19–23. *L. hispida* species complex
- 45b. Inner winter bud scales accrescent; bracts usually 1 cm or less.

- 46a. Corolla lobes more than half as long as tube; anthers usually deep pink, exserted; berry globose ..... 17. *L. praeflorens*  
 46b. Corolla lobes less than half as long as tube; berry ellipsoid ..... 24. *L. elisae*

**1. *Lonicera tubuliflora*** Rehder in Sargent, Pl. Wilson. 1: 129. 1911.

管花忍冬 *guan hua ren dong*

Shrubs, deciduous, to 4 m tall. Branches with solid pith. Winter buds with several pairs of acute scales. Young branches puberulent and minutely glandular hairy. Petiole shorter than 1 mm; leaf blade glaucescent abaxially, oblong to oblong-ovate, 5–12 × 2–3 mm, base broadly cuneate to rounded, margin sparsely glandular ciliolate at base, apex obtuse. Paired flowers fragrant, axillary on upper or middle part of young branches; peduncle to 1 mm; bracts leaflike, linear-oblong, to 5 mm; bracteoles cupular, 1/2–2/3 as long as ovary, truncate. Neighboring 2 ovaries free, ca. 1.5 mm. Sepals triangular-ovate, less than 1 mm, glabrous or sometimes sparsely glandular ciliolate. Corolla white or yellowish, tubular; tube 8–10 mm, ca. 2 mm in diam., mouth slightly constricted at apex, inside villous and glandular at base; glandular hairs in 5 regular lines; lobes spreading, orbicular-ovate, ca. 1.5 mm. Filaments inserted in middle of corolla tube. Ovary 2-locular; style shorter than stamens and less than 1/2 length of corolla tube. Berry red or red-brown, ovoid or globose, ca. 4 mm in diam. Fl. Jun–Jul, fr. Sep.

- Scrub; 2100–3100 m. NW-Sichuan.

This species seems more closely related to *Lonicera angustifolia* than to *L. rupicola* var. *syringantha* as suggested by Rehder (in Sargent, Pl. Wilson. 1: 129. 1911).

**2. *Lonicera angustifolia*** Wallich ex Candolle, Prodr. 4: 337. 1830.

狭叶忍冬 *xia ye ren dong*

Shrubs, deciduous to 3 m tall, branched. Branches with solid pith. Winter buds with several pairs of acute scales. Leaves, petioles, and bracts (sometimes bracteoles and calyx lobes) often sparsely red-brown glandular ciliolate. Petioles 1–3 mm; leaf blade obovate to elliptic or ovate, 0.5–4.5 cm × 2–13 mm, abaxially glaucous, glabrous to pubescent, base cuneate, apex acute or obtuse to rounded and sometimes mucronate. Inflorescences axillary, paired flowers, and on lateral short branches; peduncle 1–30 mm; bracts leaflike, often exceeding calyx lobes in length; bracteoles fused and cupular, ca. 1/2 as long as or equaling ovaries, apex truncate or shallowly dentate. Neighboring 2 ovaries fused above middle or throughout. Calyx shallowly cupular; lobes ovate-triangular, often unequal. Corolla white to pink, often tinged purple-red, tubular-campanulate, 6–10 mm, outside glabrous to pubescent, 4- or 5-lobed; tube inside densely hairy at throat and densely glandular below; glandular hairs in 5 regular lines; tube with 1–5 ± conspicuous pouches halfway up; lobes orbicular-ovate, 1/4–1/3 as long as tube. Stamens and style included; anthers ca. 1 mm; filaments inserted slightly below throat. Ovary usually 2-locular; style not exceeding anthers; stigmas green, globose, mucilaginous. Berry red, suborbicular, 4–6 mm in diam.; calyx persistent; seeds brownish, ovoid to oblong, compressed, 2–3 mm. Fl. May–Jul, fr. Aug–Sep.

Scrub, forests, stony places along river valleys; 2400–4500(–4700) m. SW Sichuan, Xizang, Yunnan [Afghanistan, Bhutan, India, Kashmir, N Myanmar, Nepal, Pakistan].

- 1a. Leaves 15–45 mm, apex acute or acuminate; peduncle 6–30 mm ..... 2a. var. *angustifolia*  
 1b. Leaves 5–15 mm, apex obtuse; peduncle to 5 mm ..... 2b. var. *myrtilus*

**2a. *Lonicera angustifolia* var. *angustifolia***

狭叶忍冬(原变种) *xia ye ren dong* (yuan bian zhong)

*Caprifolium angustifolium* (Wallich ex Candolle) Kuntze.

Leaves 15–45 mm, apex acute or acuminate. Peduncle 6–30 mm. 2n = 18.

Forests, scrub; 2700–4500 m. S Xizang, Yunnan [Bhutan, N India, Kashmir, Nepal].

**2b. *Lonicera angustifolia* var. *myrtilus*** (J. D. Hooker & Thomson) Q. E. Yang, Landrein, Borosova & J. Osborne, **comb. nov.**

越桔叶忍冬 *yue ju ye ren dong*

Basionym: *Lonicera myrtilus* J. D. Hooker & Thomson, J. Proc. Linn. Soc., Bot. 2: 168. 1858; *Caprifolium parvifolium* Kuntze; *L. angustifolia* var. *rhododactyla* W. W. Smith; *L. minutifolia* Kitamura; *L. myrtilus* var. *cyclophylla* Rehder; *L. myrtilus* var. *depressa* Rehder.

Leaves 5–15 mm, apex obtuse. Peduncle to 5 mm. Fl. May–Jun(–Jul), fr. Aug–Sep.

Scrub, sparse forests, stony places along river valleys; 2400–4000 (–4700) m. SW Sichuan, Xizang, Yunnan [Afghanistan, Bhutan, India (Assam), Kashmir, N Myanmar, Pakistan].

**3. *Lonicera tomentella*** J. D. Hooker & Thomson, J. Proc. Linn. Soc., Bot. 2: 167. 1858.

毛冠忍冬 *mao guan ren dong*

Shrubs, deciduous, to 4 m tall. Branches with solid pith. Winter buds with several obtuse scales. Young branches lanate or villous. Petiole 1–3 mm; leaf blade gray-green or glaucous abaxially, ovate to lanceolate, 1–4 × 0.6–1.5 cm, abaxially pubescent or rarely subglabrous, more densely pubescent on mid-vein, sometimes with scattered orange-red minute glands abaxially, base cuneate to slightly cordate, margin revolute, apex obtuse to acute. Inflorescences axillary, paired flowers; peduncle 1–14 mm; bracts leaflike, ovate to linear-oblong, to 8 mm, longer than ovaries; bracteoles ± fused and cupular, up to 1/2 as long as ovary, glabrous. Neighboring 2 ovaries fused to more than half or free, ca. 2.5 mm, glabrous and glaucous. Sepals ovate, less than 1 mm, apex obtuse. Corolla white, tinged purplish red, tubular-funnelform, outside glabrous or pubescent; tube ca. 8 mm, inside pubescent and glandular at base; glandular hairs in 5 regular lines; lobes orbicular-ovate, ca. 2.5 mm.

Stamens inserted in upper part of corolla tube, unequal in length, not exerted. Ovary usually 3-locular; style as long as corolla tube; stigmas globose. Berry blue-black, with glaucous bloom, globose, ca. 6 mm in diam. Fl. Jun–Aug, fr. Sep.

Forests, scrub; 2000–3200 m. Xizang, NW Yunnan [Bhutan, NE India, Myanmar, Nepal].

- 1a. Leaves gray-green, densely pubescent;  
lateral veins usually 7 or 8 pairs ..... 3a. var. *tomentella*  
1b. Leaves glaucous, sparsely pubescent  
or glabrous; lateral veins usually  
4 or 5 pairs ..... 3b. var. *tsarongensis*

### 3a. *Lonicera tomentella* var. *tomentella*

毛冠忍冬(原变种) mao guan ren dong (yuan bian zhong)

*Caprifolium tomentellum* (J. D. Hooker & Thomson) Kuntze; *Lonicera tomentella* var. *conaensis* P. S. Hsu & Y. F. Huang.

Leaf blade gray-green abaxially, densely pubescent, lateral veins 7 or 8 pairs.

Forests, scrub; 2900–3000 m. Xizang, NW Yunnan [NE India].

**3b. *Lonicera tomentella* var. *tsarongensis*** W. W. Smith, Notes Roy. Bot. Gard. Edinburgh 13: 168. 1921.

察瓦龙忍冬 cha wa long ren dong

Leaf blade often glaucous abaxially, sparsely pubescent or glabrous, lateral veins 4 or 5 pairs.

• Forests, scrub; 2000–3200 m. SE Xizang, NW Yunnan.

**4. *Lonicera rupicola*** J. D. Hooker & Thomson, J. Proc. Linn. Soc., Bot. 2: 168. 1858.

岩生忍冬 yan sheng ren dong

Shrubs, deciduous, erect or procumbent, to 2.5 m tall, sometimes only 10–20 cm tall at high elevations. Bark splitting. Branches with solid pith. Winter buds with several obtuse scales. Young branches white lanate or subglabrous, sometimes minutely glandular hairy; often leaves dropping at apex and leaving needlelike bare twigs. Leaves in whorls of 3 or opposite; petiole 1–3 mm; leaf blade linear-lanceolate to oblong, 0.5–3.7 × 0.1–1 cm, abaxially white lanate, sparsely pubescent, or glabrous, adaxially glabrous or rarely minutely glandular hairy, base cuneate to subcordate, margin revolute, apex acute to obtuse and slightly mucronate. Inflorescences axillary, paired flowers at bases of young branches; peduncle 0–3 mm; bracts, bracteoles, and margins of sepals minutely puberulent and glandular; bracts leaflike, linear-lanceolate, exceeding ovary; bracteoles cupular, sometimes lobed or rarely completely separate, ca. 1/2 as long as or equaling ovary. Neighboring 2 ovaries free, ca. 2 mm, glabrous. Sepals narrowly lanceolate to ovate-triangular, 2.5–3 mm. Flowers fragrant. Corolla white or pink to purple-red, tubular-funnelform; tube 8–10 mm, outside often puberulent and minutely glandular hairy, inside pubescent and glandular at base; lobes spreading, ovate, 2–4 mm. Stamens up to middle of corolla tube or slightly exceeding corolla tube, longer than style. Ovary usually 3-locular. Berry red, ellip-

soid, ca. 8 mm; seeds few, brownish, ellipsoid, compressed, ca. 4 mm. Fl. May–Aug, fr. Aug–Oct.

Alpine scrub and meadows, rock crevices, scree slopes, grasslands, forest margins, deserts; 2000–5000 m. Gansu, S Ningxia, Qinghai, Sichuan, Xizang, NW Yunnan [Bhutan, India, Nepal].

- 1a. Ecotype found in shifting sands, with short branches on long subterranean stems; young branches, petioles, and leaves minutely scabrid ..... 4c. var. *minuta*  
1b. Plants of alpine meadows, scree slopes, and forest margins, erect or procumbent.  
2a. Leaves abaxially usually white lanate, evergreen ..... 4a. var. *rupicola*  
2b. Leaves abaxially glabrous or sparsely lanate, deciduous ..... 4b. var. *syringantha*

### 4a. *Lonicera rupicola* var. *rupicola*

岩生忍冬(原变种) yan sheng ren dong (yuan bian zhong)

*Caprifolium rupicolum* (J. D. Hooker & Thomson) Kuntze; *Lonicera rupicola* subsp. *thibetica* (Bureau & Franchet) Y. C. Tang; *L. rupicola* var. *thibetica* (Bureau & Franchet) Zabel; *L. thibetica* Bureau & Franchet.

Plants erect or procumbent. Leaves evergreen, abaxially usually white lanate.

Alpine scrub and meadows, rock crevices, margins of scree slopes, grasslands at forest margins; 2100–5000 m. Gansu, S Ningxia, Qinghai, Sichuan, Xizang, NW Yunnan [India, Nepal].

**4b. *Lonicera rupicola* var. *syringantha*** (Maximowicz) Zabel in Beissner et al., Handb. Laubholzben. 462. 1903.

红岩生忍冬 hong hua yan sheng ren dong

*Lonicera syringantha* Maximowicz, Bull. Acad. Imp. Sci. Saint-Petersbourg 24: 49. 1878; *L. codonantha* Rehder; *L. rupicola* f. *glabrata* Suessenguth; *L. rupicola* subsp. *syringantha* (Maximowicz) Y. C. Tang; *L. syringantha* var. *minor* Maximowicz; *L. syringantha* var. *wolfii* Rehder; *L. wolfii* (Rehder) K. S. Hao.

Plants erect or procumbent. Leaves deciduous, abaxially glabrous or sparsely lanate.

Scrub, forest margins, alpine meadows, scree slopes; 2000–4600 m. Gansu, S Ningxia, E Qinghai, Sichuan, Xizang, NW Yunnan [India].

*Lonicera codonantha* appears to be an intermediate form between var. *rupicola* and var. *syringantha*, which has sessile, abaxially villous leaves, and brown villous stems.

**4c. *Lonicera rupicola* var. *minuta*** (Batalin) Q. E. Yang, Landrein, Borosova & J. Osborne, **comb. et stat. nov.**

矮生忍冬 ai sheng ren dong

Basionym: *Lonicera minuta* Batalin, Trudy Imp. S.-Peterburgsk. Bot. Sada 12: 170. 1892.

Ecotype with short branches on long subterranean stems; young branches, petioles, and leaves minutely scabrid. Fl. May–Jun, fr. Aug–Sep.

• Shifting sands of sand dunes; 3200–3800 m. W Gansu, Qinghai.

**5. *Lonicera spinosa*** (Decaisne) Jacquemont ex Walpers, Reper. Bot. Syst. 2: 449. 1843.

棘枝忍冬 *ji zhi ren dong*

*Xylosteon spinosum* Decaisne in Jacquemont, Voy. Inde 4(Bot.): 78. 1841; *Caprifolium spinosum* (Decaisne) Kuntze; *Lonicera albertii* Regel.

Shrubs, dwarf, to 60 cm tall, deciduous, often with spine-like, leafless branchlets. Bark splitting. Branches with solid pith. Winter buds with few scales. Leaves opposite; petiole ca. 1 mm; leaf blade linear to oblong, 4–15 × 1–2 mm, glabrous, base broadly cuneate to rounded, margin revolute, apex obtuse. Paired flowers fragrant, axillary at bases of lateral young branches; peduncle to 1 mm; bracts leaflike, longer than ovary; bracteoles cupular, more than 1/2 as long as ovary, apex subtruncate, often 2-lobed. Neighboring 2 ovaries free. Calyx cupular, ca. 1.5 mm; lobes ovate, apex obtuse. Corolla purplish red, later white, tubular-funnelform; tube ca. 10 mm, slender; lobes spreading, ovate-oblong, ca. 4 mm. Stamens inserted at mouth of corolla; anthers exserted. Style exserted. Berry pale violet to white, ellipsoid, ca. 5 mm. Fl. Jun–Jul, fr. Sep.

Scrub, scree slopes, often mixed with *Caragana* plants; 1700–4600 m. Xinjiang, Xizang [Afghanistan, India, Kashmir, Kazakhstan, Kyrgyzstan, Tajikistan].

#### 6–8. *Lonicera tangutica* species complex

Shrubs, deciduous, to 1–4 m tall. Branches with solid pith. Winter buds with 2–4 pairs of scales. Petiole 1–5 mm; leaf blade obovate to lanceolate, 0.5–8.5 × 0.2–2.5 cm, both surfaces glabrous or pubescent, base cuneate, apex obtuse to acute. Inflorescences axillary, paired flowers; peduncle usually nodding, 0–3 cm, slender, glabrous, rarely pubescent; bracts narrow, sometimes leaflike, usually exceeding or rarely shorter than ovaries; bracteoles sometimes present, separate or fused, minute to 1/4 as long as ovaries, often ciliate. Neighboring 2 ovaries fused completely or at least to middle, elliptic or oblong, ca. 2 mm, glabrous or occasionally pubescent. Calyx cupular, to 2 mm, truncate or with ovate to triangular lobes, glabrous to pubescent, sometimes ciliate. Corolla white, yellow, or pink, sometimes tinged purple, tubular-funnelform, 8–13 mm; tube glabrous, occasionally with sparse stiff hairs, nectary swollen or gibbous on ventral side at base of corolla tube, sometimes forming a spur shorter than ovaries; lobes suberect, orbicular-ovate, 1–2 mm; mouth glabrous or with sparse spreading stiff hairs. Stamens inserted at middle of corolla tube; anthers partially exserted, glabrous or ciliate. Style exserted by 1–3 mm. Berries orange, red, purple, or black, 5–6 mm in diam.; seeds brownish, ovoid or oblong, 2–2.5 mm, smooth. Fl. May–Aug, fr. Jul–Sep.

Forests, forest margins, grasslands, scrub, mountains; 800–4500 m. Anhui, Gansu, Guizhou, Hebei, Henan, W Hubei, W Hunan, Ningxia, E Qinghai, Shaanxi, Shanxi, Sichuan, Taiwan, Xizang, NW Yunnan [Bhutan, India (Sikkim), Nepal].

This is a highly variable species complex; further studies are needed for a satisfactory taxonomic treatment.

- 1a. Bracts ovate-lanceolate; berries black ..... 8. *L. kawakamii*  
1b. Bracts subulate to lanceolate or linear-lanceolate; berries orange to red.

- 2a. Young branches, leaves, peduncle, bracts, and flowers glabrous; peduncle shorter than 1 cm ..... 7. *L. litangensis*  
2b. Young branches, leaves, peduncle, bracts, and flowers ± hairy; peduncle longer ..... 6. *L. tangutica*

- Mountains; 3000–3900 m. Taiwan.

No specimens were seen; a photograph and illustration were seen in Fl. Taiwan (ed. 2, 4: 747, 1166; photo 376. 1998).

**9. *Lonicera microphylla*** Willdenow ex Schultes, Syst. Veg. 5: 258. 1819.

小叶忍冬 xiao ye ren dong

*Caprifolium microphyllum* (Willdenow ex Roemer & Schultes) Kuntze; *Lonicera oiwakensis* Hayata; *Xylosteon sieversianum* Ruprecht.

Shrubs, deciduous, 1–3 m tall. Branches with solid pith. Winter buds with 3–6 pairs of scales, rounded to acute. Petiole 1–2 mm; leaf blade abaxially often gray-white, sometimes with membranous domatia in vein axils, obovate to elliptic or oblong, 5–22 × 5–13 mm, both surfaces densely puberulent to subglabrous, base cuneate, apex obtuse or ± acute, sometimes mucronate. Inflorescences axillary, paired flowers; peduncles 5–12 mm, usually nodding; bracts subulate, exceeding ovaries, bracteoles absent. Neighboring 2 ovaries fused completely or at least to middle, glabrous. Calyx rimlike to lobed. Corolla bilabiate, white to yellow, sometimes tinged pink; tube 7–10 mm, outside hairy or glabrous, gibbous toward base on ventral side; lobes oblong, 3–7 mm, upper 4 lobes erect, lower one recurved. Stamens inserted at mouth of corolla, together with style exserted; filaments and style glabrous or with spreading hairs. Ovaries 3-locular, with 4 or 5 ovules per locule. Berry red or orange-yellow, globose, 5–6 mm in diam.; seeds yellowish brown, oblong or ovoid-ellipsoid, 2.5–3 mm, smooth. Fl. Apr–Jun(–Jul), fr. Jul–Aug(–Sep). 2*n* = 18.

Rocky slopes, grasslands, thickets, sparse forests, forest margins; 1100–3600(–4100) m. Gansu, W Hebei, ?Henan, Nei Mongol, Ningxia, Qinghai, Shanxi, Taiwan, Xinjiang, Xizang [Afghanistan, NW India, Kazakhstan, Kyrgyzstan, Mongolia, Pakistan, Russia].

**10. *Lonicera caerulea*** Linnaeus, Sp. Pl. 1: 174. 1753.

蓝果忍冬 lan guo ren dong

*Lonicera caerulea* var. *altaica* Pallas; *L. caerulea* var. *edulis* Turczaninow ex Herder; *L. caerulea* var. *tangutica* Maximowicz; *Xylosteon caeruleum* (Linnaeus) Dumont de Courset.

Shrubs, deciduous, to 2.5 m tall. Branches with solid pith. Bark flaking. Buds divaricate, sometimes with accessory ones. Winter buds with several pairs of scales, outer pair long acuminate and obscuring inner ones. Interpetiolar stipules sometimes reniform and fused to 6 mm; leaf blade ovate to oblong or obovate, 1–6 × 1–3 cm, both surfaces with sparse short hairs, more densely so and spreading hairy on midvein, sometimes subglabrous, base rounded, apex acute to obtuse. Inflorescences axillary, paired flowers; peduncle 2–10 mm; bracts linear, 2–3 × as long as ovaries; bracteoles glabrous, fused into a cupule tightly enclosing free ovaries. Corolla tubular-funnelform, 10–15 mm, outside puberulent, shallowly gibbous at base; lobes regular, 2–3 mm. Stamens exserted from corolla. Ovaries 2-loc-

ular; style exserted and glabrous. Cupule tightly fused around 2 berries, blue-black, pruinose, forming an elliptic to oblong-elliptic compound fruit, ca. 1.5 cm. Seeds brown, globose to ellipsoid, ca. 1.5 mm. Fl. May–Jun, fr. Aug–Sep.

Deciduous forests, scrub; 2600–3500 m. S Gansu, Hebei, Heilongjiang, ?Henan, Jilin, Liaoning, Nei Mongol, Ningxia, Qinghai, Shanxi, N Sichuan, Xinjiang, NW Yunnan [Japan, Korea, Mongolia, Russia; Europe, North America].

This is a very widely distributed and variable species. The berries are edible.

**11. *Lonicera gynochlamydea*** Hemsley, J. Linn. Soc., Bot. 23: 362. 1888.

蕊被忍冬 rui bei ren dong

*Caprifolium gynochlamydeum* (Hemsley) Kuntze.

Shrubs, deciduous, to 3–4 m tall. Branches with solid pith. Winter buds with several pairs of acute scales. Petiole 3–6 mm; leaf blade ovate to lanceolate, 5–11 × 1.5–3.5 cm, abaxially often densely white villous at base of midvein, occasionally with scattered dark purple glands at base, base rounded to cuneate, margin with short stiff hairs, apex long acuminate. Inflorescences axillary, paired flowers; peduncles 4–8 mm; bracts subulate, subequaling or exceeding ovaries; bracteoles fused, cupular, surrounding 2 neighboring free ovaries. Calyx forming a collarlike emergence at base; lobes triangular or lanceolate, glandular ciliate, apex obtuse to acute. Corolla bilabiate, white, pink, or purple-red, 8–12 mm, both sides with short hairs; tube slightly shorter than lobes, deeply gibbous at base. Stamens exserted; filaments sometimes hairy at base. Style shorter than stamens, stiffly hairy throughout. Cupule not accrescent; berries purple-red or white, 4–5 mm in diam., 1- or 2(–4)-seeded; seeds smooth. Fl. May, fr. Aug–Sep.

• Scrub, forests; 1200–1900(–3000) m. Anhui, Chongqing, Gansu, Guizhou, Hubei, Hunan, Shaanxi, Sichuan, Yunnan.

**12. *Lonicera ligustrina*** Wallich in Roxburgh, Fl. Ind. 2: 179. 1824.

女贞叶忍冬 nü zhen ye ren dong

Shrubs, evergreen, semievergreen, or deciduous, 1.5–2.5(–5) m tall. Winter buds with several pairs of acute scales. Young branches with stiff and upwardly curved hairs. Leaves ovate to lanceolate, 0.4–8 × 0.2–1.5 cm, leathery or papery, abaxially sometimes with minute black glands, adaxially usually shiny, glabrous or with sparse short hairs and reddish glandular hairs, midvein slightly impressed, flat or raised, sometimes stiffly hairy, base rounded to cuneate, apex acuminate to obtuse, sometimes mucronate. Inflorescences axillary, paired flowers; peduncle to 5 mm, pubescent; bracts lanceolate, 1.5–7 mm; bracteoles cupular, completely enclosing paired ovaries, sparsely glandular hairy. Neighboring 2 ovaries free. Calyx cupular, forming a collarlike emergence at base, overlapping apex of bracteoles; lobes ovate, glandular ciliate, apex obtuse. Corolla greenish yellow to white or occasionally purple-red, funnel-form, 4–12 mm; tube shallowly gibbous at base, inside villous, outside glandular; lobes almost regular, ovate, 1–2 mm, apex obtuse. Anthers exserted. Style exserted, villous at base; stigmas

capitate, hemispherical. Fruit purple, red, or white,  $\pm$  translucent, globose, 4–8 mm in diam.; seeds brownish, ovoid or subglobose, sometimes compressed, 1–2 mm, smooth. Fl. Apr–Jul, fr. Aug–Dec.  $2n = 18, 22$ .

Scrub, evergreen broad-leaved forests, sandy slopes along watersides, moist places in sparse forests; 300–3000 m. S Gansu, Guangdong, Guangxi, Guizhou, Hubei, Hunan, Shaanxi, Sichuan, Yunnan [Bhutan, India, Nepal].

Shrubs, deciduous, 1–4.5 m tall. Winter buds with a pair of boat-shaped outer scales; scales densely white tomentose inside. Young branches usually hirsute, often with stiff hairs and minute glands; bark verrucose, splitting; vigorous shoots with well-developed interpetiolar discoid stipules. Leaves ovate to lanceolate, 3–10  $\times$  2–7 cm, abaxially usually hirsute, more densely so at base of midvein, sometimes with minute glands, adaxially sparsely hirsute or subglabrous, base rounded to subcordate, margin ciliate, entire or occasionally shallowly lobed, apex acute to acuminate. Inflorescence terminal with 1–3 whorls, cymes 2-flowered (occasionally 3-flowered); peduncle 1–2 mm, hirsute, glandular; bracts leaflike, lanceolate to ovate, to 1.5 cm; bracteoles fused into an urceolate cupule, completely surrounding 2 neighboring free ovaries, accrescent to 7–13 mm in diam. in fruit, outside densely villous when young, inside adpressed villous. Calyx pubescent; lobes triangular, ciliate. Corolla bilabiate, white, later yellowish, 1.3–1.7 cm, outside usually densely hirsute and glandular hairy, inside villous; tube shallowly gibbous toward base, slightly longer than or subequaling lobes; upper lip shallowly 4-lobed; lower lip recurved. Stamens and style exerted from corolla tube. Style pubescent toward base. Cupule loosely enclosing paired berries, sometimes splitting. Berries red, ovoid, to 1 cm, 2–7-seeded; seeds light brown, ellipsoid, compressed, 4–7 mm, densely rusty pitted. Fl. Apr–Jul, fr. Aug–Oct.  $2n = 36$ .

Forests, scrub, rocky slopes; (200–)1000–2700 m. Gansu, S Hebei, Heilongjiang, Henan, Liaoning, Nei Mongol, Ningxia, E Qinghai, W Shaanxi, Shanxi, Sichuan, Yunnan [N Korea].

14. *Lonicera hypoleuca* Decaisne in Jacquemont, Voy. Inde 4(Bot): 81. 1841.

白背忍冬 bái bèi rěn dōng

Shrubs, deciduous, to 2 m tall. Winter buds with several pairs of acute scales. Young branches, petioles, and peduncles densely spreading white hispid, rarely glabrescent. Petiole 1–3 mm, slightly clasping at base; leaf blade ovate to oblong, 1–3  $\times$  0.9–1.8 cm, abaxially glaucous and densely soft hairy, adaxially pubescent, base subtruncate to slightly cordate, apex obtuse to

rounded. Inflorescence terminal, with 3–8 whorls, sometimes branching; cymes 2-flowered (occasionally 3-flowered); peduncle to 10 mm, those in lower part of inflorescence longer; bracts leaflike, to 5 mm; bracteoles fused, shallowly cupular, usually equaling ovaries, surrounding 2 neighboring free ovaries, accrescent to 5–6 mm in diam. in fruit, outside densely glandular hairy, inside glabrous. Sepals triangular, to 1 mm, ciliate. Corolla bilabiate, creamy yellow, outside puberulent; tube ca. 7 mm, shallowly gibbous at base on ventral side, inside puberulent; upper lip shallowly 4-lobed; lower lip recurved, subequaling corolla tube. Stamens and style exerted from corolla tube; filaments and style white pubescent below middle; anthers linear, ca. 3 mm. Cupule accrescent to 1/2 length of berries; berries red, ellipsoid, ca. 5 mm, hairy. Fl. Jun–Jul, fr. Sep.

Scrub on mountain slopes; 2900–3100 m. Xizang [India, Kashmir, Nepal, Pakistan].

**15. *Lonicera fragrantissima* Lindley & Paxton in Paxton, Fl. Gard. 3: 75. 1852.**

郁香忍冬 *yu xiang ren dong*

Shrubs, deciduous, to 2 m tall. Winter buds with a pair of acute, cartilaginous outer scales covering membranous inner scales. Young branches usually with reflexed bristles. Petiole 2–5 mm, hirsute; leaf blade sometimes paler abaxially, variable in shape, obovate or ovate to lanceolate, 3–8.5 × 1–4.5 cm, glabrous to pubescent or hirsute, base subcordate to cuneate, margin ciliate or subglabrous, sometimes slightly revolute, apex rounded to acuminate. Inflorescences axillary with paired flowers at base of new shoots; flowers fragrant, opening early in spring; peduncle 1–15 mm, glabrous to hirsute; bracts leaflike to lanceolate, 7–10 mm; bracteoles absent. Paired ovaries fused to middle or above, 1–3 mm. Calyx cupular, truncate or minutely lobed, sometimes ciliate, not constricted at base. Corolla bilabiate, white to pink, 1–1.5 cm, outside glabrous to hirsute; tube 4–5 mm, inside densely puberulent, shallowly gibbous toward base; upper lip ca. 7 mm, lobed to middle; lower lip recurved, ca. 8 mm. Stamens and style exerted from corolla tube; filaments unequal in length. Style glabrous. Berries red, oblong, ca. 1 cm, partly united; seeds brown, slightly compressed, oblong, ca. 3.5 mm, with shallow pits. Fl. Jan–Apr, fr. Apr–Jun.

• Forests, scrub; 100–2700 m. Anhui, Gansu, Guizhou, Hebei, Henan, Hubei, Hunan, Jiangsu, Jiangxi, Shaanxi, Shandong, Shanxi, Sichuan, Zhejiang.

**16. *Lonicera mucronata* Rehder, Rep. (Annual) Missouri Bot. Gard. 14: 83. 1903.**

短尖忍冬 *duan jian ren dong*

Shrubs, evergreen, to 2 m tall. Winter buds with a pair of acute, cartilaginous outer scales covering membranous inner scales. Young branches, petioles, and peduncles densely stiffly hairy. Leaves broadly obovate, to broadly elliptic or suborbicular, 1–2 × 1–1.5 cm, venation reticulate, glabrous or sparsely adpressed stiffly hairy on both surfaces, abaxially sometimes glaucous, margin slightly revolute, ciliate, apex obtuse and mucronate. Inflorescences axillary with paired flowers at base of new shoots; flowers fragrant, opening early in spring; peduncle to 6 mm, glabrous to hirsute; bracts ovate-oblong, slightly exceeding ovaries, margin ciliate; bracteoles absent. Paired ovaries fused to middle or above, 6–8 mm in diam. Corolla bilabiate, white to pink, 1–1.5 cm, outside glabrous to hirsute; tube 4–5 mm, inside densely puberulent, shallowly gibbous toward base; upper lip ca. 7 mm, lobed to middle; lower lip recurved, ca. 8 mm. Stamens and style exerted from corolla tube; filaments unequal in length. Style glabrous. Berries red, 5–10-seeded; seeds brownish, oblong-ellipsoid, ca. 2.5 mm, with minute shallow pits. Fl. Mar–Apr, fr. Apr–May.

• Scrub in mountain valleys; 800–1500 m. W Hubei, NE Sichuan.

**17. *Lonicera praeiflorens* Batalin, Trudy Imp. S.-Peterburgsk. Bot. Sada 12: 169. 1892.**

早花忍冬 *zao hua ren dong*

Shrubs, deciduous, to 2 m tall. Winter buds with a pair of acute, cartilaginous outer scales covering membranous inner scales. Young branches usually with long spreading hairs. Petiole 3–5 mm, densely villous; leaf blade broadly ovate, 1–7.5 × 0.9–4.5 cm, both surfaces densely adpressed pubescent, base broadly cuneate to rounded, margin ciliate, apex acute to apiculate. Inflorescences axillary paired flowers and at base of new shoots, flowers opening early in season; peduncle very short, usually concealed by bud scales at anthesis, to 1.2 cm at fruiting stage, usually glabrous; bracts broadly lanceolate, 3–7 mm, margin often ciliate and glandular; bracteoles absent. Paired ovaries free, suborbicular, usually glabrous. Calyx cupular, sometimes shallowly lobed, ciliate. Corolla yellowish white to pink, subregular, funnelform, ca. 1 cm, outside glabrous, deeply lobed; lobes erect to recurved, oblong, 6–7 mm, apex obtuse. Stamens and style exerted; anthers dark pink; style glabrous. Berries

red, globose, 6–8 mm in diam.; seeds brownish, oblong, ca. 4.5 mm, smooth. Fl. Apr, fr. May–Jun.  $2n = 18$ .

Forests, scrub; 200–600 m. Heilongjiang, Jilin, Liaoning [Japan, Korea, Russia].

**18. *Lonicera setifera*** Franchet, J. Bot. (Morot) 10: 314. 1896.

齿叶忍冬 *chi ye ren dong*

*Lonicera fragilis* H. Léveillé; *L. scabrida* Franchet; *L. setifera* var. *trullifera* Rehder; *L. subdentata* Rehder.

Shrubs, deciduous, to 3 m tall. Terminal winter bud underdeveloped, substituted by 2 lateral buds. Winter buds with a pair of outer scales covering inner scales. Young branches and petioles usually densely bristly, interspersed with glandular hairs. Petiole 3–8 mm; leaf blade oblong to oblong-lanceolate, 3–12 × 1.5–6 cm, both surfaces stiffly strigose, base cuneate to rounded, margin usually undulate to shallowly lobed, and ciliate, apex acute to acuminate. Inflorescences axillary paired flowers and at base of new shoots; flowers opening early in season; peduncle very short, usually concealed by bud scales at anthesis, not accrescent in fruit; bracts broadly ovate, to 1 cm; bracteoles absent. Paired ovaries free. Calyx cupular, irregularly lobed; lobes rounded. Peduncle, bracts, ovaries, calyx, and corolla densely glandular hairy. Corolla white to purplish or pink, tubular-hypocrateriform, 1–1.4 cm, with spreading subregular lobes, densely hairy at mouth and inside tube; tube shallowly gibbous at base, concealed by bracts; lobes 3–6 mm. Stamens and style included, less than half as long as corolla tube. Style glabrous. Berries red, ellipsoid, 1–1.2 cm, glandular hairy; seeds brownish, oblong, ca. 5 mm, smooth. Fl. Mar–Apr, fr. May–Jun.

Forests, scrub; 2300–3800 m. Sichuan, Xizang, Yunnan [India].

**19–23. *Lonicera hispida* species complex**

Shrubs, deciduous, to 3 m tall, occasionally dwarf. Winter buds with a pair of narrow keeled outer scales, covering inner scales and sometimes longitudinally sulcate. Young branches often pruinose, minutely scabrid to stiffly hairy and glandular hairy, very rarely glabrous. Petiole 1.5–6 mm; leaf blade usually ovate to oblong, sometimes elliptic, 0.6–9 × 0.4–3.5 cm, subglabrous, with short stiff hairs or adpressed villous, base cuneate to slightly cordate, margin hirsute-ciliate, apex acute to obtuse and mucronulate. Inflorescences axillary paired flowers, and at base of new shoots; peduncle stout, sometimes slightly compressed, 0.5–2 cm; bracts broadly ovate, 1–4 cm; bracteoles absent. Paired ovaries free, glabrous to hirsute, often glandular hairy. Calyx cupular, 1–4 mm, to 5 mm at fruiting, truncate or lobed; lobes broad and hirsute-ciliate. Corolla yellow-green or dark purple, funnelform, subregular, 13–35 mm; tube shallowly to deeply gibbous toward base, glabrous to puberulent outside and inside at upper part; lobes erect, ovate, 5–10 mm. Stamens and style usually subequaling or longer than corolla, occasionally shorter. Style stiffly hairy on lower half. Berries red, black-brown, or blue-black and pruinose, ovoid, 1–1.5 cm, 3–8-seeded; seeds deep brown, irregularly triangular-oblong, 4–5 mm, smooth. Fl. May–Jul, fr. Jul–Sep.  $2n = 18^*$ .

Forests, scrub, alpine grasslands, rocky places, slopes, high mountains; 1700–4800 m. Gansu, Hebei, Henan, Ningxia, Qinghai, Shaanxi,

Shanxi, Sichuan, Xinjiang, Xizang, Yunnan [Afghanistan, Bhutan, India (Sikkim), Kashmir, Kazakhstan, Kyrgyzstan, Mongolia, Nepal, Pakistan; SW Asia (Iran)].

*Lonicera sublabiata* P. S. Hsu & H. J. Wang (Acta Phytotax. Sin. 17(4): 78. 1979), based on a type specimen collected in Lixian, Sichuan, by Z. He (12715) and kept in the Shanghai Museum of Natural History (SHM), could not be located; it has a short hispid style, a bilabiate corolla (though the 5 lobes are all located on the same side so it must be the result of a deliberate split of the corolla), and it seems to flower with the emerging leaves. Nevertheless, it does not seem to differ significantly from *L. hispida* species complex.

- 1a. Ovary glandular hairy, setose, or both, sometimes glabrous; nectary usually deeply gibbous; shrubs to 3 m.

**24. *Lonicera elisae*** Franchet, Nouv. Arch. Mus. Hist. Nat., sér. 2, 6: 32. 1883.

北京忍冬 *bei jing ren dong*

*Caprifolium elisae* (Franchet) Kuntze; *C. praecox* Kuntze; *Lonicera infundibulum* Franchet; *L. infundibulum* var. *rockii* Rehder; *L. pekinensis* Rehder; *L. praecox* (Kuntze) Rehder (1911), not K. Koch (1872).

Shrubs, deciduous, to 3 m tall. Winter buds with several pairs of scales, inner 1 accrescent and orbicular-ovate. Young branches glabrous, or setose, hirsute, and glandular hairy. Petiole 3–7 mm; leaf blade ovate to lanceolate, 2.5–7 × 1–4.5 cm, both surfaces adpressed stiffly hairy, more so abaxially, base rounded to cuneate, apex acute to acuminate. Inflorescences axillary paired flowers and at base of new shoots; flowers opening early in season; peduncle ca. 0.5 cm at anthesis; bracts broadly ovate to lanceolate, 6–10 mm, glabrous, pilose or glandular with few setose hairs; bracteoles none (original description with drawing of *Lonicera elisae* shows a pair of bracteoles; these not evident on type specimen). Neighboring 2 ovaries free, glandular hairy and hirsute, hirsute or glabrous. Calyx lobed to truncate, 2–3 mm, stiffly hairy and glandular ciliate or glabrous. Corolla white or pinkish, narrowly funnelform, 1.5–2 cm, outside stiffly hairy or glabrous, shallowly gibbous toward base; lobes subregular, ca. 1/3 as long as tube. Stamens slightly exserted and style long exserted, glabrous to hairy. Peduncle to 2.5 cm in fruit; berries orange to red, ellipsoid, ca. 1 cm, sparsely glandular hairy and hirsute or glabrous; seeds yellowish brown, slightly compressed, oblong or ovoid, 3.5–4 mm, smooth. Fl. Apr–May, fr. May–Jun.

• Forests, scrub; 500–1600(–2300) m. SW Anhui, SE Gansu, Hebei, Henan, W Hubei, S Shaanxi, S Shanxi, Sichuan, NW Zhejiang.

**25. *Lonicera subhispida*** Nakai, J. Coll. Sci. Imp. Univ. Tokyo 42(2): 92. 1921.

单花忍冬 *dan hua ren dong*

*Lonicera monantha* Nakai.

Shrubs, deciduous, 1–2 m tall. Winter buds with several pairs of scales, inner ones accrescent and orbicular-ovate. Branches glandular and slightly setose or subglabrous. Petiole 3–7 mm; leaf blade oblong to ovate, 4–7 × 2.2–5 cm, both surfaces adpressed hispid and sparsely setose, base rounded to cuneate, margin bristly ciliate, apex mucronate or acute. Inflorescence reduced to a single flower or sometimes with a second flower partially developed, axillary at base of new shoots; flowers opening early in season; peduncle 0.5–1.2 mm at anthesis, accrescent to 25 mm in fruit, sparsely spreading glandular hairy; bract usually 1, sometimes with an opposite reduced bract, ovate-lanceolate, 7–14 mm, stiffly hairy and glandular hairy; bracteoles absent. Ovary with sparse glands. Calyx 0.3–0.5 mm, margin truncate to toothed. Corolla yellow, funnel-form, 1.5–2 cm; tube gibbous toward base; lobes regular, to 1/2 as long as tube, outside hairy and sparsely glandular. Stamens and style glabrous, subequaling corolla. Berry red, fusiform or ellipsoid, 8–14 mm, glabrous; seeds 3.5–4 mm. Fl. May, fr. Jun.

Forests; ca. 800 m. Jilin, ?Liaoning [Korea, Russia].

**26. *Lonicera humilis*** Karelin & Kirilov, Bull. Soc. Imp. Naturalistes Moscou 15: 370. 1842.

矮小忍冬 *ai xiao ren dong*

*Caprifolium altmannii* (Regel & Schmalhausen) Kuntze; *C. humile* (Karelin & Kirilov) Kuntze; *Lonicera altmannii* Regel & Schmalhausen; *L. cinerea* Pojarkova.

Shrubs, deciduous, to 2 m tall, sometimes dwarf and cushionlike. Winter buds with several pairs of scales, lowest pair nearly surrounding whole bud. Branches with persistent petiole bases, densely puberulent, later glabrous to densely setose-hairy and with mixed glandular hairs. Petiole 1.5–5 mm; leaf blade ovate or elliptic to oblong, 0.6–4.5 × 0.4–2.5 cm, both surfaces densely adpressed setose to glabrous, sometimes scattered verrucose and with mixed glandular hairs, base broadly cuneate to rounded, margin often ciliate, apex obtuse or acute to acuminate. Inflorescences axillary paired flowers and at base of new shoots; flowers opening early in season; peduncles 2–15 mm, usually puberulent and glandular hairy; bracts usually lanceolate, sometimes ovate, 5–12 mm, pubescent, outside glandular hairy and adpressed hairy, inside glandular hairy, margin ciliate; bracteoles absent. Neighboring 2 ovaries free, glabrous or glandular hairy. Calyx ca. 1 mm, subtruncate to shallowly lobed, sometimes sparsely long ciliate. Corolla bilabiate, yellow, 1.5–2 cm; tube shallowly to deeply gibbous toward base, outside sparsely spreading hairy, inside puberulent; lower lip slightly recurved; upper lip 4-lobed to middle. Stamens and style subequaling corolla, exerted; style sparsely stiff hairy at base. Berries red, sometimes pruinose, ob-lanceolate-ovoid, 5–8 mm; seeds yellowish brown, oblong or ellipsoid, 2.5–3 mm, smooth. Fl. Apr–Jun, fr. Jul–Aug.

Subalpine or alpine rocky slopes and crevices of steep cliffs, scrub of forest understories, grassy slopes; 1000–2500 m. Xinjiang [Afghanistan, Kazakhstan, Kyrgyzstan, Tajikistan].

## 27–28. *Lonicera alpigena* species complex

Shrubs, deciduous, to 4 m tall. Winter buds with 2–5 pairs of outer scales; inner scales accrescent, enlarged and sometimes reflexed. Branches glabrous to densely hairy with mixed glandular hairs. Petiole 3–20 mm; leaf blade obovate or ovate-elliptic to ovate-lanceolate, 1.5–17 × 0.8–6 cm, with dense or sparse stiff hairs and sparse glands or glabrous, base cuneate to subcordate, margin ciliate, apex apiculate to long acuminate. Inflorescences axillary, paired flowers; peduncle 0.5–9 cm, usually thickened toward apex; bracts linear-subulate, to 10 mm, or sometimes minute or leaflike and ovate-lanceolate, to 15 mm; bracteoles separate or sometimes fused into a cupule, ovate to oblong, to 1 mm, ciliate. Neighboring 2 ovaries free to fused, glabrous or densely glandular hairy. Calyx lobes ovate to orbicular, to 1 mm, sometimes forming a collarlike emergence at base, apex irregularly lobed, sometimes glandular ciliate. Corolla bilabiate, purple-red, very rarely white or turning from white to yellow, 1–1.5 cm, outside sparsely pubescent and glandular hairy or glabrous; tube 4–7 mm, inside puberulent, deeply gibbous above slender base; upper lip erect, 4-lobed to 1/4; lower lip recurved. Stamens subequaling corolla; filaments and style hirsute on lower part or glabrous. Berries red or black, globose, ca. 1 cm in diam.; seeds ellipsoid, 5–6 mm, shallowly pitted to smooth. Fl. Apr–Jun, fr. Jun–Oct.

Needle-leaved and broad-leaved mixed forests, scrub, grassy slopes; 900–4000 m. Anhui, S Gansu, W Henan, Hubei, Jiangxi, S Ningxia, E Qinghai, S Shaanxi, Shanxi, Sichuan, Xinjiang, Xizang, NW Yunnan, Zhejiang [Afghanistan, Bhutan, India, Kashmir, Myanmar, Russia; Europe].

*Lonicera alpigena* Linnaeus occurs in Europe; further studies are necessary to better understand the relationships within this species complex in Europe and Asia.

The type specimen of *Lonicera jilongensis* P. S. Hsu & H. J. Wang (Acta Phytotax. Sin. 17(4): 76. 1979) has suffered extensive insect damage, but it seems to belong here.

丁香叶忍冬 *ding xiang ye ren dong*

Shrubs, deciduous, to 2 m tall. Winter buds with 2 pairs of ovate and apically long acute outer scales; inner scales accrescent, enlarged and reflexed. Branches subquadrangular; branches, petioles, and peduncles densely or sparsely glandular hairy. Petiole 1.5–2.5 cm; leaf blade broadly triangular-ovate to broadly rhombic-ovate, 2.5–5.3 × 2.5–5.3 cm, base broadly cuneate to truncate, apex cuspidate and mucronate or obtuse. Inflorescences axillary paired flowers; peduncle 7–10 mm; bracts subulate, to 1/2 as long as ovaries, glandular hairy; bracteoles fused into a cupule, 1/3–2/5 as long as ovaries, glandular ciliate. Neighboring 2 ovaries free, glabrous. Calyx cupular, inconspicuously dentate. Corolla bilabiate, yellowish, ca. 1.3 cm, outside sparsely puberulent and glandular hairy; tube ca. 0.7 cm, shallowly gibbous toward base, inside villous; lobes of upper lip ovate, lobed to ca. 1/3; lower lip reflexed. Stamens slightly exceeding corolla; filaments subequal, villous on lower part. Style slightly shorter than corolla, densely villous. Berries red, globose, ca. 6 mm in diam.; seeds brownish, suborbicular or ovoid-orbicular, slightly compressed, smooth, 3–4 mm. Fl. May, fr. Jul.

● Stony slopes; ca. 1200 m. Hebei (Neiqiu).

**30. *Lonicera modesta*** Rehder in Sargent, *Trees & Shrubs* 2: 49. 1907.

下江忍冬 *xia jiang ren dong*

*Lonicera graebneri* Rehder; *L. modesta* var. *lushanensis* Rehder.

Shrubs, deciduous, to 2 m tall. Winter buds with ca. 5 pairs of outer acute, keeled scales; inner scales sometimes accrescent and enlarged. Branches, petioles, and peduncles densely pubescent or glabrous. Petiole 2–5 mm; leaf blade elliptic to oblong, broadly ovate, obovate, or rhombic, 2–8 × 1.5–6 cm, abaxially pubescent, glabrous or sparsely pubescent only on veins, adaxially glabrous or pubescent often only on midvein and lateral veins, base cuneate to rounded, margin ciliate, apex obtuse, mucronate, or slightly emarginate. Inflorescences axillary, paired flowers; peduncle 1–7 mm; bracts subulate, 2–3 mm, ciliate; bracteoles fused into a cupule, ca. 1/3 as long as ovaries, ciliate, with sparse glands. Neighboring 2 ovaries half to completely fused. Calyx lobes linear-lanceolate, 2–2.5 mm, ciliate, sometimes with sparse glands. Corolla bilabiate, white, base reddish, later yellow, 1–1.2 cm, outside sparsely pubescent or subglabrous; tube ca. 5 mm, shallowly gibbous at base, inside densely hairy; upper lip 4-lobed, lobes 2–3 mm; lower lip recurved. Stamens and style exerted from corolla tube; filaments glabrous or hairy at base. Style hairy throughout. Berries turning from orange-red to red, 7–8 mm in diam.; seeds 1–4, yellowish brown, slightly compressed, ovoid or oblong, 4–6 mm, minutely granular-raised and coarse. Fl. May–Jun, fr. Jul–Oct.

● Mixed forests, scrub; 500–1700 m. Anhui, ?Fujian, SE Gansu, W Henan, Hubei, Hunan, Jiangxi, S Shaanxi, Zhejiang.

### 31–33. *Lonicera nigra* species complex

Shrubs, deciduous, to 4 m tall. Winter buds with several pairs of outer acute, keeled scales; inner scales sometimes accrescent and enlarged. Branches with white or sometimes brown pith. Young branches and peduncles often puberulent and glandular hairy. Petiole 2–10 mm; leaf blade oblong to elliptic-lanceolate, 1.5–10 × 1–3 cm, glabrous throughout but abaxially often white hairy on midvein, base cuneate to rounded, apex acute to acuminate. Inflorescences axillary, paired flowers; peduncle 0.5–3 cm; bracts lanceolate-linear, ca. 2 mm; bracteoles free, fused into 2 pairs or into an entire or lobed cupule, 1/3 to almost as long as ovaries, glandular ciliate. Neighboring 2 ovaries free, fused in lower half or completely fused. Calyx lobes triangular or linear-lanceolate, 1–2 mm, sometimes with a collar emergence at base, glandular ciliate. Corolla bilabiate, purplish, purple-red, or white becoming yellow, 9–13 mm; tube ca. 5 mm, shallowly gibbous at base, outside puberulent or glabrous, inside puberulent; upper lip crenulate; lower lip reflexed. Stamens and style exerted from corolla tube; filaments glabrous or hairy at base. Style hairy below middle part or throughout. Berries black, often pruinose, globose, 5–7 mm in diam.; seeds oblong or ovoid, 3–7 mm, granular-raised and coarse. Fl. Apr–Jul, fr. Aug–Oct.  $2n = 18$ .

Forests, scrub, coniferous forests, forest margins, grasslands; 1500–4000 m. W Anhui, Gansu, NE Guizhou, W Henan, W Hubei, Jilin, Ningxia, Qinghai, Shaanxi, S Shanxi, Sichuan, Xizang, Yunnan [Bhutan, India, Korea, Nepal; Europe].

*Lonicera govaniana* Wallich ex Candolle (*Prodr.* 4: 337. 1830) and *L. orientalis* Lamarck (*Encycl.* 1: 731. 1785) belong to *L. caucasica* Pal-las (*Fl. Ross.* 1(1): 57. 1784). Further studies are necessary to determine if *L. caucasica*, predominantly from Asia Minor and S Asia, differs from *L. nigra* in Europe and China.

- 1a. Leaf blade usually obovate, 1–2.5 × 0.7–1.8 cm, abaxially often pruinose, apex retuse to obtuse; ovaries completely fused or sometimes free in upper part; corolla white with reddish base, later yellow ..... 33. *L. retusa*
- 1b. Leaf blade oblong to elliptic-lanceolate, 1.5–10 × 1–3 cm, glabrous throughout but abaxially often white hairy on midvein; ovaries free or fused only at base.
  - 2a. Corolla purplish or purple-red ..... 31. *L. nigra*
  - 2b. Corolla white, later yellow ..... 32. *L. nervosa*

**31. *Lonicera nigra*** Linnaeus, *Sp. Pl.* 1: 173. 1753.

金花忍冬 jin hua ren dong

Shrubs, deciduous, to 4 m tall. Winter buds ovoid-lanceolate, with several pairs of scales; outer scales triangular, sparsely puberulent; inner scales accrescent, lanceolate, densely pubescent and white long ciliate outside. Branches with pith becoming brown and later hollow. Branches and petioles spreading pubescent with interspersed minute glands. Petiole 4–10 mm; leaf blade ovate to rhombic or oblong to lanceolate, 3–10 × 1–5 cm, abaxially densely strigose to villous or sparsely pubescent, adaxially sparsely pubescent or subglabrous, base cuneate to rounded, margin ciliate, apex rounded or acute to acuminate or caudate. Inflorescences fragrant, axillary paired flowers; peduncle 1.5–3 cm; bracts linear or narrowly linear-lanceolate, 2.5–8 mm, often exceeding ovaries; bracteoles of each flower fused or separate, ovate to suborbicular, ca. 1 mm, long ciliate. Neighboring 2 ovaries free, ± glandular, glabrous or densely hairy. Calyx lobes ovate, with rounded apex, ciliate and glandular, sometimes with a collarlike emergence at base. Corolla bilabiate, white at first, later yellow, sometimes tinged orange-red, 1–1.5 cm, outside sparsely to densely hairy; tube 2–5 mm, pubescent inside, deeply or sometimes inconspicuously gibbous toward base; upper lip shallowly 4-lobed; lower lip re-

curved. Stamens and style exerted from corolla tube; filaments densely hairy below middle; connectives sometimes pubescent; style hairy throughout. Berries red, orbicular, ca. 5 mm in diam.; seeds brown-red, ellipsoid, ca. 3 mm, with minute concave dots and sometimes with red glands. Fl. May–Jun, fr. Jul–Sep.  $2n = 18$ .

Forests, scrub at forest margins; 200–3000(–3800) m. Anhui, Gansu, Guizhou, Hebei, S Heilongjiang, W Henan, Hubei, Jiangsu, Jiangxi, E Jilin, S Liaoning, S Nei Mongol, Ningxia, E Qinghai, Shaanxi, Shandong, Shanxi, Sichuan, Xizang, Yunnan, Zhejiang [Japan, N Korea, Mongolia, Russia; Europe].

*Lonicera chrysantha* is from the *L. xylosteum* species complex and is the only species in the complex occurring in China. *Lonicera xylosteum* Linnaeus occurs in Europe and Russia; further studies are necessary to better understand the relationships within this complex.

金银忍冬 jin yin ren dong

Shrubs, deciduous, to 6 m tall; trunk to 10 cm in diam. Winter buds ovoid, with several pairs of scales; outer scales tri-

angular, sparsely puberulent; inner scales accrescent, lanceolate, outside pubescent. Branches with pith becoming brown and later hollow. Branches and petioles spreading pubescent with interspersed minute glands. Petiole 2–9 mm; leaf blade green or purplish when young, usually ovate-lanceolate, 2.5–8 × 1.5–4 cm, abaxially sparsely strigose, adaxially sparsely pubescent or subglabrous, base broadly cuneate to rounded, margin ciliate, apex acute to long acuminate. Inflorescence fragrant, axillary paired flowers; peduncle 1–3 mm, shorter than petioles; bracts linear, sometimes leaflike, 3–7 mm; bracteoles of each flower ± fused, green or purplish, ca. 1 mm, apex truncate and ciliate. Neighboring 2 ovaries free, glabrous or sparsely minutely glandular hairy. Calyx campanulate, 2–3 mm, scarious between lobes; lobes broadly triangular, unequal, apex acute. Corolla bilabiate, purplish, or white at first, later yellow, ca. 2 cm, outside shortly adpressed hairy or glabrous; tube 4–5 mm, shallowly gibbous toward base, inside puberulent or glabrous; upper lip 4-lobed; lower lip recurved. Stamens and style exerted from corolla tube; filaments and style with minute hairs below middle. Berries dark red, orbicular, 5–6 mm in diam.; seeds with minute shallow concave dots. Fl. May–Jun, fr. Aug–Oct.  $2n = 18$ .

毛花忍冬 mao hua ren dong

Shrubs, deciduous, 3–5 m tall, occasionally prostrate. Winter buds with 5 or 6 pairs of scales; outer scales triangular, sparsely puberulent; inner scales sometimes accrescent, lanceolate, inside pubescent. Branches with pith becoming brown and later hollow. Branches horizontally spreading; together with petioles and peduncles densely or sparsely pubescent and minutely glandular hairy to subglabrous. Petiole 1–7 mm; leaf blade greatly varied in shape, obovate, ovate, oblong-elliptic, or ovate-lanceolate, 1–10 × 0.5–3.5 cm, both surfaces pubescent, abaxially densely pubescent or only on midvein, base rounded or broadly cuneate, rarely truncate or shallowly cordate, margin ciliate, apex obtuse and mucronate or acute to acuminate. Inflorescence axillary paired erect flowers; peduncle 1–10 mm; bracts linear-lanceolate, 3–5 mm, early withering; bracteoles suborbicular-ovate, ca. 2 mm, 1/3–1/2 as long as ovaries, ± fused at base and cupular, apex slightly truncate to lobed. Neighboring 2 ovaries free, glabrous. Calyx campanulate, 1.5–2(–4) mm, scarious, lacinate or split to base into 1 to several lobes; bracts, bracteoles, and calyx glabrous to sparsely pubescent and glandular. Corolla bilabiate, yellow, 1.2–1.5 cm, outside strigose and glandular hairy; tube ca. 4 mm, often shallowly gibbous toward base, inside densely puberulent; upper corolla lip shallowly 4-lobed; lower lip recurved, oblong, 8–11 mm. Stamens and style exerted from corolla tube; filaments inserted at throat of corolla, puberulent at base; style slightly curved, pubescent throughout; stigmas discoid, large. Berries turning from orange-yellow to yellow-red and red, globose, 6–8 mm in diam.; seeds ca. 1.5 mm, smooth. Fl. May–Jul, fr. Aug–Sep.

• Forests, forest margins, scrub; 2400–4600 m. S Gansu, ?Qinghai, S Shaanxi, W Sichuan, E and S Xizang, NW Yunnan.

Climbers. Branches becoming hollow. Branches, petioles, and peduncles covered with ± dense yellow-brown stiff curved

hairs, and with minute glandular hairs on young parts. Petiole 4–10 mm; leaf blade ovate to lanceolate, 5–14 × 2–5 cm, abaxially densely yellow-brown strigose with raised veins, adaxially glabrescent and densely hairy on midvein, veins slightly impressed adaxially, base rounded to subcordate, margin ciliate with ciliae to 1 mm, apex acute to caudate. Flowers paired in short or contracted racemes, racemes paniculate toward apex of branchlets with subulate involucre bracts; inflorescence peduncle to 7 cm; involucre bract filiform, 4–12 mm; peduncle of paired flowers 0–5 mm; bracts narrowly linear, 2–4 mm; bracteoles ovate, ca. 1 mm; bracts and bracteoles densely strigose. Neighboring 2 ovaries free, ca. 2 mm, densely strigose at least in upper half or glabrous. Calyx lobes lanceolate, to 2 mm. Corolla bilabiate, white at first, later yellow, 1.8–2.8 cm; tube 1.2–2.2 cm, outside strigose, inside hirsute, not gibbous at base; upper lip 4-lobed, lobes 2–3 mm; lower lip linear-oblong. Stamens longer or subequaling corolla; filaments sparsely hirsute on lower part. Style glabrous or hirsute in lower half. Berries black, ovoid-orbicular, ca. 8 mm in diam.; seeds ovoid and slightly compressed, ca. 3.5 mm, shallowly pitted. Fl. May–Jul, fr. Aug–Oct.

Sparse and dense forests, scrub; 600–2000 m. Fujian, Guangdong, Guangxi, Guizhou, Hunan, Jiangxi, Sichuan, Yunnan [India, N Thailand].

#### 47–51. *Lonicera macrantha* species complex

Climbers, semievergreen to deciduous. Branches solid, often becoming hollow. Branches, petioles, and peduncles with ± dense spreading, yellow-brown long stiff hairs and minute glandular hairs, grayish pubescent, yellow-brown velutinous, or sometimes glabrous. Petiole 3–15 mm; leaf blade ovate or oblong to lanceolate, 2–14 × 1–5 cm, abaxially hirsute mixed with short glandular hairs, pubescent, shortly white velutinous, glaucous with large sessile orange glands, or occasionally subglabrous, veins reticulate and raised, adaxially hirsute-hairy on veins and midvein, veins conspicuously impressed, sometimes wrinkled, base rounded to subcordate, occasionally broadly cuneate, margin ciliate and revolute, apex acute to acuminate, sometimes obtuse and mucronate. Flowers fragrant, paired and in racemes toward apex of branchlets, often paniculate with leaflike to subulate involucre bracts; peduncle 1–15 mm, sometimes to 40 mm in lower part of inflorescence; peduncle, bracts, bracteoles, and calyx lobes stiffly hairy and glandular hairy; bracts lanceolate to linear, 2–7 mm, occasionally leaflike to 14 mm; bracteoles orbicular-ovate, ca. 1 mm. Neighboring 2 ovaries free, ca. 2 mm, glabrous or sometimes sparsely to densely hirsute or with sessile glands. Calyx lobes lanceolate, 1–2 mm, ciliate. Corolla bilabiate, white, later yellow, (1.5–)3–7 cm, outside with spreading hairs and minute glandular hairs, glabrous, or strigose; tube (1–)2–5 cm, inside densely puberulent, not gibbous at base; upper lip 4-lobed, lobes ca. 5 mm; lower lip recurved. Stamens and style slightly exceeding corolla, glabrous or sometimes pubescent at base. Berries white or black, sometimes pruinose, 1 of paired ovaries sometimes aborting, globose or ellipsoid, 7–12 mm; seeds few, ovoid, compressed, 5–7 mm, shallowly pitted and furrowed. Fl. Mar–Jul, fr. Jul–Dec.

Forests of mountain valleys or slopes, scrub, riversides, stream-

sides, roadsides; 200–2900 m. S Anhui, Fujian, Gansu, Guangdong, Guangxi, Guizhou, Hainan, Hubei, Hunan, Jiangxi, Shaanxi, Shanxi, Sichuan, Taiwan, Xizang, Yunnan, Zhejiang [Bhutan, India, Japan, ?Kashmir, Myanmar, Nepal, N Vietnam].

Wang; *L. macranthoides* Handel-Mazzetti var. *heterotricha* (P. S. Hsu & H. J. Wang) B. K. Zhou; *L. omeiensis* (P. S. Hsu & H. J. Wang) B. K. Zhou; *L. similis* var. *delavayi* (Franchet) Rehder; *L. similis* var. *omeiensis* P. S. Hsu & H. J. Wang.

For description see under species complex. Distinguishing characters for this species are as follows: Stems with spreading, yellow-brown long stiff hairs and minute glandular hairs. Leaves abaxially white velutinous obscuring leaf surface, mixed with stiff hairs. Bracts sometimes leaflike, linear-lanceolate, 5–14 mm. Corolla sometimes less than 3 cm. Ovaries glabrous to sparsely hirsute. Berries black. Fl. May–Jun(–Jul), fr. Sep–Oct.

Streamsides in mountain valleys, scrub and forests on sunny mountain slopes; 400–1600(–2200) m. ?Anhui, S Fujian, S Gansu, Guangxi, Guizhou, W Hubei, W Hunan, ?Shaanxi, Shanxi, Sichuan, Yunnan, Zhejiang [Myanmar].

**49. *Lonicera confusa*** Candolle, Prodr. 4: 333. 1830.

水忍冬 shui ren dong

*Lonicera dasystyla* Rehder; *L. multiflora* Champion ex Benthams; *L. telfairii* Hooker & Arnott.

For description see under species complex. Distinguishing characters for this species are as follows: Stems grayish pubescent or glabrous. Leaves abaxially glabrous to pubescent without large sessile orange glands. Ovaries densely to sparsely hirsute or glabrous. Berries black. Fl. Mar–May, fr. Aug–Oct.

Mountain slopes, mixed forests, scrub, roadsides of plains, riversides; 300–800 m. Guangdong, Guangxi, Hainan, Yunnan [Nepal, N Vietnam].

**50. *Lonicera hypoglauca*** Miquel, Ann. Mus. Bot. Lugduno-Batavi 2: 270. 1866.

菰腺忍冬 gu xian ren dong

*Caprifolium hypoglaucum* (Miquel) Kuntze; *C. mollissimum* (Blume ex Maximowicz) Kuntze; *Lonicera affinis* Hooker & Arnott var. *hypoglauca* (Miquel) Rehder; *L. affinis* var. *mollissima* Blume ex Maximowicz; *L. affinis* var. *pubescens* Maximowicz; *L. hypoglauca* subsp. *nudiflora* P. S. Hsu & H. J. Wang; *L. rubropunctata* Hayata.

For description see under species complex. Distinguishing characters for this species are as follows: Stems grayish pubescent. Leaves abaxially glaucous with large sessile orange glands. Ovaries glabrous to sparsely hirsute. Berries black. Fl. Apr–May(–Jun), fr. Oct–Nov.

Scrub, sparse forests; 200–700(–1800) m. S Anhui, Fujian, Guangdong, Guangxi, Guizhou, SW Hubei, Hunan, Jiangxi, Sichuan, Taiwan, Yunnan, Zhejiang [Japan, ?Kashmir, ?Nepal].

**51. *Lonicera reticulata*** Champion, Hooker's J. Bot. Kew Gard. Misc. 4: 167. 1852.

皱叶忍冬 zhou ye ren dong

*Caprifolium reticulatum* (Champion) Kuntze; *Lonicera rhytidophylla* Handel-Mazzetti.

For description see under species complex. Distinguishing characters for this species are as follows: Stems yellow-brown velutinous. Leaves abaxially white-yellow velutinous with conspicuously raised veins. Berries black. Fl. Jun–Jul, fr. Oct–Nov.

• Scrub, forests; 400–1100 m. Fujian, Guangdong, NE Guangxi, ?Guizhou, S Hunan, SW Jiangxi.

**52. *Lonicera longiflora*** (Lindley) Candolle, Prodr. 4: 331. 1830.

长花忍冬 chang hua ren dong

*Caprifolium longiflorum* Lindley, Edwards's Bot. Reg. 15: t. 1232. 1829; *Lonicera longituba* H. T. Chang ex P. S. Hsu & H. J. Wang.

Climbers, subglabrous throughout but young branches and petioles sometimes slightly yellow-brown hairy. Branches solid or becoming hollow. Petiole 5–10 mm, interpetiolar line raised; leaf blade ovate or elliptic to lanceolate, 4–8.5 × 1.5–5 cm, leathery, venation pinnate or occasionally triplinerved, veins raised abaxially, base rounded to cuneate, apex acute to acuminate. Flowers paired, often clustered at apices of branchlets into lax racemes; peduncle 3–14 mm; bracts linear-lanceolate, 1–5 mm; bracteoles orbicular-ovate, ca. 1 mm, glabrous. Neighboring 2 ovaries free, oblong, ca. 3 mm, glabrous. Calyx lobes broadly triangular or lanceolate, to 1.5 mm, sometimes ciliate. Corolla bilabiate, white, later yellow, 5–9 cm, outside glabrous or with few scattered, spreading, long, glandular hairs or with stiff hairs; tube 3–6 cm, 2–3 mm in diam., inside pubescent, base not gibbous; upper lip 4-lobed to 2 mm; lower lip recurved to coiled. Stamens and style long exserted from corolla tube. Style hairy at base. Berries white to black. Fl. Mar–Sep, fr. Oct.

• Sparse forests, sunny places along roadsides on mountains; 1200–1700 m. Guangdong, Guangxi, Hainan, Yunnan.

**53. *Lonicera hildebrandiana*** Collett & Hemsley, J. Linn. Soc., Bot. 28: 64. 1891.

大果忍冬 da guo ren dong

*Lonicera braceana* Hemsley.

Climbers, evergreen to semievergreen, glabrous throughout. Branches solid, glabrous, sometimes with bristles. Winter buds with several pairs of broad, shortly acuminate scales. Petiole 1–2.5 cm; leaf blade elliptic to oblong, 7–15 × 4–7.5 cm, leathery, base broadly cuneate to rounded, sometimes slightly decurrent, apex acute to acuminate. Flowers fragrant, paired, axillary, toward apices of branchlets, sometimes shortly paniculate; peduncle 4–15 mm; bracts triangular, ca. 1.5 mm; bracteoles ovate-triangular, 0.5–1 mm. Neighboring 2 ovaries free. Calyx cupular; lobes triangular, 0.5–2 mm. Corolla bilabiate, white, becoming yellow and tinged with pink, 7.5–12 cm; tube 4.5–7 cm, ca. 4 mm in diam., not gibbous at base; upper lip 4-lobed, 2 lateral ones split to middle, middle ones only slightly lobed. Stamens and style exserted from corolla tube; filaments pubescent; anthers linear, 7–8 mm. Style and stamens shorter to equaling corolla, pubescent. Berries green, globose to pyriform, large, ca. 2.5 cm; seeds few, ca. 8 mm. Fl. Mar–Jul, fr. May–Aug.

Forests, scrub in moist places of forest margins; 1000–2300 m. Guangxi, Yunnan [Myanmar, Thailand].

A specimen of *Lonicera leiantha* Kurz was noted by Rehder (Rep. (Annual) Missouri Bot. Gard. 14: 163. 1903) as occurring in China: Yunnan, Poneshee, *D. J. Anderson s.n.* This specimen is not from the type location (Myanmar: Ava). It has no flowers and appears to be of *L. hildebrandiana*.

**54. *Lonicera bournei*** Hemsley, J. Linn. Soc., Bot. 23: 360. 1888.

西南忍冬 *xi nan ren dong*

*Caprifolium bournei* (Hemsley) Kuntze; *Lonicera obscura* Collett & Hemsley.

Climbers. Branches hollow. Branches, petioles, and peduncles densely yellow pubescent and sometimes glandular. Petiole 2–8 mm; leaf blade ovate to elliptic, 2–7.5 × 1.5–4 cm, leathery, both surfaces sometimes pubescent on midvein, veins raised abaxially, base rounded to cordate, apex acute to acuminate. Flowers fragrant, paired and axillary toward apices of branchlets, forming racemes; involucre bracts large, peduncle 1–10 mm; bracts, bracteoles, and calyx lobes pubescent; bracts lanceolate, 0.5–3 mm; bracteoles minute, orbicular-ovate. Neighboring 2 ovaries free, elliptic, ca. 2 mm, glabrous. Calyx cupular; lobes triangular, ca. 0.5 mm, apex acute. Corolla bilabiate, white, later yellow, 3–4.5 cm, outside glabrous to pubescent; tube narrowly funnelform, slightly curved, 2.5–4 cm, 1–2 mm in diam., not gibbous at base; upper lip 4-lobed, 2 lateral lobes split to middle, middle ones only slightly lobed. Stamens and style slightly exserted from corolla tube. Style sparsely puberulent. Berries red, globose, ca. 5 mm in diam. Fl. Feb–Apr, fr. May.

Forests; 800–2000 m. Guangxi, Yunnan [Myanmar].

**55. *Lonicera subaequalis*** Rehder, Rep. (Annual) Missouri Bot. Gard. 14: 172. 1903.

川黔忍冬 *chuan qian ren dong*

*Lonicera carnosifolia* C. Y. Wu ex P. S. Hsu & H. J. Wang.

Climbers. Branches solid or becoming hollow. Branchlets and leaves glabrous. Petiole 2–10 mm; leaf blade elliptic to oblong or obovate, 4.5–11 × 3–6 cm, abaxially glaucous, base attenuate and decurrent to petiole, opposite leaves sometimes slightly fused and perfoliate, margin cartilaginous, apex obtuse. Inflorescence sessile at apices of branchlets with an involucre bract of 1 pair of perfoliate leaves 4–6 cm across, apex acute; flowers sessile and verticillate, 6 per whorl; whorls 1 or 2 clustered into a capitulum; internode below involucre bract 3–6 cm; bracts minute; bracteoles suborbicular, ca. 1 mm, glandular hairy. Ovaries glabrous, sometimes glandular hairy at apex. Calyx lobes broadly ovate, ca. 1 mm, glandular and sometimes sparsely ciliate. Corolla yellow, sometimes red inside, funnel-form, 2–4 cm, outside with sparse long stiff hairs and glands, sometimes glabrous, inside puberulent; tube shallowly gibbous at base; lobes subregular, slightly unequal, ovate, 4–8 mm, apex rounded. Stamens inserted slightly below base of corolla lobes. Style exserted, glabrous to puberulent toward base. Berries red,

subglobose, ca. 7 mm in diam.; seeds whitish, ellipsoid, ca. 2 mm, pitted. Fl. May–Jun, fr. Jul–Oct.

• Shaded places in forests on mountain slopes; 1500–2500 m. Guizhou, Sichuan.

**56. *Lonicera yunnanensis*** Franchet, J. Bot. (Morot) 10: 310. 1896.

云南忍冬 *yun nan ren dong*

*Lonicera ciliatissima* C. Y. Wu ex P. S. Hsu & H. J. Wang; *L. mairei* H. Léveillé; *L. yunnanensis* var. *linearifolia* C. Y. Wu ex X. W. Li; *L. yunnanensis* var. *tenuis* Rehder.

Climbers. Branchlets glabrous, occasionally with long spreading stiff hairs. Branches solid or becoming hollow. Leaves elliptic to lanceolate or obovate, 2–10 × 1–5 cm, abaxially glaucous and glabrous or adpressed puberulent, occasionally strigose and glandular hairy, adaxially glabrous, base obtuse to rounded and decurrent to short petiole and sometimes slightly united with opposite leaf blade, margin cartilaginous, occasionally ciliate, apex obtuse and mucronulate. Inflorescence fragrant, shortly pedunculate at apices of branchlets with 1 or 2 involucre bracts of perfoliate leaves 2.5–9 cm across, apex acute to acuminate; flowers sessile and verticillate, 6 per whorl; whorls 1–3 clustered into a capitulum; internode below involucre bract 1–6 cm; bracts lanceolate, to 2 mm; bracteoles suborbicular, ca. 1 mm, glabrous. Ovaries glabrous or occasionally with long stiff hairs and minute glandular hairs. Calyx lobes triangular, minute, glabrous. Corolla bilabiate, white or yellow, 1.5–2.5 cm, outside glabrous to sparsely pubescent with minute glandular hairs; tube shallowly gibbous toward base, 10–20 mm, inside puberulent; upper lip shallowly 4-lobed; lower lip narrowly oblong. Stamens and style exserted. Berries red, black when mature. Fl. Apr–Jul, fr. Sep–Oct.

• Forests on mountain slopes, scrub; 1700–3000 m. SW Sichuan, NW Yunnan.

**57. *Lonicera tragophylla*** Hemsley, J. Linn. Soc., Bot. 23: 367. 1888.

盘叶忍冬 *pan ye ren dong*

*Caprifolium tragophyllum* (Hemsley) Kuntze; *Lonicera harmsii* Graebner.

Climbers, deciduous. Branches solid or becoming hollow. Branchlets glabrous. Leaves sessile or petiole to 3 mm; leaf blade elliptic to lanceolate or ovate, 4–12 × 2–3 cm, abaxially glaucous, shortly white hispid, sometimes with dense, stiff, yellow hairs on lower part of midvein, very rarely glabrous, adaxially glabrescent, midvein and margin sometimes purple-red-dish at base, base attenuate and decurrent to petiole, margin cartilaginous, apex obtuse or ± acute. Inflorescence at apices of branchlets, shortly pedunculate; peduncle 3–11 mm; involucre bract of 1 pair of perfoliate leaves 4–10 cm across, apex acute; flowers sessile and verticillate, 6 per whorl; whorls 2–4 clustered into a capitulum; internode below involucre bract 3–7 cm; bracts narrowly ovate, ca. 1 mm; bracteoles minute, glabrous. Ovaries pyriform, glabrous. Calyx lobes minute, triangu-

lar or ovate. Corolla bilabiate, yellow to orange-yellow, reddish outside in upper part, 5–9 cm, outside glabrous; tube not gibbous at base, 4–7 cm, inside sparsely puberulent; upper lip shallowly 4-lobed; lower lip narrowly oblong. Stamen and style exserted, glabrous. Style with swollen nectary at base. Berries turning from yellow to red-yellow when mature, eventually

deep red, subglobose, ca. 1 cm in diam.; seeds whitish, ellipsoid, ca. 2 mm, pitted. Fl. May–Jul, fr. Jul–Oct.

● Forests, scrub, rocky crevices at riversides; (700–)1000–2000(–3000) m. Anhui, S Gansu, N Guizhou, SW Hebei, NW Henan, Hubei, S Ningxia, Shaanxi, S Shanxi, Sichuan, Zhejiang.

# LINNAEACEAE

北极花科 bei ji hua ke

Yang Qiner (杨亲二)<sup>1</sup>; Sven Landrein<sup>2</sup>

Shrubs, erect or creeping. Leaves opposite, sometimes whorled, simple, estipulate, with an interpetiolar line. Inflorescence terminal or axillary; flowers in 3-flowered cymes, paired or single; bracts leaflike or reduced and located at base of ovary and forming an "epicalyx." Flowers bisexual,  $\pm$  zygomorphic. Perianth 4- or 5-merous. Corolla imbricate in bud; nectary consisting of  $\pm$  compact glandular hairs, inside corolla tube (nectaria trichomalialia). Stamens 4, alternating with corolla lobes; filaments adnate from 1/3–1/2 with corolla tube. Ovary inferior, 3- or 4-loculed, placentation axile; 1 or 2 locules with a single fertile ovule and 2 locules with numerous sterile ovules; style long, stigmas capitate. Fruit an achene crowned with persistent sepals (deciduous in *Linnaea*). Seeds 1 or 2; embryo small, straight; endosperm copious.

Seven genera and 19 species (including one cultivated hybrid): Afghanistan, China, India, Japan, Korea, Kyrgyzstan, Nepal, Pakistan, Russia, Uzbekistan, and in Europe and North America; six genera (two endemic) and 15 species (eight endemic, one cultivated hybrid) in China.

Hu Jia-qi. 1988. Caprifoliaceae (Linnaeaceae, excluding *Heptacodium* and *Symphoricarpos*). In: Hsu Ping-sheng, ed., Fl. Reipubl. Popularis Sin. 72: 112–131.

- 1a. Petioles of opposite leaf pairs dilated and connate at base, enclosing axillary buds; corolla hypocrateriform, with a cylindrical tube and 4 or 5 spreading lobes; flowers in 3-flowered cymes or paired; stigmas green and mucilaginous ... 1. *Zabelia*
- 1b. Petioles of opposite leaf pairs not dilated, axillary buds exposed; corolla funnelform or bilabiate with 5 spreading lobes; flowers paired or single; stigmas white and not mucilaginous.
  - 2a. Two bracts accrescent and becoming winglike in fruit; ovary 4-locular with 2 fertile locules ..... 5. *Dipelta*
  - 2b. Bracts not winglike in fruit; ovary 3- or 4-locular with 1 or 2 fertile locules.
    - 3a. Evergreen, creeping subshrubs; two bracts shieldlike and covered with sticky glandular hairs; inflorescence reduced to 2 single flowers at apices of branchlets (those can look like paired flowers but have more bracts and internodes separating them) ..... 6. *Linnaea*
    - 3b. Erect shrubs; bracts and inflorescence not as above.
      - 4a. Bracts and bracteoles covered with bristles, accrescent and becoming spongy, woody and fused to ovaries in fruit ..... 4. *Kolkwitzia*
      - 4b. Bracts and bracteoles without bristles, small and non-acrescent in fruit.
        - 5a. Flowers terminal and paired (flowers opening simultaneously), sometimes 1–3(–8) due to supernumerary flowers axillary to bracteoles (more often so on repeat-bloom long shoots), spring flowering ..... 3. *Diabelia*
        - 5b. Flowers axillary, paniculate, single or paired (flowers opening consecutively), summer or autumn flowering ..... 2. *Abelia*

## 1. ZABELIA (Rehder) Makino, Makinoa 9: 175. 1948.

六道木属 liu dao mu shu

*Abelia* sect. *Zabelia* Rehder in Sargent, Pl. Wilson. 1: 124. 1911.

Shrubs, deciduous. Old branches often with 6 deep longitudinal grooves. Young branches often with retrorse stiff hairs. Leaves opposite, margin entire or dentate (or sometimes lobed on vigorous shoots), shortly petiolate, estipulate. Petioles of opposite leaf pairs dilated and connate at base, enclosing winter buds. Inflorescence a terminal congested thyrse of sessile cymes; cymes 1–3-flowered. Calyx of 4 or 5 sepals, persistent, spreading, narrowly oblong to elliptic. Corolla white, pale rose, or sometimes reddish, hypocrateriform and  $\pm$  zygomorphic, 4- or 5-lobed; corolla tube usually without distinct swelling at base, glandular inside. Stamens included, didynamous, inserted at base or middle of corolla tube; anthers yellow, introrse. Ovary usually 3-locular, 2 locules with 2 series of sterile ovules and 1 locule with a single fertile ovule; style filiform; stigmas green, capitate, mucilaginous. Fruit a leathery achene, oblong, crowned with persistent calyx lobes; seed subterete, testa membranous; endosperm fleshy.

Six species: Afghanistan, China, NW India, Japan, Korea, Kyrgyzstan, Nepal, Russia (Far East); three species (one endemic) in China.

This group was first published by Rehder (in Sargent, Pl. Wilson. 1: 118. 1911) as *Abelia* sect. *Zabelia*. It was described in honor of Zabel who was the first to delimit the genus *Abelia* into sections (Mitt. Deutsch. Dendrol. Ges. 2: 33. 1893). The phylogeny of this group was further studied by Makino and supported by the studies of Ikuse and Kurosawa (Notes on Sect. *Zabelia* Rehder of the genus *Abelia*, J. Jap. Bot. 29(4): 11. 1954), and later by Fukuoka (Phylogeny of the Tribe Linnaeaceae, Acta Phytotax. Geobot. 23: 82. 1968). The genus *Zabelia* was segregated from *Abelia* based on pollen, wood anatomy, inflorescence structure, and karyology (Makino, Makinoa 9: 175. 1948; cf. Hisauchi & Hara, J. Jap. Bot. 29: 143. 1954).

<sup>1</sup> Herbarium, South China Botanical Garden, Chinese Academy of Sciences, 723 Xingke Lu, Tianhe Qu, Guangzhou, Guangdong 510650, People's Republic of China.

<sup>2</sup> Herbarium, Royal Botanic Gardens, Kew, Richmond, Surrey TW9 3AE, United Kingdom.

- 1a. Calyx and corolla lobes 5; inflorescence a congested terminal thyrse of sessile cymes (cymes 1–3-flowered); bracts and bracteoles leaflike; sepals long ciliate in fruit ..... 1. *Z. triflora*
- 1b. Calyx and corolla lobes 4; inflorescence terminal of paired flowers (occasionally more due to supernumerary flowers axillary to bracteoles); bracts and bracteoles reduced; sepals not long ciliate in fruit (occasionally sparsely ciliate) ..... 2–3. *Z. biflora* species complex

**1. *Zabelia triflora*** (R. Brown ex Wallich) Makino, Makinoa 9: 175. 1948.

醉鱼草状六道木 *zui yu cao zhuang liu dao mu*

*Abelia triflora* R. Brown ex Wallich, Pl. Asiat. Rar. 1: 14. 1829; *A. angustifolia* Bureau ex Franchet; *A. buddleioides* W. W. Smith; *A. buddleioides* var. *divergens* W. W. Smith; *A. buddleioides* var. *intercedens* Handel-Mazzetti; *A. buddleioides* var. *stenantha* Handel-Mazzetti; *Zabelia buddleioides* (W. W. Smith) Hisauchi & H. Hara; *Z. buddleioides* var. *divergens* (W. W. Smith) Golubkova; *Z. buddleioides* var. *stenantha* (Handel-Mazzetti) Hisauchi & H. Hara; *Z. stenantha* (Handel-Mazzetti) Golubkova.

Shrubs, deciduous, 1–2 m tall. Young branches with retrorse stiff hairs, becoming glabrous. Petiole very short, to 2 mm, hispid. Leaf blade ovate to lanceolate, 15–70 × 5–20 mm, both surfaces glabrous but long hispid on margin and veins abaxially, base cuneate, margin entire to occasionally serrate or lobed, apex acute. Inflorescence a congested terminal thyrse of cymes (cymes 1–3-flowered); pedicels short or nearly absent. Bracts leaflike, lanceolate to obovate; bracteoles linear to subulate, ca. 4 mm, hispid. Calyx of 5 linear sepals, 4–10 × ca. 1 mm, ciliate with stiff hairs. Corolla white, sometimes tinged red, hypocrateriform, 10–20 mm, nearly twice as long as sepals; lobes 5, spreading, suborbicular; tube densely villous inside, with sparsely adpressed hairs outside. Stamens 4, didynamous, included; filaments short, hispid; anthers oblong. Ovary narrowly ovoid, hirsute; styles filiform, exceeding stamens; stigmas capitate. Achene terete, striate, crowned with 5 slightly enlarged and long ciliate persistent sepals. Fl. May, fr. Jun–Aug.

Forests, scrub, grasslands; 1800–3500 m. SW Sichuan, SE Xizang, NW Yunnan [Afghanistan, NW India, Nepal, Pakistan].

The Chinese specimens were previously named as *Abelia buddleioides* by W. W. Smith (Notes Roy. Bot. Gard. Edinburgh 9: 75. 1915–1916). The type specimen *Forrest 12636* from Yunnan is similar to the type of *A. triflora* var. *parvifolia* (Clarke) Hisauchi & H. Hara from Pakistan. Nevertheless, the group shows much variation in the size and shape of the leaves and sepals.

### 2–3. *Zabelia biflora* species complex

Shrubs deciduous, 2–3 m tall. Petiole 4–7 mm, sparsely hispid. Leaf blade narrowly ovate or obovate to lanceolate, 30–80 × 5–30 mm, abaxially glabrous but with stiff hairs on veins, adaxially sparsely pubescent when young, base cuneate to obtuse, margin entire or with 1–6 pairs of teeth, apex acute to long acuminate. Inflorescence terminal, of paired flowers (occasionally more due to supernumerary flowers axillary to bracteoles); flowers sessile but long pedunculate, peduncles often appearing ± fused; peduncles 0–12 mm; flowers with 3 bracts at base of each ovary; bracts 1–6 mm. Sepals 4, ovate-lanceolate or obovate. Corolla white sometimes tinged red abaxially, 4-lobed; lobes orbicular, 1/3 or 1/5 as long as tube; tube pubescent inside. Stamens 4, didynamous, included. Ovary to 8

mm, with sparse, stiff hairs; styles long, equaling corolla, slender; stigmas capitate, not exerted from corolla tube. Achene 1–1.5 cm, crowned with 4 persistent and slightly enlarged sepals. Fl. Apr–Jun, fr. Aug–Sep.

Scrub, forests, grasslands; 800–3700 m. Anhui, Fujian, SE Gansu, Guizhou, Hebei, Henan, Hubei, Hunan, Jiangxi, Liaoning, Nei Mongol, S Ningxia, Shaanxi, Shanxi, Sichuan, Xizang, Yunnan, Zhejiang [Japan, Korea, Russia (Far East)].

The *Zabelia biflora* species complex was revised by Nakai (J. Jap. Bot. 13(8): 1–12. 1937) who distinguished 11 species. We currently recognize two species in China.

Most of the differences between taxa were based on the length of the peduncles, bracts, and bracteoles, which are highly variable. Classification of *Zabelia biflora* is complex and needs to be investigated.

- 1a. Distributed in NE China (Anhui, Hebei, Henan, Liaoning, Nei Mongol, Shanxi) ..... 2. *Z. biflora*
- 1b. Distributed in SW China (Anhui, Fujian, SE Gansu, Guizhou, Henan, Hubei, Jiangxi, S Ningxia, Shaanxi, Shanxi, Sichuan, Xizang, Yunnan, Zhejiang) ..... 3. *Z. dielsii*

## 2. *ABELIA* R. Brown in Abel, Narr. J. China, App. B, 376. 1818.

糯米条属 *nuo mi tiao shu*

Shrubs, deciduous or semi-evergreen. Winter buds exposed, ovoid-orbicular, small, with several pairs of scales. Leaves opposite, rarely 3- or 4-whorled, shortly petiolate with an interpetiolar line, estipulate. Leaf margin entire to dentate or crenate-serrate. Flowers axillary, paniculate, single or paired (flowers opening consecutively); paired flowers with 6 bracts (*Abelia chinensis*), single flowers with 4 bracts (*A. uniflora* and *A. forrestii*) at base of ovaries; bracts small and not accrescent. Sepals 2–5, spreading, narrowly oblong, elliptic, persistent. Corolla 5-lobed, funnelform or bilabiate, white, yellow, pink, or red. Corolla tube gibbous ventrally at base containing a nectary of dense glandular hairs (nectaria trichomalia). Stamens didynamous, adnate to corolla tube, included or exserted; anthers introrse. Ovary narrowly oblong, 3-locular, 2 locules with 2 series of sterile ovules, 1 locule with a single fertile ovule; style filiform; stigmas capitate, white and papillose. Fruit an oblong, leathery achene, crowned with persistent sepals. Seed subterete, testa membranous; endosperm fleshy.

Five species (including one cultivated hybrid): China, Japan; five species (three endemic, one cultivated hybrid) in China.

- 1a. Flowers paired, opening consecutively; paired ovaries with 6 bracts at base; sepals 5; corolla funnelform, 10–12 mm; stamens and style conspicuously exserted from corolla tube ..... 1. *A. chinensis*  
 1b. Flowers solitary; ovary with 4 bracts at base; sepals 2–5; corolla bilabiate (funnelform to slightly bilabiate in *A. ×grandiflora*), 20–50 mm; stamens and style not conspicuously exserted from corolla tube.  
 2a. Corolla ca. 20 mm; plants cultivated ..... 5. *A. ×grandiflora*  
 2b. Corolla 25–50 mm; plants wild.  
 3a. Sepals usually 2; corolla lower lip with reticulate orange markings ..... 3–4. *A. uniflora* species complex  
 3b. Sepals usually 5; corolla lower lip without any markings ..... 2. *A. forrestii*

**1. *Abelia chinensis*** R. Brown in Abel, Narr. J. China, App. B, 376. 1818.

糯米条 *nuo mi tiao*

*Abelia aschersoniana* (Graebner) Rehder; *A. cavaleriei* H. Lévillé; *A. chinensis* var. *ionandra* (Hayata) Masamune; *A. hanceana* M. Martens ex Hance; *A. ionandra* Hayata; *A. liponensis* M. T. An & G. Q. Gou; *A. rupestris* Lindley; *Linnaea aschersoniana* Graebner; *L. chinensis* (R. Brown) A. Braun & Vatke; *L. rupestris* (Lindley) A. Braun & Vatke.

Shrubs, deciduous to semi-evergreen, to 2 m tall, highly branched. Young branches slender and pubescent. Leaves opposite, sometimes in whorls of 3; leaf blade ovate, 2–5 × 1–3.5 cm, abaxially sparsely pubescent, densely white villous at base of midvein and lateral veins, base rounded or cordate, margin remotely crenate-serrate, apex acute to long acuminate. Inflorescence a large terminal panicle of paired flowers (flowers opening consecutively). Flowers fragrant, with 6 oblong or lanceolate bracts at base of paired ovaries. Calyx of 5 sepals, elliptic, 5–6 mm, turning red at fruiting stage. Corolla 5-lobed, white to pink, funnelform, 10–12 mm, ca. 2 × as long as sepals, outside pubescent and gibbous at base of tube. Stamens and style long exserted; filaments slender, equal in length, inserted at base of corolla tube. Ovary cylindric, slightly compressed, pubescent, longitudinally striate; stigmas capitate. Achene crowned with persistent and slightly enlarged sepals. Fl. Aug–Sep, fr. Oct–Nov.  $2n = 32$ .

Mountains; 200–1500 m. Fujian, Guangdong, Guangxi, Guizhou, ?Henan, Hubei, Hunan, ?Jiangsu, Jiangxi, Sichuan, Taiwan, Yunnan, Zhejiang [Japan].

This species is commonly cultivated in China.

**2. *Abelia forrestii*** (Diels) W. W. Smith, Notes Roy. Bot. Gard. Edinburgh 9: 76. 1916.

细瘦糯米条 *xi shou nuo mi tiao*

*Linnaea forrestii* Diels, Notes Roy. Bot. Gard. Edinburgh 5: 178. 1912; *Abelia gracilentia* W. W. Smith; *A. gracilentia* var. *microphylla* W. W. Smith; *A. microphylla* (W. W. Smith) Golubkova.

Shrubs, deciduous, to 2 m tall. Branches densely pubescent. Leaf blade narrowly elliptic to lanceolate, 3–7 × 1–2 cm, base obtuse, margin entire, apex acute. Flowers single and axillary, sometimes slightly paniculate; peduncles 3–4 mm; ovary with 4 linear bracts at base. Calyx reddish in fruit; sepals 5, oblanceolate, 6–8 × 1–2 mm, 3-veined, sparsely pubescent. Corolla white to rose, bilabiate, outside pubescent or glandular hairy, inside sparsely villous; tube to 45 mm, expanded in upper part, gibbous at base; lobes 5, orbicular, 4–5 mm; lip without any markings. Stamens 4; filaments ca. as long as corolla; anthers elliptic, to 2 mm. Style sparsely pubescent; stigmas capitate, slightly exserted. Achene to 7 mm, crowned with 5 persistent and enlarged sepals. Fl. May–Sep, fr. Oct.

• Sunny places, on mountain slopes, scrub; 1900–3300 m. SW Sichuan, NW Yunnan.

This is a rare species.

### 3–4. *Abelia uniflora* species complex

Shrubs deciduous, to 4 m tall. Branches pubescent, occasionally glabrous. Leaves highly variable in shape and size, ovate, orbicular, or lanceolate, 1–8 × 0.5–3.5 cm, abaxially densely white pubescent at base of midvein and lateral veins, adaxially sparsely pubescent, base cuneate, margin subentire or remotely serrate, apex obtuse to acuminate. Flowers single and axillary, sometimes slightly paniculate. Calyx of 2 oblong to elliptic sepals, 10–15 mm, ca. 1/3 as long as corolla tube. Corolla white to purplish pink, bilabiate, 25–50 mm, gibbous at base of tube, 5-lobed, outside pubescent, inside villous on lip; upper lip 2-lobed; lower lip 3-lobed, bearded and with reticu-

late orange markings. Stamens 4, didynamous; filaments partially adnate to corolla tube. Ovary pubescent, with 4 ovate to lanceolate bracts at base; style ca. as long as corolla tube; stigmas capitate. Achene 6–15 mm, pubescent, crowned with 2 persistent and slightly enlarged sepals. Fl. Apr–Jun, fr. Aug–Oct.

• Thickets, forests; 200–2000 m. Fujian, Gansu, Guangxi, Guizhou, Henan, Hubei, Hunan, Shaanxi, Sichuan, Yunnan.

This species shows variation in leaf and sepal shape, ovary length, and corolla size. In the past, many species have been recognized as separate. A specimen collected in Guizhou (Simmons *et al.* 288) has been identified to show introgression from *Abelia chinensis*. This phenomenon, as well as possible polyploidy, renders the infraspecific classification of *A. uniflora* very unreliable.

- 1a. Leaves shortly acuminate; sepals with rounded apex ..... 3. *A. uniflora*  
 1b. Leaves long acuminate with asymmetrical apex; sepals with acute apex ..... 4. *A. macrotera*

3. *Abelia uniflora* R. Brown in Wallich, Pl. Asiat. Rar. 1. 15. 1830.

蓮梗花 tong geng hua

*Abelia engleriana* (Graebner) Rehder; *A. longituba* Rehder; *A. mairei* H. Léveillé; *A. myrtilloides* Rehder; *A. parvifolia* Hemsley; *A. schischkinii* Golubkova; *A. schumannii* (Graebner) Rehder; *A. tereticalyx* (Graebner & Buchwald) Rehder; *A. verticillata* H. Léveillé; *Linnaea engleriana* Graebner; *L. koehneana* Graebner; *L. parvifolia* (Hemsley) Graebner; *L. schumannii* Graebner; *L. tereticalyx* Graebner & Buchwald; *Strobilanthes hypericifolia* H. Léveillé.

For description see under species complex. Distinguishing characters for this species are as follows: Leaves shortly acuminate. Sepals with rounded apex. Fl. Apr–Jun, fr. Aug–Oct.

• Thickets, forests; 200–2000 m. Fujian, Gansu, Guangxi, Guizhou, Henan, Hubei, Hunan, Shaanxi, Sichuan, Yunnan.

The holotype of *Abelia uniflora* is held in Cambridge University Herbarium (CGE) and the name was validly published by R. Brown within the description of *Zabelia triflora*.

4. *Abelia macrotera* (Graebner & Buchwald) Rehder in Sargent, Pl. Wilson. 1: 126. 1911.

二翅糯米条 er chi nuo mi tiao

*Linnaea macrotera* Graebner & Buchwald, Bot. Jahrb. Syst. 29: 131. 1900; *Abelia deutzifolia* (H. Léveillé) H. Léveillé; *A. graebneriana* Rehder; *A. graebneriana* var. *deutzifolia* (H. Léveillé) Lauener; *Strobilanthes deutzifolia* H. Léveillé.

For description see under species complex. Distinguishing characters for this species are as follows: Leaves long acuminate with asymmetrical apex. Sepals with acute apex. Fl. Apr–Jun, fr. Aug–Oct.

• Thickets, forests; 200–2000 m. Guangxi, Guizhou, Henan, Hubei, Hunan, Shaanxi, Sichuan, Yunnan.

5. *Abelia* × *grandiflora* (Rovelli ex André) Rehder, Cycl. Amer. Hort. 1: 1. 1900.

大花糯米条 da hua nuo mi tiao

*Abelia rupestris* Lindley f. *grandiflora* Rovelli ex André, Rev. Hort. 58: 488. 1886.

Shrubs, semi-evergreen, 1–1.5 m tall. Branches pubescent. Leaves sometimes whorled on vigorous shoots (3- or 4-whorled). Leaves adaxially glossy green, sometimes coppery tinged, ovate, to 4.5 cm, glabrous or with tuft of hairs on veins abaxially, base cuneate, margin remotely serrate with unequal teeth, apex acute. Flowers single and axillary, paniculate; peduncle 2–4 mm; flower with 4 bracts at base of ovary. Calyx with sepals varying from 2–5, reddish, often partly united, lanceolate, apex acute. Corolla white, sometimes tinged with pink, funnelform to slightly bilabiate, gibbous at base, ca. 20 mm, slightly fragrant, hirsute bearded with long hairs on lower lip. Stamens nearly as long as corolla tube; filaments partially adnate to corolla, generally inserted but sometimes slightly protruding, glabrous. Ovary 2–8 mm, slender, minutely pilose; style slightly exserted, 17–18 mm, glabrous; stigmas capitate. Achene 8–10 mm, slender, sparsely pilose or glabrous, with persistent sepals at apex. Fl. Jun–Oct, fr. Sep–Nov.

Cultivated in China [cultivated in Africa, the Americas, and Europe].

*Abelia* × *grandiflora* is a cultivated hybrid between *A. uniflora* and *A. chinensis*. It is commonly cultivated in the Americas, Africa, and Europe but less so in China.

### 3. DIABELIA Landrein, Phytotaxa 3: 35. 2010.

双六道木属 shuang liu dao mu shu

*Linnaea* [unranked] *Serratae* Graebner, Bot. Jahrb. Syst. 29: 127. 1900.

Shrubs, deciduous. Winter buds exposed, with several pairs of scales. Branches without grooves. Leaves opposite, shortly petiolate with an interpetiolar line, estipulate. Leaf margin entire to serrate, often undulate. Flowers terminal and paired at ends of short shoots (flowers opening simultaneously); flowers sometimes 1–3(–8) due to supernumerary flowers axillary to bracteoles (more often so on repeat-bloom long shoots); paired flowers with 6 bracts at base of ovaries, bracts small and not accrescent. Sepals 2–5, spreading, narrowly oblong, elliptic, persistent and ± accrescent in fruit. Corolla 5-lobed, bilabiate, white, yellow, pink, or red. Corolla tube gibbous ventrally at base and containing a nectary of dense glandular hairs sometimes clavate and free (nectaria tri-chomalial). Stamens didynamous, adnate to corolla tube, included or exserted; anthers introrse. Ovary narrowly oblong, 3-locular, 2 locules with 2 series of sterile ovules, 1 locule with a single fertile ovule; style filiform; stigmas capitate, white and papillose. Fruit an oblong, leathery achene, crowned with persistent sepals. Seed subterete, testa membranous; endosperm fleshy.

Three species: China, Japan; two species in China.

- 1a. Sepals usually 2; nectary not clavate and free at apex ..... 1. *D. serrata*  
 1b. Sepals usually 5; nectary clavate and free at apex ..... 2. *D. spathulata*

**1. *Diabelia serrata*** (Siebold & Zuccarini) Landrein, Phytotaxa 3: 37. 2010.

黄花双六道木 huang hua shuang liu dao mu

*Abelia serrata* Siebold & Zuccarini, Fl. Jap. 1: 76. 1835.

Shrubs, deciduous, to 3 m tall. Branches pubescent. Leaf blade ovate, ca.  $5 \times 2.5$  cm, both surfaces sparsely pubescent, more densely so on veins, base cuneate, margin entire or remotely serrate, ciliate, apex acute to acuminate. Flowers paired, terminal; ovaries with 6 bracts at base; peduncle 2–3 mm; bracts lanceolate, 2–3 mm. Calyx of usually 2 oblong sepals, ca.  $10 \times 6$  mm, apex sometimes lobed. Corolla bilabiate, yellow or yellow-green, with orange markings on lower lip; tube ca. 18 mm, inside villous. Stamens 4, didynamous, partially adnate to corolla tube, slightly exserted. Ovary 8–10 mm, pubescent; style filiform, slightly exceeding stamens; stigmas capitate. Achene crowned with usually 2 slightly accrescent sepals. Fl. May, fr. Sep.

Forests; ca. 900 m. Zhejiang (Yongjia) [Japan].

**2. *Diabelia spathulata*** (Siebold & Zuccarini) Landrein, Phytotaxa 3: 37. 2010.

温州双六道木 wen zhou shuang liu dao mu

*Abelia spathulata* Siebold & Zuccarini, Fl. Jap. 1. 77. 1835.

Shrubs, deciduous, to 3 m tall. Branchlets glabrous. Petiole to 4 mm; leaf blade ovate, ca.  $6 \times 3$  cm, both surfaces sparsely pubescent, base rounded, margin entire to remotely serrate and undulate, apex acuminate to caudate. Flowers paired; ovaries with 6 bracts at base; peduncle 4–9 mm; bracts lanceolate, 2–3 mm. Calyx reddish; sepals usually 5, oblong-lanceolate. Corolla to 25 mm, bilabiate; upper lip 2-lobed; lower lip 3-lobed, pink or white tinged with yellow, villous inside and with orange markings on lower lip; tube constricted in middle. Nectary clavate and free at apex. Stamens 4, didynamous; filaments partially adnate to corolla tube. Style filiform, equaling corolla tube; stigmas capitate. Achene glabrous or sparsely pubescent, crowned with usually 5 persistent and slightly enlarged sepals. Fl. May, fr. Jun–Oct.

Forests; 700–900 m. Zhejiang (Wenzhou) [Japan].

#### 4. **KOLKWITZIA** Graebner, Bot. Jahrb. Syst. 29: 593. 1901.

蜡实属 wei shi shu

Shrubs, deciduous. Winter buds with several pairs of pubescent scales. Leaves opposite, shortly petiolate with an interpetiolar line, estipulate. Flowers paniculate, single or paired (flowers opening consecutively) in same inflorescence; paired flowers with 6 bracts, single flowers with 4 bracts at base of ovaries; ovaries each crowned with a long narrow beak; bracts densely hairy, adnate to ovaries, accrescent and becoming spongy, woody, and covered with stiff bristles in fruit. Calyx of 5 narrow, sparsely pubescent sepals. Corolla bilabiate, 5-lobed; lobes spreading. Stamens 4, didynamous, partially adnate to corolla tube. Ovary 3- or 4-locular, 2 locules with 2 series of sterile ovules, 1 or 2 locules with a single fertile ovule. Achenes single or in pairs embedded in accrescent bristly bracts, each crowned with persistent sepals.

• One species: China.

**1. *Kolkwitzia amabilis*** Graebner, Bot. Jahrb. Syst. 29: 593. 1901.

蜡实 wei shi

*Kolkwitzia amabilis* var. *calicina* Pampanini; *K. amabilis* var. *tomentosa* Pampanini.

Shrubs, erect, to 3 m tall. Branchlets hirsute, becoming glabrous. Petiole 1–2 mm; leaf blade elliptic to ovate,  $3\text{--}8 \times 1.5\text{--}2.5$  cm, both surfaces sparsely pubescent, densely spreading pubescent and ciliate on veins and margin, base rounded or broadly cuneate, margin entire, rarely shallowly dentate, apex acute to acuminate. Inflorescence paniculate; flowers single or paired (flowers opening consecutively) in same inflorescence;

peduncle 10–15 mm; bracts lanceolate, tightly adnate to base of ovary. Sepals 5, lanceolate, to 5 mm, pubescent. Corolla whitish, tinged pink, 15–25 mm, outside pubescent, base very narrow, abruptly enlarged above middle; lower lip 3-lobed, bearded, with orange reticulate markings; upper lip 2-lobed. Ovary bottle-shaped with a long neck; style pubescent; stigmas capitate, inserted. Achenes embedded in spongy, woody, and bristly bracts, apex elongated, crowned with persistent, non-acrescent sepals. Fl. May–Jun, fr. Aug–Sep.  $2n = 32^*$ .

• Mountain slopes, roadsides, scrub; 300–1300 m. Anhui, Gansu, ?Hebei, Henan, Hubei, Shaanxi, Shanxi.

This species is rare in the wild but widely cultivated.

#### 5. **DIPelta** Maximowicz, Bull. Acad. Imp. Sci. Saint-Pétersbourg 24: 50. 1877.

双盾木属 shuang dun mu shu

Shrubs, erect, deciduous. Winter buds with several pairs of scales. Leaves opposite, estipulate, shortly petiolate, slightly pubescent on veins and margin, margin entire or dentate at apex. Inflorescences of single flowers, paniculate; ovaries with 4 bracts at base; bracts unequal in size, larger 2 tightly adnate to ovary. Sepals 5, linear to lanceolate,  $\pm$  fused at base. Corolla bilabiate, distinctly nar-

rowed and gibbous at base; upper lip 2-lobed; lower lip 3-lobed. Stamens 4, didynamous, partially adnate to corolla tube, included. Ovary 4-locular, 2 locules with 2 series of sterile ovules, 2 locules each with a single fertile ovule; style slightly shorter than corolla. Fruit an achene with 2 accrescent, membranous, winglike bracts at base, crowned with persistent calyx.

- Three species: China.

- 1a. Sepals fused into a tube for at least 2/3 of their length; style villous ..... 3. *D. elegans*  
 1b. Sepals fused for less than 1/2 their length; style glabrous to sparsely hairy.  
 2a. Narrow part of corolla tube exerted from sepals; accrescent bracts often peltate, obscuring sepals at anthesis, calyx divided to base ..... 1. *D. floribunda*  
 2b. Narrow part of corolla tube not exerted from sepals; accrescent bracts reniform, not obscuring sepals at anthesis, calyx divided 1/2–2/3 ..... 2. *D. yunnanensis*

**1. *Dipelta floribunda*** Maximowicz, Bull. Acad. Imp. Sci. Saint-Petersbourg 24: 51. 1877.

双盾木 *shuang dun mu*

*Dipelta floribunda* var. *parviflora* Rehder.

Shrubs or small trees, to 6 m tall, deciduous. Branches glandular hairy, becoming glabrous. Petiole 6–14 mm; leaf blade ovate to lanceolate, 4–10 × 1.5–6 cm, midvein white pubescent, base cuneate or obtuse, margin entire, occasionally remotely 2- or 3-dentate at apex, apex acute or long acuminate. Peduncles to 10 mm; ovaries with 4 bracts tightly adnate to base; 2 outer bracts larger, peltate, obscuring sepals at anthesis, accrescent to 20 mm wide when mature, dry membranous, with conspicuous veins; 2 inner bracts smaller, unequal, one ovate, other smaller and narrowly elliptic. Calyx 5-lobed, glandular hairy; lobes linear, 5–7 mm. Corolla white to pink, bilabiate, narrowly cylindrical at base, flaring and campanulate in upper part, 25–40 mm; lower lip with reticulate orange-yellow markings. Ovary pubescent; style filiform, glabrous to sparsely hairy. Achene crowned with persistent calyx, enclosed within 2 accrescent, membranous, winglike, peltate bracts. Fl. Apr–Jul, fr. Aug–Sep.

- Mixed forests, scrub; 600–2200 m. Gansu, Guangxi, Hubei, Hunan, Shaanxi, Sichuan.

*Dipelta wenxianensis* Y. F. Wang & Lian (Acta Bot. Boreal.-Occid. Sin. 14(6): 91, f. 92. 1994; as seen in the illustration but type specimen not located) and a specimen collected in Gansu (Wenxian: Bikou, *D. E. Boufford* 37425) with peltate bracts, pilose style, calyx divided to base, and short corolla tube both show intermediate characters between *D. floribunda* and *D. yunnanensis*. It is not excluded that other intermediate specimens exist.

**2. *Dipelta yunnanensis*** Franchet, Rev. Hort. 63: 246. 1891.

云南双盾木 *yun nan shuang dun mu*

*Dipelta ventricosa* Hemsley; *D. yunnanensis* var. *brachycalyx* Handel-Mazzetti.

Shrubs, deciduous, to 4 m tall. Branches pubescent. Petiole to 5 mm; leaf blade elliptic to lanceolate, 5–10 × 2–4 cm, abaxially white villous on midvein, ciliate along margin, adaxially sparsely pubescent, base cuneate to rounded, margin entire or rarely remotely dentate, apex acuminate to long acuminate. Ovaries with 4 bracts; 2 outer bracts larger, reniform, accrescent in fruit and not obscuring calyx at anthesis; 2 inner bracts smaller, unequal, one ovate, other smaller and narrowly elliptic. Calyx 5-lobed, pubescent; lobes divided 1/2–2/3, spreading in fruit. Corolla white to dark pink, bilabiate, 20–40 mm, very short and narrowly tubular at base; lower lip pubescent with yellow-orange reticulate markings. Ovary pubescent; style inserted, glabrous. Achene ovoid with a short neck, pubescent. Achene crowned with persistent calyx, enclosed within 2 accrescent, membranous, winglike, and reniform bracts. Fl. May–Jul, fr. Jul–Nov.

- Mixed forests, scrub; 800–2400 m. Gansu, Guizhou, Hubei, Shaanxi, Sichuan, Yunnan.

**3. *Dipelta elegans*** Batalin, Trudy Imp. S.-Peterburgsk. Bot. Sada 14: 174. 1895.

优美双盾木 *you mei shuang dun mu*

Shrubs, deciduous, to 2 m tall. Leaf blade elliptic, 5–10 × 2–5 cm, glandular hairy, pubescent on veins and margin, base acute to rounded, margin entire or remotely dentate in upper 1/2, apex long acute to long acuminate. Ovaries with 4 bracts; 2 outer bracts larger, peltate, accrescent in fruit and not obscuring calyx at anthesis. Calyx tubular-campanulate, 5-lobed, sparsely hairy; lobes obtuse, ca. 1/3 as long as tube. Corolla bilabiate, densely pubescent, narrowly cylindric at base, flaring and campanulate in upper part; lower lip villous. Ovary pubescent; style pilose to sparsely pubescent; stigmas capitate. Achene with 2 very large persistent peltate bracts to 40 mm wide. Fl. May–Jun, fr. Sep.

- Broad-leaved forests; ca. 2000 m. Gansu, ?Shaanxi, Sichuan.

## 6. LINNAEA Linnaeus, Sp. Pl. 2: 631. 1753.

北极花属 *bei ji hua shu*

*Linneusia* Rafinesque; *Obolaria* Kuntze (1891), not Linnaeus (1753).

Subshrubs, creeping, evergreen. Branches ascending, slender. Leaves opposite, petiolate, estipulate. Inflorescences of 2 paired and nodding flowers at apices of short lateral branches; peduncles long, slender; ovary with 2 pairs of bracts at base; 2 outer bracts larger and shieldlike, covered with stipitate glandular hairs; 2 inner bracts minute; peduncles, ovaries, and sepals glandular hairy.

Sepals 5, deciduous. Corolla funnelform, 5-lobed, slightly bilabiate. Stamens 4, didynamous, inserted in corolla tube; anthers included. Ovary 3-locular, 2 locules with 2 series of sterile ovules, 1 locule with a single fertile ovule; style filiform; stigmas capitate. Fruit a 1-seeded achene.

One species: widely distributed in alpine and cold regions of the N Hemisphere.

**1. *Linnaea borealis*** Linnaeus, Sp. Pl. 2: 631. 1753.

北极花 bei ji hua

*Linnaea borealis* f. *arctica* Witrock.

Subshrubs, creeping, evergreen, 5–10 cm tall. Stem long, slender, sparsely shortly pubescent. Petiole 3–4 mm; leaf blade orbicular to obovate, abaxially glabrous, adaxially sparsely pubescent, margin with 1–3 pairs of rounded teeth. Flowers fra-

grant, nodding; main peduncles 60–70 mm; inflorescence bracts linear, shortly pubescent; inflorescence peduncles less than 10 mm. Sepals shortly pubescent, narrowly acute, deciduous in fruit. Corolla white to pink, to 10 mm; tube glabrous outside, pubescent inside. Stigmas capitate. Achenes nodding, yellow, orbicular. Fl. and fr. Jul–Aug.  $2n = 32$ .

Needle-leaved forests, on trunks, mossy rocks; 700–2300 m. Hebei, Heilongjiang, Jilin, ?Liaoning, Nei Mongol, Xinjiang [widely distributed in other parts of N temperate regions].

## MORINACEAE

刺参科 ci shen ke

Hong Deyuan (洪德元)<sup>1</sup>; Fred R. Barrie<sup>2</sup>

Herbs, perennial, caudexes usually covered with remnants of old leaf bases. Leaves opposite or verticillate; petioles often amplexicaul at base, forming a sheath. Flowers hermaphroditic, zygomorphic, in verticillasters or subcapitate to capitate heads. Involucel (epicalyx) of 4 fused bracteoles, with several to numerous spiny teeth or setae, 12-veined. Calyx fissured along ventral side, or 2-lipped. Corolla tubular; limb 5-lobed, scarcely to markedly 2-lipped. Stamens 4, all fertile, or 2 fertile plus 2 staminodes; anthers introrse, 2-celled, opening longitudinally. Ovary of 3 carpels, inferior, 1-locular, 6-veined, adnate to calyx tube; style 1, slender; stigma simple; ovules solitary, pendulous. Fruit an achene, enclosed in involucel and surmounted with persistent calyx.

Two genera and ca. 13 species: SE Europe to the Himalaya and SW China; two genera and ten species (four endemic) in China.

Hsing Chi-hua. 1986. *Morina*. In: Lu An-ming & Chen Shu-kun, eds., Fl. Reipubl. Popularis Sin. 73(1): 48–56.

- 1a. Fertile stamens 4; calyx limb oblique; fertile stems always coming from below rosettes; plants not thistlelike ..... 1. *Acanthocalyx*  
1b. Fertile stamens 2; calyx limb 2-lipped; fertile stems not from below rosettes; plants thistlelike ..... 2. *Morina*

### 1. ACANTHOCALYX (Candolle) Tieghem, Ann. Sci. Nat., Bot., sér. 9, 10: 199. 1909.

刺续断属 ci xu duan shu

*Morina* sect. *Acanthocalyx* Candolle, Prodr. 4: 645. 1830.

Taproots fleshy, branching. Caudexes short, woody, often covered with remnants of old leaf bases. Flowering stems emerging below rosettes, usually with 2 bilateral lines of hairs on internodes. Cauline leaves opposite; petioles joined, forming a sheath. Inflorescences subcapitate, often with 1 or more whorls of flowers below primary head; involucral bracts free, connate or sheathing at base; flowers sessile; involucels campanulate, very fragile and papery at anthesis, enlarging and becoming ± leathery in fruit, persistent, with several to numerous teeth. Calyx tubular, oblique at mouth, with a ventral fissure, often with 2 lateral and 3 posterior subspine teeth. Corolla tubular, somewhat swollen below limb, with 2 posterior and 3 anterior spreading lobes. Stamens 4, ± equal, inserted just below swollen part of corolla tube. Style equal to or exceeding corolla tube in length; stigma disk-shaped; ovary 1-loculed; ovule pendulous. Achenes smooth or rugose, apex somewhat cup-shaped.

Two species: Himalaya and the Hengduan Mountains; two species in China.

- 1a. Corolla pink or purple; leaf blade elliptic, lanceolate, or linear-lanceolate; calyx 7–15 mm ..... 1. *A. nepalensis*  
1b. Corolla white or yellowish white; leaf blade linear or linear-lanceolate; calyx 4–7 mm ..... 2. *A. alba*

**1. *Acanthocalyx nepalensis*** (D. Don) M. J. Cannon, Bull. Brit. Mus. (Nat. Hist.), Bot. 12(1): 12. 1984.

刺续断 ci xu duan

Fertile stems 1–3, 10–50 cm tall, sparsely pubescent above. Rosulate leaves lanceolate or linear-lanceolate, less frequently linear, 10–25 × 0.5–2.6 cm, both surfaces glabrous, base attenuate, sheathing, margins usually setose or spinose, apex acute to acuminate. Cauline leaves 2–4-paired, elliptic to linear-lanceolate, reduced above; lowermost pair often reduced, subovate or spatulate, spineless; uppermost pair densely spiny at base, overlapping but not sheathing. Inflorescence capitate, sometimes with 1 or 2 separate clusters of flowers below primary head; involucral bracts ovate, spinose, concave or folded; involucels sessile, tubular-campanulate, 8–10 mm, outside sparsely villous, apex truncate, villous, with 15 or more irregular spines. Calyx tubular, green below, purple above, or entirely purple, 7–15 mm; tube ca. 1/2 as long as total length of calyx; fissure large, edges villous and dentate-spiny; spines usually 5, irregularly arranged. Corolla pink or purple, slightly zygomorphic,

straight or slightly curved; tube 10–25 × 1.5–3 mm, villous; lobes 5, obcordate, 3–4 mm. Stamens 4, included; filaments sparsely villous, inserted at corolla throat. Style longer than stamens. Achenes columnar, 4–6 mm, glabrous or puberulent. Fl. Jun–Aug, fr. Jul–Sep.

Grassy slopes, alpine meadows; 2800–4200 m. W Sichuan, S and SE Xizang, N Yunnan [Bhutan, N India, Nepal].

Caudex covered with remnants of old leaf bases. Fertile

stems 1–3, 10–40 cm tall. Rosulate leaves linear or linear-lanceolate, 10–20 × 0.5–1 cm, both surfaces glabrous, base attenuate, margins entire. Leaves on flowering stems 2–4-paired, similar to rosulate leaves but shorter; petioles folded, sheathing; lowermost pair often much smaller, subovate, usually spineless, with sheaths nearly as long as or longer than blades; uppermost pair of leaves densely spiny and much broader at base. Inflorescences capitellate, sometimes with 1 or 2 separate flower clusters below primary head; involucre bracts ovate, spinose, concave or folded; involucels sessile, tubular-campanulate, 4–7 mm, apex truncate, villous, with 12–16 irregular spines. Calyx green, tubular, 5–8 mm; tube 1–2.5 mm; limb usually with 2 lateral and 3 posterior teeth, margins villous. Corolla white, yellowish, or yellowish green; tube markedly curved, 12–20 mm, densely puberulent above; limb 5-lobed; lobes obcordate, ca. 3 mm. Filaments inserted at corolla throat. Style longer than stamens. Achenes columnar, 4–6 mm, glabrous to densely puberulent. Fl. Jun–Aug, fr. Jul–Sep.

Subalpine or alpine meadows, forests; 2500–4100 m. SE Gansu (Tao He basin), S Qinghai, W Sichuan, SE Xizang, NW Yunnan [N India].

## 2. MORINA Linnaeus, Sp. Pl. 1: 28. 1753.

刺参属 ci shen shu

*Asaphes* Sprengel (1827), not Candolle (1825); *Cryptothladia* (Bunge) M. J. Cannon; *Morina* sect. *Cryptothladia* Bunge.

Roots usually thickened, branched. Caudex short, woody, usually covered with remnants of leaf bases. Leaves in whorls of 3 or 4(–6), rarely 2, opposite, linear to oblong-lanceolate, entire to pinnatifid, spinose. Inflorescence of several verticillasters, each subtended by a whorl of leaflike bracts. Flowers sessile or shortly pedicellate, enveloped in an involucre; involucels campanulate, with 8–16 spiny teeth, 2 significantly longer than others. Calyx tube oblique, campanulate; limb 2-lipped, lips 2- or 3-lobed or emarginate. Corolla tube elongate; limb spreading, 2-lipped; upper lip 2-lobed, lower one 3-lobed. Fertile stamens 2, inserted at corolla throat; staminodes 2, at base of corolla tube, cordate. Nectary 1, anterior, at base of corolla tube, 3-lobed. Ovary inferior, 1-loculed, enveloped in an involucre; style usually longer than stamens; stigma disklike; ovule single, pendulous. Achenes rugose, columnar, slightly or markedly obliquely truncate.

About ten species: from the Balkans to C Asia and E Himalaya; eight species (four endemic) in China.

Cannon and Cannon (Bull. Brit. Mus. (Nat. Hist.), Bot. 12(1): 1–35. 1984) treated *Cryptothladia* at the rank of genus, separating it from *Morina*. Hong (Novon 20: 418–419. 2010) has explained why this taxon would be better merged into the genus *Morina*.

Cannon and Cannon (loc. cit.: 18) stated that *Morina parviflora* Karelin & Kirilov (*Cryptothladia parviflora* (Karelin & Kirilov) M. J. Cannon) occurred on the border of Kazakhstan with China (Dzungarian Alatau). However, we have not seen any specimens that could be identified as this species.

- 1a. Involucral bracts connate, forming shallow cups; involucel teeth much shorter than tube (1/2 or less as long as tube) ..... 6. *M. polyphylla*
- 1b. Involucral bracts free; involucel teeth at least 2/3 as long as tube.
  - 2a. Leaves with petioles 4–8 cm; leaf margins spinose, rarely sinuate-dentate.
    - 3a. Involucral bracts acuminate at apex, spinose along whole margins; calyx lips 2-lobed, lobes lanceolate, 5–6 mm; middle and upper cauline leaves petiolate ..... 1. *M. chlorantha*
    - 3b. Involucral bracts acute or rounded at apex, spinose only at base; calyx emarginate; middle and upper cauline leaves sessile ..... 2. *M. bracteata*
  - 2b. Leaves sessile or subsessile; leaf margins mostly lobed, less frequently entire.
    - 4a. Leaves entire or slightly toothed; flowers in 20 or more closely packed whorls of 8–12 ..... 5. *M. ludlowii*
    - 4b. Leaves lobed; flowers in fewer, usually interrupted, whorls.
      - 5a. Corolla 2–3 cm, greatly exceeding calyx, obviously 5-lobed; staminodes inserted at middle part of corolla tube.
      - 5b. Involucral bracts broadly ovate or orbicular, ca. as long as wide (excluding pointed apex); calyx covered by involucral bracts ..... 7. *M. longifolia*

- 6b. Involucral bracts broadly ovate-lanceolate, much longer than wide; calyx exposed ..... 8. *M. coulteriana*  
 5b. Corolla less than 1 cm, almost hidden by calyx, weakly lobed with 2 or 4 major lobes;  
 staminodes inserted at base of corolla tube.  
 7a. Calyx lobes 4, ovate, apex rounded; leaves shallowly lobed ..... 3. *M. chinensis*  
 7b. Calyx lobes 4–6, narrowly ovate or ovate-lanceolate, apex usually spinose; leaves cleft  
 almost to midvein ..... 4. *M. kokonorica*

**1. *Morina chlorantha*** Diels, Notes Roy. Bot. Gard. Edinburgh 5: 208. 1912.

绿花刺参 lǜ huā cǐ shēn

*Cryptothladia chlorantha* (Diels) M. J. Cannon; *Morina chlorantha* var. *subintegra* Pax & K. Hoffmann ex H. Limpricht.

Caudexes robust, base covered with brown fibrous remnants of leaves. Stems 20–70 cm tall. Basal leaves rosulate; petiole 5–7 cm; blade lanceolate to ovate-lanceolate, 15–35 × 2–2.5 cm, base decurrent, apex acuminate, margin spinose, rarely sinuate-dentate, tooth margin spinose. Cauline leaves similar but smaller, in 2 or 3 whorls of 4, rarely opposite, gradually becoming sessile upward, glabrous. Inflorescence of 6–8 whorls, compact but separated after anthesis; each whorl with 4 involucral bracts, these narrowly ovate, 2.5–3 cm, glabrous, base densely spinose, margins spinose, apex acuminate; involucels tubular, 1.2–1.5 cm, stalked, outside pubescent, apex ca. 10-spinose. Calyx green, 8–10 mm, both sides pubescent, 2-lipped, each lip 2-lobed; lobes lanceolate, 5–6 mm, long ciliate, apex obtuse or 2-spinose at apex. Corolla green-yellow, slightly shorter than calyx, 7–9 mm, outside villous; limb 2-lipped; lobes 5. Stamens inserted at upper part of corolla tube; filaments short, villous; staminodes subsessile, inserted at base of corolla tube. Gynoecium included, slightly longer than stamens; stigma capitate, slightly compressed. Achenes purple-brown, oblong, ca. 5 mm, angular and furrowed, apex obliquely truncate. Fl. May–Aug, fr. Aug–Sep.

• Grassy slopes, forest margins; 2800–4000 m. W Sichuan, NW Yunnan (Lijiang, Zhongdian).

**2. *Morina bracteata*** C. Y. Cheng & H. B. Chen, Acta Phytotax. Sin. 29: 190. 1991.

宽苞刺参 kuan bao cǐ shēn

Roots elongate, branched. Caudexes short, covered with black-brown fibrous remnants of old leaves. Stems ca. 45 cm tall, glabrous below, villous above. Basal leaves rosulate; petiole 4–8 cm; leaf blade elliptic or obovate-elliptic, 9–12 × 2.5–3 cm, both surfaces glabrous, base attenuate to petiole, margin spinulose only at base, apex acute; cauline leaves similar, in whorls of 4, sessile or shortly petiolate. Inflorescence of 6 or 7 whorls, lower whorls often separate from each other, upper ones compact, each whorl with 4 involucral bracts; involucral bracts ovate, 2.5–3.5 cm, glabrous or white villous at base, spinulose only along lower margins, apex acute or rounded; involucels tubular-campanulate, 1–1.5 cm, white villous outside, apex with 10–12 spines; spines unequal in length, 6 or 7 longer, 2–3 mm. Calyx campanulate, ca. 9 mm, villous, 2-lobed; lobes 4.5–5 mm, apex emarginate, rounded. Corolla shorter than calyx, pale green, tubular, 5–6 mm, villous outside; limb slightly 2-lipped; lobes 5, subequal. Fertile stamens in-

serted at upper part of corolla tube; filaments short, barbate; staminodes inserted at base of corolla tube. Style slightly longer than stamens; stigma capitate. Achenes brown, obovoid-oblong, 6–6.5 × 3–3.5 mm, tuberculate-rugose, apex obliquely truncate. Fl. and fr. Aug.

• Slopes; ca. 3200 m. Sichuan (Butuo).

**3. *Morina chinensis*** Y. Y. Pai, Repert. Spec. Nov. Regni Veg. 44: 122. 1938.

刺参 cǐ shēn

*Cryptothladia chinensis* (Y. Y. Pai) M. J. Cannon; *Morina lorifolia* C. Y. Cheng & H. B. Chen.

Roots robust, usually unbranched. Caudexes short, simple or branched, covered with old, nearly complete leaf bases. Fertile stems 15–70 cm tall, glabrous and purple below, purplish and white villous above. Leaves on sterile stems 6–8, linear-lanceolate, 10–25 × 1–2 cm, glabrous, midvein marked, base decurrent and amplexicaul, apex acuminate, margin irregularly and shallowly lobed; lobes subtriangular, with 3–9 rigid spines. Cauline leaves in 2 or 3 whorls of 4–6 leaves, similar to those on sterile stems but shorter, 5–15 cm, gradually smaller upward, margins of lobes spinose. Inflorescence of 6–9 whorls of up to 20 flowers each, compact at anthesis but separated in fruit; involucral bracts 4, leaflike, narrowly ovate, 2.5–3.5 cm, margins densely spiny, apex acuminate; involucels hidden in involucral bracts, campanulate, 1–1.4 cm, sparsely villous outside, apex truncate, margin with 10 unequal spines to 6 mm. Calyx exerted ca. 3 mm above involucel, 2-lipped, 6–10 mm, each lip 2-lobed; lobes rounded, veins prominent, outside glabrous, inside lanate, base barbate. Corolla pale green, shorter than calyx, 6–7 mm; limb 2-lipped, upper lip 2-lobed, lower lip 3-lobed, sparsely villous. Stamens adnate to upper part of corolla tube; staminodes inserted at base of corolla tube; anthers included. Style slightly longer than stamens; stigma capitate. Achenes brown, oblong, 2–3 mm, rugose, apex obliquely truncate, with persistent calyx, hidden in involucels. Fl. Jul–Aug, fr. Sep.

• Alpine meadows with shrubs; 2800–4300 m. SE Gansu, Nei Mongol (Helan Shan), Qinghai, NW Sichuan, Xizang (Qamdo).

**4. *Morina kokonorica*** K. S. Hao, Repert. Spec. Nov. Regni Veg. 40: 215. 1936.

青海刺参 qīng hǎi cǐ shēn

*Cryptothladia kokonorica* (K. S. Hao) M. J. Cannon.

Roots robust, ca. 40 cm, up to 3 cm in diam., simple or remotely branched. Caudexes usually branched, covered with brown-black remnants of old leaves. Stems usually caespitose, 20–70 cm tall, simple or 2- or 3-branched, ridged and glabrous below, villous above. Leaves on sterile shoots 5 or 6, rosulate, linear-lanceolate, 7–20 × 1–1.5 cm, both surfaces glabrous, base

decurent into petiole, margin coarsely and irregularly pinnatifid, with triangular, spinose lobes, apex acuminate. Leaves on fertile stems similar, in 2 or 3 whorls of 4, narrowly lanceolate, base amplexicaul, smaller upward. Inflorescence of up to 8 whorls of 16–20 flowers, compact in bud, but separated after anthesis, each with 4 involucre bracts, these narrowly ovate, 2–3 cm, margin yellow spinose, apex acuminate; involucre campanulate, hidden in bracts, 1.2–1.5 cm, prominently veined, stalked, margin with more than 10 unequal spines up to 7 mm. Calyx cup-shaped, 8–15 mm, exserted ca. 3 mm above involucre bracts, outside glabrous, inside villous, base barbate, 2-segmented, each segment 2- or 3-lobed; lobes lanceolate, apex often spinose. Corolla pale green, 6–8 mm, included in calyx, outside glabrous; limb 2-lipped, 5-lobed. Stamens inserted at upper part of corolla tube; filaments short, villous; staminodes inserted at base of corolla tube, subsessile. Style included, slightly longer than stamens; stigma capitate. Achenes brown, columnar, 6–7 mm, smooth, angular, apex obliquely truncate. Fl. Jun–Aug, fr. Aug–Sep.

• Stony slopes, meadows, flood plains; 3000–4500 m. S Gansu, Qinghai, W Sichuan, E and S Xizang (west to Burang, north to Bainain, Sogxian).

**5. *Morina ludlowii*** (M. J. Cannon) D. Y. Hong, *Novon* 20: 418. 2010.

藏南刺参 zang nan ci shen

*Cryptothladia ludlowii* M. J. Cannon, *Bull. Brit. Mus. (Nat. Hist.)*, Bot. 12: 22. 1984.

Caudexes thickly covered with fibrous remnants of leaf bases. Stems up to 50 cm tall. Basal and lower cauline leaves in whorls of 3 or 4, narrowly elliptic, 5–9 × 1–2 cm, adaxially pubescent, connate basally, forming a loose sheath, margins entire or remotely toothed, ciliate, spinose; upper cauline leaves similar, uppermost whorl often barely connate. Inflorescence short initially, 2–3 cm, elongating rapidly, terete, or slightly grooved, densely covered with whitish, mostly retrorse hairs. Flowers in 20 or more closely packed whorls of 8–12; involucre bracts leaflike, regularly decussate, lowermost whorl similar to leaves but smaller, usually 3-lobed; lobes irregularly spinose-dentate, acute or cuspidate; central lobe larger, often reddish or deeply colored; involucre tubular-campanulate, 4–6 mm, ca. 2 mm wide at base, laminate, becoming larger and rigid in fruit, villous, often with stalked or sessile glands, 4–12-dentate, one tooth often larger. Calyx tube tubular-campanulate, 2.5–4 mm at anthesis; limb 2-fid; lobes shallowly divided; lobules rounded to apiculate, outside glabrous, inside villous and glandular. Corolla included, ± tubular, outside glabrous, 4-lobed; posterior lobe ± fimbriate; anterior lobe entire, exceeding posterior, inside hispid; lateral 2 lobes very small. Stamens inserted at middle part of corolla tube; filaments short, with a tuft of hairs below anthers; staminodes at base of corolla tube, shortly stalked. Style slightly shorter than corolla tube; stigma disk-shaped. Achenes subglobose, 3–5 mm, abaxially with a shallow furrow, apex slightly obliquely truncate, obtusely pointed, somewhat rugose. Fl. May–Aug, fr. Aug–Sep.

Thickets, stony hillsides; 3700–4300 m. S Xizang (Cona) [Bhutan, NE India].

**6. *Morina polyphylla*** Wallich ex Candolle, *Prodr.* 4: 644. 1830.

多叶刺参 duo ye ci shen

*Cryptothladia polyphylla* (Wallich ex Candolle) M. J. Cannon.

Roots ± lignified, up to 2 cm in diam. Caudexes thickly covered with brown fibrous remnants of old leaves, up to 3 cm in diam. Flowering stems to 50 cm tall, terete, or furrowed, glabrous below, white hairy above, often purple. Leaves on sterile shoots rosulate; petiole long and narrow; blade linear to linear-lanceolate, up to 40 × 1.5–4 cm, pinnatifid; segments usually 3–5-fid; lobules spinose apically, glabrous or sparsely pubescent; cauline leaves on flowering shoots in whorls of (3 or) 4–6, similar but smaller. Inflorescence 8–10 cm, compact, of many whorls; involucre bracts (3 or) 4–6 per whorl, connate basally, forming a cup-shaped structure, apex linear or linear-lanceolate, with lateral spines and tapering into a robust spine; involucre cylindric, 6–13 mm, toothed, usually pilose, rarely subglabrous, with many sessile and a few stalked glands, teeth usually 8–10, apex tapered to a terminal bristle or spine, 1 or 2 longer than others. Calyx tubular or campanulate, 7–12 mm; tube 4–5 mm, usually densely pilose and glandular inside; limb 2-lobed; lobes spreading, white or lavender, deeply divided, 4 lobules apically rounded or spinose. Corolla pink or white, ca. as long as involucre, subtubular; limb 4-lobed. Stamens inserted at middle of corolla tube; staminodes inserted at base of corolla tube. Style ca. as long as corolla tube; stigma disk-shaped. Achenes 4.8–5.5 × 2.8–3 mm, plano-convex, obliquely truncate, surmounted with persistent and enlarged calyx. Fl. May–Jul, fr. Aug–Sep.

Grassy slopes, alpine meadows, rarely forests; 2600–4700 m. S Xizang (Yadong) [Bhutan, N India (Sikkim), Nepal].

**7. *Morina longifolia*** Wallich ex Candolle, *Prodr.* 4: 644. 1830.

长叶刺参 chang ye ci shen

Caudexes often covered with fibrous remnants of old leaves. Stems up to 80 cm tall. Leaves on sterile shoots rosulate, rosulate leaves and lower cauline leaves with petioles fused, forming sheaths 2.5–4.5 cm; blade linear to linear-lanceolate, up to 40 × 4 cm, both surfaces glabrous, margin regularly lobed, each lobe with 4 or 5 spinose teeth; upper cauline leaves similar, smaller, usually 3 per whorl, sheaths up to 8 mm, or petioles barely connate. Flowering stems erect, to 90 cm, glabrous, slightly ridged to terete below, pubescent to villous above. Inflorescence of (4–) 7–9(–11) whorls, pedicellate or sessile; upper whorls confluent at anthesis, separating in fruit; involucre bracts broadly ovate to orbicular, bases markedly overlapping, adaxially sparsely hairy, abaxially villous, margin often with numerous short spiny teeth and ciliate, apex spinose; involucre tubular, 7–10 × 2.5–4 mm, glandular pubescent, spines 5–13. Flowers pedicellate. Calyx glabrous, or with short adpressed hairs on tips; lobes shallowly bifid; lobules rounded or rarely slightly apiculate; tube 4.5–6 × 2.5–4 mm at anthesis. Corolla white, becoming pink to deep red; tube 20–30 × 1–2 mm, with many glandular and a few simple hairs outside; limb 2-lipped; lobes of lower lip ± spreading, central lobe ca. 7 × 3 mm, upper lip ± spreading. Stamens inserted at throat of corolla; filaments 1–3 mm, with a tuft of hairs below anthers; stami-

nodes minute, inserted 2–3.5 mm below mouth of corolla under anterior lip. Style slightly longer than stamens; stigma disk-shaped. Achenes rugose on abaxial side, with a deep furrow and prominent longitudinal veins on adaxial side, apex slightly obliquely truncate and crenulate. Fl. Jun–Sep, fr. Sep–Oct.  $2n = 16, 34$ .

Grassy slopes, thickets; 3000–4300 m. S Xizang (Gyirong) [Bhutan, India, ?Nepal, Pakistan].

**8. *Morina coulteriana*** Royle, Ill. Bot. Himal. Mts. 1: 245. 1835.

黄花刺参 huang hua ci shen

Caudexes woody, often covered with remnants of old leaf bases. Sterile shoots dwarf; fertile shoots up to 1 m tall or more, ridged and glabrous below, sparsely villous and purple above. Leaves on sterile shoots rosulate, 20–25 × ca. 2.5 cm, glabrous, pinnatilobate, with spiny, simple or compound teeth; petioles fusing to form a deep sheath 8–15 mm; lower cauline leaves similar, in whorls of 3 or 4(or 5); upper cauline leaves also

similar but smaller. Inflorescence of 6–8 whorls of numerous flowers; lower 3–5 whorls separate, upper 3 or 4 confluent; involucre bracts 3 or 4 per whorl, broadly ovate-lanceolate, up to 8 × 2 cm, spiny, prominently net-veined, upper bracts smaller; involucels subcylindrical, villous, 4–9 × 2.5–4 mm, with 9–12 teeth. Calyx glabrous to villous, with a large tuft of hairs at base, tubular-campanulate, 3–6.5 × 2–4 mm; limb 2-lipped; lips deeply bifid, apex acute or apiculate, often spinose. Corolla yellow or greenish yellow; tube villous, 25–30 × 1–2 mm; limb 2-lipped; upper lip 2-lobed, lower one 3-lobed, median lobe of lower lip 5.5–10 × 3.5–6 mm. Stamens with filaments 2–3 mm, with a tuft of hairs below anthers; staminodes minute, cordiform. Style slightly longer than stamens; stigma disk-shaped. Achenes convex on adaxial side, rugose on abaxial side, with very deep longitudinal furrows. Fl. Jun–Aug, fr. Aug–Sep.

Grassy or shrubby slopes; 3000–3700 m. S Xinjiang, SE Xizang (Mainling) [Afghanistan, NW India, Kyrgyzstan, Pakistan, Tajikistan, Uzbekistan].

## DIPSACACEAE

川续断科 chuan xu duan ke

Hong Deyuan (洪德元)<sup>1</sup>, Ma Liming (马黎明)<sup>1</sup>; Fred R. Barrie<sup>2</sup>

Herbs, mostly perennial, less frequently annual or biennial, very rarely subshrubs. Leaves opposite, or sometimes whorled, simple, entire or toothed, pinnatifid to pinnatisect. Inflorescences of compact cymes forming a terminal, involucre head, or diffuse and paniculiform (*Triplostegia*). Flowers bisexual, nearly always subtended by 1 or 2 cupular, apically toothed or subtire involucre (epicalyx); receptacle hairy or naked. Calyx usually small, cupular, or 4- or 5-segmented, or with up to 10 teeth or setae. Corolla sympetalous, 5 (or 4)-lobed,  $\pm$  irregular. Stamens 4, rarely 2 or 3, inserted at summit of corolla tube; anthers 4-sporangiate, opening by longitudinal slits. Gynoecium of 2 carpels, but 1 carpel obsolete; ovary inferior, 1-loculed; ovule solitary, apical, pendulous; style slender; stigma entire or 2-fid. Fruit an achene, enclosed by involucre and crowned by persistent calyx.

Ten genera and ca. 250 species: Africa, Asia, Europe; four genera and 17 species (four endemic) in China.

He Shi-yuan, Hsing Chi-hua & Yin Tsu-tang. 1986. Dipsacaceae. In: Lu An-ming & Chen Shu-kun, eds., Fl. Reipubl. Popularis Sin. 73(1): 44–84.

- 1a. Inflorescence paniculiform ..... 1. *Triplostegia*
- 1b. Inflorescence a compact head.
  - 2a. Plants spiny; flowers uniform; involucre usually without an evident crown ..... 4. *Dipsacus*
  - 2b. Plants without spines; flowers usually dimorphic, corolla of marginal flowers larger and 2-lipped; involucre usually with a crown.
    - 3a. Leaves usually all basal; calyx segments 8 or more, plumose or setose, shedding ..... 2. *Pterocephalus*
    - 3b. Leaves mostly cauline; calyx segments 5, setose, persistent ..... 3. *Scabiosa*

### 1. TRIPLOSTEGIA Wallich ex Candolle, Prodr. 4: 642. 1830.

双参属 shuang shen shu

Herbs, perennial, erect. Taproots fusiform. Rhizomes horizontal. Basal leaves dense, rosulate; leaf blade serrate or pinnatifid; cauline leaves decussate, otherwise similar. Inflorescence paniculiform, flowers in remote, terminal, simple or compound dichasia, all parts densely white villous and glandular hairy; bracts linear; involucre 2, urceolate, outer involucre 4-lobed, outer surface glandular pubescent, inner involucre 8-ribbed. Flowers nearly actinomorphic. Calyx reduced, 4-lobed. Corolla tubular-funnelform, 5-lobed; lobes subequal, imbricate in bud. Stamens 4, equal in length, alternate with corolla lobes; anthers introrse, versatile. Style solitary; stigma capitate. Achenes enveloped in urceolate involucre. Seeds subglobose, acute at both ends, smooth, with 2 obscure angles; endosperm copious; embryo small.

Two species: from India and Nepal northward to Gansu, southward to Malaysia, and eastward to Taiwan; two species in China.

*Triplostegia pinifolia* H. Léveillé and *T. mairei* H. Léveillé have been identified respectively as *Sedum fastigiatum* J. D. Hooker & Thomson (Crassulaceae) and *Chrysosplenium macrophyllum* Oliver (Saxifragaceae) by L. A. Lauener (Notes Roy. Bot. Gard. Edinburgh 30: 284, 290. 1970).

- 1a. Corolla 3–5 mm; involucre hooked at apex; leaf blade ovate-lanceolate, petiolate ..... 1. *T. glandulifera*
- 1b. Corolla 7–12 mm; involucre not hooked at apex; leaf blade obovate to obovate-lanceolate, sessile ..... 2. *T. grandiflora*

**1. *Triplostegia glandulifera*** Wallich ex Candolle, Prodr. 4: 642. 1830.

双参 shuang shen

*Hoeckia aschersoniana* Engler & Graebner; *Triplostegia repens* Hemsley.

Herbs, perennial, erect, 15–40 cm tall. Taproots 2-forked, brown, nearly fusiform, 30–50  $\times$  2–3 mm, slightly fleshy. Rhizomes elongate, 4-angular, nodes 4–6, internodes 0.5–2 cm, nodes rooted. Stems angular, glabrous or sparsely puberulent, glandular hairy above. Leaves opposite, petiolate; petiole 1–3 cm; leaf blade obovate-lanceolate, 2–6  $\times$  1.5–4 cm, pinnatifid,

more deeply so at base, abaxially puberulent on veins, adaxially sparsely puberulent, ultimately glabrescent, margin irregularly lobed or serrate; upper leaves smaller, lobed, sessile. Inflorescences paniculiform; bracts 2–4 mm, midvein prominent, margin sparsely ciliate; pedicels ca. 1 mm; outer involucre 4-lobed; lobes lanceolate, 1.5–2 mm, abaxially densely covered with purple glandular hairs; inner involucre urceolate, ca. 1.5 mm, 8-ribbed, apex constricted into limb; limb 8-toothed or 8-dentate. Corolla white or rose, funnelform, 3–5 mm; lobes obtuse. Stamens slightly exserted; filaments ca. 5 mm; anthers white. Style slightly longer than stamens. Achenes enveloped by involucre; involucre 3–4 mm in fruit, glandular hairy, 4-lobed; lobes long acuminate, hooked. Fl. and fr. Jul–Oct.  $2n = 18$ .

Forests, grassy slopes, meadows, by streams; 1500–4000 m. Chongqing, SE Gansu (Xigu), Hubei (Enshi, Jianshi), Shaanxi (Yangxian), W Sichuan, Taiwan (Yushan), SE Xizang, NW Yunnan [Bhutan, India, Malaysia (peninsular), Myanmar, Nepal].

**2. *Triplostegia grandiflora*** Gagnepain, Bull. Soc. Bot. France 47: 333. 1901.

大花双参 da hua shuang shen

*Triplostegia delavayi* Franchet ex Diels.

Herbs, perennial, erect, 20–45 cm tall. Taproots often dichotomous, nearly fusiform, 30–40 × ca. 5 mm, slightly fleshy. Rhizomes short, nodes 2–4, internodes ca. 1 cm. Stems solitary, simple, slightly 4-angular, white villous, sometimes glandular hairy above. Leaves opposite, sessile, slightly amplexicaul, obovate to obovate-lanceolate, 3–8 cm, both surfaces villous, base cuneate, apex rounded, pinnatifid or pinnatilobate; terminal lobe

largest, all lobes serrate; upper leaves gradually smaller and becoming bractlike. Inflorescence branches elongate, densely white villous and glandular hairy; bracts leaflike to linear, 5–20 mm, 1-veined, white villous and glandular hairy, margin shallowly serrate or entire, apex obtuse; pedicels 2–3 mm; outer involucre 4-lobed; lobes lanceolate, 2–3 mm, densely covered with black glandular hairs, apex acute; inner involucre ovoid, 8-ribbed; limb 5-dentate, teeth acute at base, hirsute. Calyx reduced. Corolla whitish rose, funnelform, nearly actinomorphic, 1–1.2 cm, outside sparsely puberulent, 5-lobed; lobes ca. 1/3 as long as total length of corolla, apex obtuse. Stamens slightly exserted; anthers yellow, introrse. Ovary enveloped by urceolate involucre; style shorter than stamens; stigma capitate. Achenes enveloped in involucre; lobes not hooked. Fl. and fr. Jul–Oct.

Forests, forest margins, grassy slopes; 2000–3000 m. SW Sichuan, N Yunnan [Bhutan].

## 2. **PTEROCEPHALUS** Vaillant ex Adanson, Fam. Pl. 2: 152, 595. 1763.

翼首花属 yi shou hua shu

Herbs, perennial or annual, or sometimes subshrubs. Leaves basal, rosulate, entire, pinnatifid to pinnatisect. Capitula solitary, terminal; involucre of 2, rarely 3 whorls of 4–6 involucre bracts; receptacles covered with hirsute hairs or bracts; involucre 1, 4–8-ribbed, apex obscurely dentate, or corona-like, or membranous and dentate. Calyx segmented and 8–24-setose or pinnate. Corolla 4- or 5-lobed, that of central flowers nearly actinomorphic, that of marginal flowers nearly 2-lipped; upper lip with 1 lobe, entire or 2-lobed; lower lip usually 3-lobed. Stamens 4, rarely 2 or 3, inserted at upper part of corolla, exserted. Ovary inferior, enveloped by involucre. Achenes smooth or ribbed. Seeds with a large, straight embryo and scanty endosperm.

About 25 species: from the Mediterranean to C Asia and tropical Africa; two species (one endemic) in China.

- 1a. Leaves spatulate or linear-spatulate, entire or narrowly segmented; inflorescences globose in fruit; involucre bracts of outer layer narrowly ovate; persistent calyx segmented into 20 pinnate hairs; corolla 5-lobed, obovoid, 4–5 mm ..... 1. *P. hookeri*
- 1b. Leaves oblong-lanceolate or oblanceolate, pinnatifid to bipinnatisect; inflorescences compressed globose in fruit; involucre bracts of outer layer lanceolate; persistent calyx segmented into 8 brown setae; corolla 4-lobed ..... 2. *P. bretschnideri*

**1. *Pterocephalus hookeri*** (C. B. Clarke) E. Pritzel, Bot. Jahrb. Syst. 29: 601. 1901.

*Scabiosa hookeri* C. B. Clarke in J. D. Hooker, Fl. Brit. India 3: 218. 1881; *Pterocephalodes hookeri* (C. B. Clarke) V. Mayer & Ehrendorfer; *Pterocephalus batangensis* Pax ex K. Hoffmann.

Herbs, perennial, 10–50 cm tall, white villous throughout. Taproots robust, columnar, 8–15 × 1.5–3.5 cm, lignified. Leaves all basal, rosulate, oblanceolate, 5–18 × 1–2.5 cm, base attenuate into winged petiole, margin entire, remotely and coarsely serrate, or pinnatifid, apex obtuse or acute; segments in 3–5 pairs, obliquely ovate or lanceolate, 1–2 cm; terminal lobe larger, lanceolate, abaxially white, midvein conspicuous, adaxially green, white puberulent. Scapes 10–40 cm, 2–4 mm in diam., white villous, more densely so near inflorescences. Capitula solitary, terminal, erect or slightly pendulous, globose, 3–4 cm in diam.; involucre bracts 2- or 3-layered, narrowly ovate to ovate-lanceolate, 12–18 × 5–7 mm, pilose, margin ciliate, apex acute; bracts linear-oblanceolate, 1–1.2 cm, base clawed, densely white villous, midvein conspicuous; involucre tubular,

4–5 × ca. 1.5 mm, outside white hirsute, attenuate toward base, sinuate-dentate, apex slightly spreading. Calyx segmented to base into 20 soft pinnate hairs. Corolla yellowish white to pale purple, tubular-funnelform, 1–1.2 cm, outside rather densely villous, shallowly 5-lobed; lobes obtuse, ca. 3.5 mm. Stamens 4; anthers dark purple, ca. 3 mm. Ovary enveloped in involucre; style ca. 1.5 cm, strongly exserted; stigma pale brown, compressed globose. Achenes pale brown, obovoid, 3–5 mm, longitudinally 8-ribbed, sparsely adpressed hairy; pinnate hairs of persistent calyx ca. 1 cm, white. Fl. and fr. Jul–Oct.

Grassy slopes, meadows, by fields; 1800–4800 m. S Qinghai, W Sichuan, Xizang, N Yunnan [Bhutan, India, Nepal].

**2. *Pterocephalus bretschnideri*** (Batalin) Pritzel ex Diels, Bot. Jahrb. Syst. 29: 601. 1901.

裂叶翼首花 lie ye yi shou hua

Herbs, perennial, 8–40 cm tall. Taproots columnar, 3–20 mm in diam. Leaves basal, rosulate; petiole 3–10 cm; leaf blade

oblong to oblanceolate, 5–20 cm, pinnatifid to bipinnatisect; segments linear, both surfaces glabrous or puberulent. Scapes white puberulent, more densely so near inflorescence. Capitula solitary, terminal, oblate, 2.5–3 cm in diam.; involucre bracts 2-layered, 10–14, broadly linear, outside white puberulent; receptacles disklike, densely white hairy; bracts brown, linear-lanceolate, 4–6 mm, pubescent, apex acuminate; involucels ellipsoid-obovoid, 4–5 mm, 8-ribbed, densely white hirsute, membranous at apex, dentate. Calyx segmented into 8 brown setae, setae 1–1.2 cm, hispidulous above. Corolla pale rose to

purple-red, tubular, 12–15 mm; tube 7–10 mm, densely white villous; limb with 4 obtuse lobes, slightly 2-lipped; upper lip slightly larger, ca. 2.5 mm; 3 lobes of lower lip ca. 2 mm, with several brown veins. Stamens 4, inserted at upper part of corolla; filaments ca. 5 mm, obviously exserted. Stigma capitate. Achenes ellipsoid, ca. 4 mm, apex tapering into a rostrum, 8-veined, sparsely villous; persistent calyx 8-setose. Fl. Jul–Aug, fr. Sep–Oct.

● Mountainous rocky crevices, grassy slopes in forests; 1600–3400 m. W Sichuan, SE Xizang (Nangxian), N Yunnan.

### 3. *SCABIOSA* Linnaeus, Sp. Pl. 1: 98. 1753.

蓝盆花属 lan pen hua shu

*Asterocephalus* Zinn.

Herbs, biennial or perennial, sometimes subshrubs due to lignification at base, rarely annual. Leaves opposite; cauline leaves amplexicaul; leaf blade pinnatipartite or pinnatisect, rarely entire. Capitula terminal, oblate-globose, ovoid, or ovoid-conical, long pedunculate; involucre bracts leaflike, in 1 or 2 series; receptacles conical to semiglobose, sometimes columnar; bracts linear-lanceolate, 1-veined, back often carinate; involucel (epicalyx) 1, broadly funnelform or angular-columnar, 8-ribbed in fruit, furrowed in entire length, or furrowed only above and rounded at base, often fissured into 2–8 pits apically, top becoming a membranous, campanulate or rotate crown, 16–30-veined, margin dentate. Calyx stalked, disklike, 5-segmented into radial setae. Corolla usually dimorphic, tubular, blue, purple, purple-red, yellow, or white, 4- or 5-lobed; that of marginal ray flowers usually larger, 2-lipped; upper lip usually 2-lobed, shorter; lower lip 3-lobed, elongated and raylike; that of central flowers usually tubular; lobes subequal in length. Stamens 4, exserted. Ovary enveloped in involucels; style slender; stigma peltate or capitate. Achenes enveloped in involucels, crowned with persistent setose calyx. Seeds with a large, straight embryo and scanty endosperm.

About 100 species: S and W Africa, Asia, Europe, mainly in the Mediterranean; six species (one endemic) in China.

- 1a. Annuals; capitula ca. 5 mm in diam. at anthesis; calyx setae up to 1 cm ..... 3. *S. olivieri*
- 1b. Perennials; capitula over 30 mm in diam. at anthesis; calyx setae shorter.
  - 2a. Involucels subcylindrical, not angular below, furrowed or pitted above.
    - 3a. Basal leaf blades lanceolate or elliptic, entire ..... 1. *S. alpestris*
    - 3b. Basal leaf blades pinnatifid; leaf segments 1.5–3 mm wide ..... 2. *S. austroaltaica*
  - 2b. Involucels 8-ribbed, or with 4 obvious and 4 obscure ribs.
    - 4a. Corolla yellow; involucels obviously 8-ribbed ..... 4. *S. ochroleuca*
    - 4b. Corolla blue or purple; involucels 8-ribbed, but only 4 ribs marked, while others obscure.
      - 5a. Leaves pinnatifid to pinnatisect; segments linear or lanceolate ..... 5. *S. comosa*
      - 5b. Leaves linear-lanceolate, margins serrate or lacerate ..... 6. *S. lacerifolia*

1. *Scabiosa alpestris* Karelin & Kirilov, Bull. Soc. Imp. Naturalistes Moscou 15: 536. 1842.

高山蓝盆花 gao shan lan pen hua

*Trochocephalus alpestris* (Karelin & Kirilov) A. Löve & D. Löve.

Herbs, perennial. Caudexes lignified, 2–5-branched, outside brown-black. Stems 20–50 cm tall, nodes 2–4, usually pubescent, occasionally glabrous. Basal leaves and first pair of lower cauline leaves petiolate; petioles 5–7 cm; leaf blade lanceolate, 5–8 × 0.5–1.1 cm, glabrous or sparsely puberulent, base attenuate into petiole, margin usually entire, ciliate, hairs white, apex acuminate. Cauline leaves in 1–3 pairs, second and third pairs pinnatisect; lateral segments linear-lanceolate; terminal lobe larger, lanceolate, 4–7 × 0.6–0.8 cm; all segments pubescent below, margins ciliate. Peduncles ca. 10 cm; capitula 3–6 cm in diam. at anthesis, globose and ca. 3 cm in diam. in fruit; involucre bracts linear-lanceolate, 1.2–1.5 cm, densely white hirsute; involucels 8–10 mm, rounded and sparsely white pilose

below, with 8 pits above, crown membranous, 5–6 mm, 16–18-veined, margin sinuous-dentate. Calyx 5-setose, setae brown, radial, 1–3 mm, longer than crown. Corolla pale purple or purple-red, outside lanate; limb ± lipped, 5-lobed; lobes unequal in size. Anthers yellow. Style purple-red; stigma capitate, exserted. Fl. May–Aug, fr. Aug–Sep.

Alpine meadows; 3000–3200 m. Xinjiang (Huocheng, Wujia, Zhaosu) [Kazakhstan, Kyrgyzstan].

2. *Scabiosa austroaltaica* Bobrov in Schischkin & Bobrov, Fl. URSS 24: 457. 1957 [*"austro-altaica"*].

阿尔泰蓝盆花 a er tai lan pen hua

*Lomelosia austroaltaica* (Bobrov) Soják; *Scabiosa xjiangensis* Y. K. Yang, G. J. Liu & J. K. Wu.

Subshrubs, 20–60 cm tall. Caudexes robust, lignified, several branched. Stems erect, nodes 1–4, densely puberulent. Leaves mostly basal; basal leaves petiolate; petiole 1–2.5 cm; leaf blade oblong, 3–10 × 0.7–3 cm, pinnatifid; segments linear-

lanceolate, incised, pubescent. Cauline leaves smaller, 2- or 3-paired, sessile, sparsely puberulent,  $\pm$  setose at axils of veins, pinnatisect; segments lanceolate, 5–20  $\times$  1.5–3 mm. Capitula 2–3 cm in diam. at anthesis, globose and 1.5–2 cm in diam. in fruit; involucre bracts narrowly ovate, 1/3–1/2 as long as marginal ray flowers, sparsely puberulent, apex acuminate; bracts linear-lanceolate, upper 1/3 carinate, lower part linear, sparsely villous; involucels 3–4 mm, above with 8 pits, base densely white hirsute, crown 2–3 mm wide. Calyx 5-setose. Corolla blue-purple, outside adpressed puberulent. Fl. Jun–Jul, fr. Aug.

Grassy slopes; ca. 1200 m. Xinjiang [E Kazakhstan].

**3. *Scabiosa olivieri*** Coulter, Mém. Dipsac. 36. 1823.

小花藍盆花 xiao hua lan pen hua

*Lomelosia olivieri* (Coulter) Greuter & Burdet; *Scabiosa olivieri* var. *longinvolucra* Y. K. Yang, N. R. Cui & Y. Hazit; *Trochocephalus olivieri* (Coulter) A. Löve & D. Löve.

Herbs, annual, 10–38 cm tall. Taproots solitary, 40–50  $\times$  3–4 mm. Stems terete, slender, branched from base and dichotomous from lower middle part, white puberulent. Leaves opposite, sessile; leaf blade oblong or linear-lanceolate, 20–50  $\times$  3–10 mm, both surfaces densely villous, margin often entire, not segmented, or with 1 or 2 pairs of leaflets, sometimes pinnatifid. Peduncles 3–10 cm, slender, sparsely villous; capitula globose, 3–5 mm in diam. at anthesis, flowers 5–15, strongly dimorphic; involucre bracts 3–5, oblong-ovate or ovate-orbicular, 2–3  $\times$  1.5–2 mm, shorter than flowers, rather densely villous, apex acuminate; involucels broadly funnelform, ca. 2 mm, base white hispidulous, upper half 8-pitted; crown spreading, 3–6 mm wide, membranous, with 20–24 ribs, outside sparsely villous along ribs. Calyx radially 5-setose, shortly stalked, brown, setae sometimes to 1 cm, 4–5  $\times$  as long as involucre crown. Corolla pale purple or white, outside puberulent. Achenes white hairy. Fl. May–Jun, fr. Jun–Jul.  $2n = 18$ .

Sandy places, deserts of plains. N Xinjiang (Manas He basin, Ürümqi) [from E Mediterranean to C Asia and India].

**4. *Scabiosa ochroleuca*** Linnaeus, Sp. Pl. 1: 101. 1753.

黃盆花 huang pen hua

Herbs, perennial. Caudexes columnar, often multi-branched, brown. Stems caespitose or solitary, erect, 25–80 cm tall, shallowly furrowed, white villous above. Basal leaves petiolate; petiole 1–5 cm; leaf blade pinnatifid, 5–10 cm, with 2–4 pairs of segments, or undivided. Cauline leaves 2–5-paired, subsessile or shortly petiolate; leaf blade 4–10 cm, abaxially densely pubescent, adaxially white villous, pinnatifid to pinnatisect or bipinnatisect, segments unequal in length; ultimate segments lanceolate or linear-lanceolate, 1.5–2 mm wide, 1-veined, apex acuminate. Peduncles 18–30 cm, white villous; capitula solitary, terminal, oblate-spheroidal, 2–2.5 cm in diam. at anthesis, becoming oblong, ca. 1.5 cm in fruit; involucre bracts linear-lanceolate, both surfaces sparsely pubescent, apex acuminate; bracts oblanceolate, sparsely puberulent, apex acute; involucels funnelform, 3–4 mm, 8-ribbed and 8-furrowed, sparsely white villous on ribs and sparsely puberulent in furrows, crown 1.5–2 mm wide, outside sparsely puberulent, edges

dentate. Calyx lobes 5, brown-yellow, ca. 4 mm, setose. Corolla yellow or white, 7–10 mm; marginal ray flowers subequal to central ones in size. Corolla tube 6–7 mm, outside densely white villous; lobes 5, unequal in size, middle one of lower lip to 3 mm, others 1.5–2  $\times$  ca. 1.5 mm. Stamens 4, inserted at middle part of corolla tube, exserted. Achenes yellowish, ellipsoid, ca. 2.5 mm, setae up to 7 mm; receptacles visible after achenes shed, fusiform, 10–15  $\times$  ca. 4 mm, densely puberulent. Fl. Jul–Aug, fr. Aug–Sep.  $2n = 16$ .

Meadows, grasslands, grassy slopes: 1300–2200 m. NW Xinjiang [Kazakhstan, Mongolia, Russia (Siberia); C Europe].

**6. *Scabiosa lacerifolia*** Hayata, Bot. Mag. (Tokyo) 20: 16. 1906.

台湾蓝盆花 tai wan lan pen hua

Herbs, perennial, glabrous or puberulent. Stems erect, 10–20 cm tall, sparsely branched. Leaves sessile, semiamplexicaul; leaf blade linear-lanceolate, pinnatisect or lacerate, segments irregularly dentate; basal leaves 5–12 × 5–6 cm. Cauline leaves opposite, 4–5 cm, apex acute. Peduncles 5–6 cm or even

longer; capitula terminal, oblate-globose, 3.5–4 cm in diam.; involucre bracts 3-whorled, lanceolate; outermost ones ca. 1.5 cm; inner ones shorter; bracts spatulate, ca. 5 mm; involucels 4-ribbed, with 8 pits at apex, crown membranous, 4-lobed; lobes obtuse. Calyx 5-setose, radial. Corolla blue-purple; marginal ray flowers usually larger, corolla ca. 1.8 cm, 5-lobed, 2-lipped. Stamens 4, all fertile. Style filiform. Achenes surrounded by involucels, and crowned with persistent involucels and calyx setae, obovoid, 3–3.5 mm; setae ca. 1 mm.

• Grassy slopes, rocky ridges; 2000–3600 m. Taiwan.

**4. *DIPSACUS* Linnaeus, Sp. Pl. 1: 97. 1753.**

川续断属 chuan xu duan shu

Herbs, biennial or perennial. Stems erect, angulate and sulcate, usually echinulate or hispid along ridges. Basal leaves long petiolate, entire, 3-cleft, or pinnatifid, usually dentate or lobed. Cauline leaves opposite, sessile or petiolate, usually 3–5-lobed, sometimes pinnatifid or entire, both surfaces usually hispid, but glabrous or papillate-echinulate in some species. Capitula terminal, oblong, globose, or ovoid-globose; involucre bracts erect or spreading, leaflike, 1- or 2-layered, rostrate; involucels 4–8-ribbed, adnate to ovary; flowers bisexual. Calyx actinomorphic, shallowly disciform, 4-lobed, white pubescent. Corolla tubular, 4-lobed; lobes unequal in size. Stamens 4, inserted at corolla tube, alternate with corolla lobes. Gynoecium of 2 carpels; ovary inferior, enveloped by involucre; ovule solitary, pendulous, anatropous; style filiform; stigma oblique or lateral. Achenes surmounted with persistent calyx, enveloped by leathery involucre. Seed coat membranous; embryo imbedded in endosperm.

About 20 species: N Africa, Asia, Europe; seven species (two endemic) in China.

- 1a. Stems glabrous; bract rostra 1.5–3 mm ..... 1. *D. azureus*
- 1b. Stems ± spiny; bract rostra 3–11 mm.

Herbs, perennial, 0.6–1.5 m tall. Stems glabrous, nearly spineless. Basal leaves long petiolate, undivided; cauline leaves opposite, ca. 6-paired, glabrous, sessile or petiole up to 10 cm; leaf blade 6–26 × 3–10 cm, pinnatifid to pinnatisect; terminal segment lanceolate, margin coarsely serrate; lateral segments 4–7-paired, lanceolate to elliptic, 1.2–7 × 1–3 mm. Heads 3 or 4, subspherical; terminal one 2–2.5 × 3–4.5 cm; peduncles 30–60 cm, glabrous or pubescent above; involucre bracts 2-layered; 5 or 6 in outer layer, ovate; 7–9 in inner layer, elliptic or lanceolate; bracts obovate-lanceolate or oblanceolate, 5–14 × 4–5 mm, rostra 1.5–3 mm; involucels 4-ribbed, 3–4 mm. Calyx disciform, 0.5–1 mm; lobes irregular. Corolla purple-blue, funnel-

form, 8–15 mm, outside villous; lobes elliptic or oblong, 3–4 × 1.5–2.5 mm. Stamens exserted. Style strongly exserted; stigma clavate. Achenes 4-angular, ca. 3.5 mm, totally enveloped in involucre. Fl. and fr. Aug–Sep.

1900–2000 m. Xinjiang (Huocheng, Tekes) [Kazakhstan, Kyrgyzstan].

**2. *Dipsacus inermis*** Wallich, Fl. Ind. 1: 367. 1820.

藏续断 zang xu duan

*Cephalaria cachemirica* Decaisne; *Dipsacus inermis* var. *mitis* (D. Don) Y. Nasir; *D. mitis* D. Don; *D. strictus* D. Don; *Virga inermis* (Wallich) Holub.

Herbs, perennial, 0.5–2 m tall. Taproots clavate, up to 3.5 cm in diam. Stems branched, usually 6-ridged, ridges sparsely spiny. Basal leaves rosulate, often wilted at anthesis, long petiolate; leaf blade elliptic, 5–13 × ca. 3.5 cm, undivided, margin serrate, or 3- or 5-segmented; terminal segment much larger; cauline leaves subsessile or with petiole up to 7 cm; leaf blade

broadly lanceolate, 10–22 × 3.5–7 cm, trifid or pinnatifid; lateral segments in 2 or 3 pairs; terminal segment larger, ovate, all segments yellowish hirsute on both surfaces, margins serrate. Capitula 1 or 3, 2–3.5 cm in diam. at anthesis and in fruit; peduncles up to 40 cm; involucre bracts linear, white hirsute; bracts lanceolate or obovate-lanceolate, 14–20 mm at anthesis, rostrum 5–9 mm, setose and hirsute; involucels ovoid-columnar, 5–8 mm. Corolla white or yellowish, funnelform, 11–15 mm; tube 3.5–4 mm; lobes unequal. Stamens exserted. Style strongly exserted. Achenes narrowly ellipsoid, ca. 4.5 × 1.5 mm, 4-angular, glabrous. Fl. Jul–Aug, fr. Aug–Oct.

Forests, grassy slopes, by streams; 2100–3900 m. Xizang (Nyalam), Yunnan [Afghanistan, Bhutan, India, Kashmir, Myanmar, Nepal, Pakistan].

深紫续断 shen zi xu duan

*Dipsacus fulingensis* C. Y. Cheng & Ai.

Herbs, perennial, 1–1.8 m tall. Taproots columnar, slightly fleshy. Stems erect, 6–8-ridged, ridges sparsely covered with retrorse spines. Basal leaves rosulate; petiole up to 30 cm; leaf blade broadly lanceolate, 10–18 × 6–12 cm, pinnatifid or pinnatisect; segments 5–7; terminal segment larger, oblong or broadly ovate, 6–12 × 4–8 cm; lateral ones smaller downward, lanceolate to ovate; all segments abaxially glabrous, adaxially puberulent or glabrous. Lower and middle cauline leaves shorter petiolate; leaf blade pinnatisect; terminal segment larger; lateral segments 2- or 3-paired, ovate to lanceolate; upper cauline leaves undivided or 3-segmented, segments lanceolate, both surfaces glabrous, sometimes adaxially sparsely white puberulent, margins entire. Heads globose, 2–2.5 cm in diam.; peduncles up to 30 cm; involucre bracts 7 or 8, leaflike, lanceolate,

white puberulent; bracts oblong-obovate, 6–8 mm, rostrum 1–3 mm, glabrous, sparsely setose, or villous basally; involucels obovoid-columnar; limb 4-lobed; lobes acute at apex. Calyx disk-shaped, 4-angular, outside glabrous, inside and apex villous. Corolla black-purple; tube 6–7 mm, base narrowly tubular, 1–1.5 mm; limb with one larger lobe. Stamens strongly exserted. Achenes pale brown, 2.5–4 mm, 4-angular, cuneate. Fl. Jul–Sep, fr. Sep–Nov.

• Among herbs by streams, grassy slopes by fields. Chongqing (Fuling, Nanchuan, Qianjiang).

*Dipsacus atropurpureus* differs from *D. asper* only in having a black-purple corolla (vs. yellowish or white) and a shorter rostrum (1–2 vs. 3–5 mm). Although accepted as separate species here, the two may be conspecific. Field observations and population sampling are needed to clarify this issue.

**7. *Dipsacus japonicus*** Miquel, Verslagen Meded. Afd. Natuurk. Kon. Akad. Wetensch., ser. 2, 2: 83. 1868.

日本续断 *ri ben xu duan*

Herbs, biennial or perennial?, up to 1.5 m tall. Roots not fleshy. Stems often branched, 4–6-ridged, with retrorse spines on ridges. Basal leaves rosulate, long petiolate; leaf blade narrowly elliptic, pinnatisect or undivided. Cauline leaves opposite, long petiolate to sessile; leaf blade elliptic-ovate to elliptic, 8–25 × 3–10 cm, abaxially spiny-hispid, adaxially hispidulous, pinnatisect or pinnatifid, rarely undivided; segments 2- or 3-paired; terminal lobe much larger. Capitula terminal, globose, 1.5–3.2 cm at anthesis and in fruit; involucre bracts linear, spiny-hispid; bracts obovate, 9–11 × 4–5 mm, hispidulous, rostrum 3–5 mm, lateral sides spiny-hispid; involucels 4-ribbed, 5–6 mm, white villous, 8-dentate at apex. Calyx cup-shaped, ca. 1 mm, 4-lobed, white villous. Corolla pink, purple-red, or purplish, 5–8 mm, outside villous. Stamens slightly exserted. Achenes oblong-cuneate, 4-angular, ca. 6 mm, glabrous. Fl. Aug–Sep, fr. Sep–Nov.

Grassy slopes, roadsides; below 2600 m. Anhui (Qingyang, Shucheng), Chongqing (Chengkou, Wushan, Wuxi), E Gansu (Pingliang, Yuzhong), Hebei, Henan, Hubei (Xianfeng), Hunan (Cili), Jiangsu, Jiangxi, Liaoning, Shaanxi, Shandong, Shanxi, N Sichuan (Barkam, Songpan), W Zhejiang [Japan, Korea].

## VALERIANACEAE

败酱科 *bai jiang ke*

Hong Deyuan (洪德元)<sup>1</sup>; Fred R. Barrie<sup>2</sup>, Charles D. Bell<sup>3</sup>

Herbs, perennial or biennial, rarely annuals [or shrubs, absent from China], with a characteristic fetid odor caused by monoterpenoid and sesquiterpenoid ethereal oils; vestiture of white, multicellular hairs; taprooted or rhizomatous; roots adventitious. Leaves opposite, basal and cauline, less frequently all basal, simple to pinnatisect or imparipinnate, entire to variously toothed. Inflorescences cymose, simple or compound dichasia or monochasia, bracteate and bracteolate. Flowers perfect or rarely unisexual. Calyx 5-lobed (*Nardostachys*), reduced to inconspicuous teeth (*Patrinia*), or setaceous, plumose, and pappuslike (*Valeriana*). Corolla connate, regular to irregular, sometimes 2-lipped; tube often gibbous (nectariferous) near base; limb (3–)5-lobed; corollas of female flowers 1/3–1/2 size of those of perfect or male flowers. Stamens 1–4, inserted near base of corolla tube, weakly to strongly exerted in bisexual and male flowers, vestigial and included in female flowers; anthers versatile, 4-sporangiate, opening by longitudinal slits. Ovary inferior; carpels 3, 1 fertile, with a solitary, pendulous, apical ovule, 2 sterile; style solitary; stigma entire or 3-lobed. Fruit a cypsela (but commonly referred to as an achene), sometimes winged; sterile locules often reduced; calyx persistent. Seed 1, embryo large, straight, and without endosperm.

Twelve genera and ca. 300 species: nearly cosmopolitan; three genera and 33 species (18 endemic) in China.

Chiu Lien-ching & Wang Han-jin. 1986. Valerianaceae. In: Lu An-ming & Chen Shu-kun, eds., Fl. Reipubl. Popularis Sin. 73(1): 5–44.

- 1a. Stamens 3, rarely 4; calyx segments up to 20, inrolled at anthesis, unrolled in mature fruit, becoming plumose and pappuslike ..... 3. *Valeriana*
- 1b. Stamens 4, rarely reduced to 1–3; calyx 5-dentate, not pappuslike in fruit.
  - 2a. Bracteoles not enlarged into wings in fruit; caudices nearly always covered with fibrous remains of old leaves; leaves entire ..... 1. *Nardostachys*
  - 2b. Bracteoles enlarged into wings in fruit; caudices without fibrous remains of old leaves; leaves segmented or serrate ..... 2. *Patrinia*

### 1. NARDOSTACHYS Candolle, Prodr. 4: 624. 1830.

甘松属 *gan song shu*

Herbs, perennial. Rhizomes short, stout, branching. Caudices robust, densely covered with fibrous or lamellar old leaf sheaths, crowned with rosulate leaves. Flowering stems emerging below rosettes. Rosulate leaves narrowly spatulate or linear-oblanceolate, veins 3–5, parallel, base attenuate into petiole, margin entire, apex obtuse. Cauline leaves usually 2- or 3-paired, lanceolate, smaller apically. Cymes aggregated into a terminal capitulum; involucre bracts 2- or 3-paired; each flower subtended by a bract; bracteoles 2, small. Calyx 5-dentate, enlarged in fruit. Corolla campanulate; tube gibbous basally; limb 5-lobed. Stamens 4. Sterile locules of fruit not reduced.

Two species: the Himalaya; one species in China.

1. *Nardostachys jatamansi* (D. Don) Candolle, Prodr. 4: 624. 1830.

甘松 *gan song*

*Patrinia jatamansi* D. Don, Prodr. Fl. Nepal. 159. 1825;  
*Nardostachys chinensis* Batalin; *N. grandiflora* Candolle.

Caudices erect or oblique. Flowering stems 5–50 cm tall. Rosulate leaves narrowly spatulate or linear-oblanceolate; petiole subequal to leaf blade in length; blade 3–25 × 0.5–2.5 cm, glabrous or sparsely puberulent, veins 3, base attenuate, margin entire, apex obtuse. Cauline leaves mostly 2- or 3-paired, lowermost elliptic to obovate, base attenuate into petiole; uppermost sessile, oblanceolate to lanceolate, sometimes sparsely serrate.

Capitula 1.5–2 cm in diam.; primary peduncles sometimes elongated; involucre bracts 4–6, lanceolate; bracts narrowly ovate to ovate, subequal to flowers in length. Calyx 5-lobed; lobes semiorbicular to triangular-lanceolate, enlarged in fruit, usually ciliate. Corolla purple-red, pink, or magenta, campanulate, 4.5–9 mm, 5-lobed; lobes broadly ovate to oblong, 2–3.8 mm, outside ± villous, occasionally glabrous. Stamens subequal to corolla in length; filaments villous. Style subequal to stamens in length; stigma capitate. Achenes obovoid, 3–4 mm, partially or uniformly white hispid or glabrate; calyx lobes deltoid to ovate, 1.5–2.5 mm, prominently and reticulately veined. Fl. late Jun–Aug, fr. Aug–Sep.

Alpine thickets or meadows; 2500–5000 m. SE Gansu, S Qinghai (Maqên, Yushu), W Sichuan, Xizang, N Yunnan [Bhutan, India, Nepal].

败酱属 *bai jiang shu*

*Fedia* Adanson; *Fuisa* Rafinesque.

Herbs, perennial, less frequently biennial; taprooted or rhizomatous; roots or rhizomes strongly stinking. Stems sometimes lignified at base. Basal leaves rosulate, simple to pinnatifid or pinnatisect, often wilted or caducous at anthesis. Cauline leaves opposite, simple to pinnatifid or pinnatisect, margin serrate or dentate, rarely entire. Inflorescence of corymbiform or paniculiform compound dichasia. Flowers 3–6 mm; calyx limb 5-lobed; lobes sinuous, obtusely dentate, ovate or ovate-deltoid, persistent, rarely enlarged in fruit. Corolla yellow, pale yellow, or white, campanulate or funnelform; tube villous within, gibbous basally, nectary sac with dense glands; limb 5-lobed, lobes slightly unequal. Stamens (1–)4, in unequal pairs, inserted at base of corolla tube, usually exserted; longer filaments villous basally, shorter filaments glabrous; anthers oblong, versatile. Style sometimes curved above; stigma capitate or peltate. Achene ovoid or obovoid-oblong; bracteoles reduced or expanded and winglike, detaching as a unit with fruit, 2- or 3-veined, reticulate veins conspicuous. Seeds compressed ellipsoid.

About 20 species: C and E Asia; 11 species (five endemic) in China.

- 1a. Cauline leaves in whorls of 3 ..... 10. *P. trifoliata*
- 1b. Cauline leaves opposite, decussate.
  - 2a. Bracteoles reduced in fruit; peduncles densely hirsute on upper side only; corolla yellow ..... 6. *P. scabiosifolia*
  - 2b. Bracteoles enlarged and winged in fruit; peduncles uniformly pubescent or hairs in bilateral rows; corolla yellow, pale yellow, or white.
    - 3a. Winged bracteoles 2- or occasionally 3-veined.
      - 4a. Peduncles hispidulous, hairs less than 0.4 mm; cauline leaves usually pinnatifid, rarely entire.
        - 5a. Leaves rigid, leathery, leaf segments obtuse or acute at apex; corolla 6.5–9 mm; bracteoles in fruit 7–9 × 5–7 mm ..... 7. *P. scabra*
        - 5b. Leaves thin, papery, leaf segments acute to acuminate at apex; corolla 3–4.5 mm; bracteoles in fruit 5.5–6.2 × 4.5–5.5 mm ..... 2. *P. heterophylla*
      - 4b. Peduncles hirsute, hairs ca. 1 mm; cauline leaves usually undivided or sometimes with 1–3 pairs of lateral segments.
        - 6a. Corolla white, limb 3.5–5 mm wide; stamens 4 ..... 11. *P. villosa*
        - 6b. Corolla yellow or pale yellow, very rarely white, limb 2–4 mm wide; stamens 1–4 ..... 4. *P. monandra*
    - 3b. Winged bracteoles usually 3-veined, rarely 2-veined or multiveined.
      - 7a. Peduncles scaberulose.
        - 8a. Basal and cauline leaves pinnatisect or bipinnatisect; segments linear ..... 3. *P. intermedia*
        - 8b. Basal leaves usually shallowly lobed or entire; cauline leaves pinnatifid or pinnatisect, segments various in shape ..... 5. *P. rupestris*
      - 7b. Peduncles hirsute.
        - 9a. Plants usually more than 30 cm tall; calyx not obviously enlarged in fruit; leaves glabrous ..... 1. *P. glabrifolia*
        - 9b. Plants dwarf, less than 25 cm tall; calyx obviously enlarged in fruit; leaves usually pubescent.
          - 10a. Rhizomes robust; basal leaves oblanceolate, entire or pinnatifid ..... 8. *P. sibirica*
          - 10b. Rhizomes usually slender; basal leaves oblanceolate-oblong, all pinnatifid ..... 9. *P. speciosa*

**1. *Patrinia glabrifolia*** Yamamoto & Sasaki, Trans. Nat. Hist. Soc. Formosa 19: 106. 1929.

光叶败酱 *guang ye bai jiang*

Herbs, perennial, 25–60 cm tall. Rhizomes horizontal, coarse. Stems erect, glabrous, or bilaterally puberulent above. Lower leaves crowded, spatulate or weakly petiolate, glabrous; petiole to 5 cm; blade oblanceolate or oblong, to 25 × 6 cm, base attenuate, margin coarsely serrate, apex acuminate. Cauline leaves petiolate; petiole 1–3.5 cm; blade linear to linear-lanceolate, 4.5–9 × 0.5–1.5 cm, glabrous, base cuneate-decurrent, margin entire or coarsely serrate, apex acuminate. Inflorescence corymbiform-paniculiform; lateral branches in 4–6 pairs, with 2 lines of dense, stiff hairs; pedicels reduced. Calyx lobes inconspicuous. Corolla yellow, ca. 5 mm, regularly 5-lobed; lobes spreading. Stamens 4, exserted. Style ca. 2.5 mm; stigma capitate; fertile ovary locule slightly compressed, ellipsoid,

densely hispidulous or subglabrous below and above margin. Achenes oblong, 2.5–3 mm; bracteoles elliptic or obovate-elliptic, ca. 3 × 1.5 mm, to obovate or orbicular, 3–7 × 2.5–6 mm, 3-veined, apex rounded, sinuate or with 3 rounded lobes. Fl. Jul, fr. Aug.

• Calcareous stony slopes; 1000–2200 m. C and E Taiwan (Hualian, Nantou).

**2. *Patrinia heterophylla*** Bunge, Enum. Pl. Chin. Bor. 35. 1833.

墓回头 *mu hui tou*

*Patrinia angustifolia* Hemsley; *P. graveolens* Hance; *P. heterophylla* subsp. *angustifolia* (Hemsley) H. J. Wang.

Herbs, perennial, 15–100 cm tall. Rhizomes horizontal, longer than 20 cm. Stems erect, densely scaberulose or subglabrous. Basal leaves rosulate, petiolate; blade narrowly elliptic,

3–8 cm, pinnatifid to pinnatisect; segments 1–5 pairs, ovate to linear-lanceolate; terminal segment usually larger, ovate to ovate-lanceolate, margin serrate or crenulate. Cauline leaves subsessile or petiolate; lower leaves pinnatisect, with 2–6 pairs of segments; terminal segment  $\pm$  larger, broadly ovate to linear-lanceolate, 7–9  $\times$  5–6 cm, apex acuminate to long acuminate. Middle and upper leaves often undivided, or with 1 or 2 pairs of segments; terminal segment larger, ovate, ovate-lanceolate, or subrhombic, crenulate. Inflorescence corymbiform; peduncles densely hispidulous; lower involucral bracts with 1 or 2(–4) pairs of linear segments; upper bracts entire, linear, subequal to or longer than inflorescence. Calyx lobes conspicuous or inconspicuous, ovate, ovate-oblong, or ovate-deltoid, 0.1–0.3 mm. Corolla campanulate; tube 1.8–2.4 mm, 1.5–2 mm in diam. distally; lobes ovate or ovate-elliptic, 0.8–1.8  $\times$  ca. 1.6 mm. Stamens 4, exserted; longer filaments 3–3.6 mm; shorter filaments 1.9–3 mm; anthers oblong, ca. 1.2 mm. Ovary ovoid or oblong, 0.7–1.5 mm; style slightly curved, 2.3–2.7 mm; stigma peltate or capitate. Achenes oblong or obovoid, hispidulous, or glabrescent on one or both surfaces, apex truncate; bracteoles obovate, obovate-oblong, or obovate-elliptic, rarely elliptic, 5.5–6.2  $\times$  4.5–5.5 mm, 2(or 3)-veined, apex rounded, shallowly 3-lobed, or unequally 2-lobed on one lateral side. Fl. Jul–Sep, fr. Aug–Oct.  $2n = 22^*$ .

• Grassy slopes, open woods, roadsides; 100–2600 m. Anhui, Chongqing, E Gansu (E of Yuzhong), Guizhou (Jiangkou), Hebei, Henan, W Hubei, Hunan, Jiangsu (Tianci Shan), Jiangxi (Lu Shan, Wuning, Xiushui), Jilin (Tongyu), Liaoning (Jianping, Suizhong), S Nei Mongol (Daqing Shan, Xinghe), S Ningxia (Tongxin), E Qinghai (Minhe), Shaanxi, Shandong (Mengshan, Taishan), Shanxi (Jiexiu, Lishi), Sichuan (Emei, Jinchuan, Nanping), Zhejiang (Tianmu Shan).

Herbs, perennial or biennial, 1.5–2.2 m tall. Taproots horizontal, oblique, or vertical. Stems slightly lignified at base, robust, uniformly retrorsely hispidulous or with 2 bilateral lines. Basal leaves wilted at anthesis; cauline leaves petiolate; petiole ca. 1 cm, reduced or absent above; blade oblong, 4–14.5  $\times$  2–9.5 cm, sparsely adpressed hispidulous, margin entire, or lyrate with 1 or 2(or 3) pairs of lateral segments, margin crenate or dentate. Inflorescence corymbiform or paniculiform, 20–25 cm in diam.; lateral branches in 4–6 pairs, densely hirsute; involucral bracts linear-lanceolate to lanceolate, ca. 8.5 cm, entire, or pinnately 3–5-segmented; terminal segment ovate-lanceolate, apex acute to acuminate. Calyx small, 5-dentate. Corolla yellow or pale yellow, rarely white, funnellform; tube 1.2–1.8 mm, 1.4–1.8 mm in diam.; limb 2–4 mm wide; lobes ovate to ovate-oblong, 0.6–1.8  $\times$  1–1.2 mm. Stamens 1–4, often one longer and exserted; filaments 1.5–3.3 mm; anthers oblong or ellipsoid, 0.5–0.8 mm. Ovary obovoid, 0.8–1.8 mm; style 1.7–2.8 mm; stigma capitate or peltate. Achenes ovoid-globose; sterile ovary locules thickened, obovoid-oblong, glabrous or sparsely hispidulous; fertile locule compressed ellipsoid, margin hispidulous; bracteoles broadly ovate to suborbicular, 5–7  $\times$  5–8 mm, 2(or 3)-veined, apex usually shallowly 3-lobed. Fl. Aug–Sep, fr. Sep–Oct.  $2n = 88$  (under *P. formosana*).

Grassy slopes, thickets, forests, forest margins, roadsides; 100–3100 m. Anhui, Chongqing, SE Gansu (Tianshui, Wenxian), Guangxi, Guizhou, Henan, Hubei, Hunan, Jiangsu (Ganyu, Liyang, Yuntai Shan), Jiangxi, Liaoning (Dalian, Huanren), S Shaanxi, Shandong (Zoucheng), Sichuan, Taiwan (Nantou, Taizhong, Taoyuan), Yunnan, Zhejiang (Kaihua, Tiantai Shan, Yinxian) [Bhutan, India (Darjeeling, Sikkim), Nepal].

岩败酱 yan bai jiang

*Valeriana rupestris* Pallas, Reise Russ. Reich. 3: 266. 1776.

Herbs, perennial, 20–100 cm tall. Taproot clavate, to ca. 1.5 cm in diam.; caudex slender, simple or several branched. Stems woody at base, covered with persistent old leaf remnants, new growth herbaceous, scaberulose. Basal leaves usually wilted at anthesis, subsessile or petiolate; petiole 2–4 cm; blade obovate-oblong, oblong, ovate, or obovate, 2–7  $\times$  1–2.5 cm, pinnatilobate, pinnatifid to pinnatisect, or undivided, margin crenulate; segments linear, oblong-lanceolate, or lanceolate; terminal segment usually crenulate, lobed or segmented. Cauline leaves sessile to shortly petiolate; blade oblong or elliptic, 3–7 cm, pinnatifid to pinnatisect; lateral segments usually in 3–6

pairs, linear or linear-lanceolate to oblong-lanceolate, sparsely crenulate or entire; terminal segment 3-partite, with 3 linear secondary segments. Inflorescence corymbiform, 2.5–20 cm in diam.; lateral branches in 3–7 pairs; lowermost bracts pinnatisect, with 3–5 pairs of linear segments; upper bracts smaller, linear, or with 1 or 2 pairs of filiform-linear segments. Calyx margin truncate, sinuous or shallowly 5-lobed; lobes ovate, 0.1–0.2 mm. Corolla yellow, funnelform-campanulate, 2.5–4 mm; tube 1.8–2 mm, 1.5–2 mm in diam. distally; limb 3–5.5 mm wide; lobes oblong, ovate-elliptic, ovate-oblong, ovate, or ovate-orbicular, 1.2–2 × 1–1.5 mm. Stamens 4; longer filaments 3–4 mm, shorter filaments 2.6–3.5 mm; anthers 0.7–0.8 mm. Ovary columnar, 0.5–1.3 mm, hispidulous, or glabrescent on one or both surfaces; style 2.2–3.3 mm; stigma peltate. Achenes obovoid-columnar, 2.4–2.6 × 1.5–1.8 mm, hispidulous to glabrescent; pedicel 0.5–1 mm; bracteoles oblong, ovate, or obovate, 3.5–5.1 × 3.5–3.6 mm, 3-veined, apex sometimes shallowly 3-lobed. Fl. Jul–Sep, fr. Aug–late Oct.  $2n = 22$ .

Stony slopes, meadows, margins of *Betula* or *Populus* forests; 200–2500 m. Chongqing (Chengkou, Wanyuan), E Gansu (E of Maxian Shan), Hebei (Weichang, Xiaowutai Shan, Zhangbei), E Heilongjiang, Henan (Huixian), E Jilin (Chunhua, Helong, Jilin), Liaoning (Jianping, Qianshan), NE Nei Mongol, Ningxia (Guyuan), Shaanxi (Wuqi, Zhidan), Shanxi (Luya Shan) [Mongolia, Russia (Far East, Siberia)].

败酱 bai jiang

*Fedia scabiosifolia* Treviranus; *F. serratulifolia* Treviranus; *Patrinia hispida* Bunge.

Herbs, perennial, 30–100(–200) cm tall. Rhizomes horizontal or oblique. Stems erect, yellow-green to yellow-brown, sometimes pale purplish, glabrate basally, hispidulous apically, hairs in 2 bilateral rows. Basal leaves rosulate, wilted at anthesis; petiole 3–12 cm; blade pale green abaxially, dark green adaxially, ovate, elliptic, or elliptic-lanceolate, 1.8–10.5 × 1.2–3 cm, simple to pinnatifid or pinnatisect, surfaces glabrate or hispidulous on veins, base cuneate, margin ciliate, entire to coarsely serrate, apex obtuse or acute. Cauline leaves sessile, broadly ovate to lanceolate, 5–15 cm, reduced above, both surfaces hispidulous to glabrescent, usually pinnatifid or pinnatisect, lateral segments in 2–5 pairs, terminal segment ovate, elliptic, or elliptic-lanceolate, margin coarsely serrate, apex acuminate. Inflorescence corymbiform, lateral branches in 5–7 pairs; peduncles densely hirsute abaxially; involucre bracts linear, ca. 1 mm. Calyx lobes inconspicuous. Corolla yellow, campanulate; tube ca. 1.5 × 1.5 mm, weakly gibbous; lobes ovate, ca. 1.5 × 1–1.3 mm. Stamens 4, longer filaments ca. 3.5 mm, shorter filaments 2–2.7 mm; anthers oblong, ca. 1 mm. Ovary ellipsoid-oblong, ca. 1.5 mm; style ca. 2.5 mm; stigma peltate, 0.5–0.6 mm in diam. Achenes oblong, 3–4 mm, 3-angular, compressed, sterile locules reduced; bracteoles inconspicuous. Seeds ellipsoid, compressed. Fl. Jul–Sep, fr. Sep–Oct.  $2n = 22$ .

Forests, forest margins, thickets, grassy areas, roadsides; (below 100–)400–2600 m. Throughout China except Guangdong, Hainan, Ningxia, Qinghai, Xinjiang, and Xizang [Japan, Korea, Mongolia, Russia (Far East, Siberia)].

三叶败酱 san ye bai jiang

Herbs, perennial, 30–90 cm tall. Rhizomes horizontal, slightly ascending. Stems erect, scaberrulose. Basal leaves rosulate, 3–8 cm, long petiolate, pinnatifid to pinnatisect; segments 1–4-paired, ovate-orbicular; terminal segment usually larger, ovate to ovate-lanceolate; cauline leaves in whorls of 3, pinnatisect; segments 1–4-paired; terminal segment larger, ovate or lanceolate, 3–7 × 1–5 cm, sparsely scaberrulose, base cuneate, apex acuminate, margin crenulate; upper cauline leaves subsessile. Inflorescence corymbiform, lateral branches in 3–7 pairs, scaberrulose; involucre bracts with 1 or 2 pairs of linear segments. Calyx small, 5-lobed; lobes inconspicuous, 0.1–0.3 mm. Corolla campanulate, 3–5 mm, outside scaberrulose, inside glabrous; tube 1.8–3 mm; lobes 5, 0.8–1.5 × ca. 1 mm. Stamens 4, longer filaments ca. 3 mm, shorter filaments ca. 2 mm, glabrous or scaberrulose. Ovary obovoid, ca. 1 mm; style 2.3–2.7 mm; stigma truncate-capitate. Achenes oblong; bracteoles ovate, 2-veined, rarely 3-veined, shallowly 3-lobed. Fl. and fr. Jul–Aug.

• Grassy slopes, roadsides; 1100–2300 m. SE Gansu.

**11. *Patrinia villosa*** (Thunberg) Dufresne, Hist. Nat. Valér. 54. 1811.

攀倒甌 pan dao zeng

Herbs, perennial or biennial, 50–120 cm tall, rhizomatous or rarely stoloniferous. Stems with 2 bilateral, hispidulous lines, rarely uniformly hispidulous or glabrescent. Basal leaves rosulate, long petiolate; blade ovate, broadly ovate, or oblong-lanceolate to ovate-lanceolate, 4–25 × 2–18 cm, base decurrent, margin serrate or pinnatifid, with 1 or 2(–4) pairs of segments, apex acuminate. Cauline leaves petiolate; petiole 1–3 cm, upper leaves subsessile; blade similar to basal leaves or rhombic-ovate, hispidulous or glabrescent, base decurrent, margin coarsely serrate, apex caudate-acuminate or acuminate. Inflorescence paniculiform or corymbiform, lateral branches in 5 or 6 pairs, densely hirsute; involucre bracts ovate-lanceolate to linear. Calyx small, hispidulous, sometimes sparsely glandular hairy; limb sinuous; lobes 0.3–0.5 mm. Corolla white, campanulate; tube 1.5–2.6 × 1.7–2.3 mm, deeply 5-lobed; lobes dissimilar in shape, ovate, ovate-oblong, or ovate-elliptic, 0.7–2 × 1.1–1.8 mm. Stamens 4, exerted. Style shorter than stamens. Achenes obovoid; bracteoles obovate, ovate, obovate-oblong, or elliptic, sometimes orbicular, 2.8–6.5 × 2.5–8 mm, hispidulous between 2 main veins, 2(or 3)-veined, base cuneate or rounded, apex rounded, entire or slightly 3-lobed. Fl. Aug–Oct, fr. Sep–Nov.  $2n = 44$ .

Forests, forest margins, thickets, grassy areas, roadsides; below 100–2000 m. Anhui, Chongqing, Fujian, Guangdong, Guangxi, Guizhou, Henan, Hubei, Hunan, Jiangsu, Jiangxi, SE Liaoning, Taiwan, Zhejiang [Japan].

- 1a. Leaves without glands; lowest involucre bracts entire ..... 11a. subsp. *villosa*  
 1b. Leaves adaxially with minute brown-red glands; lowest involucre bracts usually with 1 or 2 pairs of segments ..... 11b. subsp. *punctifolia*

斑叶败酱 ban ye bai jiang

Leaves with minute brown-red glands adaxially. Lowermost involucre bracts usually with 1 or 2 pairs of segments.

• Grassy slopes, thickets, forest margins, roadsides; below 800 m. SE Liaoning (Benxi, Huanren, Kuandian).

### 3. VALERIANA Linnaeus, Sp. Pl. 1: 31. 1753.

缬草属 xie cao shu

Herbs, perennial. Plants hermaphroditic, gynodioecious, polygamo-dioecious, or dioecious, glabrous or variously pubescent, villous or hirsute, hairs 1- to several celled, white or translucent. Rhizomes elongate, with fibrous roots, or rhizomes reduced, with fascicled, often clavate, roots. Taproots absent (Chinese spp.). Stolons present or absent. Basal leaves rosulate, petiolate or spatulate, undivided, pinnate or pinnatifid, persistent or caducous. Cauline leaves opposite, petiolate to sessile; petiole length typically diminishing upward along stem; blade pinnate, pinnatifid, pinnatisect, or undivided. Inflorescence paniculiform or corymbiform, at anthesis: flowers in remote terminal clusters or in a densely capitate head, branches elongating in fruit; lowermost bracts often lobed, bracts otherwise simple and entire; bracteoles simple, similar to bracts; flowers bisexual, male (not in China?) or female. Calyx a ring at anthesis, unfurling into 5–15 white, plumose segments, 4–8 mm, in mature fruit. Corolla funnelform, rotate or salverform; tube usually gibbous near base; limb 5-lobed. Stamens 3 (4 in *Valeriana kawakamii*), inserted on corolla tube. Achene compressed dorsally, 3-veined on abaxial side, 1-veined on adaxial side, sterile locules reduced; crowned by persistent, plumose calyx, segments 2–7 mm.

About 300 species: Asia, Europe, North and South America; 21 species (13 endemic) in China.

A difficulty in the key is the rhizomes as unfortunately many collections do not have the rhizomes attached.

- 1a. Leaves undivided, or at least lower 2 or 3 pairs of cauline leaves undivided.
  - 2a. Rhizomes relatively stout, 0.5–1.5 cm in diam.; leaves cordate at base, 2–14 × 3–10 cm ..... 13. *V. jatamansi*
  - 2b. Rhizomes relatively slender, less than 0.5 cm in diam.; leaves not cordate at base.
    - 3a. Leaves all undivided.
      - 4a. Leaves entire or sparsely crenulate; plants less than 12 cm tall; achenes hairy ..... 21. *V. trichostoma*
      - 4b. Leaves serrate; plants more than 12 cm tall; achenes glabrous.
        - 5a. Inflorescences laxly paniculiform at anthesis, flowers clustered at branch tips; stem glabrous ..... 15. *V. lancifolia*
        - 5b. Inflorescences compact and capitate at anthesis; stem hirsute ..... 11. *V. hiemalis*
    - 3b. Upper cauline leaves divided.
      - 6a. Undivided leaves entire.
        - 7a. Plants 10–35 cm tall; leaf segments sparsely serrate ..... 5. *V. fedtschenkoi*
        - 7b. Plants 5–15 cm tall; leaf segments entire ..... 20. *V. tangutica*
      - 6b. Undivided leaves serrate.
        - 8a. Corolla less than 3 mm; upper cauline leaves usually pinnatisect, segments 5–7 ..... 16. *V. minutiflora*
        - 8b. Corolla 3.5–4 mm; upper cauline leaves 3-segmented, rarely 5-segmented, lateral segments much smaller than terminal segment ..... 2. *V. barbulate*
- 1b. Leaves all divided, or rarely lowest 1 or 2 pairs of cauline leaves undivided.
  - 9a. Rhizomes 2–8 cm, with marked internodes; roots fibrous, not fascicled; inflorescences lax, with several separate corymbs even at anthesis ..... 7. *V. flaccidissima*
  - 9b. Rhizomes reduced, without marked internodes; roots fascicled; inflorescences compact or lax at anthesis.
    - 10a. Leaf segments entire, rarely incised; plants 5–20(–50) cm tall; leaves all pinnatisect or at least middle and upper cauline leaves pinnatisect, with 4–11 pairs of segments; inflorescences compact at least at anthesis.
      - 11a. Plants 5–20(–30) cm tall; leaf segments rounded or obtuse; terminal segment ± larger than lateral ones.
        - 12a. Achenes hirsute on both sides; petiole of lowermost cauline leaves 3–6 cm ..... 12. *V. hirticalyx*
        - 12b. Achenes glabrous; petiole of lowermost cauline leaves 0.5–2 cm ..... 8. *V. flagellifera*
      - 11b. Plants 10–50 cm tall; leaf segments acute to acuminate at apex; terminal segments similar to or larger than lateral ones.
        - 13a. Corolla 1.5–3 mm; stems sparsely retrorsely puberulent; all leaf segments similar in shape and size, sparsely puberulent ..... 19. *V. stenoptera*
        - 13b. Corolla ca. 6 mm; stems glabrous; terminal leaf segment larger than lateral ones, glabrous or sometimes ciliate ..... 6. *V. ficariifolia*
    - 10b. Leaf segments always serrate (except *V. stenoptera*); plants more than (20–)30 cm tall; leaves pinnatisect or not, with 1–11 pairs of segments; inflorescences lax or compact.
      - 14a. Inflorescences lax, with several separate heads even at anthesis.
        - 15a. Leaves lyrate, terminal segment markedly larger, over 2 times wider than lateral ones; corolla rose or red, 3–4 mm ..... 10. *V. hengduanensis*
        - 15b. Leaves pinnatisect, terminal segments slightly wider than lateral ones; corolla white, 1.5–3.5 mm, or rose, 4–4.5 mm.
          - 16a. Corolla rose, 4–4.5 mm; inflorescence corymbiform; achenes ca. 4 mm ..... 18. *V. sichuanica*

- 16b. Corolla white, 1.5–3.5 mm; inflorescence paniculiform; achenes 2–2.5(–3) mm.  
 17a. Plants over 50 cm tall; leaf segments large, terminal ones over 3 cm ..... 9. *V. hardwickii*  
 17b. Plants usually less than 20 cm, rarely up to 30 cm tall; leaf segments smaller, terminal ones less than 2 cm ..... 3. *V. briquetiana*
- 14b. Inflorescences compact and capitate, at least at anthesis.  
 18a. Leaves usually lyrate, with 1–4 pairs of segments; terminal segment markedly larger than lateral segments.  
 19a. Corolla narrowly tubular, tube 4–6 × as long as lobes; achenes 1.5–2 mm ..... 4. *V. daphniflora*  
 19b. Corolla funnelform, tube nearly as long as lobes; achenes 2.5–3 mm.  
 20a. Roots fibrous, less than 1 mm in diam.; lateral leaf segments 1- or 2-paired; corolla lobes elliptic ..... 2. *V. barbulata*  
 20b. Roots ± carrot-shaped, 1.5–2 mm in diam.; lateral leaf segments 1–4-paired; corolla lobes ovate ..... 16. *V. minutiflora*
- 18b. Leaves pinnatisect, with 4–11 pairs of segments; terminal segment equal to or slightly larger than lateral segments.  
 21a. Leaf segments usually entire, rarely incised, acute to acuminate at apex ..... 19. *V. stenoptera*  
 21b. Leaf segments always serrate, obtuse or acute at apex.  
 22a. Plants 10–20 cm tall; corolla white, tubular, ca. 2.7 mm ..... 14. *V. kawakamii*  
 22b. Plants over 50 cm tall; corolla rose or white, funnelform, 3–6 cm.  
 23a. Plants glandular-hairy at upper part of stems and inflorescence rachises; inflorescence capitate ..... 1. *V. amurensis*  
 23b. Plants without glandular hairs; inflorescence corymbiform ..... 17. *V. officinalis*

**1. *Valeriana amurensis*** P. Smirnov ex Komarov, *Izv. Bot. Sada Akad. Nauk S.S.S.R.* 30: 214. 1932.

黑水缬草 *hei shui xie cao*

*Valeriana amurensis* f. *leiocarpa* H. Hara; *V. officinalis* Linnaeus var. *incisa* Nakai ex Mori.

Plants 80–150 cm tall. Rhizomes reduced; roots fascicled, 1–2 mm in diam. Stems solitary, erect, simple, hispidulous, glandular pubescent above. Leaves cauline, in 5–11 pairs; petiole of lowermost leaves to 4 cm; blade 9–12 × 4–10 cm, pinnatisect; segments 7–10, ovate to ovate-lanceolate, puberulent, margin coarsely serrate; upper leaves similar but smaller. Inflorescence capitate at anthesis, expanding in fruit; peduncles and pedicels glandular pubescent; bracts lanceolate or linear, glandular pubescent, apex acute or acuminate. Corolla rose, funnelform, 3–5 mm. Achenes triangular-ovoid, ca. 3 mm, hispid. Fl. Jun–Jul, fr. Jul–Aug.

Meadows, *Larix* or *Betula* forests. Heilongjiang, Jilin [Korea, Russia (Far East)].

*Valeriana amurensis* differs from *V. officinalis* only in having glandular hairs at the upper part of the stems, inflorescence rachises, and bracts. A population study is needed to clarify if *V. amurensis* is just a variant of the latter or a distinct species.

**2. *Valeriana barbulata*** Diels, *Notes Roy. Bot. Gard. Edinburgh* 5: 295. 1912.

髯毛缬草 *ran mao xie cao*

Plants 5–25 cm tall. Rhizomes reduced; roots fascicled, fibrous, less than 1 mm in diam. Stems solitary, erect, simple. Cauline leaves 5–8 pairs; lowermost often undivided; petiole 1–3.5 cm; blade broadly ovate to elliptic, 0.5–1.6 × 0.5–1 cm, sparsely serrate; upper leaves with petiole 1–1.2 cm, 3(–5)-segmented; terminal segment ovate-orbicular or broadly elliptic, 0.8–2 × 0.5–1.2 cm, petiole and abaxial surface sparsely pubescent, margin ciliate; lateral segments reduced. Inflorescence capitate at anthesis, 1–1.5 cm in diam.; bracts and bracteoles

linear-lanceolate to lanceolate. Corolla rose, reddish purple, or pink, 2.5–4 mm; lobes broadly elliptic, 0.7–1.5 mm, glabrous or villous at throat. Stamens and style exserted. Achenes narrowly ovoid or ellipsoid, 2.5–3 mm, pubescent or glabrous. Fl. Jul–Sep, fr. Aug–Sep.

Alpine meadows or stony sites; 3000–4600 m. SW Sichuan, SE Xizang, NW Yunnan [Bhutan, Myanmar, Nepal].

**3. *Valeriana briquetiana*** H. Léveillé, *Cat. Pl. Yun-Nan*, 277. 1917.

滇北缬草 *dian bei xie cao*

Plants up to 30 cm tall. Rhizomes reduced; roots fascicled, ± thickened, clavate, ca. 1.5 mm in diam. Stems erect or ascending, simple or rarely branched, densely villous below, sparsely villous to glabrate above. Basal and lower cauline leaves usually wilted at anthesis; occasionally lower 1 or 2 cauline pairs persistent; petiole to 2.5 cm; blade obovate-orbicular, ca. 2 × 1.5 cm; middle cauline leaves: petiole 1–3 cm, sparsely villous; blade pinnatisect, sparsely hispidulous adaxially, hirsute abaxially; terminal segment elliptic to linear-elliptic, 10–20 × 3–11 mm, margin usually serrate; lateral lobes 2 or 4, similar but smaller; uppermost 1 or 2 pairs of cauline leaves smaller, subsessile or sessile, otherwise similar. Inflorescence paniculiform, flowers and fruit in remote, terminal, dichasial clusters; peduncles to 15 cm, lax in fruit; bracts leaflike to linear-subulate; bracteoles linear, entire. Corolla funnelform, 2.5–3.5 mm; tube ca. 2 mm; lobes oblong-ovate. Stamens and style prominently exserted. Achenes ovoid-lanceolate, 2.5–3 mm, puberulent on anterior side, glabrous on posterior side. Fl. and fr. Jul.

• 2600–2800 m. NE Yunnan.

**4. *Valeriana daphniflora*** Handel-Mazzetti, *Acta Horti Gothob.* 9: 179. 1934.

瑞香缬草 *rui xiang xie cao*

Plants 15–40 cm tall. Rhizomes reduced; roots 3–6, fascicled, 1.5–2 mm in diam. Stolons rarely present. Stems soli-

tary, erect, simple, sparsely puberulent. Lowermost cauline leaves long petiolate; blade orbicular to broadly elliptic, 1–2 × 1–1.5 cm, undivided, entire or sparsely and irregularly serrate apically. Middle and upper cauline leaves petiolate to subsessile; blade ovate, 1.5–2 × 0.8–1 cm, pinnatifid; segments 3–7, glabrous or hispidulous on veins abaxially, margin irregularly serrate; terminal segment rhombic or elliptic, 1–1.2 × 0.4–0.6 cm; lateral segments smaller, linear-elliptic to linear. Inflorescence capitate at anthesis, 1.5–2.5 cm in diam., becoming lax and ca. 5 cm in diam. in fruit; bracts linear; bracteoles linear, subequal to achenes in length. Corolla rose or pink, tubular, 4.5–6 × ca. 1 mm; lobes ca. 1 mm. Stamens and style exserted. Achenes ovoid-ellipsoid, 1.5–2 × ca. 1 mm, glabrous or sparsely villous. Fl. (late Jul–)Aug, fr. Sep.

• Grassy slopes; 2600–3000(–4500) m. SW Sichuan, Xizang, NW Yunnan (Binchuan, Lijiang).

**5. *Valeriana fedtschenkoi*** Coincy, Ecl. Pl. Hisp. 2: 15. 1895.

新疆缬草 xin jiang xie cao

*Valeriana longiflora* Regel & Schmalhausen, Trudy Imp. S.-Peterburgsk. Bot. Sada 7: 384. 1880, not Willkomm (1851).

Plants 10–35 cm tall, subglabrous throughout. Rhizomes horizontal or ascending, 1–2 cm, apex covered with fibrous remains of old leaves; roots fibrous. Stems erect. Basal leaves in 1–3 pairs; petiole 3–6 cm; blade ovate-orbicular, 1–2.5 × 1–2 cm, simple, subentire to crenulate; cauline leaves 2- or 3-paired; petiole 0.5–2.5 cm; blade obovate-oblong, ca. 4 × 2–4 cm, lyrate; lobes 3–5, terminal lobe ovate or suborbicular, 2–3.5 cm; lateral lobes smaller, lanceolate to linear. Inflorescence capitate at anthesis, ca. 1.5 cm in diam., becoming lax and broader in fruit; bracts and bracteoles linear-lanceolate. Corolla rose, funnelform, 5–6 mm; lobes oblong, 2–2.5 mm. Stamens and style exserted. Achenes ovoid-ellipsoid, glabrous. Fl. Jun–Jul, fr. Jul–Aug. *2n* = 16.

Forests, alpine meadows; 2300–3900 m. Xinjiang [Afghanistan, Kazakhstan, Kyrgyzstan, N Pakistan].

The Chinese record of *Valeriana turczaninowii* Grubov (in FRPS 73(1): 41. 1986) is referable to *V. fedtschenkoi*.

**6. *Valeriana ficariifolia*** Boissier, Fl. Orient. 3: 89. 1875.

芥叶缬草 jie ye xie cao

Plants 30–40 cm tall. Rhizomes reduced; roots fascicled, more than 1 mm in diam. Stems solitary, erect or ascending, glabrous. Basal leaves long petiolate; petiole 3–9 cm; blade broadly ovate or cordate, 1.5–4 × 1.5–4.5 cm, glabrous or hispidulous, subentire. Lower cauline leaves in 2 or 3 pairs; petiole 2–4 cm, clasping and sheathing; blade lyrate; terminal lobe orbicular to broadly elliptic, 2–3 × 1.5–2 cm, margin entire or irregularly sinuous; lateral lobes 2- or 3-paired, remote, broadly ovate, 1.2–1.4 × ca. 0.8 cm, smaller toward base. Upper leaves similar but smaller. Inflorescence capitate at anthesis, 1–2 cm in diam., expanding and lax in fruit; peduncles glabrous or puberulent; bracts and bracteoles linear-lanceolate, margin ciliate basally. Corolla reddish, ca. 6 mm. Stamens and style exserted. Achenes narrowly ovoid, 5–6 mm, glabrous. Fl. Jul, fr. Jul–Aug. *2n* = 16, 18.

Mountain slopes; 2800–3000 m. Xinjiang (Yecheng) [Afghanistan, Kazakhstan, Tajikistan; SW Asia (Iran)].

The Chinese record of *Valeriana sisymbriifolia* Vahl (in FRPS 73(1): 43. 1986) is referable to *V. ficariifolia*.

**7. *Valeriana flaccidissima*** Maximowicz, Bull. Acad. Imp. Sci. Saint-Petersbourg 12: 228. 1867.

柔垂缬草 rou chui xie cao

*Valeriana faberi* Graebner; *V. nokozanensis* Yamamoto; *V. tripteroides* Handel-Mazzetti (1934), not (Neuman) Kreyer (1930).

Plants 20–80 cm tall, stoloniferous. Rhizomes 2–8 cm; roots fibrous, less than 0.5 mm in diam.; stolons terminating in leafy rosettes. Stems erect, simple, glabrous. Basal leaves simple or 3-lobed, margin crenulate or entire, apex obtuse. Cauline leaves ovate, pinnatisect, glabrous, or puberulent along veins abaxially; segments 3–7, remote; terminal segment ovate or lanceolate, 2–4 × 1–2 cm, glabrous or pubescent abaxially, margin coarsely serrate, apex obtuse or acuminate; lateral segments similar but smaller. Inflorescence paniculiform; involucre bracts and bracteoles linear to linear-lanceolate; bracteoles equal to or slightly shorter than achenes. Corolla reddish, purple, or white, funnelform, 2.5–3.5 mm; lobes oblong to ovate-oblong, shorter than corolla tube. Stamens and style usually exserted. Achenes narrowly ovoid, ca. 3 mm, glabrous or hispidulous. Fl. (Mar–)Apr–Jun, fr. May–Aug.

Forest margins, grassy areas, by streams; 400–3600 m. Anhui (Shucheng), Chongqing, SE Gansu, Guizhou, SE Henan (Shangcheng), W Hubei, Hunan (Xinning), Sichuan, Taiwan (Gaoxiong, Nantou, Xinzhu), Yunnan [Japan].

**8. *Valeriana flagellifera*** Batalin, Trudy Imp. S.-Peterburgsk. Bot. Sada 13: 374. 1894.

秀丽缬草 xiu li xie cao

*Valeriana pseudodioica* Pax & K. Hoffmann; *V. venusta* L. C. Chiu; *V. xiaheensis* L. C. Chiu.

Plants 5–20(–30) cm tall. Rhizomes reduced; roots fascicled, fibrous, 0.5–1 mm in diam. Stolons present or absent. Stems solitary, erect, sparsely puberulent. Basal leaves caducous; cauline leaves in 6–9 pairs, glabrous adaxially, hispidulous along veins abaxially; petiole of lowermost 1 or 2 pairs 0.5–2 cm; blade undivided, obovate, ca. 1.5 × 1–1.2 cm, margin entire, ciliate, apex rounded; middle leaves 3-lobed, lateral lobes reduced; upper leaves pinnatisect, 1–3 × 0.5–1.5 cm; lateral segment in 4–10 pairs, margin entire or rarely coarsely serrate, sparsely ciliate, apex rounded or obtuse, terminal lobe similar but slightly larger. Inflorescence capitate at anthesis; bracts and bracteoles linear-lanceolate, bracteoles shorter than achenes. Flowers polygamous; corolla rose, red, purplish red, pink, or white, funnelform, ca. 3.5 mm (bisexual) or 2.5–3 mm (female); lobes oblong, 1–1.5 mm. Stamens exserted in bisexual flowers, vestigial in female flowers; style exserted. Achenes not seen. Fl. Jun–Jul, fr. Aug.

• Moist slopes; 3300–4300 m. S Gansu (Xiahe), Qinghai (Tongde), W Sichuan (Dawu, Sertar), NW Yunnan (Dêqên).

**9. *Valeriana hardwickii*** Wallich in Roxburgh, Fl. Ind. 1: 166. 1820.

长序缬草 chang xu xie cao

*Valeriana barbulata* Diels var. *gymnostoma* Handel-Mazetti; *V. hardwickii* var. *hoffmeisteri* Klotzsch; *V. hardwickii* var. *leiocarpa* Miquel; *V. helictes* Graebner; *V. rhodoleuca* H. B. Chen & C. Y. Cheng; *V. rosthornii* Graebner; *V. udicola* Briquet.

Plants to 150 cm tall. Rhizomes short; roots slender, ca. 1 mm in diam. Stolons 1 to several, or absent. Stems erect, often hispidulous below, glabrous above except at nodes. Basal leaves long petiolate; petiole to 9 cm; blade pinnatisect or pinnatifid, rarely simple and cordate; terminal segment ovate to ovate-lanceolate, 3.5–7 × 1.5–3 cm, hispidulous to glabrate, base subrounded, margin entire or serrate, apex acuminate; lateral segments 4 or 6, remote, reduced toward petiole. Cauline leaves similar, gradually reduced apically. Inflorescence paniculiform, flowers and fruit in remote dichasial clusters, primary peduncles to 70 cm; bracts linear-subulate; bracteoles deltoid-ovate, ca. 1/2 as long as achenes, margin entire or crenulate. Corolla white, pinkish white, or purplish, campanulate to funnelform, 1.5–2.5(–3.5) mm, tube and lobes of equal length. Stamens and style subequal to corolla in length or slightly exserted. Achenes broadly ovoid to ovoid, 2–3 × 1–1.2 mm, hispidulous or less frequently glabrous. Fl. Jun–Aug, fr. Jul–Oct.  $2n = 14, 16, 28, 32$ .

Grassy slopes, forest margins, by streams; 900–3800 m. Chongqing (Nanchuan), Fujian (Chong'an), Guangxi (Damiao Shan), Guizhou, SW Hubei, W Hunan (Qianyang, Xinning, Xuefeng Shan), Jiangxi (Wugong Shan), Sichuan, S and SE Xizang, Yunnan [Bhutan, India, Indonesia, Laos, Myanmar, Nepal, Pakistan, Thailand, N Vietnam].

**10. *Valeriana hengduanensis*** D. Y. Hong, Acta Phytotax. Sin. 30: 373. 1992.

横断山缬草 *heng duan shan xie cao*

Plants 40–100 cm tall. Rhizomes reduced; roots fascicled, 1–1.5 mm in diam. Stolons sometimes present. Stems solitary, erect, simple, glabrous or sparsely puberulent. Basal leaves caducous; lower 1 or 2 pairs of cauline leaves with petiole 2–9 cm; blade simple, broadly elliptic or obovate, 3–8 × 2–4.5 cm, subentire or serrate; upper leaves petiolate to subsessile; petiole to 7 cm; blade 5–10 × 3–5 cm, glabrous or sparsely villous, lyrate; segments 3–7, crenulate or serrate; terminal segment broadly elliptic to orbicular, much larger than others, 4–8 × 2–5 cm. Inflorescence laxly capitate; bracts linear. Corolla rose or red, funnelform, 3–4.5 mm. Achenes lanceolate, 3–3.5 mm, glabrous.

• Forests, ravines; 3100–3700 m. SW Sichuan (Muli), NW Yunnan (Dêqên, Weixi, Zhongdian).

**11. *Valeriana hiemalis*** Graebner, Bot. Jahrb. Syst. 29: 600. 1901.

全缘叶缬草 *quan yuan ye xie cao*

Plants 20–50 cm tall. Rhizomes reduced; roots fascicled, 0.5–1.5 mm in diam. Stems solitary, simple, hirsute. Leaves simple; basal leaves spatulate, caducous; cauline leaves in 3–5 pairs; lower leaves petiolate, petiole 0.5–3 cm; upper leaves subsessile to sessile; blade ovate or oblong, 1–5 × 0.7–3 cm, hirsute, margin entire or serrate, apex obtuse to acute. Inflorescence capitate at anthesis, 1–2 cm in diam., ca. 5 cm in diam. in fruit; bracts linear, 0.7–1.1 cm. Corolla white or light pink, funnelform, 2.5–3.5 mm; lobes ca. 1 mm. Achenes narrowly ovoid,

3–3.5 mm, glabrous. Fl. late Jun–Aug, fr. Sep.

• Forests; 2000–3000 m. Shaanxi (Taibai Shan), NW Sichuan.

**12. *Valeriana hirticalyx*** L. C. Chiu, Acta Phytotax. Sin. 17(3): 124. 1979.

毛果缬草 *mao guo xie cao*

Plants 5–18 cm tall, stoloniferous. Rhizomes reduced; roots fascicled, fibrous, ca. 1 mm in diam.; stolons terminating in leafy rosettes. Stems solitary, erect, simple, glabrous or sparsely hirsute except at nodes. Rosette leaves long petiolate; blade orbicular, entire, caducous. Cauline leaves in 2 or 3 pairs, lowermost long petiolate; petiole 3–6 cm, subsessile apically; blade obovate, 1.5–3 × 1–1.5 cm, pinnatisect; segments 3–9, oblong to obovate, margin entire and ciliate; terminal segment 1–1.5 × 0.6–0.8 cm; lateral segments reduced. Inflorescence capitate at anthesis, ca. 1 cm in diam., expanding to 3–4 × 2–3 cm in fruit; bracts and bracteoles spatulate to lanceolate; bracteoles slightly shorter than fruit. Corolla red, tubular, ca. 5 mm, inside villous, lobes elliptic-oblong, ca. 2 mm. Stamens and style exserted. Achenes ellipsoid-ovoid, 3.5–4 × ca. 2 mm, both surfaces hirsute. Fl. Jul–Aug, fr. Aug–Sep.

• Grassy slopes with shrubs, stony places; 4000–5000 m. Qinghai (Henan, Nangqên, Qilian, Zadoi), NE Xizang (Amdo, Biru, Sogxian).

**13. *Valeriana jatamansi*** W. Jones, Asiat. Res. 2: 416. 1790.

蜘蛛香 *zhi zhu xiang*

*Valeriana harmsii* Graebner; *V. jatamansi* var. *frondosa* Handel-Mazzetti; *V. jatamansi* var. *glabra* Merrill; *V. jatamansi* var. *hygrobia* (Briquet) Handel-Mazzetti; *V. hygrobia* Briquet; *V. mairei* Briquet; *V. wallichii* Candolle; *V. wallichii* var. *violifolia* Franchet.

Plants 20–70 cm tall. Rhizomes short, robust, usually 0.5–2 cm in diam., nodes crowded; roots fibrous. Stems 1 to several, erect, glabrate to pubescent, more densely so at nodes. Basal leaves persistent, rosulate; petiole 4–10 cm; blade simple, cordate to cordate-ovate, 2–14 × 3–10 cm, hispidulous or glabrous, margin irregularly crenulate, crenate, or dentate, apex acute. Cauline leaves in 2 or 3 pairs, sessile or subsessile, 1–3 cm, simple or trifoliolate; lateral lobes reduced; terminal lobe ovate. Inflorescence corymbiform, villous at nodes; bracts subulate, margin scarious; bracteoles ca. as long as achenes. Corolla white or pinkish, funnelform; flowers polygamous; bisexual flowers 3–4 mm, female flowers ca. 1.5 mm. Stamens and style exserted. Achenes narrowly ovoid, 2–2.5 × 1–1.5 mm, both sides villous. Fl. (Apr–)May–Jul, fr. Jun–Sep.  $2n = 16, 32$ .

Grassy slopes, forests, by streams; below 2500(–3100) m. Chongqing (Kaixian, Nanchuan), Gansu, Guizhou (Leishan, Zunyi), Henan (Xixia), W Hubei, Hunan (Longshan), Sichuan (Emei Shan), Xizang (Zayü), Yunnan [Bhutan, E and N India, Nepal, N Thailand, Vietnam].

**14. *Valeriana kawakamii*** Hayata, Icon. Pl. Formosan. 5: 82. 1915.

高山缬草 *gao shan xie cao*

Plants 10–20 cm tall, stoloniferous. Rhizomes short, slender. Stems simple, glabrous. Lower cauline leaves long petiolate; petiole ca. as long as leaf blade, semiamplexicaul; blade obovate-spatulate, 2–3 × 0.8–1 cm, pinnatisect; terminal lobe

ovate, ca.  $10 \times 7$ – $10$  mm, puberulent, ultimately glabrescent, base cuneate, margin entire or remotely dentate, ciliate, apex obtuse to acute; lateral lobes similar but smaller, ca.  $4 \times 2$  mm, gradually reduced distally; upper leaves remote, smaller; leaflets 3–5. Inflorescence corymbiform, 1–2 cm in diam.; bracts linear, ca.  $4 \times 0.5$  mm, base dilated and amplexicaul, auriculate, ciliate, margin entire, apex obtuse. Flowers sessile. Corolla tubular-campanulate, ca.  $2.7 \times 1.5$  mm; lobes oblong-deltoid, ca.  $0.7 \times 0.7$  mm, glabrous, apex obtuse. Filaments inserted at middle part of corolla tube, ca. 1 mm, included, glabrous. Stamens 4, inserted distally in tube. Style exserted, 1–1.5 mm; stigma clavate. Achenes oblong-ovoid, ca. 3 mm. Fl. Apr–Jul, fr. Jul.

- Forests; high elevations. Taiwan.

**15. *Valeriana lancifolia*** Handel-Mazzetti, Acta Horti Gothob. 9: 181. 1934.

披针叶缬草 pi zhen ye xie cao

Plants 15–50 cm tall. Rhizomes reduced; roots fascicled, 0.5–1 mm in diam. Stems solitary, erect, simple, glabrous or subglabrous except at nodes. Leaves in 3 or 4 pairs near base of stem, sessile or shortly petiolate; blade oblong or lanceolate, 2– $10 \times 0.5$ –3 cm, base truncate, rounded, or broadly cuneate, margin coarsely serrate, apex rounded to acute. Inflorescence laxly paniculiform at anthesis; branches elongating in fruit, to ca. 30 cm; bracts spatulate, margin incised-dentate. Corolla rose, funnelform, 3–4 mm; lobes ovate, ca. 1/2 as long as tube. Stamens slightly exserted. Style evidently exserted. Achenes sublanceolate,  $2.5$ – $3 \times 1$  mm, glabrous; calyx segments ca. 5.5 mm. Fl. Jun–Jul, fr. Jul–Aug.

- Grassy slopes; 3200–4300 m. W Sichuan.

**16. *Valeriana minutiflora*** Handel-Mazzetti, Acta Horti Gothob. 13: 233. 1939.

小花缬草 xiao hua xie cao

Plants 8–45 cm tall. Rhizomes reduced; roots fascicled, clavate, 1.5–2 mm in diam.,  $\pm$  fleshy. Stems solitary, erect, simple. Cauline leaves in 3–5 pairs; petiole of lowermost leaves 1.5–3 cm; blade obovate to elliptic,  $1.2 \times 0.7$ –1.5 cm, sparsely pubescent, base rounded, margin coarsely serrate or crenulate, apex obtuse. Middle and upper leaves with shorter petiole; blade lyrate; terminal segment ovate to elliptic, 1–2 cm, margin sparsely serrate or crenulate, apex obtuse or acute; lateral segments much smaller, in 1 or 2 pairs. Inflorescence capitate at anthesis; bracts and bracteoles linear, entire or serrate, subequal to achenes in length. Corolla whitish rose, white, rose-purple, or pink, funnelform, 2.5–3 mm (bisexual) or ca. 1.5 mm (female), glabrous or pilose within; lobes ovate, equal to tube in length. Achenes ovoid-oblong, ca. 2.5 mm, glabrous or partially pilose. Fl. Jul–Aug, fr. Aug–Sep.

- Forests, grassy or stony slopes; 3000–4100 m. Qinghai, W Sichuan (Kangding, Qianning, Xiangcheng), Xizang, NW Yunnan.

**17. *Valeriana officinalis*** Linnaeus, Sp. Pl. 1: 31. 1753.

缬草 xie cao

*Valeriana alternifolia* Bunge; *V. alternifolia* f. *angustifolia* (Komarov) Kitagawa; *V. alternifolia* var. *angustifolia* (Komarov) S. H. Li; *V. alternifolia* f. *verticillata* (Komarov) S. X. Li;

*V. chinensis* Kreyer ex Komarov; *V. coreana* Briquet; *V. coreana* subsp. *leiocarpa* (Kitagawa) Voroschilov; *V. dubia* Bunge; *V. fauriei* Briquet; *V. fauriei* var. *leiocarpa* (Kitagawa) Kitagawa; *V. leiocarpa* Kitagawa; *V. nipponica* Nakai ex Kitagawa; *V. officinalis* var. *alternifolia* (Bunge) Ledebour; *V. officinalis* var. *latifolia* Briquet; *V. pseudofficinalis* C. Baranov; *V. tianschanica* Kreyer ex Handel-Mazzetti.

Plants up to 150 cm tall, infrequently stoloniferous. Rhizomes reduced; roots fascicled, clavate, 1.5–2.5 mm in diam. Stems hirsute or hispidulous, particularly at nodes, rarely glabrous. Basal and lowermost cauline leaves usually wilted at anthesis; cauline leaves petiolate to sessile; petiole 0–8 cm; blade ovate to broadly ovate, 5–15  $\times$  3–8 cm, pinnatisect; segments 7–15, lanceolate or linear, glabrous or  $\pm$  hispidulous, base decurrent, margin entire or coarsely serrate; terminal and lateral segments similar in shape and size. Inflorescence corymbiform, large and compact even in fruit, or with 2 distinct, secondary lateral inflorescences; bracts leaflike below, small and linear-lanceolate otherwise; bracteoles elliptic-oblong, oblanceolate, or linear-lanceolate, margin scarious-ciliate, apex awned. Corolla purplish red, pink, or white, funnelform, 4–6 mm; lobes elliptic. Stamens and style strongly exserted. Achenes narrowly ovoid, 4–5 mm, both sides glabrous or pubescent. Fl. May–Jul, fr. Jun–Oct.  $2n = 14, 28, 42, 56$ .

Grassy slopes, forests, by streams; below 2500 m, but up to 4000 m in Qinghai, Sichuan, and Xizang. Anhui, Chongqing, Gansu, Guizhou (Fanjing Shan, Huangping, Kaili), Hebei, Henan, W Hubei, W Hunan (Sangzhi, Xinning), Jiangxi (Lu Shan), N and SE Nei Mongol, Qinghai, Shaanxi, Shandong (Changqing, Kunyu Shan, Taishan), Shanxi, Sichuan, Taiwan, Xizang (Jomda, Qamdo, Riwoqê), Zhejiang (Tianmu Shan) [Japan, Russia; Europe].

*Valeriana officinalis* is a very variable species for which several infraspecific taxa have been described.

**18. *Valeriana sichuanica*** D. Y. Hong, Acta Phytotax. Sin. 30: 371. 1992.

川缬草 chuan xie cao

Plants 25–55 cm tall. Rhizomes reduced; roots fascicled, fibrous, ca. 1 mm in diam. Stolons sometimes present. Stems solitary, erect, simple, densely retrorsely hispid below, gradually sparsely so upward. Leaves all cauline, sparsely hispidulous adaxially; lower 1 or 2 pairs with petiole 2–3 cm; blade ovate to elliptic, 2–5  $\times$  1.2–2 cm, margin subentire to serrate; upper leaves pinnatisect, segments 4- or 5-paired, linear to elliptic, 1.5–3  $\times$  0.2–0.7 cm; terminal segment similar or slightly broader. Inflorescence laxly corymbiform; peduncles 8–14 cm; bracts linear; bracteoles ca. as long as achenes. Corolla rose, funnelform, 4–4.5 mm; tube ca. 2.5 mm, inside villous; lobes 1.5–2  $\times$  ca. 1 mm. Stamens and style exserted. Achenes narrowly ovoid, ca. 4 mm, sparsely hispid. Fl. Jul, fr. Aug.

- Mountain slopes; ca. 3600 m. SW Sichuan (Muli).

**19. *Valeriana stenoptera*** Diels, Notes Roy. Bot. Gard. Edinburgh 5: 295. 1912.

窄叶缬草 zhai ye xie cao

*Valeriana stenoptera* var. *cardaminea* Handel-Mazzetti.

Plants ca. 10 cm tall, infrequently stoloniferous. Rhizomes reduced; roots 3–6, fascicled, 1.5–2 mm in diam. Stems solitary, simple, erect, sparsely retrorsely puberulent below and at nodes above. Lower cauline leaves long petiolate; petiole 3–4 cm; blade obovate to ovate, 1–2 cm, undivided or with 1 or 2 pairs of small segments at base, margin serrulate. Middle and upper cauline leaves long petiolate to shortly petiolate or sessile; blade oblong or oblong-lanceolate, 2–5 × 1–2 cm, pinnatisect; segments 5–15, linear to linear-lanceolate, 12–20 × 1–2 mm, sparsely puberulent, margin entire or incised. Inflorescence capitate, becoming lax in fruit, 6–12 × 2–8 cm; bracts linear-lanceolate, sparsely dentate; bracteoles as long as or slightly shorter than achenes. Corolla rose, funnelform; tube 1.5–3 × 0.8–1.2 mm, inside villous; lobes elliptic, 1.5–2 × ca. 1 mm. Stamens and style exserted. Achenes ovoid-ellipsoid, ca. 4 mm, often pubescent. Fl. Jul–Aug, fr. Aug–Sep.

• Grassy slopes, forest margins, by water; 3000–4000 m. W Sichuan, Xizang, NW Yunnan.

**20. *Valeriana tangutica*** Batalin, Trudy Imp. S.-Peterburgsk. Bot. Sada 13: 375. 1894.

小纈草 xiao xie cao

Plants 10–20 cm tall, glabrous throughout. Rhizomes ascending, 0.5–2 cm, usually covered with fibrous remains of old leaves; roots fibrous, ca. 0.5 mm in diam. Stems erect, simple. Basal and lower cauline leaves long petiolate; petiole to 5 cm; blade broadly ovate to oblong-ovate, 1–4 × 1–1.5 cm, margin entire. Middle cauline leaves lyrate; terminal lobe orbicular or oblong, ca. 1 × 1 cm; lateral lobes 1- or 2-paired, reduced, elliptic to linear-elliptic, margin entire, apex obtuse. Upper cauline

leaves pinnatifid; segments 5–7, linear-lanceolate, entire; terminal one larger. Inflorescence semiglobose, 1–2 cm in diam.; bracts and bracteoles lanceolate, membranous. Corolla white, rose, pink, or sometimes purplish, funnelform, 5–6 mm; lobes obovate, nearly as long as tube. Stamens and style exserted. Achenes ovoid-ellipsoid, ca. 3 × 1 mm, glabrous. Fl. Jun–Jul, fr. Jul–Aug.

• Meadows, forests; 2000–3900(–4200) m. Gansu (Jiayuguan, Lintan, Sunan), SW Nei Mongol (Alxa Zuoqi), NW Ningxia (Helan Shan), N and NE Qinghai, Sichuan (Xiangcheng).

**21. *Valeriana trichostoma*** Handel-Mazzetti, Anz. Akad. Wiss. Wien, Math.-Naturwiss. Kl. 60: 117. 1923.

毛口纈草 mao kou xie cao

*Valeriana muliensis* S. K. Wu.

Plants less than 12 cm tall, stoloniferous. Rhizomes reduced; roots fascicled. Stems solitary, erect, simple, glabrous. Basal leaves not seen; cauline leaves undivided; petiole of lowermost leaves 2–5 cm; leaves shortly petiolate to subsessile above; blade orbicular to orbicular-elliptic, 8–13(–30) mm, hispidulous, 3–5-veined, base rounded, margin entire or those of upper leaves coarsely crenulate, apex rounded. Inflorescence capitate, 1.3–2.5 cm in diam.; peduncles ca. 1 cm; bracts linear-spatulate, ca. 6 mm, sparsely ciliate. Corolla rose or pink, funnelform, ca. 7 mm; tube ca. 4 mm, inside hirsute; lobes obovate-oblong. Stamens ca. as long as corolla. Ovary densely hirsute; style exserted by ca. 2 mm. Achenes not seen. Fl. Jul–Aug, fr. Sep.

• Grassy slopes; 3600–4600 m. SW Sichuan (Muli), NW Yunnan (Lijiang, Zhongdian).

## ANNONACEAE

番荔枝科 fan li zhi ke

Li Bingtao (李秉滔 Li Ping-tao)<sup>1</sup>; Michael G. Gilbert<sup>2</sup>

Trees, shrubs, or climbers, wood and leaves often aromatic; indument of simple or less often (*Uvaria*, *Annona*) stellate hairs. Leaves alternate, normally distichous. Stipules absent. Petiole usually short; leaf blade simple, venation pinnate, margin entire. Inflorescences terminal, axillary, leaf-opposed, or extra-axillary [rarely on often underground suckerlike shoots]. Flowers usually bisexual, less often unisexual, solitary, in fascicles, glomerules, panicles, or cymes, sometimes on older wood, usually bracteate and/or bracteolate. Sepals hypogynous, [2 or] 3, imbricate or valvate, persistent or deciduous, rarely enlarging and enclosing fruit, free or basally connate. Petals hypogynous, 3–6(–12), most often in 2 whorls of 3 or in 1 whorl of 3 or 4[or 6], imbricate or valvate, sometimes outer whorl valvate and inner slightly imbricate. Stamens hypogynous, usually many, rarely few, spirally imbricate, in several series; filaments very short and thick; anther locules 2, contiguous or separate, rarely transversely locular, adnate to connective, extrorse or lateral, very rarely introrse, opening by a longitudinal slit; connectives often apically enlarged, usually  $\pm$  truncate, often overtopping anther locules, rarely elongated or not produced. Carpels few to many, rarely solitary, free or less often connate into a 1-locular ovary with parietal placentas; ovules 1 or 2 inserted at base of carpel or 1 to several in 1 or 2 ranks along ventral suture, anatropous; styles short, thick, free or rarely connate; stigmas capitate to oblong, sometimes sulcate or 2-lobed. Fruit usually apocarpous with 1 to many free monocarps, these sometimes moniliform (constricted between seeds when more than 1-seeded), often fleshy, indehiscent, rarely dehiscent (*Anaxagorea*, *Xylopia*), and often with base extended into stipe, rarely on slender carpophore (*Disepalum*), less often syncarpous with carpels completely connate and seeds irregularly arranged and sometimes embedded in fleshy pulp. Seeds 1 to many per monocarp or many per syncarp, often arillate; endosperm copious, ruminate; embryo minute, near hilum.

About 129 genera and over 2,300 species: tropics and subtropics, especially in Old World; 24 genera (one endemic, three introduced) and 120 species (41 endemic, 11 introduced) in China.

The flowers often open before the petals have fully expanded making it easy to underestimate floral dimensions.

One of the major studies of the Annonaceae of tropical Asia was by Suzanne Jovet-Ast (1914–2006), who published an account of the Indochinese species under her maiden name, Ast (Fl. Indo-Chine, Suppl. 1: 62–121. 1938). Unfortunately, she failed to provide Latin descriptions for her many new taxa, none of the names of which was therefore validly published. Her new combinations were validly published, however, and she did subsequently validate a few species of *Goniothalamus* under her maiden name; but she did not validate most of her new species until after she married and took up the name “Jovet-Ast.” These later names form the major part of all her publications, so we have chosen to cite her as “Jovet-Ast [“Ast”]” for those taxa validated under her maiden name.

Tsiang Ying & Li Ping-t'ao. 1979. Annonaceae. In: Tsiang Ying & Li Ping-t'ao, eds., Fl. Reipubl. Popularis Sin. 30(2): 10–175.

- 1a. Fruit syncarpous, with completely united carpels and seeds embedded in pulp (usually cultivated as fruit trees).
  - 2a. Outer petals usually free, abaxially flat ..... 23. *Annona*
  - 2b. Outer petals connate at base, abaxially spurred or winged ..... 24. *Rollinia*
- 1b. Fruit apocarpous, with carpels forming free, often stipitate, monocarps.
  - 3a. Sepals or inner petals and sometimes also outer petals clearly imbricate; stellate hairs often present.
    - 4a. Trees or self-supporting shrubs; stellate hairs absent; sepals imbricate; petals valvate or very minutely imbricate; ovules 1 per carpel ..... 15. *Trivalvaria*
    - 4b. Climbing shrubs; stellate hairs present; sepals valvate; inner petals and sometimes also outer petals imbricate; ovules 2 or more per carpel.
      - 5a. Petals spreading at anthesis; torus depressed ..... 2. *Uvaria*
      - 5b. Petals incurved at anthesis, not opening widely; torus flattened, margin prominent ..... 3. *Cyathostemma*
  - 3b. Sepals and inner and outer petal whorls all valvate or rarely very narrowly imbricate at tip only (only 1 whorl of petals present in *Dasymaschalon*); simple hairs usually present, less often plant glabrous.
    - 6a. Climbing shrubs.
      - 7a. Peduncles and fruiting pedicels hooklike ..... 20. *Artabotrys*
      - 7b. Peduncles and fruiting pedicels not hooklike.
        - 8a. Monocarps ellipsoid, moniliform when more than 1-seeded; petals basally constricted to form enclosed floral chamber around stamens and carpels ..... 6. *Desmos*
        - 8b. Monocarps globose to cylindric, never moniliform; petals not constricted.

In addition, extensive contributions were received from Richard M. K. Saunders (*Dasymaschalon*, *Desmos*, *Mitrephora*, and *Pseuduvaria*), Wang Jing (王静; *Dasymaschalon*), Aruna D. Weerasooriya (*Mitrephora*), Yvonne C. F. Su (许传芳; *Pseuduvaria*), and Ng Kwok Wun (吴帼媛; *Desmos*); School of Biological Sciences, The University of Hong Kong, Pokfulam Road, Hong Kong, People's Republic of China.

- 9a. Monocarp stipes 5.3–7.5 cm; outer petals usually much larger than inner petals; stamen connectives apically truncate (flowers of *F. hainanensis* unknown) ..... 21. *Friesodielsia*
- 9b. Monocarp stipes 0.3–4 cm; outer petals only slightly larger than inner petals; stamen connectives apically acuminate to obtuse ..... 22. *Fissistigma*
- 6b. Trees or erect shrubs.
- 10a. Petals (2 or) 3, in 1 whorl ..... 7. *Dasymaschalon*
- 10b. Petals 6, in 2 whorls.
- 11a. Inner petals basally clawed or stipitate, laminas vaulted and connate into an apical cap at least initially.
- 12a. Outer petals 2–7 mm, usually smaller than inner petals and similar to sepals (inner and outer petals subequal in *Orophea hainanensis* and *O. yunnanensis*).
- 13a. Inner petals with a long basal claw, usually apically lozenge-shaped and cohering by their margins into a cap over stamens and carpels, sometimes with their tips conspicuously recurved; pedicel 0.2–1.2 cm ..... 4. *Orophea*
- 13b. Inner petals with a short basal claw, shallowly saccate, at first cohering by their margins but soon free; pedicel usually 1.4–10 cm (0.5–0.7 cm in *M. glochidioides*) ..... 5. *Milusa*
- 12b. Outer petals more than 12 mm, equaling or longer than inner petals, conspicuously different from sepals.
- 14a. Stamens linear-oblong; inner petals each with a short claw or stipe ..... 8. *Goniothalamus*
- 14b. Stamens cuneate; inner petals each with a long claw or stipe.
- 15a. Outer petals 1.6–2.5(–3.4) cm, longer than inner petals ..... 9. *Mitrephora*
- 15b. Outer petals 1–1.5 cm, shorter than inner petals ..... 10. *Pseuduvaria*
- 11b. Inner petals not basally clawed, spreading or connivent and apically 3-edged.
- 16a. Stamen connectives apically acuminate.
- 17a. Petals 5–8 cm, linear to linear-lanceolate ..... 19. *Cananga*
- 17b. Petals 0.7–1 cm, ovate-triangular to ovate-oblong, usually saccate and incurved at base
- 18a. Monocarps dehiscent, stipe clavate; ovules 2 per carpel ..... 1. *Anaxagorea*
- 18b. Monocarps indehiscent, stipe not clavate; ovules 5–22 per carpel ..... 18. *Alphonsea*
- 16b. Stamen connectives apically truncate, rounded, or broadly 3-angular.
- 19a. Ovules 1 or 2(or 3) per carpel, basally or nearly basally inserted.
- 20a. Inner petals concave and incurved to cover stamens; fruiting carpels free but usually connivent ..... 17. *Popowia*
- 20b. Inner petals spreading; fruiting carpels free and not connivent
- 21a. Monocarp bases extended into stipes, not articulate at base ..... 14. *Polyalthia*
- 21b. Monocarps on slender carpophores, articulate between apex of carpophore and base of monocarp ..... 16. *Disepalum*
- 19b. Ovules many per carpel, ventrally inserted.
- 22a. Flower buds lanceolate, apically long beaked and 3-angled; sepals connate at base or beyond into a cup; petals elongated, concave at base, narrowly convex below middle; anther locules transversely septate ..... 11. *Xylopia*
- 22b. Flower buds ovoid, apically rounded; sepals connate at base but not into a cup; petals flat or cucullate; anther locules not transversely septate.
- 23a. Petals flat; stamen connectives apically rounded; stigmas subcapitate, not constricted at base; monocarps almost sessile (Chinese species) ..... 12. *Meiogyne*
- 23b. Petals cucullate; stamen connectives apically truncate to subtruncate; stigmas ovoid, constricted at base; monocarps long stipitate ..... 13. *Chieniodendron*

# 1. ANAXAGOREA A. Saint-Hilaire, Nouv. Bull. Sci. Soc. Philom. Paris 1825: 91. 1825.

蒙蒿子属 meng hao zi shu

Li Bingtao (李秉滔 Li Ping-tao); Michael G. Gilbert

Shrubs or small trees. Inflorescences terminal, leaf-opposed, axillary, or extra-axillary, fasciculate or 1-flowered. Flowers pedicellate. Torus convex. Sepals 3, valvate, connate at base. Petals 6, in 2 whorls, with each whorl valvate, erect to spreading flat, subequal or outer larger than inner. Stamens many, all fertile or inner stamens sometimes reduced to staminodes; anther locules

linear-oblong; connectives apically apiculate. Carpels few to many; ovules 2 per carpel, basal; stigmas subglobose to oblong. Fruit apocarpous; monocarps long stipitate, clavate, dehiscent. Seeds 1 or 2 per monocarp, black and very shiny, without an aril.

About 27 species: tropical Asia and America; one species in China.

Both molecular (Richardson et al., *Philos. Trans.*, Ser. B, 359: 1495–1508. 2004) and morphological studies (Scharaschkin & Doyle, *Amer. J. Bot.* 93: 36–54. 2006) show that *Anaxagorea* is the sister group to the rest of the family.

**1. *Anaxagorea luzonensis*** A. Gray, U.S. Expl. Exped., Phan. 27. 1854.

蒙蒿子 meng hao zi

Shrubs 1–2 m tall, erect, glabrous except for flowers. Petiole 0.6–2 cm; leaf blade oblong to broadly elliptic, 9–16 × 3–7 cm, membranous, yellowish when dry, secondary veins 7 or 8 on each side of midvein, base rounded, apex acute to obtuse. Inflorescences leaf-opposed, 1- or 2-flowered. Flowers ca. 1.2 cm. Pedicel ca. 6 mm. Sepals rounded to ovate, outside puber-

lent. Petals greenish; outer petals ovate, slightly longer and ca. 2 × broader than inner petals; inner petals 8–9 × 4–5 mm. Stamens many. Carpels 2–4, ovoid-oblong, puberulent. Monocarp stipes clavate; monocarps 2–3 × 0.5–0.7 cm, dehiscing on dorsal side, apex acute. Seeds reddish when young, shiny dark brown upon maturity, obovate, flat, 8–11 × 6–7 mm. Fl. Jun–Oct, fr. Oct–Jan.

Densely forested slopes; 500–700 m. S Guangxi, Hainan [India, Indonesia, Laos, Myanmar, Philippines, Sri Lanka, Thailand].

## 2. *UVARIA* Linnaeus, Sp. Pl. 1: 536. 1753.

紫玉盘属 zi yu pan shu

Li Bingtao (李秉滔 Li Ping-tao); Michael G. Gilbert

*Narum* Adanson; *Uva* Kuntze.

Shrubs, climbing, sometimes erect or small trees, indument with stellate hairs. Inflorescences terminal, axillary, extra-axillary, leaf-opposed, or rarely on older branches; flowers mostly solitary or paired, rarely in short racemes or few-flowered cymes. Torus depressed, pubescent or tomentose. Sepals 3, valvate, usually connate at base. Petals 6, in 2 whorls, sometimes connate at very base, each whorl imbricate. Stamens many; anther locules often oblong or linear; connectives apically truncate to rounded. Carpels many, rarely few, linear-oblong; ovules many per carpel or rarely 2 or 3, in 1 or 2 series; styles outside often pilose; stigmas usually apically 2-cleft, involute. Fruit apocarpous; monocarps mostly ± stipitate, oblong, ovoid, or subglobose, fleshy and berrylike. Seeds several per monocarp or 1 by abortion, subhorizontal, with or without a short aril.

About 150 species: Old World tropics; eight species (one endemic) in China.

L. L. Zhou et al. (*Syst. Biodivers.* 7: 249–258. 2009) include *Cyathostemma* in *Uvaria* on the basis of a recent molecular study, but this is not accepted by one of us (Li). See the account of *Cyathostemma* for more details.

- 1a. Leaf blade abaxially glabrous or inconspicuously and sparsely stellate pubescent but soon glabrescent.
  - 2a. Leaf blade oblong to oblong-ovate, abaxially glabrous; ovules 6–8 per carpel ..... 1. *U. boniana*
  - 2b. Leaf blade obovate-lanceolate, abaxially inconspicuously and sparsely stellate pubescent, glabrescent; ovules 2 per carpel.
    - 3a. Fruit ca. 1 cm in diam., smooth; leaf blade secondary veins 8–12 on each side of midvein ..... 2. *U. tonkinensis*
    - 3b. Fruit ca. 3.5 cm in diam., densely tuberculate; leaf blade secondary veins 12–14 on each side of midvein ..... 3. *U. kweichowensis*
- 1b. Leaf blade abaxially distinctly tomentose or pubescent, hairs simple or stellate.
  - 4a. Flowers 9–10 cm in diam.; monocarps cylindric, 4–6 cm, slightly constricted between seeds ..... 6. *U. grandiflora*
  - 4b. Flowers 1.5–4 cm in diam.; monocarps globose to ovoid-ellipsoid, 2–3.8 cm, not constricted between seeds.
    - 5a. Monocarps with soft and dense spines; petals yellowish and leaf blade thinly leathery to thickly papery ..... 4. *U. calamistrata*
    - 5b. Monocarps unarmed; petals dark red to purple, or if yellow then leaf blade membranous.
      - 6a. Leaf blade membranous; petals yellow to yellowish ..... 5. *U. kurzii*
      - 6b. Leaf blade thinly leathery or leathery; petals dark red to purple.
        - 7a. Leaf blade apex acuminate, secondary veins adaxially flat; flowers ca. 1.5 cm in diam. .... 7. *U. rufa*
        - 7b. Leaf blade apex acute, obtuse, or rounded, secondary veins adaxially impressed; flowers 2.5–4 cm in diam. .... 8. *U. macrophylla*

**1. *Uvaria boniana*** Finet & Gagnepain, Bull. Soc. Bot. France 53(Mém. 4): 71. 1906.

光叶紫玉盘 guang ye zi yu pan

Shrubs to 5 m tall, climbing, glabrous except for flowers. Petiole 2–8 mm; leaf blade oblong to oblong-ovate, 4–15 × 1.8–5.5 cm, papery, secondary veins 8–10 on each side of midvein and slightly prominent on both surfaces, base cuneate to

rounded, apex acuminate to acute. Inflorescences extra-axillary, often leaf-opposed, 1- or 2-flowered. Pedicel 2.5–5.5 cm, bracteolate below middle. Sepals ovate, 2.5–3 mm, margin ciliate. Petals purple, leathery, puberulent; outer petals broadly ovate, ca. 1 × 1 cm; inner petals slightly smaller than outer petals, inside concave. Stamen connectives apically truncate, papillary. Carpels oblong, incurved, densely yellow pubescent; ovules 6–8 per carpel; stigmas horseshoe-shaped, apex 2-cleft. Monocarp stipes 4–5.5 cm; monocarps purple, globose to ellipsoid-ovoid, ca. 1.3 cm in diam. Fl. May–Oct, fr. Jun–Apr.

Moist secondary forests, thickets; 100–800 m. Guangdong, Guangxi, Guizhou, Hainan, Jiangxi [Vietnam].

**2. *Uvaria tonkinensis*** Finet & Gagnepain, Bull. Soc. Bot. France 53(Mém. 4): 74. 1906.

东京紫玉盘 *dong jing zi yu pan*

*Melodorum subglabrum* Bân; *M. vietnamense* Bân; *M. vietnamense* var. *calcareum* Bân; *Uvaria tonkinensis* var. *subglabra* Finet & Gagnepain.

Shrubs to 6 m tall, climbing. Branchlets sparsely stellate pubescent, glabrescent. Petiole 5–10 mm; leaf blade obovate, obovate-lanceolate, oblong, or elliptic, 12–21 × 4–7 cm, papery, abaxially sparsely stellate hairy but soon glabrescent, adaxially glabrous, secondary veins 8–12 on each side of midvein, base rounded to slightly cordate, apex long to shortly acuminate or rarely acute. Inflorescences terminal or leaf-opposed, 1-flowered. Pedicel 1.5–4.5 cm, sparsely stellate hairy. Sepals broadly obovate, 3–4 mm, outside densely stellate, inside concave and glabrous. Petals purple, 1.5–1.9 × 1.5–1.9 cm; outer petals obovate, broadly ovate, or orbicular, outside densely stellate pubescent; inner petals smaller than outer petals. Stamen connectives glabrous or hairy. Carpels cylindric, stellate pubescent or with hairs only at base and apically; ovules 2 per carpel; stigmas apically entire or 2-cleft. Monocarp stipes 2.5–5 cm; monocarps purple, globose, ca. 1 cm in diam.; epicarp smooth. Fl. Feb–Sep, fr. Aug–Dec.

Thickets, open forests; 200–600 m. Guangdong, W Guangxi, Hainan, S Yunnan [Vietnam].

**3. *Uvaria kweichowensis*** P. T. Li, Acta Phytotax. Sin. 14(1): 107. 1976.

贵州紫玉盘 *gui zhou zi yu pan*

Shrubs to 5 m tall, climbing. Branchlets sparsely stellate pubescent, glabrescent, lenticellate. Petiole 5–6 mm; leaf blade obovate to elliptic, 8–18 × 3.5–8 cm, papery, glossy, glabrous except for sparsely stellate pubescent veins, secondary veins 10–14 on each side of midvein and at ca. 45° to midvein, base rounded to broadly cuneate, apex acute and mucronate. Inflorescences leaf-opposed. Flowers not seen. Monocarp stipes ca. 1 cm, stout; monocarps ovoid, ca. 5.5 × 3.5 cm, densely stellate tomentose, apex rounded; epicarp tuberculate. Fl. Aug, fr. Sep–Oct.

• Secondary forests; ca. 1000 m. W Guangxi, SW Guizhou, Yunnan.

*Uvaria kweichowensis* is listed as Endangered (EN A2c) by the

IUCN Red List of Threatened Species (Version 2010.3; <http://www.iucnredlist.org>; accessed on 6 Oct 2010).

**4. *Uvaria calamistrata*** Hance, J. Bot. 20: 77. 1882.

刺果紫玉盘 *ci guo zi yu pan*

Shrubs to 8 m tall, climbing. Branchlets sparsely stellate pubescent, glabrescent. Petiole 5–10 mm, stellate tomentose; leaf blade oblong, elliptic, or obovate-oblong, 5–17 × 2–7 cm, thinly leathery to thickly papery, abaxially densely stellate pubescent, adaxially sparsely stellate pubescent, secondary veins 8–10 on each side of midvein, base obtuse, apex long acuminate to acute. Inflorescences axillary or leaf-opposed, fasciculate, 1–4-flowered. Flowers ca. 1.8 cm in diam. Sepals ovate, ferruginous tomentose. Petals yellowish; outer petals oblong, ca. 8 × 5 mm, ± equal to or slightly larger than inner petals, pubescent. Stamen connectives apically rounded to obtuse, puberulent. Carpels 7–15, pubescent; ovules 6–9 per carpel. Monocarps red, ellipsoid, 2–3.5 × 1.5–2.5 cm; epicarp densely softly spiny. Seeds brown, compressed, 3-angular, 10–12 × 8–9 mm. Fl. May–Jul, fr. Jul–Dec.

Forests or scrub on very steep slopes; 200–800 m. Guangdong, Guangxi, Hainan [Vietnam].

The fine, strong bast fibers obtained from the inner bark of *Uvaria calamistrata* is used for cordage and sack manufacturing.

**5. *Uvaria kurzii*** (King) P. T. Li, Acta Phytotax. Sin. 14(1): 106. 1976.

黄花紫玉盘 *huang hua zi yu pan*

*Uvaria hamiltonii* J. D. Hooker var. *kurzii* King in Ridley, Mat. Fl. Malay. Penins. 1(4): 263. 1892.

Shrubs to 16 m tall, climbing, densely stellate tomentose to stellate pubescent\*throughout. Petiole ca. 5 mm; leaf blade oblong-obovate, oblong-elliptic, or obovate, 9.5–21 × 4–8.5 cm, membranous, secondary veins 13–18 on each side of midvein, base narrowly and shallowly cordate, apex acuminate, obtuse, or sometimes rounded. Inflorescences leaf-opposed, 1- or 2-flowered; bracts ovate, ca. 7 × 3.5 mm. Flowers ca. 3.5 cm in diam. Pedicel 2.5–4 cm, bracteolate at middle. Sepals broadly ovate, ca. 5 × 5–6 mm. Petals yellow to yellowish; outer petals ovate to obovate-oblong, ca. 1.6 × 1.1–1.2 cm, apex rounded; inner petals as large as outer petals. Anthers oblong, ca. 3 mm; connectives apically truncate, puberulent. Carpels oblong, ca. 4 mm; ovules 10 per carpel, in 2 series; stigmas horseshoe-shaped, apex 2-cleft. Monocarps ovoid to subglobose, 2–3 × ca. 2 cm; epicarp densely tawny brown pubescent, not spiny. Fl. May, fr. Jul–Aug.

Dense forests; 400–1300 m. Guangxi, Yunnan [India].

Material of this species has been misidentified as *Cyathostemma yunnanense*.

**6. *Uvaria grandiflora*** Roxburgh ex Hornemann, Suppl. Hort. Bot. Hafn. 141. 1819.

大花紫玉盘 *da hua zi yu pan*

*Unona grandiflora* Leschenault ex Candolle; *Uvaria platy-petala* Champion ex Benthams; *U. purpurea* Blume; *U. rhodantha* Hance.

Shrubs to 10 m tall, climbing, densely stellate pubescent to ferruginous tomentose throughout. Petiole 5–8 mm; leaf blade oblong-obovate, 7–30 × 3.5–12.5 cm, papery to thinly leathery, secondary veins 10–17(–24) on each side of midvein and at ca. 60° to midvein, base shallowly cordate, apex acute, shortly acuminate, or sometimes caudate. Inflorescences leaf-opposed, cymose, 1(–3)-flowered; bracts 2, ovate to obovate, ca. 3 × 2.5 cm. Flowers 7–10 cm in diam. Pedicel 0.5–5 cm. Sepals broadly ovate, 2–2.5 × 2.5–3.5 cm, connate for basal third, membranous, inside glabrous, apex obtuse to acute. Petals dark red to vermilion red, turning purplish with age, obovate to oval-obovate, 4–4.5 × 2.5–3.5 cm, puberulent. Stamens oblong to linear, 6–7 mm; connectives apically truncate, glabrous. Carpels oblong to linear, ca. 8 mm; ovules 30–50 per carpel, in 2 series; stigmas apically involute and 2-cleft. Monocarp stipes 1.5–3 cm; monocarps orange, cylindric, 4–6 × 1.5–2 cm, slightly constricted between seeds, fleshy, apex mucronate; epicarp not spiny, minutely tomentose. Seeds pale brown, ovoid, flattened. Fl. Mar–Nov, fr. May–Dec.

Open forests, thickets; 400–1000 m. S Guangdong, SE Guangxi, Hainan [India, Indonesia, Malaysia, Myanmar, Philippines, Sri Lanka, Thailand, Vietnam].

**7. *Uvaria rufa* Blume, Fl. Javae, Annonaceae, 19. 1830.**

小花紫玉盘 xiao hua zi yu pan

Shrubs to 5 m tall, climbing. Branches stellate tomentose, hairs rust-colored when dry. Petiole 5–10 mm; leaf blade elliptic to ovate-oblong, 5–15 × 2.5–6 cm, thinly leathery, abaxially stellate tomentose, secondary veins ca. 12 on each side of midvein, base cordate, apex acuminate. Inflorescences leaf-opposed or extra-axillary, cymose, 1–4-flowered. Flowers ca. 1.5 cm in diam., stellate pubescent. Petals purple to dark red, ovate, 8–12 × 6–7 mm, apex rounded. Stamens oblong; connectives apically truncate, glabrous. Carpels oblong; stigmas apically 2-cleft. Monocarp stipes 1–2 cm; monocarps ovoid-ellipsoid to sometimes globose, ca. 2 × 1–1.5 cm, not constricted between seeds, apex rounded; epicarp not spiny. Fl. Mar–Jun, fr. Jun–Oct.

Sparsely forested slopes; 400–1700 m. Hainan, Yunnan [Cam-

bodia, India, Indonesia, Laos, Malaysia, Philippines, Thailand, Vietnam].

**8. *Uvaria macrophylla* Roxburgh, Fl. Ind. 2: 663. 1824.**

紫玉盘 zi yu pan

*Guatteria cordata* Dunal; *Uvaria badiiflora* Hance; *U. cordata* (Dunal) Alston (1931), not Schumacher & Thonning (1827); *U. dolichoclada* Hayata; *U. macchurei* Diels; *U. macrophylla* var. *microcarpa* (Champion ex Benth) Finet & Gagnepain; *U. microcarpa* Champion ex Benth; *U. obovatifolia* Hayata; *U. synsepala* Miquel.

Shrubs to 18 m tall, climbing, stellate pubescent throughout or stellate tomentose when young and glabrescent, hairs ferruginous in dried specimens. Petiole 5–10 mm; leaf blade obovate, oblong-obovate, elliptic, or broadly oblong, 9–30 × 3–15 cm, leathery, secondary veins 9–14(–22) on each side of midvein, abaxially elevated, and usually adaxially impressed when dry, base shallowly cordate, truncate, rounded, or rarely cuneate, apex acute, obtuse, or rounded and mostly apiculate. Inflorescences leaf-opposed or rarely extra-axillary, sometimes cymose, 1- or 2(or more)-flowered; bracts ovate to broadly elliptic, 4–7 mm. Flowers 2–3.8 cm in diam. Pedicel 0.5–4 cm. Sepals ovate to broadly ovate, 4–5 × 4–5 mm. Petals dark red, purple, or purplish, subovate to oblong-elliptic, 1.2–2 × 0.6–1.3 cm, spreading, apex rounded to obtuse. Stamens oblong, ca. 9 mm; connectives ovoid, apex puberulent or glabrous; outer stamens sterile, oblanceolate, ca. 7 mm. Carpels oblong, ca. 5 mm; stigmas horseshoe-shaped, apex 2-cleft and involute. Monocarps orange, ovoid to subterete, 1–3 × 1–1.5 cm, not constricted between seeds; epicarp not spiny, hairy or glabrous. Seeds globose, 6.5–7.5 mm in diam. Fl. Mar–Sep, fr. Jul–Mar.  $2n = 22$ .

Open forests, scrub; 400–1400 m. Fujian, Guangdong, Guangxi, Hainan, Taiwan, SE Yunnan [Bangladesh, Indonesia, Malaysia, Papua New Guinea, Philippines, Sri Lanka, Thailand, Vietnam].

The fine strong bast fiber obtained from the bark of *Uvaria macrophylla* is used for making sacks. The roots are used as a sedative, to stop vomiting, and for rheumatism. The leaves are used to relieve pain and to reduce swellings.

**3. CYATHOSTEMMA Griffith, Not. Pl. Asiat. 4: 707. 1854.**

杯冠木属 bei guan mu shu

Li Bingtao (李秉滔 Li Ping-tao); Michael G. Gilbert

Shrubs, climbing. Inflorescences terminal, extra-axillary, or often leaf-opposed; flowers solitary or in pendulous and few-flowered cymes from branches or trunk. Flowers bisexual or unisexual, subglobose. Pedicel bracteate. Torus flattened, margins prominent. Sepals 3, valvate, connate at base, usually hirsute. Petals 6, biseriate, short, subequal or inner smaller, imbricate at apex, valvate at base remaining incurved. Stamens numerous, oblong; anthers subintrorse; connectives oblique, incurved. Carpels numerous; ovules few to numerous per carpel, in 2 series; styles cylindric, glabrous; stigma conical, 2-cleft at apex. Fruit apocarpous, pedicellate; monocarps stipitate, oblong or ovoid. Seeds several per monocarp, in 2 series.

About ten species: China, Indonesia, Malaysia, Thailand, Vietnam; one species in China.

*Cyathostemma* was included in *Uvaria* on the basis of a recent molecular study by L. L. Zhou et al. (Syst. Biodivers. 7: 249–258. 2009). This study included 25 species of *Uvaria* and seven species of *Cyathostemma* (but not *C. yunnanense*) and showed the *Cyathostemma* spp. to form two separate groups nested within *Uvaria* and separated by four species of *Uvaria*. One of us (Gilbert) believes that this shows Zhou et al. were right to transfer all species of *Cyathostemma* to *Uvaria*.

1. *Cyathostemma yunnanense* Hu, Bull. Fan Mem. Inst. Biol. 10: 121. 1940.

杯冠木 bei guan mu

*Cyathostemma vietnamense* Bân; *Uvaria yunnanensis* (Hu) L. L. Zhou, Y. C. F. Su & R. M. K. Saunders (2009), not Li (1978).

Shrubs to 5 m tall, climbing, brownish pubescent throughout, often glabrescent. Petiole 5–8 mm; leaf blade obovate, 13–20 × 4.5–9 cm, membranous to papery, secondary veins 13–15 on each side of midvein, abaxially distinctly elevated, and adaxially slightly elevated and sparsely stellate pubescent or glabrous, base rounded to shallowly cordate, apex acute to obtuse. Inflorescences axillary, cymose, several flowered. Flowers small. Pedicel 1–1.5 cm, densely stellate pubescent; bracteoles 1 or 2, oblong to obovate, 4–13 mm. Calyx cupular; sepals reni-

form, densely stellate pubescent. Petals yellowish green; outer petals broadly ovate, ca. 7 × 7 mm; inner petals ca. 6 × 5 mm. Stamens ca. 3.5 mm; connectives broadly conic, puberulent. Carpels ca. 3.5 mm, densely pubescent; ovules 4–14 per carpel, in 2 series; stigmas conic, glabrous. Fruiting pedicel 0.7–4 cm; monocarpis ellipsoid, 4–7 × 3–4 cm; epicarp tubercular and densely tomentose to glabrous. Fl. Jun–Jul, fr. Aug–Oct.

Scrub on slopes; ca. 1000 m. S Yunnan [Vietnam].

*Cyathostemma yunnanense* is known in China only from the type collection. Other Chinese records are based on misidentifications of material of *Uvaria kurzii*. *Uvaria yunnanensis* (Hu) L. L. Zhou, Y. C. F. Su & R. M. K. Saunders (Syst. Biodivers. 7: 255. 2009) appears to be a later homonym of *U. yunnanensis* Li (Pl. Fossils China: Tertiary 3: 19, pl. 24, t. 7, f. 4. 1978, not seen), based on fossil material. A new epithet would be required if *Cyathostemma* was included within *Uvaria* because of the blocking name *U. vietnamensis* Meade (2005).

#### 4. OROPHEA Blume, Bijdr. 18. 1825.

澄广花属 cheng guang hua shu

Li Bingtao (李秉滔 Li Ping-tao); Michael G. Gilbert

*Mezzettiopsis* Ridley.

Trees or erect shrubs. Leaf blade often with pellucid dots. Inflorescences axillary or superaxillary, cymose, pedunculate or sessile, 1- or several flowered. Flowers bisexual. Sepals 3, smaller than outer petals. Petals 6, in 2 whorls, free, each whorl valvate; outer petals ovate or obovate, usually smaller than inner petals (± equal in *Orophea hainanensis* and *O. laui*); inner petals with base narrowly clawed, apical limbs lozenge-shaped and cohering by margins to form a mitriform cap, apex usually acute or acuminate and sometimes extended, thickened, and recurved. Stamens 3–14; anther locules ovoid, extrorse; connectives apically acute or obtuse but not truncate. Carpels 3–15, free; ovules 1–4 per carpel; stigmas sessile or subsessile, capitate or ellipsoid. Fruit apocarpous; monocarpis shortly stipitate, usually globose or oblong, sometimes constricted between seeds. Seeds 1–4 per monocarp.

About 37 species; S and SE Asia; six species (three endemic) in China.

All the Chinese species of *Orophea* belong to *O.* subg. *Sphaerocarpon* Kessler, distinguished by carpels with 2(or 3) ovules per carpel producing globose monocarpis with hemispherical seeds. *Mezzettiopsis* is included here following Leonardia and Kessler (Blumea 46: 141–163. 2001).

- 1a. Leaf blade base oblique; petals reddish or reddish yellow.
  - 2a. Shrubs to 4 m tall; leaf blade base shallowly cordate, abaxially hirsute; carpels 3–6; monocarpis villous ..... 1. *O. hirsuta*
  - 2b. Trees to 10 m tall; leaf blade base rounded, abaxially glabrous or glabrescent; carpels 12; monocarpis glabrous ..... 2. *O. polycarpa*
- 1b. Leaf blade base equilateral; petals white, yellowish green, or greenish.
  - 3a. Leaf blade leathery; stamens 9–14; carpels hairy.
    - 4a. Secondary veins of leaves 10–15 on each side of midvein; carpels 3; inner petals ± as long as outer petals ..... 3. *O. yunnanensis*
    - 4b. Secondary veins of leaves 7–11 on each side of midvein; carpels 9–18; inner petals much longer than outer petals, tips conspicuously recurved and thickened ..... 6. *O. laui*
  - 3b. Leaf blade papery; stamens 6–9; carpels glabrous.
    - 5a. Shrubs 2–4 m tall; petioles, leaf blades abaxially, sepals, and petals outside pubescent; inner petals clearly longer than outer petals; carpels 3 ..... 4. *O. multiflora*
    - 5b. Trees 6–8 m tall; petioles, leaf blades, sepals, and petals glabrous; inner and outer petals subequal; carpels 6 ..... 5. *O. hainanensis*

1. *Orophea hirsuta* King, J. Asiat. Soc. Bengal, Pt. 2, Nat. Hist. 61(2): 81. 1892.

毛澄广花 mao cheng guang hua

Shrubs to 4 m tall. Branchlets, petioles, leaf blades abaxially, and peduncles persistently ferruginous hispid. Petiole 1–2 mm; leaf blade elliptic to oblong, 3.5–12 × 1.5–5 cm, papery, secondary veins 7–11 on each side of midvein, base obliquely shallowly cordate, apex acuminate to acute. Inflorescences superaxillary, cymose, 1–3-flowered; peduncle 1–1.5 cm. Pedicel

ca. 4.5 mm, with 1 or 2 bracteoles at base. Sepals broadly ovate, puberulent. Petals reddish; outer petals broadly ovate, 3–4 mm, outside puberulent; inner petals ca. 8 mm, inside sparsely puberulent, basally long clawed, apically lozenge-shaped. Stamens 6. Carpels 3–6, glabrous; ovules 2 or 3 per carpel. Monocarp stipes 1–2 mm; monocarpis globose, 0.8–1.3 cm in diam., sparsely villous. Fl. Apr–Jul, fr. Jul–Dec.

Forested slopes; 300–600 m. Hainan, S Yunnan [Cambodia, India, Laos, Malaysia, Vietnam].

**2. *Orophea polycarpa*** A. Candolle, Mém. Soc. Phys. Genève 5: 215. 1832.

广西澄广花 *guang xi cheng guang hua*

*Orophea anceps* Pierre; *O. gracilis* King; *O. polycarpa* var. *anceps* (Pierre) Jovet-Ast ["Ast"]; *O. polycarpa* var. *undulata* (Pierre) Jovet-Ast ["Ast"]; *O. polycephala* Pierre; *O. undulata* Pierre.

Trees to 10 m tall. Branchlets grayish brown, pubescent when young, glabrescent. Petiole 1.5–3 mm, glabrous or glabrescent; leaf blade elliptic to oblong-elliptic, 4–10 × 1.5–4.5 cm, thickly papery, glabrous or abaxially glabrescent, secondary veins 8–10 on each side of midvein, base obliquely rounded, apex shortly acuminate to obtuse. Inflorescences axillary, 1-flowered. Flowers small. Pedicel filiform, 5–10 mm, bracteolate near base. Sepals triangular, ca. 2 × 1.5 mm, outside puberulent, inside glabrous. Petals reddish; outer petals elliptic to orbicular, 4–5 × 3–4 mm, outside puberulent, inside glabrous; inner petals rhombic, 8–9 × ca. 5 mm, glabrous, base long clawed, margin apically ciliate and revolute toward apex. Stamens 6; connectives apically conic. Carpels 12, glabrous; ovules 2 per carpel. Monocarp stipes 5–7 mm; monocarps globose, 0.5–1.9 cm in diam. Fl. Jul–Sep, fr. Aug–Nov.

Open forests; ca. 600 m. Guangxi, Hainan, SE Yunnan [Bangladesh, Cambodia, Laos, Malaysia, Myanmar, Sri Lanka, Thailand, Vietnam].

**3. *Orophea yunnanensis*** P. T. Li, Acta Phytotax. Sin. 14(1): 106. 1976.

云南澄广花 *yun nan cheng guang hua*

Shrubs ca. 2 m tall. Bark grayish black. Branchlets glabrous. Petiole ca. 3 mm; leaf blade oblong-elliptic to oblong-ovate, 2.5–7.5 × 1–2.3 cm, leathery, glabrous except abaxially puberulent on midvein, midvein adaxially flat, secondary veins 10–15 on each side of midvein and slightly elevated on both surfaces, base attenuate to broadly cuneate, apex acuminate. Inflorescences axillary, 1- or 2-flowered. Flowers ca. 3 mm in diam. Pedicel 2–5 mm, bracteolate at base or to near middle. Sepals triangular, outside puberulent, inside glabrous. Petals greenish yellow; outer petals ovate-triangular, 2.5–3 × 1.5–2 mm, outside pubescent, inside glabrous; inner petals ± as long as outer petals. Stamens ca. 12, ovoid; connectives apically acute. Carpels 3, densely villous; ovules 3 per carpel; stigmas capitate. Fruit not seen. Fl. Apr, fr. May–Jul.

● Forested slopes; ca. 600 m. Yunnan (Jiangchuan).

*Orophea yunnanensis* is listed as Critically Endangered (CR B1ab(i,ii,v)) by the IUCN Red List of Threatened Species (Version 2010.3; <http://www.iucnredlist.org>; accessed on 6 Oct 2010).

**4. *Orophea multiflora*** Jovet-Ast, Notul. Syst. (Paris) 9: 85. 1940.

多花澄广花 *duo hua cheng guang hua*

*Orophea chinensis* S. Z. Huang.

Shrubs to 4 m tall, erect. Bark grayish brown. Branchlets hispid when young, glabrescent. Petiole ca. 2 mm, hispid; leaf blade elliptic to oblong-elliptic, 5–9 × 2–3.5 mm, thickly pa-

pery, abaxially sparsely hispid or glabrous, adaxially glabrous, secondary veins 6–9 on each side of midvein, base rounded, apex acuminate. Inflorescences axillary, cymose, 1–3-flowered. Flowers ca. 5 mm in diam. Pedicel ca. 2 mm, hispid. Sepals ovate-triangular, 1–2 × ca. 1 mm, outside pubescent, inside glabrous. Petals greenish yellow; outer petals orbicular, ca. 3 × 2–3 mm, outside pubescent, inside glabrous; inner petals ovate-triangular, 5–8 × 2–4 mm, outside densely pubescent, inside glabrous. Stamens 9; filaments very short. Carpels 3, glabrous; ovules 2 or 3 per carpel; stigmas capitate. Monocarps globose, ca. 1 cm in diam. Fl. Mar, fr. Apr–Jun.

Forests on limestone; ca. 500 m. SW Guangxi [Vietnam].

The name *Orophea multiflora* was first published in 1938 (Fl. Indo-Chine, Suppl. 1: 121) but not validly so.

**5. *Orophea hainanensis*** Merrill, J. Arnold Arbor. 6: 132. 1925.

澄广花 *cheng guang hua*

Trees to 8 m tall. Branchlets sparsely pubescent or glabrous. Petiole 2–3 mm, glabrous or glabrescent; leaf blade elliptic to ovate, 4–9.5 × 2–4 cm, thickly papery, glabrous, secondary veins 4–7 on each side of midvein, base broadly cuneate, apex shortly acuminate to acute. Inflorescences axillary or superaxillary, usually 1–3-flowered, sparsely pubescent; peduncle 4–20 cm; bracts ciliate. Flowers 3–5 mm in diam. Pedicel 4–10 mm. Sepals ovate-triangular, 1.5–2 × 1–1.5 mm, golden pubescent, apex acute. Petals greenish white; outer petals broadly ovate to orbicular, ca. 4 × 4 mm, margin ciliate, apex acute; inner petals 7–8 mm, basal half a long and incurved claw, apex rhombic to ovate-triangular. Stamens 6; connectives apically incurved and mucronulate. Carpels 6–10, glabrous; ovules 2 per carpel; stigmas subcapitate, puberulent. Monocarp stipes 2–5 mm; monocarps globose, 7–8 mm in diam. Fl. Apr–Jul, fr. Jun–Dec.

● Dense woodlands; 400–700 m. Hainan, Guangxi.

**6. *Orophea laui*** Leonardía & Kessler, Blumea 46: 157. 2001.

蚁花 *yi hua*

Shrubs or small trees, 2.5–15 m tall. Branchlets slender, sparsely pubescent or glabrous. Petiole 3–7 mm; leaf blade oblong, narrowly oblong, or lanceolate, 5.5–19 × 2.2–7.5 cm, ± thickly papery to thinly leathery, sparsely pubescent or glabrous, midvein abaxially sometimes hispid and adaxially flat to slightly sunken, secondary veins 7–11 on each side of midvein, base cuneate, apex acute to shortly acuminate. Inflorescences axillary, cymose, 6-flowered or more, densely pubescent; peduncle 4–15 mm. Pedicel 0.9–1.2 cm, bracteolate near base. Sepals triangular to broadly ovate, 2–2.5 × ca. 2 mm, outside densely puberulent. Outer petals sepal-like, ovate, 3–4 × 3–4 mm, outside greenish white, slightly warty, and pubescent; inner petals 13–16 × 2–4 mm, slightly warty, sparsely hairy, basally clawed, limb strongly recurved and thickened. Stamens 9 in a single whorl or 12 (or 14) in 2 whorls; connectives apically rounded. Carpels 9–18, sparsely hairy, glabrescent; ovules 2–6 per carpel; stigmas capitate. Fruiting pedicel 4–9 mm, 1.5–2 mm thick; monocarp stipes 6–10 × ca. 1 mm; monocarps ca. 10, globose, 1–1.3(–2) cm in diam., glabrous. Seeds 1 or 2 per monocarp.

- Forested slopes; 400–1200 m. Hainan, S Yunnan.

This species was originally included within *Orophea creaghii* (Ridley) Leonardia & Kessler (*Mezzettiopsis creaghii* Ridley), but Leonardia and Kessler believe that the Chinese material originally iden-

tified as that species (Merrill, Lingnan Sci. J. 14: 5. 1935) is better treated as a distinct species endemic to China. *Orophea creaghii* s.s. differs by the leaves drying dark reddish brown and with shortly caudate tips and is found in Indonesia, Malaysia, and the Philippines.

## 5. MILIUSA Leschenault ex A. Candolle, Mém. Soc. Phys. Genève 5: 213. 1832.

野独活属 *ye du huo shu*

Li Bingtao (李秉滔 Li Ping-tao); Michael G. Gilbert

*Saccopetalum* Bennett.

Trees or erect shrubs. Inflorescences axillary or superaxillary, fasciculate or cymose, 1-flowered. Flowers mostly bisexual. Pedicel slender, usually elongate. Torus elevated, usually long pubescent. Sepals 3, small, valvate, connate at base. Petals 6, in 2 whorls, with each whorl valvate; outer petals similar to sepals; inner petals large, erect, thin, base shallowly saccate and shortly clawed, margin initially cohering but readily free, apex usually revolute. Stamens many; connectives narrow and not concealing anther locules, apex subapiculate. Carpels many, oblong; ovules 1–8 per carpel; stigmas capitate, ovoid, or globose. Fruit apocarpous; monocarps many, subsessile to long stipitate, globose to ovoid. Seeds 1 to several per monocarp.

About 38 species: tropical and subtropical Asia and Australia; seven species (three endemic) in China.

- 1a. Leaf blade broadest above middle; ovules 1 per carpel.
  - 2a. Leaf blade apex acuminate to shortly acuminate, secondary veins obscure and 7–9 on each side of midvein; pedicel 1–1.4 cm ..... 1. *M. tenuistipitata*
  - 2b. Leaf blade apex obtuse, secondary veins raised and 12–15 on each side of midvein; pedicel 2–3 cm ..... 2. *M. cuneata*
- 1b. Leaf blade broadest at or below middle; ovules 2–8 per carpel.
  - 3a. Shrubs; leaf blade glabrous or with larger veins only sparsely puberulent and glabrescent; sepals and petals sparsely pubescent.
    - 4a. Leaf blade secondary veins 13–20 on each side of midvein; pedicel 0.5–0.7 cm, superaxillary; inner petals ca. 0.3 cm ..... 3. *M. glochidioides*
    - 4b. Leaf blade secondary veins 10–12 on each side of midvein; pedicel 4–6.5 cm, axillary; inner petals ca. 1.8 cm ..... 4. *M. balansae*
  - 3b. Trees; leaf blade abaxially pubescent or tomentose; sepals and petals pubescent or tomentose.
    - 5a. Leaf blade 5–10 cm wide, base obliquely cordate; flowers 3–6 in leaf-opposed cymes or on short and few-leaved branches; carpels glabrous ..... 5. *M. velutina*
    - 5b. Leaf blade 1.8–5 cm wide, base obtuse to rounded and slightly oblique; flowers 1–3 and axillary; carpels pubescent.
      - 6a. Pedicel 3.5–7.5 cm; outer petals as long as sepals; ovules 2 per carpel; monocarps glabrous ..... 6. *M. sinensis*
      - 6b. Pedicel 1.5–3 cm; outer petals longer than sepals; ovules 8 per carpel; monocarps puberulent ..... 7. *M. horsfieldii*

1. *Miliusa tenuistipitata* W. T. Wang, Acta Phytotax. Sin. 6: 200. 1957.

云南野独活 *yun nan ye du huo*

Trees to 12 m tall, d.b.h. to 30 cm, most parts pubescent. Petiole 1–4 mm; leaf blade obovate-elliptic to obovate-oblong, 7.5–19 × 2.8–7 cm, membranous, secondary veins 7–9 on each side of midvein and inconspicuous on both surfaces, base rounded to broadly cuneate and sometimes slightly oblique, apex acuminate to shortly acuminate. Inflorescences axillary, 1-flowered; bracts lanceolate, ca. 3 mm. Flowers ca. 1 cm. Pedicel 1–1.4 cm. Sepals ovate-oblong, ca. 4 × 1.5 mm. Outer petals 2.5–5 × ca. 2 mm; inner petals ovate, ca. 9 × 5 mm, puberulent. Stamen connectives slightly elevated. Carpels 4–8, oblong, puberulent; ovule 1 per carpel; stigmas globose, glabrous. Fruiting pedicel 1.7–3.5 cm; monocarp stipes 0.9–2.1 cm; monocarps globose, ca. 7 mm in diam., glabrous, tuberculate. Seeds 1 per monocarp. Fl. May, fr. Jun.

- Mixed forests, scrub; 700–1500 m. SE Xizang, S Yunnan.

2. *Miliusa cuneata* Craib, Bull. Misc. Inform. Kew 1912: 145. 1912.

楔叶野独活 *xie ye ye du huo*

*Miliusa bannaensis* X. L. Hou.

Trees to 6 m tall. Branchlets grayish brown, reticulately striate brown tomentose or glabrous. Petiole 3–4(–8) mm; leaf blade oblanceolate to broadly oblanceolate, 4–18(–26) × 1.5–8(–10) cm, papery, more densely pubescent on veins but sometimes glabrous, secondary veins 12–15 on each side of midvein, base cuneate to rounded, apex obtuse to bluntly acuminate. Inflorescences axillary at leafless nodes, 2–6-flowered; peduncle 1–2 mm; bracts 1 or 2, broadly ovate, 1.5–2 × 1.5–2 mm. Pedicel (1–)2–3 cm, pendulous; bracteoles 1 or 2 at base of pedicel and 1 below middle, similar to bracts, persistent. Sepals triangular to broadly lanceolate, ca. 2 mm, outside pubescent. Petals pale purple; outer petals similar to sepals, ca. 3.5 × 0.7–1 mm, pubescent; inner petals broadly lanceolate to oblong, ca. 2 × 1.3 cm, outside pubescent, inside puberulent and basally

concave. Stamens 14–16, in 2 series, ca. 1.5 mm; connectives apically shortly cuspidate. Carpels many, ellipsoid to ovoid, sparsely white pubescent; ovule 1 per carpel; stigmas terete, glabrous. Fruiting peduncle ca. 2 mm, thicker than long; monocarp stipes 0.7–1.4 cm; monocarps 8–14, drying blackish, subglobose to ellipsoid-ovoid, 7–9 × ca. 5 mm, glabrous; epicarp tuberculate, glabrous. Seed 1 per monocarp. Fl. Apr–Sep, fr. Jun–Feb.

Open forests; 500–1500 m. S Yunnan [N Thailand].

**3. *Milium glochidioides*** Handel-Mazzetti, *Sinensia* 3: 185. 1933.

广西野独活 *guang xi ye du huo*

Shrubs to 1.5 m tall. Branchlets terete, ferruginous pilose to glabrescent. Petiole to 2 mm; leaf blade elliptic to narrowly ovate-lanceolate, 3–8 × 1–3 cm, sparsely pilose to glabrescent, secondary veins 13–20 on each side of midvein, base obliquely rounded, apex shortly acuminate. Inflorescences superaxillary, 1- or 2-flowered; bracts ovate, 0.5–1 mm, sericeous. Pedicel filiform, 0.5–0.7 cm, glabrous. Sepals broadly ovate, ca. 1 mm, outside minutely strigose, inside glabrous. Outer petals as long as sepals; inner petals ovate, ca. 3.5 × 2.5 mm, outside minutely strigose, inside glabrous. Stamens ca. 20; filaments as long as anther locules; connectives broader than anther locules, subangular. Carpels ca. 10, glabrous. Fruit not seen. Fl. Jul, fr. Aug–Oct.

• Forested slopes; below 900 m. Guangxi.

The Annonaceae Checklist (Rainer & Chatrou, eds., *AnnonBase* in *Species 2010* & *ITIS Catalogue of Life*; <http://herbarium.botanik.univie.ac.at/annonaceae/listTax.php>; accessed on 1 Oct 2010) treats this species as a synonym of *Orophea polycarpa*. The short pedicels are certainly anomalous among other Chinese species of *Milium* and more typical of *Orophea*, but there are serious discrepancies in the descriptions of these two taxa within China, most notably in petal sizes and stamen numbers, such that we do not wish to follow the checklist here.

**4. *Milium balansae*** Finet & Gagnepain, *Bull. Soc. Bot. France* 53(Mém. 4): 149. 1906.

野独活 *ye du huo*

*Milium chunii* W. T. Wang; *M. filipes* Merrill & Chun (1935), not Ridley (1920).

Shrubs 2–5 m tall. Branchlets slightly pubescent. Petiole 2–3 mm; leaf blade elliptic, elliptic-oblong, or oblong, 7–15 × 2.5–4.5 cm, membranous, glabrous or sparsely puberulent on midvein and secondary veins but glabrescent, secondary veins 10–12 on each side of midvein, base cuneate to rounded and oblique, apex acuminate to shortly acuminate. Inflorescences axillary, 1-flowered. Flowers 1.3–1.6 cm in diam. Pedicel filiform, 4–6.5 cm, pendulous, glabrous. Sepals ovate, ca. 2 mm, slightly pubescent. Petals red; outer petals slightly longer than sepals; inner petals ovate, 1.2–2.5 × 0.7–1.5 cm, apex reflexed. Anthers ovoid to obovoid. Carpels oblong to lens-shaped, slightly pubescent; ovules 2 or 3 per carpel; stigmas terete, puberulent. Fruiting peduncle 4–7.5 cm, slender; monocarp stipes 1–2 cm; monocarps globose, 7–10 mm in diam. Seeds 1–3 per monocarp. Fl. Apr–Jul, fr. Jul–Dec.

Forests or scrub in valleys; 500–1800 m. Guangdong, Guangxi, Guizhou, Hainan, S Yunnan [Vietnam].

**5. *Milium velutina*** (Dunal) J. D. Hooker & Thomson, *Fl. Ind.* 1: 151. 1855.

大叶野独活 *da ye ye du huo*

*Uvaria velutina* Dunal, *Monogr. Anonac.* 91. 1817; *Guarteria velutina* (Dunal) A. Candolle; *U. villosa* Roxburgh.

Trees to 20 m tall. Branches tomentose when young. Petiole 2–7 mm, tomentose; leaf blade elliptic, ovate, or oblong, 8–15[–30] × 5–10[–16] cm, secondary veins ca. 16 on each side of midvein, base obliquely rounded to cordate, apex acute to shortly acuminate. Inflorescences leaf-opposed or on short few-leaved branches, cymose, 3–6-flowered. Peduncle 6–25 mm, tomentose; bracts minute, caducous. Pedicel 5–10 cm, slender; bracteoles similar to bracts. Torus glabrous. Sepals and outer petals ovate-triangular, 2–8 × 1.5–3.5 mm; inner petals dark brown, ovate-lanceolate to lanceolate-rhombic, ca. 10[–18] × 6[–10] mm, outside with very dense appressed golden hairs, inside glabrous. Carpels many, pubescent; ovules 2 per carpel, stigma clavate. Monocarp stipes 5–8 mm; monocarps globose to ovoid, ca. 20 × 16 mm, pilose. Fl. May, fr. Jul.  $2n = 18$ .

Forested slopes; 500–700 m. S Yunnan [Cambodia, India, Laos, Malaysia, Myanmar, Nepal, Pakistan, Thailand, Vietnam].

**6. *Milium sinensis*** Finet & Gagnepain, *Bull. Soc. Bot. France* 53(Mém. 4): 151. 1906.

中华野独活 *zhong hua ye du huo*

*Evodia lvi* H. Léveillé.

Trees to 6 m tall, most parts pubescent and densely so when young. Petiole 2–3 mm; leaf blade elliptic, oblong-elliptic, or rarely oblong, 5–13 × 2–5 cm, thinly papery to membranous, secondary veins 9–11 on each side of midvein, base obtuse to rounded and slightly oblique, apex acuminate to obtuse. Inflorescences axillary, erect to pendulous, 1-flowered; bracts 2–4, pubescent. Flowers 1–1.5 cm in diam. Pedicel 3.5–7.5 cm; bracteoles 2–4, near pedicel base. Sepals lanceolate, ca. 3 mm, apex obtuse and spreading. Outer petals as long as sepals; inner petals purplish red, ovate, 10–15 × 6–8 mm. Stamen connectives apically apiculate. Carpels ovoid, pubescent; ovules 2 per carpel; stigmas ovoid to subcapitate, glabrous. Monocarp stipes 1.3–2.1 cm, pendulous, puberulent; monocarps globose to obovoid, 7–10 × 7–8 mm, glabrous. Seeds 1 or 2 per monocarp. Fl. Apr–Sep, fr. Jul–Dec.

• Dense forests, scrub; 500–1500 m. Guangdong, Guangxi, Guizhou, S Yunnan.

**7. *Milium horsfieldii*** (Bennett) Pierre, *Fl. Forest. Cochinch.* t. 38. 1881.

囊瓣木 *nang ban mu*

*Saccopetalum horsfieldii* Bennett, *Pl. Jav. Rar.* 165. 1840; *Alphonsea prolifica* Chun & F. C. How; *Milium prolifica* (Chun & F. C. How) P. T. Li; *M. tectona* C. E. Parkinson; *S. arboreum* Elmer; *S. lineatum* Craib; *S. prolificum* (Chun & F. C. How) Tsing; *S. unguiculatum* Fischer.

Trees to 15[–35] m tall, evergreen, d.b.h. to 50 cm. Bark ochre-colored. Branches villous. Petiole ca. 2 mm, villous; leaf blade elliptic to oblong, 4–13 × 1.8–4 cm, papery, abaxially villous, adaxially sparsely pubescent but densely so on veins, secondary veins 10–14 on each side of midvein, base rounded and slightly oblique, apex acute to acuminate. Inflorescences axillary, cymose, 1–30-flowered. Pedicel 1.5–3 cm, recurved. Sepals broadly triangular, ca. 3(–10) × 1–2 mm. Petals dark red; outer petals lanceolate, ca. 7(–13) × 1–2 mm, reflexed at anthesis; inner petals ovate-lanceolate, 20–26(–40) × 5–10(–15) mm, incurved, with a conspicuous midvein. Stamens ca. 1 mm. Carpels incurved crescent, densely sericeous; ovules 8 per carpel, in 2 series; stigmas ovoid, glabrous. Monocarp stipes 1–

1.5 cm; monocarps 5–20, dark red at maturity, globose to subglobose, 1–2 cm in diam., puberulent. Seeds 2–8 per monocarp, reniform, ca. 11 × 5 mm. Fl. Mar–Jun, fr. Jul–Aug.

Dense forests, woodlands; 300–1000 m. Guangdong, Hainan [India (Andaman and Nicobar Islands), Indonesia, Laos, Malaysia, Myanmar, Philippines, Thailand; Australia].

The timber from *Miliusa horsfieldii* is straight, hard, non-splitting, and fine grained and is used for vehicle construction, agricultural implements, machinery, etc. Merrill and Chun (Sunyatsenia 2: 230. 1935) misidentified material of this species as *Alphonsea mollis* Dunn.

*Miliusa horsfieldii* is listed as Vulnerable (VU A2c) by the IUCN Red List of Threatened Species (Version 2010.3; <http://www.iucnredlist.org>; accessed on 6 Oct 2010, as *Saccopetalum prolificum*).

## 6. DESMOS Loureiro, Fl. Cochinch. 1: 329 [“*Desmis*”], 352. 1790.

假鹰爪属 *jia ying zhua shu*

Li Bingtao (李秉滔 Li Ping-tao); Ng Kwok Wun (吴帼媛), Richard M. K. Saunders

Shrubs, erect or scandent, rarely treelets, indument of simple hairs. Petiole short; leaf blade venation arcuately looped near margin. Inflorescences solitary, axillary, superaxillary, or leaf-opposed, 1- or 2-flowered. Flowers bisexual. Sepals 3, valvate. Petals 6, in 2 whorls; each whorl valvate, subequal or outer whorl slightly larger than inner whorl; inner whorl basally constricted around reproductive organs to form enclosed floral chamber. Stamens many; connectives apically truncate or rounded; pollen inaperturate, in monads. Carpels many, free; ovary densely hairy; ovules 1–8 per carpel; stigmas oblong or ovoid, bent, with 1 U-shaped opening and a groove continued down adaxial side of carpel. Fruit apocarpous; monocarps many, shortly stipitate, fleshy, ellipsoid when 1-seeded or moniliform (rarely only slightly so) when more than 1-seeded. Seeds subglobose or ellipsoid.

About 25–30 species: tropical and subtropical Asia; five species (two endemic) in China.

- 1a. Outer petals significantly smaller than inner petals; sepals ca. 1 mm; multi-seeded monocarps only slightly moniliform.
  - 2a. Leaf blade secondary veins 10–14 on each side of midvein; monocarps hairy ..... 4. *D. yunnanensis*
  - 2b. Leaf blade secondary veins 7–11 on each side of midvein; monocarps glabrous ..... 5. *D. saccopetaloides*
- 1b. Outer petals slightly larger than or subequal to inner petals; sepals 4–11 mm; multi-seeded monocarps distinctly moniliform.
  - 3a. Young branches densely hairy; leaf blade abaxially with erect hairs ..... 1. *D. dumosus*
  - 3b. Young branches subglabrous to hairy; leaf blade abaxially with appressed hairs.
    - 4a. Leaf blade 15–28 × 5.5–8 cm, secondary veins 12–17 on each side of midvein; inflorescences to 4-flowered; fruit pedicel 6–8 cm ..... 2. *D. grandifolius*
    - 4b. Leaf blade 6–14 × 2–6.5 cm, secondary veins 7–12 on each side of midvein; inflorescences 1-flowered; fruit pedicel 2–6 cm ..... 3. *D. chinensis*

**1. *Desmos dumosus* (Roxburgh) Safford, Bull. Torrey Bot. Club 39: 506. 1912.**

毛叶假鹰爪 *mao ye jia ying zhua*

*Unona dumosa* Roxburgh, Fl. Ind. 2: 670. 1824.

Climbers to 4 m tall, woody. Branches densely hairy when young. Petiole 5–10 mm; leaf blade obovate-elliptic to oblong, 5–16 × 2–7 cm, membranous to thinly papery, abaxially densely erect hairy, secondary veins 9–15 on each side of midvein, base shallowly cordate to truncate, apex shortly acuminate to acute. Inflorescences extra-axillary or leaf-opposed, 1-flowered. Pedicel 1–3 cm. Flowers pendulous. Sepals ovate to lanceolate, 4–11 × 2.5–6.5 mm. Outer petals ovate to obovate, 4–6.5 × 1.5–3.5 cm; inner petals ovate to lanceolate, 3–4(–6.5) × 0.5–0.8(–2) cm. Stamen connectives apically truncate to rounded. Carpels many; stigmas clavate, apex 2-cleft. Fruiting pedicel 2–4 cm; monocarp stipes 4–7 mm; monocarps ellipsoid or monili-

form, 0.8–5.5 × 0.5–0.8 cm, sparsely to densely hairy. Fl. Apr–Aug, fr. Jul–Apr.

Open forests, thickets; 500–1700 m. Guangxi, Guizhou, S Yunnan [Bhutan, India, Laos, Singapore, Thailand, Vietnam].

**2. *Desmos grandifolius* (Finet & Gagnepain) C. Y. Wu ex P. T. Li, Acta Phytotax. Sin. 14(1): 104. 1976.**

大叶假鹰爪 *da ye jia ying zhua*

*Unona desmos* Dunal var. *grandifolia* Finet & Gagnepain, Bull. Soc. Bot. France 53(Mém. 4): 81. 1906; *Desmos cochinchinensis* Loureiro var. *grandifolius* (Finet & Gagnepain) Jovet-Ast [“Ast”].

Climbers to 5 m tall, woody. Branches subglabrous to hairy when young. Petiole 5–10 mm; leaf blade oblong, 15–28 × 5.5–8 cm, papery to thinly leathery, abaxially sparsely to densely appressed hairy, secondary veins 12–17 on each side of

midvein and adaxially flattened, base shallowly cordate to truncate, apex shortly acuminate. Inflorescences fasciculate, (1-)4-flowered. Flowers pendulous. Pedicel 2.5–8 cm, puberulent, glabrescent; bracteoles near pedicel base, ovate, ca. 2.5 mm, abaxially puberulent, adaxially sparsely puberulent. Sepals ovate, 4–10 × 4–7 mm. Outer petals elliptic to lanceolate, 3.5–6 × 1.5–3 cm; inner petals lanceolate, 3–5 × 0.6–1 cm, puberulent on both surfaces. Anthers oblong, ca. 1.5 mm; connectives apically truncate to rounded. Carpels ca. 15; stigmas clavate, apex 2-cleft. Fruiting pedicel 6–8 cm; monocarp stipes ca. 1.6 cm; monocarps ellipsoid or moniliform, 1–5 × ca. 0.6 cm, hairy. Fl. Mar–Apr, fr. May–Sep.

Dense forests or thickets in valleys; 100–500 m. Guangxi, S Yunnan [Vietnam].

**3. *Desmos chinensis*** Loureiro, Fl. Cochinch. 1: 352. 1790.

假鹰爪 jia ying zhua

*Artabotrys esquirolii* H. Léveillé; *Unona chinensis* (Loureiro) Candolle; *U. discolor* Vahl.

Climbers to 4 m tall, woody. Branches stout, sparsely hairy when young, with raised grayish white lenticels. Petiole 3–8 mm; leaf blade oblong to elliptic, rarely broadly ovate, 6–14 × 2–6.5 cm, membranous to thinly papery, abaxially glaucous and sparsely appressed hairy, adaxially glossy, secondary veins 7–12 on each side of midvein, base rounded to slightly oblique, apex acute to acuminate. Inflorescences superaxillary or leaf-opposed, 1-flowered. Flowers 3–6 cm wide, pendulous. Pedicel 2–6.5 cm. Sepals ovate to lanceolate, 4–10 × 2–4.5 mm. Outer petals oblong to oblong-lanceolate, 3–6.5 × 1–2 cm; inner petals lanceolate, 4–7 × 1–2 cm. Stamen connectives apically truncate to rounded. Carpels 25–35; stigmas clavate, apex 2-cleft. Fruiting pedicel 2–6 cm; monocarp stipes 4–14 mm; monocarps ellipsoid or moniliform, 0.8–6 cm × 4–6 mm, with 2–6 joints; joints yellowish brown, subglobose, ca. 7 × 6 mm, sparsely hairy, apex of terminal obtuse to shortly rostrate. Fl. Apr–Oct, fr. Jun–Dec.  $2n = 20$ .

Wastelands and thickets in valleys; 100–1500 m. Guangdong, Guangxi, S Guizhou, Hainan, SE Yunnan [Bhutan, Cambodia, India, Indonesia, Laos, Malaysia, Nepal, Philippines, Thailand, Vietnam].

The bast fibers of *Desmos chinensis* are used for cordage; the roots and leaves are used medicinally; and the leaves are used in brewing liquor in Hainan.

**4. *Desmos yunnanensis*** (Hu) P. T. Li, Fl. Reipubl. Popularis Sin. 30(2): 51. 1979.

云南假鹰爪 yun nan jia ying zhua

*Phaeanthus yunnanensis* Hu, Bull. Fan Mem. Inst. Biol. 10: 125. 1940; *Dasymaschalon yunnanense* (Hu) Bân.

Climbers, to 6 m tall, woody. Branches densely hairy when young. Petiole 3–8 mm; leaf blade oblong to obovate-oblong, 10–16 × 3.5–6.8 cm, membranous to thinly papery, abaxially appressed hairy, secondary veins 10–14 on each side of midvein and adaxially elevated, base rounded, apex acuminate. Inflorescences axillary, 1-flowered. Pedicel to 2.5 cm. Sepals broadly ovate, ca. 1 mm. Outer petals ovate, ca. 3 mm; inner petals ovate to obovate, ca. 2.8 × 2 cm, outside densely puberulent, inside sparsely puberulent. Stamen oblong, ca. 2 mm; connectives apically truncate. Carpels ca. 13, oblong, ca. 2 mm, glabrous, very sparsely hairy, or pilose; ovules 2–5 per carpel; stigmas globose. Monocarp stipes ca. 1 cm; monocarps slightly moniliform, to 3.5 × 0.5 cm, with 2 or 3 joints; joints cylindric to ellipsoid, pilosulose. Fl. Oct, fr. Aug.

• Mixed forests; 1000–1400 m. S Yunnan (Xishuangbanna).

The taxonomic placement of this species within *Desmos* is questionable and requires further research.

**5. *Desmos saccopetaloides*** (W. T. Wang) P. T. Li, Guihaia 13: 314. 1993.

亮花假鹰爪 liang hua jia ying zhua

*Phaeanthus saccopetaloides* W. T. Wang, Acta Phytotax. Sin. 6: 199. 1957.

Trees or woody climbers, to 6 m tall. Branches appressed ferruginous pubescent when young, glabrescent. Petiole 3.5–5 mm; leaf blade elliptic, oblong, or ovate-oblong, 5.5–13.5 × 2–4.5 cm, membranous, abaxially sparsely hairy but glabrescent, adaxially glabrous except for puberulent midvein, secondary veins 7–11 on each side of midvein, base cuneate, apex acuminate. Inflorescences leaf-opposed, 1-flowered. Pedicel 2–2.2 cm. Sepals ovate-triangular, ca. 1 × 1 mm. Outer petals ovate-triangular, ca. 4 mm; inner petals ovate-oblong to lanceolate, 2.7–3.5 × 1–1.3 cm, outside pubescent, inside densely pubescent. Stamen connectives apically truncate. Carpels ca. 12, ca. 2.2 mm, densely tomentose; ovules ca. 8 per carpel; stigmas sessile, globose. Monocarp stipes 4–6 mm; monocarps slightly moniliform, 1.8–2.7 × 1–1.2 cm, with 3–5 joints, glabrous. Fl. Aug–Sep, fr. Oct–Nov.

• Forested slopes; 1200–2300 m. S Yunnan (Xishuangbanna).

The taxonomic placement of this species within *Desmos* is questionable and requires further research.

**7. *DASYMASCHALON*** (J. D. Hooker & Thomson) Dalla Torre & Harms, Gen. Siphon. 174. 1901.

皂帽花属 zao mao hua shu

Li Bingtao (李秉滔 Li Ping-tao); Wang Jing (王静), Richard M. K. Saunders

*Unona* sect. *Dasymaschalon* J. D. Hooker & Thomson, Fl. Ind. 1: 134. 1855.

Small trees [rarely climbers], indument of simple hairs. Petiole short; leaf blade venation arcuately looped near margin. Inflorescences axillary, 1-flowered. Flowers bisexual. Sepals 3, valvate. Petals (2 or) 3, in 1 whorl alternate with sepals, valvate, apically connivent to form a mitriform dome (floral chamber) over reproductive organs and often with very small basal apertures between

petals. Stamens many; connectives apically truncate or apiculate; pollen inaperturate, in monads. Carpels many, free; ovary densely hairy; ovules 1 to many per carpel. Fruit apocarpous; monocarp stipitate, ellipsoid when 1-seeded or moniliform when more than 1-seeded, fleshy, with a terminal apiculus. Seeds 1–6 per monocarp, globose or ellipsoid.

About 30 species: tropical and subtropical Asia; six species (two endemic) in China.

*Dasymaschalon* was included within *Desmos* in FRPS (30(2): 45–53. 1979) but is supported by molecular studies and is easily distinguished morphologically by the absence of an inner whorl of petals (J. Wang et al., Syst. Bot. 34: 252–265. 2009).

- 1a. Leaf blade midvein adaxially hairy; petiole densely hairy; sepals ovate, 7–16 × 4–9 mm; fruiting pedicel densely hairy ..... 1. *D. trichophorum*
- 1b. Leaf blade midvein adaxially glabrous; petiole glabrous or sparsely hairy; sepals triangular, 1–4 × 1.5–4 mm; fruiting pedicel glabrous or sparsely hairy.
  - 2a. Leaf blade 6–8.5 cm; petiole 2.3–3.3 mm; stamen connectives apically apiculate; pollen verrucate; monocarp stipes 2.5–3 mm; seeds 5–6 mm ..... 2. *D. robinsonii*
  - 2b. Leaf blade 10.5–21.5 cm; petiole 4.4–11 mm; stamen connectives apically truncate to rounded; pollen echinate; monocarp stipes 4–18 mm; seeds 6.5–24 mm.
    - 3a. Leaf blade base slightly cordate; floral chamber ca. 20% of petal length ..... 3. *D. glaucum*
    - 3b. Leaf blade base rounded or slightly attenuate; floral chamber 50%–90% of petal length.
      - 4a. Petiole glabrous; petals ca. 7 cm; monocarps 8.5–10 mm wide; monocarp stipes ca. 1.8 cm ..... 4. *D. tibetense*
      - 4b. Petiole sparsely hairy; petals 2–4.5 cm; monocarps 4.5–8 mm wide; monocarp stipes 0.6–1.3 cm.
        - 5a. Floral chamber ca. 50% of petal length; monocarps 1.1–2 cm; seeds globose, ca. 1.3 × as long as wide ..... 5. *D. rostratum*
        - 5b. Floral chamber ca. 90% of petal length; monocarps 3–5 cm; seed ellipsoid, 3.5–6 × as long as wide ..... 6. *D. sootense*

1. *Dasymaschalon trichophorum* Merrill, Lingnan Sci. J. 6: 326. 1930.

皂帽花 zao mao hua

Trees to 3.5 m tall. Branches very densely hairy when young. Petiole 2.5–5.5 mm, densely hairy; leaf blade elliptic to obovate, 7–15 × (2.5–)4–8 cm, papery, abaxially glaucous and sparsely to densely hairy, adaxially glabrous or sparsely hairy, midvein hairy and abaxially more densely so, secondary veins 10–14 on each side of midvein and adaxially impressed, base rounded to shallowly cordate, apex acute. Flowers axillary or terminal on young growth. Pedicel 1–2 cm, densely hairy. Sepals 7–16 × 4–9 mm. Petals purplish red, triangular to ovate, 1.6–3 × 0.7–1 cm, papery, not twisted, outside densely hairy; floral chamber 4–6.5 mm, 20%–30% of petal length. Stamens 40–70 per flower; connectives apically apiculate; pollen echinate. Carpels 15–25, hispid; stigmas sparsely papillate. Fruiting pedicel 1–2.4 cm, densely hairy; monocarp stipes 3.5–6.5 mm; monocarps dark purple, subglobose when 1-seeded or moniliform when more than 1-seeded, 8.5–13 × 2.7–5.5 mm, with grayish white bristles, glabrescent, terminal apiculus 0.2–0.8 mm; joints 3–8, subglobose, 5–6 × ca. 5 mm, constrictions 1.2–2.3 mm wide, 25%–35% of monocarp width. Seeds 3–8 per monocarp, subglobose, 5.2–6 × 4.8–5 mm. Fl. Apr–Jul, fr. Jul–Dec.

● Sparsely forested slopes on sandy soil; below 100 m. Guangdong, Guangxi, Hainan.

Specimens of *Dasymaschalon trichophorum* have previously been misidentified as *D. macrocalyx* Finet & Gagnepain (*Desmos macrocalyx* (Finet & Gagnepain) P. T. Li), which does not occur in China.

2. *Dasymaschalon robinsonii* Jovet-Ast, Notul. Syst. (Paris) 9: 84. 1940.

钝叶假鹰爪 dun ye jia ying zhua

*Desmos robinsonii* (Jovet-Ast) P. T. Li.

Trees to 2 m tall. Branches sparsely hispid when young, glabrescent. Petiole 2.3–3.3 mm, sparsely hairy; leaf blade elliptic, 4–10 × 1.5–3.5 cm, thinly leathery, both surfaces glabrous, abaxially glaucous, midvein abaxially very sparsely hairy and adaxially glabrous, secondary veins 7–9(–11) on each side of midvein and adaxially impressed, base rounded to slightly cordate, apex acute, obtuse, or subrounded. Flowers axillary or subterminal on young growth. Pedicel ca. 4.5(–11) mm, very sparsely hairy. Sepals 2.7–3.7 × 2.2–2.7 mm. Petals triangular, 2.3–2.6 × ca. 0.6 cm, leathery, not twisted, outside very sparsely hairy; floral chamber ca. 1.2 cm, ca. 50% of petal length. Stamens ca. 60; connectives apically apiculate; pollen verrucate. Carpels ca. 12; stigmas densely papillate. Fruiting pedicel 6–8 mm, very sparsely hairy; monocarp stipes 2.5–3 mm; monocarps moniliform, with 3–5 subglobose joints, glabrous, ca. 4.5 mm wide, constrictions 2.5–2.9 mm wide, terminal apiculus ca. 0.8 mm. Seeds 3–5 per monocarp, subglobose, 5.3–5.8 × 4.4–4.9 mm. Fl. Apr–Jun, fr. Jun–Oct.

Open forests on limestone; ca. 600 m. Guizhou (Libo) [Vietnam].

The name *Dasymaschalon robinsonii* was first published in 1938 (Fl. Indo-Chine, Suppl. 1: 115) but not validly so.

3. *Dasymaschalon glaucum* Merrill & Chun, Sunyatsenia 2: 227. 1935.

白叶皂帽花 bai ye zao mao hua

*Dasymaschalon rostratum* Merrill & Chun var. *glaucum* (Merrill & Chun) Bân.

Trees to 8 m tall. Branches glabrous or hairy when young. Petiole 4.5–10 mm, sparsely hairy; leaf blade elliptic to obovate, 10.5–21 × 4–8 cm, leathery to subleathery, both surfaces glabrous, abaxially glaucous, midvein abaxially glabrous and

adaxially sparsely hairy, secondary veins 8–15 on each side of midvein and flush or adaxially slightly impressed, base slightly cordate, apex acuminate. Flowers on young growth. Pedicel 1.7–1.9 cm, very sparsely hairy. Sepals 2.5–3 × 2.5–3 mm. Petals purplish red, ovate, 2.6–4.2 × 0.8–1 cm, leathery, spirally twisted, outside densely hairy; floral chamber ca. 6 mm, ca. 20% of petal length. Stamens many; connectives apically truncate to rounded; pollen echinate. Carpels many; stigmas with sparse hairs. Fruiting pedicel 0.7–5.5 cm, glabrous or sparsely hairy; monocarp stipes 4–15 mm; monocarps red to brown, ellipsoid when 1-seeded or moniliform when more than 1-seeded, 1.6–5.5 cm × 5–8 mm, terminal apiculus 0.3–4 mm; constrictions 1.2–3.5 mm wide. Seeds 1–6 per monocarp, ellipsoid, 6.5–13 × 4.8–7 mm. Fl. Aug–Oct, fr. Apr–Feb.

Forested slopes on limestone or sandstone; 200–2400 m. Guangxi, Hainan [Laos, Thailand, Vietnam].

**4. *Dasymaschalon tibetense*** X. L. Hou, *Nordic J. Bot.* 23: 276. 2005.

西藏皂帽花 xi zang zao mao hua

Trees to 5 m tall. Branches glabrous or hairy when young. Petiole 0.9–1.1 cm, glabrous; leaf blade oblong, 13.5–20 × 4.5–5.5 cm, papery, both surfaces glabrous, abaxially glaucous, midvein glabrous on both surfaces, secondary veins ca. 12 on each side of midvein and adaxially flush, base slightly cuneate, apex acuminate. Flowers on young growth. Pedicel 1.2–1.5 cm, sparsely hairy. Sepals ca. 1.5 × 1.5 mm. Petals triangular, ca. 7 × 1.2 cm, leathery, not twisted, outside sparsely hairy; floral chamber ca. 5.5 mm, ca. 80% of petal length. Stamens ca. 100; connectives apically rounded; pollen echinate. Carpels not seen. Fruiting pedicel 1–2.3 cm, glabrous; monocarp stipes ca. 1.8 cm; monocarps ellipsoid when 1-seeded or moniliform when more than 1-seeded, ca. 2.1 × 1 cm, terminal apiculus ca. 0.2 mm; constrictions ca. 6 mm wide. Seeds 1 or 2 per monocarp, ellipsoid, 16–19 × ca. 10 mm. Fl. Mar–Jul, fr. Jun–Aug.

• Semi-evergreen subtropical forests; 500–1300 m. SE Xizang.

**5. *Dasymaschalon rostratum*** Merrill & Chun, *Sunyatsenia* 2: 8. 1934.

喙果皂帽花 hui guo zao mao hua

*Desmos rostratus* (Merrill & Chun) P. T. Li.

Trees to 4 m tall. Branches sparsely hairy when young. Petiole 5–10 mm, sparsely hairy; leaf blade elliptic to oblong, 13–21.5 × 3.5–7.5 cm, papery, both surfaces glabrous or very sparsely hairy, abaxially glaucous, midvein abaxially sparsely

hairy and adaxially glabrous, secondary veins 10–16 on each side of midvein and adaxially flush, base rounded to slightly attenuate, apex acute to acuminate. Flowers on young growth. Pedicel 1.2–4 cm, sparsely hairy. Sepals 2–3.5 × 1.5–3.5 mm. Petals ovate, 2–4 × 0.7–1.2 cm, leathery, generally not twisted, outside densely hairy; floral chamber 1–2 cm, ca. 50% of petal length. Stamens ca. 120; connectives apically truncate; pollen echinate. Carpels ca. 10; stigmas glabrous. Fruiting pedicel 2–5 cm, very sparsely hairy; monocarp stipes 6–13 mm; monocarps orangish red, subglobose when 1-seeded or moniliform when more than 1-seeded, 1.1–2 × 0.6–0.8 cm, terminal apiculus 2–4 mm; constrictions 2–3 mm wide. Seeds 1 or 2 per monocarp, subglobose, 8–9 × 6–7 mm. Fl. Apr–Oct, fr. Jul–Dec.

Sparsely forested slopes; 300–1000 m. ?Fujian, Guangdong, Guangxi, Hainan, SE Xizang, S Yunnan [Vietnam].

*Dasymaschalon rostratum* has been reported from Fujian (X. L. Hou & S. J. Li, *J. Trop. Subtrop. Bot.* 11: 171–173. 2003), but two of us (Wang and Saunders) believe the identity of this report is suspect and needs to be confirmed.

**6. *Dasymaschalon sootepense*** Craib, *Bull. Misc. Inform. Kew* 1912: 144. 1912.

黄花皂帽花 huang hua zao mao hua

*Desmos sootepensis* (Craib) J. F. Maxwell.

Trees to 10 m tall. Branchlets pilose, glabrous or glabrescent with age. Petiole 5–9 mm, sparsely hairy; leaf blade elliptic, 10–18 × 3–7 cm, papery, abaxially glaucous and very sparsely hairy, adaxially glabrous or very sparsely hairy, midvein abaxially sparsely hairy and adaxially glabrous, secondary veins 9–12(–18) on each side of midvein and flush or adaxially impressed, base rounded to very slightly attenuate, apex acuminate. Flowers on young growth. Pedicel 1–3 cm, sparsely hairy, bracteolate at base. Sepals broadly ovate, 1–2.5(–3) × 2.2–2.6(–3) mm. Petals yellow, ovate, 2.5–4.5 × 1.1–1.3(–2) mm, papery, not twisted, outside sparsely hairy; floral chamber to 3.7 mm, ca. 90% of petal length. Stamens ca. 140; connectives apically truncate; pollen echinate. Carpels ca. 20, oblong, ca. 3 mm; ovules 2–7 per carpel; stigmas glabrous or sparsely hairy. Fruiting pedicel 1.5–3 cm, glabrous or sparsely hairy; monocarp stipes 6–12 mm; monocarps red, ellipsoid when 1-seeded or moniliform when more than 1-seeded, 3–6 × 0.4–0.7 cm, terminal apiculus 1.5–2.5 mm; constrictions 2–2.5 mm wide. Seeds 1–4 per monocarp, ellipsoid, 17–24 × 4–5 mm. Fl. Apr–Jul, fr. Jun–Sep.

Evergreen broad-leaved forests on rocky/sandy alluvium; 600–1300 m. S Yunnan [N Thailand].

## 8. *GONIOTHALAMUS* (Blume) J. D. Hooker & Thomson, *Fl. Ind.* 1: 105. 1855.

哥纳香属 ge na xiang shu

Li Bingtao (李秉滔 Li Ping-tao); Michael G. Gilbert

*Polyalthia* sect. *Goniothalamus* Blume, *Fl. Javae, Annonaceae*, 71, 79. 1830.

Trees or erect shrubs. Petiole short; leaf blade large, secondary veins arcuately looped near margin. Inflorescences axillary or extra-axillary, 1-flowered or several flowers in fascicles. Pedicel bracteolate at base. Sepals 3, valvate. Petals 6, in 2 whorls, with each whorl valvate; outer petals flat, thick; inner petals small, base shortly clawed, apex forming a cap. Stamens many; anther locules linear or oblong, extrorse; connectives oblong or clavate, 3-angular, apex truncate or rarely rounded. Carpels many; ovules 1–10 per

carpel,  $\pm$  basal; styles elongate; stigmas entire or apex 2-lobed. Fruit apocarpous; monocarps sessile to shortly stipitate, oblong-ellipsoid or ovoid. Seeds 1–10 per monocarp.

About 130–140 species: tropical and subtropical Asia; 11 species (five endemic) in China.

A record of *Goniothalamus macrophyllus* (Blume) J. D. Hooker & Thomson from the Flora area (X. L. Hou, <http://www.abclunwen.com/lunwen-free-387606/>; accessed on 25 Nov 2010) was based on a misidentification of *Polyalthia simiarum*.

- 1a. Leaf blade margin and midvein abaxially densely rust-colored hirsute.
  - 2a. Leaf blade 56–76  $\times$  13–19 cm; monocarps 6–9  $\times$  ca. 2 cm ..... 1. *G. cheliensis*
  - 2b. Leaf blade 20–41  $\times$  5.5–11.5 cm; monocarps 2–3  $\times$  0.6–0.8 cm ..... 2. *G. donnaiensis*
- 1b. Leaf blade glabrous throughout.
  - 3a. Inflorescences 3- or 4-flowered; leaf blade abaxially grayish green; inner petals ca. 2  $\times$  as long as outer petals ..... 11. *G. laoticus*
  - 3b. Inflorescences 1- or 2-flowered; leaf blade abaxially green, sometimes drying brownish; inner petals much shorter than outer petals.
    - 4a. Leaf blade narrowly lanceolate to oblong-lanceolate.
      - 5a. Branchlets and petioles pubescent; stigmas deeply 2-cleft ..... 3. *G. chinensis*
      - 5b. Branchlets and petioles glabrous; stigmas entire or shallowly 2-cleft.
        - 6a. Ovaries pubescent; ovules 2 per carpel ..... 4. *G. gardneri*
        - 6b. Ovaries glabrous; ovules 1 per carpel ..... 5. *G. gabriacianus*
    - 4b. Leaf blade oblong, oblong-elliptic, elliptic, or obovate.
      - 7a. Leaf blade thinly papery, secondary veins adaxially flat to depressed; inflorescences 2-flowered.
        - 8a. Pedicel ca. 4 mm; styles ca. 2  $\times$  as long as ovaries; ovules basal; leaf blade secondary veins 7–9 on each side of midvein ..... 6. *G. yunnanensis*
        - 8b. Pedicel 9–15 mm; styles 1–1.5  $\times$  as long as ovaries; ovules lateral; leaf blade secondary veins 9–21 on each side of midvein ..... 7. *G. leiocarpus*
      - 7b. Leaf blade papery to leathery, secondary veins adaxially raised; inflorescences 1-flowered.
        - 9a. Petioles and monocarps pubescent to puberulent ..... 8. *G. amuyon*
        - 9b. Petioles and monocarps glabrous.
          - 10a. Flowers to 7 cm, ca. 5.5 cm in diam.; outer petals oblong-lanceolate; ovules 2 per carpel; monocarps ca. 1.5  $\times$  1.3 cm ..... 9. *G. calvicarpus*
          - 10b. Flowers to 2.5 cm, ca. 2.5 cm in diam.; outer petals broadly ovate; ovules 6 per carpel; monocarps 3–6  $\times$  2–2.5 cm ..... 10. *G. howii*

**1. *Goniothalamus cheliensis*** Hu, Bull. Fan Mem. Inst. Biol. 10: 122. 1940.

景洪哥纳香 jing hong ge na xiang

Trees to 5 m tall. Branches dark gray hispid. Petiole 2–2.5 cm, stout, rust-colored hirsute; leaf blade obovate, 56–76  $\times$  13–19 cm, papery, abaxially sparsely hispid, adaxially glabrous, midvein densely rust-colored hirsute, secondary veins 26–30 on each side of midvein and prominent on both surfaces, base cuneate, margin densely rust-colored hirsute, apex caudate with a ca. 5 cm acumen. Flowers not seen. Fruiting carpels oblong-elliptic, 6–9  $\times$  1.5–2 cm, densely rust-colored hirsute, lenticellate, acuminate on both ends. Seeds 4, oblong, ca. 2.5  $\times$  1.5 cm. Fl. Mar, fr. Apr–Sep.

• Forested slopes; ca. 1500 m. S Yunnan.

*Goniothalamus cheliensis* is listed as Endangered (EN A2c) by the IUCN Red List of Threatened Species (Version 2010.3; <http://www.iucnredlist.org>; accessed on 6 Oct 2010).

**2. *Goniothalamus donnaiensis*** Finet & Gagnepain, Bull. Soc. Bot. France 53(Mém. 4): 121. 1906.

田方骨 tian fang gu

Trees to 5 m tall, most parts densely rust-colored hirsute when young. Petiole 1–1.5 cm, stout; leaf blade obovate-lanceolate to oblong-lanceolate, 20–41  $\times$  5.5–11.5 cm, papery,

adaxially glabrous or hirsute along midvein, secondary veins 17–22 on each side of midvein, base cuneate, apex caudate with a 1–3 cm acumen. Flowers solitary. Pedicel short. Sepals broadly ovate, ca. 8  $\times$  6 mm, inside glabrous. Petals reddish; outer petals ovate-lanceolate to oblong-lanceolate, ca. 2.3  $\times$  0.5 cm; inner petals ovate-triangular, ca. 1.5  $\times$  0.5 cm, inside glabrous, base attenuate into a ca. 3 mm claw. Stamens oblong, ca. 2 mm; anther locule with transverse stripes; connectives apically rounded to subtruncate. Carpels cylindric-ovoid, ca. 4.5 mm, hirsute; ovules 2 per carpel, subbasal; style oblong,  $\pm$  long as ovary, glabrous. Monocarps 4–12, connate, ovate-oblong, 2–3  $\times$  0.6–0.8 cm, both ends acuminate. Seeds 1 or 2 per monocarp, yellowish, ovoid, ca. 1.5  $\times$  5 mm, ribbed at bilateral plane. Fl. May–Sep, fr. Aug–Oct.

Densely forested slopes; 200–800 m. SW Guangxi, S Guizhou, SE Yunnan [Vietnam].

The bark of *Goniothalamus donnaiensis* is used as medicine for traumatic injuries and fractures.

**3. *Goniothalamus chinensis*** Merrill & Chun, Sunyatsenia 2: 6. 1934.

哥纳香 ge na xiang

Shrubs to 4 m tall. Branchlets pubescent when young, glabrescent. Petiole 5–12 mm, robust, pubescent or glabrous; leaf blade oblong-elliptic to oblong-lanceolate, 13–30  $\times$  3–8 cm,

papery, glabrous, secondary veins 12–14 on each side of midvein, base broadly cuneate, apex shortly acuminate to obtuse. Inflorescences axillary, 1- or 2-flowered. Pedicel ca. 1 cm, with several bracteoles at base. Sepals broadly ovate, 5–6 × 5–6 mm, puberulent. Petals yellowish green; outer petals narrowly lanceolate, 2.2–3 × ca. 0.7 cm, outside puberulent; inner petals ovate, ca. 1.2 cm, apex acute to acuminate. Stamens linear-oblong, ca. 2 mm; connectives apically truncate. Carpels cylindric, brown hispid; ovules 2 per carpel; styles as long as ovary; stigmas apically 2-cleft. Monocarps shortly stipitate, oblong-ellipsoid, 10–18 × 5–6 mm, sparsely hispid to glabrescent, apex obtuse. Fl. Jul–Sep, fr. Jul–Oct.

- Forested slopes; 300–600 m. S Guangxi, Hainan.

**4. *Goniothalamus gardneri*** J. D. Hooker & Thomson, Fl. Ind. 1: 107. 1855.

长叶哥纳香 *chang ye ge na xiang*

Trees to 5 m tall, all parts glabrous. Branches brown when young, striate with age. Petiole 0.4–2 cm, swollen; leaf blade narrowly oblong-lanceolate, 10–39 × 2.5–8 cm, leathery, midvein adaxially depressed, secondary veins 14–20 on each side of midvein and inconspicuous, base cuneate, apex acuminate to acute. Inflorescences axillary, 1-flowered. Pedicel 5–10 mm, bracteolate at base. Sepals broadly ovate, ca. 1.5 × 1 cm. Petals green turning brownish yellow, leathery; outer petals oblong-lanceolate, 5–6 × 1–1.5 cm; inner petals elliptic, ca. 1.5 × 1 cm. Stamens linear but obconic when dry, ca. 1.8 mm; connectives apically flat to very slightly convex, puberulent. Carpels cylindric, pubescent; ovules 2 per carpel; styles slender; stigmas entire. Monocarps to 20, ovoid, 1–1.7 × 0.5–0.8 cm. Seeds 1 or 2 per monocarp, pale reddish brown, ovoid, slightly compressed. Fl. May–Nov, fr. Nov–Feb.

Densely forested slopes; 200–700 m. Hainan [India, Sri Lanka, Vietnam].

R. M. K. Saunders (in litt.) believes that *Goniothalamus gardneri* is endemic to Sri Lanka and that the Chinese and other material so named has been misidentified. The Sri Lankan material differs by the sparsely puberulent stems, slightly smaller sepals (0.8–1.2 cm), and shorter petals (outer 2.4 to less than 5 cm, abaxially puberulent; inner 0.9–1.4 cm).

**5. *Goniothalamus gabriacianus*** (Baillon) Jovet-Ast ["Ast"] in Lecomte, Fl. Indo-Chine, Suppl. 1: 95. 1938.

保亭哥纳香 *bao ting ge na xiang*

*Oxymitra gabriaciana* Baillon, Adansonia 10: 106. 1871; *Goniothalamus saigonensis* Pierre ex Finet & Gagnepain.

Trees to 5 m tall, glabrous except for flowers. Petiole 5–8 mm; leaf blade narrowly oblong-lanceolate, 12.5–22 × 2–4 cm, leathery, midvein adaxially depressed, secondary veins obscure, base cuneate, apex obtuse. Inflorescences axillary, 1-flowered. Pedicel short, bracteolate at base. Sepals broadly ovate, outside puberulent, inside glabrous. Petals greenish; outer petals oblong-triangular, ca. 1.2 cm, hispidulous; inner petals ovate, ca. 1 cm, outside hispidulous, inside glabrous. Stamens oblong; anther locules longitudinally striate; connectives apically subcapitate, puberulent. Carpels cylindric, glabrous; ovule 1 per carpel,

basal; styles terete; stigmas apically shallowly 2-cleft. Monocarps oblong-ellipsoid to ellipsoid, 1–1.8 × 0.5–0.8 cm, glabrous. Seed 1 per monocarp. Fl. May–Jul, fr. May–Nov.

Densely forested slopes; 300–800 m. Hainan [Cambodia, Laos, Thailand, Vietnam].

**6. *Goniothalamus yunnanensis*** W. T. Wang, Acta Phytotax. Sin. 6: 209. 1957.

云南哥纳香 *yun nan ge na xiang*

*Goniothalamus lii* X. L. Hou & Y. M. Shui.

Trees to 5 m tall. Bark brown. Branches pale brown, glabrescent. Petiole 5–13 mm, drying blackish, slightly rugose; leaf blade oblong-elliptic, oblong, or sometimes obovate-oblong, 7–23 × 2.8–7 cm, thinly papery, glabrous, secondary veins 7–15(–21) on each side of midvein and adaxially depressed to slightly raised, base broadly cuneate, apex acute to acuminate. Inflorescences axillary, sometimes from leafless nodes, 1- or 2-flowered; peduncle 1–2 mm; bracts 2–4, ovate, 1–2 mm. Pedicel (2–)4–9(–13) mm, sparsely pubescent. Sepals broadly ovate-triangular, 5–8 × 4–8 mm, outside puberulent, inside glabrous. Petals reddish yellow; outer petals broadly lanceolate, 2–2.5 × 0.7–1.3 cm, rust-colored pubescent, inside densely rust-colored tomentulose; inner petals obovate to oblong-ovate, 7–11 × 4–5 mm, connate above middle, pubescent, base attenuate to a ca. 2 mm claw. Stamens many, (1.5–)2.2–3 mm; connectives apically truncate. Carpels ca. 14, ca. 3 mm, puberulent or glabrous; ovules 2 per carpel, basal; styles ca. 2 × as long as ovaries. Monocarp stipes ca. 4 mm; monocarps 5–16, ellipsoid, 1.8–2.5 × 0.8–0.9 cm, glabrous, minutely punctate, apex shortly cuspidate. Seeds (1 or)2 per monocarp. Fl. Apr–Jun, fr. Nov.

- Forested slopes; 100–800 m. S Yunnan.

**7. *Goniothalamus leiocarpus*** (W. T. Wang) P. T. Li, Acta Phytotax. Sin. 14(1): 112. 1976.

金平哥纳香 *jin ping ge na xiang*

*Mitrephora leiocarpa* W. T. Wang, Acta Phytotax. Sin. 6: 207. 1957.

Trees to 5 m tall, glabrous except for flowers. Branches lenticellate. Petiole 6–10 mm, ca. 2 mm thick; leaf blade obovate-oblong to sometimes oblong, 6–29 × 4.5–9 cm, papery, secondary veins 9–18 on each side of midvein, base cuneate to broadly cuneate, apex shortly acuminate to acute. Inflorescences axillary, 2-flowered. Flowers ca. 1.6 cm. Pedicel ca. 1.5 cm, puberulent, bracteolate at base. Sepals broadly ovate, ca. 5 mm, outside sparsely puberulent, inside glabrous. Petals reddish yellow; outer petals ovate, 1.8–2.3 × 1.1–1.5 cm, thickly leathery, outside sparsely puberulent, inside rust-colored tomentulose, base shortly clawed, apex acute; inner petals obovate, ca. 1.3 × 0.8 cm, leathery, outside glabrous, inside pubescent, base with a ca. 3.5 mm claw, margin densely pubescent, apex acute. Stamens ca. 1.5 mm; connectives apically truncate. Carpels ca. 18, linear, ca. 4 mm, glabrous; ovules 10 per carpel, in 2 series; styles clublike, as long as ovaries. Monocarps solitary or several fasciculate, ovoid, 4–7 × 2.2–4.2 cm, glabrous. Seed 1 per monocarp, reniform, 2.5–3 × ca. 2 cm. Fl. May–Jul, fr. Aug–Nov.

- Forested slopes; 700–1600 m. S Yunnan.

**8. *Goniothalamus amuyon*** (Blanco) Merrill, Philipp. J. Sci., C, 10: 264. 1915.

台湾哥纳香 *tai wan ge na xiang*

*Uvaria amuyon* Blanco, Fl. Filip. 463. 1837; *Polyalthia sasakii* Yamamoto.

Shrubs or small trees, 2–5 m tall. Petiole 6–8 mm, sparsely pubescent; leaf blade oblong-elliptic to elliptic, 8–16 × 3–5.5 cm, papery, glabrous, abaxially with brown specks, secondary veins 8–11 on each side of midvein and adaxially slightly prominent, base broadly cuneate, apex obtuse. Inflorescences axillary. Pedicel ca. 6 mm. Sepals ovate-triangular, outside pubescent. Outer petals lanceolate, ca. 3.5 × 0.7 cm, thick, outside pubescent; inner petals ovate, smaller than outer petals. Stamens many; connectives broadly 3-angular. Carpels cylindric; ovules 1–3 per carpel; styles linear, ca. 3.5 mm. Fruiting carpels ovoid to ellipsoid, 1–1.8 × 0.6–0.9 cm. Seeds 1 or 2 per monocarp. Fl. May–Jul, fr. Jul–Oct.

Mixed woods; 300–500 m. S Taiwan [Philippines].

**9. *Goniothalamus calvicarpus*** Craib, Bull. Misc. Inform. Kew 1922: 227. 1922.

大花哥纳香 *da hua ge na xiang*

Trees to 8 m tall. Branchlets pubescent, glabrescent. Petiole 0.7–1.5 cm, robust; leaf blade oblong, 17–35 × 5.5–9 cm, papery, glabrous, midvein stout and adaxially depressed, secondary veins 14–20 on each side of midvein and slightly elevated on both surfaces, base rounded to broadly cuneate, apex obtuse to shortly acuminate. Inflorescences axillary or extra-axillary, 1-flowered. Pedicel 1–1.5 cm, glabrous, many bracteolate at base. Sepals broadly ovate, 2–2.5 cm, glabrous. Outer petals oblong-lanceolate, 5–6.5 × ca. 1.5 cm, puberulent; inner petals oblong-ovate, ca. 2 × 0.8 cm, puberulent. Stamens oblong, ca. 4 mm; connectives 3-angular. Carpels cylindric, ca. 6 mm, pubescent; ovules 2 per carpel; styles elongate; stigmas apically 2-cleft. Monocarps fasciculate, subsessile, ovoid, ca. 1.5 × 0.8 cm, puberulent. Seed 1 per monocarp. Fl. Apr–Aug, fr. Aug–Nov.

Forested slopes; 800–1500 m. S Yunnan [N Thailand].

Saunders and Chalermglin (Bot. J. Linn. Soc. 156: 359–363. 2008) regard the Chinese material identified as *Goniothalamus griffithii* J. D. Hooker & Thomson to be more correctly placed in *G. calvicarpus*, treating *G. griffithii* as a local species restricted to S Myanmar and adjacent W Thailand. The Chinese material is somewhat intermediate

between the two, and clearly the situation needs more detailed investigation.

**10. *Goniothalamus howii*** Merrill & Chun, Sunyatsenia 5: 60. 1940.

海南哥纳香 *hai nan ge na xiang*

Trees to 15 m tall, glabrous except for flowers. Petiole 7–10 mm; leaf blade oblong to sometimes elliptic, 10–25 × 4–8 cm, papery, brownish when dry, secondary veins 10–15 on each side of midvein, base cuneate to rounded, apex shortly acuminate to obtuse. Inflorescences axillary, 1-flowered. Pedicel 1–2 cm, puberulent, several bracteolate at base. Sepals broadly ovate, ca. 5 mm, outside puberulent. Petals yellowish green; outer petals broadly ovate, 2.2–2.5 × 1.6–1.8 cm, leathery, sparsely pubescent; inner petals broadly ovate to subrhomboid, 1.3–1.5 cm, thickly leathery, densely hispid. Stamens oblong; connectives orbicular. Carpels 15–18, pubescent; ovules 6 per carpel, in 1 series; styles oblong, as long as ovary; stigmas apically 2-cleft. Monocarps ovoid to cylindric-ovoid, 3–6 × 2–2.5 cm, glabrous. Fl. Mar–Sep, fr. May–Jan.

- Forested slopes; 300–800 m. Hainan, S Yunnan.

**11. *Goniothalamus laoticus*** (Finet & Gagnepain) Bân, Bot. Zhurn. (Moscow & Leningrad) 59: 554. 1974.

柄芽银钩花 *bing ya yin gou hua*

*Mitrephora laotica* Finet & Gagnepain, Bull. Soc. Bot. France 54(Mém. 5): 87. 1907.

Trees to 10 m tall, glabrous except for flowers. Branches robust. Petiole ca. 7 mm; leaf blade oblong, 13–18 × 3–5 cm, leathery, abaxially pale gray/glaucous, adaxially glossy, midvein adaxially concave, secondary and reticulate veins obscure, base attenuate, apex obtuse and shortly cuspidate. Inflorescences 3- or 4-flowered. Flowers ca. 1.2 cm. Pedicel 6–7 mm, robust, bracteolate at base. Sepals broadly ovate to suborbicular, erect, outside puberulent, inside glabrous. Outer petals lanceolate, suberect, both surfaces pubescent; inner petals obovate, ca. 2 × as long as outer petals, both surfaces pubescent, base clawed, margin ciliate. Stamens many; connectives semiorbicular, papillose. Carpels 10, cylindric, glabrous; ovules 8–10 per carpel; stigmas fusiform, papillose. Fruit not seen. Fl. Apr–Jun, fr. Jul–Oct.

Dense woods; ca. 700 m. S. Yunnan [Laos, C and N Thailand].

Weerasooriya and Saunders (Syst. Bot. 30: 262. 2005) follow Bân and exclude this species from *Mitrephora*.

## **9. MITREPHORA** J. D. Hooker & Thomson, Fl. Ind. 1: 112. 1855, not *Mitrophora* Necker ex Rafinesque (1813), nor Lévêillé (1846) [Fungi].

银钩花属 *yin gou hua shu*

Li Bingtao (李秉滔 Li Ping-tao); Aruna D. Weerasooriya, Richard M. K. Saunders

*Uvaria* sect. *Mitrephorae* Blume, Fl. Javae, Annonaceae, 13. 1830; *Kinginda* Kuntze.

Trees to 40 m tall. Petiole short; leaf blade venation arcuately looped near margin, secondary veins 4–24 on each side of midvein. Flowers terminal, leaf opposed, or extra-axillary, solitary or in cymes; sympodial rachides simple or branched, internodes short or long. Flowers bisexual, pendent. Pedicel short or long, with basal bracts and submedian bracteoles. Sepals 3, valvate, basally ±

connate. Petals 6, in 2 whorls, free, with each whorl valvate; outer petals usually smaller than inner petals, without a basal claw; inner petals with base clawed, apically connivent to form a mitriform dome. Stamens many; anthers cuneate, extrorse; connectives apically truncate. Carpels few to many, free; ovules several per carpel, in 2 series. Fruit apocarpous; monocarps sessile or stipitate, globose, obovoid, or cylindric, sometimes longitudinally ridged, smooth or rarely warty.

About 47 species: tropical and subtropical Asia; three species in China.

- 1a. Petioles and abaxial surface of leaf blades densely hairy; bracteoles  $4.5\text{--}7.5 \times 3.5\text{--}9$  mm; sepals  $5\text{--}9 \times 5\text{--}9$  mm; carpels 12–17; monocarps subglobose, without a longitudinal ridge ..... 1. *M. tomentosa*  
 1b. Petioles and abaxial surface of leaf blades subglabrous to sparsely hairy; bracteoles  $1.5\text{--}3.5 \times 1\text{--}4$  mm; sepals  $3\text{--}4 \times 3\text{--}4.5$  mm; carpels 7–10; monocarps  $\pm$  elongate, with a longitudinal ridge.  
 2a. Leaf blade secondary veins 7–9 on each side of midvein; outer petal margin never undulate; monocarp stipes  $1.4\text{--}1.8$  cm ..... 2. *M. macclurei*  
 2b. Leaf blade secondary veins 10–14 on each side of midvein; outer petal margin undulate in older flowers; monocarp stipes  $0.9\text{--}1.3$  cm ..... 3. *M. wangii*

**1. *Mitrephora tomentosa*** J. D. Hooker & Thomson, Fl. Ind. 1: 113. 1855.

银钩花 yin gou hua

*Kinginda thorelii* (Pierre) Kuntze; *K. tomentosa* (J. D. Hooker & Thomson) Kuntze; *Mitrephora bousigoniana* Pierre; *M. collinsae* Craib; *M. edwardsii* Pierre; *M. thorelii* Pierre; *M. thorelii* var. *bousigoniana* (Pierre) Finet & Gagnepain; *M. thorelii* var. *microphylla* Finet & Gagnepain; ?*M. vandiflora* Kurz.

Trees to 20 m tall. Branches densely hairy when young. Petiole 4–12.5 mm, densely hairy; leaf blade ovate, lanceolate, or rarely oblong,  $6.5\text{--}21.5 \times 3\text{--}10$  cm, leathery, abaxially densely hairy, adaxially glabrous, secondary veins (8–)14–20 on each side of midvein, base rounded to slightly cordate, apex acute to shortly acuminate. Inflorescence rachides unbranched, internodes short. Pedicel  $1.1\text{--}2.3$  cm; bracteoles  $4.5\text{--}7.5 \times 3.5\text{--}9$  mm. Sepals ovate,  $5\text{--}9 \times 5\text{--}9$  mm. Outer petals pale yellow turning dark yellow, lanceolate to oblanceolate,  $1.6\text{--}2\text{--}(3.4) \times 0.7\text{--}1.8$  cm, margin undulate on older flowers; inner petals cream to yellow with apical purple streaks,  $0.8\text{--}1.7 \times 0.7\text{--}1.3$  cm. Stamens  $1\text{--}1.3$  mm. Carpels 12–17,  $1.5\text{--}1.7$  mm; ovules 10–12 per carpel. Fruiting pedicel  $1.5\text{--}3.4$  cm; monocarp stipes  $1.6\text{--}3\text{--}(3.9)$  cm; monocarps subglobose,  $1.2\text{--}2.3 \times 0.8\text{--}2$  cm, densely hairy, smooth, without longitudinal ridge. Seeds ca.  $12 \times 8$  mm. Fl. Jan–Apr, fr. May–Sep.

Wet and dry evergreen broad-leaved forests; below 100–1200 m. W Guangxi, S Guizhou, Hainan, S Yunnan [Cambodia, India (Assam), Laos, Thailand, Vietnam].

The wood of *Mitrephora tomentosa* is used for building carts and as structural timbers. The bark is a source of saponins and is used as a soap.

**2. *Mitrephora macclurei*** Weerasooriya & R. M. K. Saunders, Syst. Bot. 30: 251. 2005.

山蕉 shan jiao

Trees to 10 m tall. Branches densely hairy when young. Petiole 6–8.5 mm, sparsely hairy; leaf blade lanceolate, (8–)10–14  $\times 3\text{--}4.5$  cm, leathery, abaxially subglabrous to sparsely hairy, adaxially glabrous, secondary veins 7–9 on each side of midvein, base broadly cuneate, apex acute. Inflorescence rachides unbranched, internodes short. Pedicel  $1.2\text{--}2$  cm; bracte-

oles  $1.5\text{--}3.5 \times 2\text{--}4$  mm. Sepals ovate,  $3\text{--}4 \times 3\text{--}3.5$  mm. Outer petals white turning yellow, elliptic to ovate,  $1.8\text{--}2.5 \times 1.1\text{--}2$  cm, margin never undulate; inner petals purple,  $1.1\text{--}1.3 \times 0.6\text{--}0.9$  cm. Stamens  $1.5\text{--}1.9$  mm. Carpels 7 or 8,  $2\text{--}2.5$  mm; ovules 8–10 per carpel. Fruiting pedicel ca.  $1.3$  cm; monocarp stipes  $1.4\text{--}1.8$  cm; monocarps obovoid, ca.  $3.8 \times 2.5$  cm, sparsely hairy, smooth, with longitudinal ridge. Seeds ca.  $1.2 \times 1$  cm. Fl. Mar–May, fr. Sep–Oct.

Riverine forests; ca. 800 m. Guangxi, S Guizhou, Hainan, S Yunnan [Laos, Malaysia (peninsular), Vietnam].

Previous workers (e.g., FRPS 30(2): 58. 1979) have confused *Mitrephora macclurei* with *M. teysmannii* Scheffer (generally under the synonym *M. maingayi* J. D. Hooker & Thomson). They are most easily distinguished by the outer petals, which in *M. teysmannii* are cream-colored with reddish streaks (becoming dark yellow with reddish brown streaks with age) and have undulate margins, whereas in *M. macclurei* the outer petals are uniformly white (becoming yellow with age) and lack undulate margins. The Chinese material corresponds to *M. macclurei*. It is cultivated in Guangdong.

**3. *Mitrephora wangii*** Hu, Bull. Fan Mem. Inst. Biol. 10: 123. 1940.

云南银钩花 yun nan yin gou hua

Trees to 10 m tall. Branches densely hairy when young. Petiole  $6.5\text{--}11.5$  mm, sparsely hairy; leaf blade oblong-lanceolate,  $10.5\text{--}24\text{--}(27) \times 3.5\text{--}8$  cm, leathery, abaxially sparsely hairy, adaxially glabrous, secondary veins 10–14 on each side of midvein, base cuneate to broadly cuneate, apex shortly acuminate to acuminate. Inflorescence rachides unbranched, internodes short. Pedicel  $1.2\text{--}1.7$  cm; bracteoles  $1.5\text{--}2 \times 1\text{--}1.5$  mm. Sepals ovate,  $3\text{--}3.5 \times 3\text{--}4.5$  mm. Outer petals white turning bright yellow, ovate,  $1.6\text{--}2.3 \times 1\text{--}1.9$  cm, margin  $\pm$  undulate on older flowers; inner petals purplish,  $1.1\text{--}1.9 \times 0.6\text{--}1.3$  cm. Stamens  $0.8\text{--}1$  mm. Carpels 8–10,  $1.8\text{--}2$  mm; ovules 6–8 per carpel. Fruiting pedicel  $1\text{--}1.6$  cm; monocarp stipes  $0.9\text{--}1.3$  cm; monocarps oblong,  $2.4\text{--}3.8 \times 1.4\text{--}2.6$  cm, sparsely hairy, smooth, with longitudinal ridge. Seeds ca.  $9 \times 6$  mm. Fl. Jan–May, fr. Jun–Sep.

Densely forested slopes; 500–1600 m. S Yunnan [N Thailand].

*Mitrephora wangii* is listed as Vulnerable (VU A2c) by the IUCN Red List of Threatened Species (Version 2010.3; <http://www.iucnredlist.org>; accessed on 6 Oct 2010).

## 10. PSEUDUVARIA Miquel, Fl. Ned. Ind. 1(2): 32. 1858.

金钩花属 *jin gou hua shu*

Li Bingtao (李秉滔 Li Ping-tao); Yvonne C. F. Su (许传芳), Richard M. K. Saunders

Trees to 40 m tall, dioecious, monoecious, andro-dioecious, or hermaphroditic. Petiole short or absent; leaf blade venation arcuately looped near margin. Inflorescences on young branches [rarely on trunks], rhpidial, solitary or in clusters; peduncle short [or long]; sympodial rachis internodes short [or long]. Flowers unisexual [or bisexual], pendent. Pedicel short or long, with submedian bracteoles. Sepals 3, valvate, free or basally connate, membranous. Petals 6, in 2 whorls, free, with each whorl valvate; outer petals generally shorter than inner petals, generally without basal claw, membranous; inner petals sometimes with adaxial glands, base generally clawed, apically connivent to form a mitriform dome. Male flowers: stamens [7–]46–56[–153], cuneate, extrorse, often with a ring of staminodes; connectives apically truncate. Female flowers: staminodes [0–]7–9[–20]; carpels [1–]7–14[–30], free; ovules [1–]5 or 6[–20] per carpel, in [1 or]2 series. Fruit apocarpous; monocarps shortly stipitate [or sessile], generally globose [or ellipsoid], mostly with longitudinal groove, [smooth or] rugose. Seeds smooth or rugose.

About 56 species: tropical and subtropical Asia; one species in China.

**1. *Pseuduvaria trimera*** (Craib) Y. C. F. Su & R. M. K. Saunders, Syst. Bot. Monogr. 79: 174. 2006.

金钩花 *jin gou hua*

*Mitrephora trimera* Craib, Bull. Misc. Inform. Kew 1913: 65. 1913; *Pseuduvaria indochinensis* Merrill.

Trees to 20 m tall, monoecious. Branches pale gray, densely puberulent when young, glabrescent. Petiole 3–11 mm, very densely puberulent; leaf blade obovate-elliptic to elliptic, 10–23 × 3.5–8.5 cm, thinly leathery, abaxially bluish green and glabrous, adaxially glossy and sparsely puberulent, secondary veins 10–12(–18) on each side of midvein and pubescent on both surfaces, base broadly cuneate to obtuse, apex acuminate. Inflores-

cences on young branches, in clusters of 3–6, each 1- or 2-flowered; peduncle inconspicuous; sympodial rachides short. Flowers unisexual. Pedicel 1–3 cm. Sepals ovate, 1–1.5 × 2–2.5 mm. Petals yellow; outer petals ovate, 2–3 × 1.5–3 mm; inner petals clawed-triangular, 5–8 × 3–5.5 mm, basal claw 2.5–5 mm. Male flowers: stamens 46–56. Female flowers: staminodes 7–9; carpels 7–14; ovules 5 or 6 per carpel, in 2 series. Fruiting pedicel 2–3 cm; monocarp stipes 1–1.4 cm; monocarps green, globose, 1.6–2.2 × 1.6–2.1 cm, densely puberulent. Seeds rugose. Fl. Feb–Apr, fr. Apr–Jul.

Evergreen and deciduous broad-leaved forests at base of limestone mountains; 200–700(–1500) m. S Yunnan [Myanmar, Thailand, Vietnam].

## 11. XYLOPIA Linnaeus, Syst. Nat., ed. 10, 2: 1241, 1250, 1378. 1759, nom. cons.

木瓣树属 *mu ban shu shu*

Li Bingtao (李秉滔 Li Ping-tao); Michael G. Gilbert

*Xylopicrum* P. Browne.

Trees [or shrubs]. Flowers axillary, solitary [or fasciculate]. Flower buds lanceolate [to subulate]. Pedicel usually short, bracteolate at apex [or base]. Sepals 3, valvate, thick, connate at base sometimes into a cup-shaped calyx. Petals 6, in 2 whorls, with each whorl valvate, connivent or scarcely open, elongated, thick, woody when dry, inside basally concave, middle narrowly convex; outer petals larger and longer than inner petals. Stamens many; anther locules oblong, extrorse, transversely septate; connectives 3-angular, apex truncate-dilated. Carpels few to many, free; ovules 2–6 per carpel, sutural; styles elongated; stigmas clavate [capitate, or oblong], extended. Fruit apocarpous; monocarps stipitate, oblong [to elongated], moniliform, often dehiscent. Seeds [1–]3–8[to many] per monocarp, ovoid; aril present but often inconspicuous.

About 160 species: Africa, America, SE Asia; one species in China.

**1. *Xylopia vielana*** Pierre, Fl. Forest. Cochinch. t. 34. 1881.

木瓣树 *mu ban shu*

Trees to 20 m tall. Branches dark brown, densely tomentulose when young, glabrescent, densely lenticellate. Petiole 4–8 mm, tomentose to glabrescent; leaf blade elliptic to ovate, 3–7 × 1.2–3 cm, papery, abaxially tomentulose, adaxially appressed pubescent, secondary veins 6 or 7 on each side of midvein, base obtuse to rounded, apex obtuse to shortly acuminate. Inflorescences axillary, 1-flowered. Flower buds lanceolate, with 3 longitudinal ribs. Flower ca. 2 × 0.5–0.8 cm, recurved. Pedicel 2–3 mm, tomentulose, bracteolate at apex. Calyx shallowly 3-

lobed; sepals broadly ovate, ca. 4 × 4 mm, outside densely tomentulose, inside glabrous. Outer petals lanceolate, ca. 15 × 3 mm, concave, thick, woody when dry, tomentulose; inner petals linear-lanceolate, ca. 14 × 2 mm, tomentulose, with adaxially elevated central rib. Stamens oblong, ca. 2.5 mm; anther locules transversely septate; connectives narrowly 3-angular, pubescent. Carpels ca. 4 mm, densely villous; styles slender; stigmas clavate, villous. Monocarp stipes ca. 1.5 cm; monocarps oblong, 2.5–3.5 × 0.8–1 cm. Seeds 3–8 per monocarp, ovoid. Fl. Mar–Jun, fr. Jun–Oct.

Forested slopes; 400–700 m. S Guangxi [Cambodia, N Thailand, Vietnam].

## 12. MEIOGYNE Miquel, Ann. Mus. Bot. Lugduno-Batavi 2: 12. 1865.

鹿茸木属 *lu rong mu shu*

Li Bingtao (李秉滔 *Li Ping-tao*); Michael G. Gilbert

Shrubs [or trees], with simple hairs. Leaves with closely spaced oblique secondary veins. Inflorescences axillary, 1–3-flowered. Flowers bisexual. Torus conic. Sepals 3, valvate, united at base. Petals 6, in 2 whorls, with each whorl valvate, flat; outer petals slightly longer than or  $\pm$  as long as inner. Stamens many; anther locules cuneate; connectives apically rhomboidal. Carpels 2–7(–12), sessile, villous; ovules several per carpel, in 2 series; stigmas sessile, subcapitate. Fruit apocarpous; monocarps 1–3[–5], usually sessile, ovoid [oblong or ellipsoid]. Seeds [several to] many per monocarp.

About nine species: S and SE Asia; one species (endemic) in China.

**1. *Meiogyne kwangtungensis*** P. T. Li, Acta Phytotax. Sin. 14(1): 104. 1976.

鹿茸木 *lu rong mu*

Shrubs to 3 m tall. Bark dark gray. Branches densely villous when young, glabrescent. Petiole 2–3 mm, villous; leaf blade oblong to elliptic, 6–18  $\times$  2.5–5.5 cm, membranous, abaxially glaucous and villous, adaxially glossy and glabrous except for pubescent midvein, midvein adaxially impressed, secondary veins ca. 10 on each side of midvein and prominent on both surfaces, base rounded to sometimes shallowly cordate, apex acuminate. Flowers axillary, reportedly light red. Fruiting pedicel much longer than monocarps. Monocarps 1–3, sessile, ovoid,

1.8–3  $\times$  1–1.5 cm, obscurely moniliform, very shallowly transversely constricted between seed, densely tomentose, base rounded, apex apiculate. Seeds 10 per monocarp, in 2 series. Fl. Jul, fr. Jul–Aug.

• Open woodland in valleys; ca. 600 m. Hainan.

Flowers are needed to confirm the generic placement of this taxon. The Annonaceae Checklist (Rainer & Chatrou, eds., AnnonBase in Species 2010 & ITIS Catalogue of Life; <http://herbarium.botanik.univie.ac.at/annonaceae/listTax.php>; accessed on 1 Oct 2010) suggests that it might be better placed within *Pseuduvaria* or *Mitrephora*. *Meiogyne kwangtungensis* is only known from the type collection, which is in fruit although the protologue does report the flower color to be light red.

## 13. CHIENIODENDRON Tsiang & P. T. Li, Acta Phytotax. Sin. 9: 374. 1964.

蕉木属 *jiao mu shu*

Li Bingtao (李秉滔 *Li Ping-tao*); Michael G. Gilbert

Trees, with simple hairs. Inflorescences axillary or superaxillary, 1- or 2-flowered. Flowers bisexual. Pedicel short, bracteolate at base. Sepals 3, valvate, connate at base. Petals 6, in 2 whorls, with each whorl valvate, subequal but inner petals narrower than outer petals, thick and fleshy to leathery when dry, inside basally concave to cucullate. Stamens many; anther locules oblong-obovoid; connectives broad and thickened, apex truncate to subtruncate. Carpels 2–12; ovules 6–10 per carpel, in 2 series; styles subsessile; stigmas large, erect, base constricted, apex entire. Fruit apocarpous; monocarps stipitate, slightly constricted between seeds, rust-colored tomentulose. Seeds many per monocarp, in 2 series.

• One species: China.

The IUCN Red List of Threatened Species (Version 2010.3; <http://www.iucnredlist.org>; accessed on 6 Oct 2010) treats the only member of this genus, *Chieniodendron hainanense* (under the name *Oncodostigma hainanense*), as Endangered (EN A2c).

Heusden (Blumea 38: 492–494. 1994) includes *Chieniodendron* within *Meiogyne*.

**1. *Chieniodendron hainanense*** (Merrill) Tsiang & P. T. Li, Acta Phytotax. Sin. 9: 375. 1964.

蕉木 *jiao mu*

*Fissistigma hainanense* Merrill, J. Arnold Arbor. 6: 131. 1925; *Desmos hainanensis* (Merrill) Merrill & Chun; *F. mac-lurei* Merrill (1923), not Merrill (1922); *Meiogyne hainanensis* (Merrill) Bân; *Oncodostigma hainanense* (Merrill) Tsiang & P. T. Li.

Trees to 16 m tall, evergreen, d.b.h. to 50 cm. Branchlets, bracteoles, pedicels, outer petals on both surfaces, inner petals outside, and fruit rust-colored pubescent. Petiole 4–5 mm, pubescent; leaf blade oblong to oblong-lanceolate, (4–)6–10(–16)  $\times$  (1.5–)2–3.5(–5) cm, thinly papery, drying brown or brownish green, glabrous except for veins, midvein adaxially impressed,

secondary veins 6–10 on each side of midvein, base rounded, apex shortly acuminate. Bracts ovate, 2–4 mm. Flowers ca. 1.5 cm in diam. Pedicel 6–7 mm; bracteoles ovate, 2–4 mm. Bud globose. Sepals ovate-triangular, 4–5 mm. Petals yellowish green; outer petals oblong-ovate, 1.4–1.7  $\times$  1–1.1 cm; inner petals slightly thicker and shorter, ca. 1.4  $\times$  0.8–0.9 cm, cucullate, inside basally concave and glabrous. Stamens ca. 2 mm. Carpels oblong, densely villous; stigmas clavate, erect, apex entire and puberulent. Monocarps to 8, shortly stipitate, ellipsoid, cylindric, or obovoid, 2–5  $\times$  2–2.5 cm, constricted between seeds, longitudinally ridged on one side. Seeds 6–10 per monocarp, pale yellowish brown, obliquely quadrate. Fl. Apr–Dec, fr. Aug–Mar.

• Dense forest in valleys; 300–600 m. S Guangxi, Hainan.

14. **POLYALTHIA** Blume, Fl. Javae, Annonaceae, 68. 1830.

暗罗属 an luo shu

Li Bingtao (李秉滔 Li Ping-tao); Michael G. Gilbert

Trees or shrubs. Inflorescences axillary, internodal, or leaf-opposed, sessile or shortly pedunculate, 1- to many flowered. Flowers usually bisexual. Sepals 3, usually small, valvate or rarely subimbricate in bud, free. Petals 6, in 2 whorls, free, valvate or rarely subimbricate in bud, subequal, flat and spreading; inner petals sometimes slightly larger or smaller than outer, concave and arched over stamens. Stamens usually many; anther locules cuneate; connectives apically orbicular or rhomboidal, concealing anther locules, apex flat-topped or slightly convex. Carpels rather few to many, free; ovules 1 or 2(or 3) per carpel, basal or sutural; styles absent, very short, or long; stigmas mostly dilated. Fruit apocarpous; monocarps few to many, short to long stipitate, mostly globose or ovoid, fleshy. Seeds 1 or 2(or 3) per monocarp, with a longitudinal circumferential groove.

About 120 species: Old World tropics from Africa to the W Pacific, with the center of distribution in SE Asia; 17 species (six endemic, one introduced) in China.

Molecular data (Mols et al., Amer. J. Bot. 91: 590–600. 2004) have shown that *Polyalthia* as traditionally delineated is polyphyletic and will eventually have to be divided among several genera.

- 15b. Leaf blade 8–20 cm, secondary veins glabrous ..... 11. *P. laui*

**1. *Polyalthia verrucipes*** C. Y. Wu ex P. T. Li, Acta Phytotax. Sin. 14(1): 110. 1976.

疣叶暗罗 you ye an luo

Trees to 12 m tall. Branches grayish black, glabrous. Petiole 3–7 mm, with transverse striations; leaf blade oblong to oblong-lanceolate, 10–17 × 2.5–5 cm, membranous, both surfaces glabrous and densely verrucate, midvein abaxially elevated and adaxially flat, secondary veins 15–18 on each side of midvein, delicate, and prominent on both surfaces, base broadly cuneate to obtuse, apex acuminate. Inflorescences axillary, 1- or 2-flowered. Pedicel 5–7 mm; bracteoles at middle and base, ovate to semiorbicular. Sepals orbicular to broadly ovate, apex rounded. Petals yellowish, linear-lanceolate, ca. 13 × 2–3 mm, membranous, glabrous; outer petals larger than inner petals. Stamens numerous; connectives slightly convex. Carpels 10–15, oblong, glabrous; ovary with 2 basal ovules; stigma ovoid. Fruiting pedicel 5–7 × ca. 3 mm; monocarp stipes 5–8 mm, verrucate; monocarps ovoid, 2–2.5 × 1–1.5 cm, glabrous. Seed 1 per monocarp, yellowish, ovoid, 18–20 × 8–11 mm. Fr. Apr–Jul.

- Densely forested slopes; 1000–1900 m. S Yunnan.

*Polyalthia verrucipes* is listed as Endangered (EN A2c) by the IUCN Red List of Threatened Species (Version 2010.3; <http://www.iucnredlist.org>; accessed on 7 Oct 2010).

X. L. Hou and P. T. Li (Acta Phytotax. Sin. 45: 369. 2007) included *Polyalthia chinensis* within *P. verrucipes*, but this is no longer accepted.

**2. *Polyalthia litseifolia*** C. Y. Wu ex P. T. Li, Acta Phytotax. Sin. 14(1): 110. 1976.

木姜叶暗罗 mu jiang ye an luo

Trees to 40 m tall. Bark grayish brown. Branches brown, glabrous. Petiole 6–10 mm, adaxially furrowed, glabrous, [with axillary bud at base]; leaf blade elliptic to broadly elliptic, 9–20 × 4.5–8 cm, membranous to subleathery, both surfaces glabrous and densely papillose, secondary veins 10–16 on each side of midvein, reticulate veins elevated on both surfaces, base rounded to broadly cuneate, apex shortly acuminate to obtuse. Inflorescences axillary, 1-flowered. Pedicel 2–3.5 cm, glabrous. Sepals triangular-lanceolate, ca. 12 mm, outside puberulent, inside glabrous. Petals broadly linear, 6–9 × 0.7–1.1 cm, subequal, glabrous, margin slightly revolute, with a midrib and 2–4 parallel secondary veins. Stamens many, ca. 1.5 mm; connectives apically truncate. Carpels 5 or 6, glabrous; ovules 3 per carpel; stigmas clavate, puberulent. Monocarp stipes 1–3 cm; monocarps oblong to ovoid, 3–3.5 × 2–2.5 cm, constricted between seeds, glabrous, verrucose. Seeds 3 per monocarp. Fl. Apr–Jul, fr. May–Sep.

- Sparsely forested slopes, moist valleys; ca. 600 m. S Yunnan.

*Polyalthia litseifolia* is listed as Endangered (EN A2c) by the IUCN Red List of Threatened Species (Version 2010.3; <http://www.iucnredlist.org>; accessed on 7 Oct 2010).

西藏暗罗 xi zang an luo

Trees to 10 m tall. Bark grayish white. Branches gray, with many lenticellate and irregular stripes. Petiole ca. 5 mm; leaf blade oblong-elliptic to obovate-lanceolate, 9–13 × 2.5–3.8 cm, thinly papery, glabrous, adaxially glossy, secondary veins 8–10 on each side of midvein, reticulate veins abaxially slightly elevated, base cuneate to broadly cuneate, apex caudate. Inflorescences axillary, 1- or 2-flowered. Pedicel ca. 7 mm; bracteoles at middle and base, semiorbicular to ovate. Sepals broadly ovate, apex rounded. Petals green, linear, ca. 13 × 2–3 mm, subequal, membranous, flat, glabrous. Stamens many; connectives apically rounded to subtruncate. Carpels many, oblong, glabrous; stigma slightly oblique. Carpels each with 2 ovules. Fruit not seen. Fl. Aug.

• Montane forests; ca. 1000 m. SE Xizang (Mêdog).

**4. *Polyalthia fragrans*** (Dalzell) Benth. & J. D. Hooker in J. D. Hooker, Fl. Brit. India 1: 63. 1872.

伞花暗罗 san hua an luo

*Guatteria fragrans* Dalzell, Hooker's J. Bot. Kew Gard. Misc. 3: 206. 1851.

Trees to 18 m tall. Branches hoary when young. Petiole 1–1.8 cm; leaf blade ovate-oblong to oblong-lanceolate, 10–24 × 5–12.5 cm, membranous, abaxially minutely puberulent on major veins but glabrescent, adaxially glabrous or puberulent, secondary veins 14–16 on each side of midvein, oblique, close-set, parallel, and abaxially very prominent, reticulate veins inconspicuous, base rounded, apex rounded to long acuminate. Inflorescences in axils of fallen leaves or on woody tubercles on branches, cymose, pedunculate, few to many flowered, hoary-tomentose. Flowers fragrant. Pedicel to 2.5 cm, slender; bracteoles inserted below middle of pedicel, orbicular. Sepals orbicular, ca. 3 mm in diam., recurved at anthesis, outside densely felted puberulent. Petals greenish yellow to pale yellow, linear, 3.8(–5) × ca. 0.5 cm, subequal, densely minutely hairy. Stamens many; connectives apically truncate. Carpels many, hairy. Fruiting pedicel to 3.5 cm; monocarp stipes to 5 cm, densely pubescent; monocarps broadly ovoid, 2.5–4 cm, walls thin and brittle, surface hoary. Seed 1 per monocarp. Fl. Apr–May, fr. Jun–Aug.

Forested slopes; ca. 700 m. S Yunnan [India].

**5. *Polyalthia simiarum*** (Buchanan-Hamilton ex J. D. Hooker & Thomson) Benth. ex J. D. Hooker & Thomson in J. D. Hooker, Fl. Brit. India 1: 63. 1872.

*Guatteria simiarum* Buchanan-Hamilton ex J. D. Hooker & Thomson, Fl. Ind. 1: 142. 1855; *Polyalthia cheliensis* Hu; *P. simiarum* subsp. *cheliensis* (Hu) Bân; *Unona simiarum* (A. Hamilton ex J. D. Hooker & Thomson) Baillon ex Pierre.

Trees to 25 m tall. Bark grayish white. Branches puberulent when young, glabrous and sparsely lenticellate with age. Petiole 5–10 mm, robust; leaf blade ovate-oblong, oblong, lanceolate, or oblanceolate, 9–28 × 3.5–12.5 cm, membranous to papery, hyalopunctate, glabrous or puberulent only on midvein, secondary veins 13–20 on each side of midvein, oblique, close-set, parallel, and prominent on both surfaces, base rounded to broadly cuneate and sometimes oblique, apex acuminate, shortly acuminate, or obtuse. Inflorescences axillary or on older or short branches, 1- to several flowered; bracts ovate, tomentulose. Pedicel ochraceous, 2.5–4 cm, tomentulose, bracteolate near base to middle. Sepals ovate-triangular, ca. 5 × 5 mm, outside pubescent, inside glabrous. Petals yellowish green; outer petals ± longer than inner petals; inner petals linear-lanceolate to linear, 1.5–3.5 × 0.3–0.4 cm, outside puberulent, inside ± glabrous. Stamens oblong; connectives apically broadly truncate to convex. Carpels oblong, pubescent; ovule 1 per carpel, basal; stigmas capitate, puberulent. Fruiting pedicel 2–3 cm; monocarp stipes 3–3.5 cm, glabrous; monocarps ovoid to ovoid-ellipsoid, 2.5–3 × 1.2–1.7 cm, glabrous. Seed 1 per monocarp. Fl. Apr–Sep, fr. Jul–Dec.  $2n = 14$ .

Forested slopes; 500–1200 m. S and SW Yunnan [Bhutan, Cambodia, India, Laos, Myanmar, C and N Thailand, Vietnam].

The record of *Goniothalamus macrophyllus* (Blume) J. D. Hooker & Thomson from the Flora area (X. L. Hou, <http://www.abclunwen.com/lunwen-free-387606/>; accessed on 25 Nov 2010) was based on a misidentification of *Polyalthia simiarum*.

**6. *Polyalthia viridis*** Craib, Bull. Misc. Inform. Kew 1914: 4. 1914.

毛脉暗罗 mao mai an luo

Trees to 15 m tall. Branches tawny pubescent when young, gray lenticellate with age. Petiole ca. 1 cm, robust, transversely striate, tawny pubescent; leaf blade oblong to elliptic-oblong, 18–28 × 5–8.5 cm, thinly leathery, glabrous except for pubescent midvein and secondary veins, secondary veins 15–18 on each side of midvein, prominent on both surfaces and pubescent, base truncate, shallowly cordate, or sometimes rounded, apex acute. Inflorescences axillary, several flowered. Pedicel ca. 2.5 cm, pubescent. Sepals broadly ovate, 3.5–4 mm, outside pubescent, inside glabrous. Petals green, linear-oblong, ca. 3 cm × 4 mm, glabrous. Ovules 2 per carpel. Fruiting pedicel 2–7 cm, robust; monocarp stipes 3–5 cm, glabrous; monocarps oblong-ellipsoid, 2.5–4 × ca. 1.8 cm, glabrous. Seed 1 per monocarp. Fl. Apr–Jul, fr. Aug–Feb.

Densely forested slopes; 600–1100 m. S and SW Yunnan [Thailand].

**7. *Polyalthia pingpiensis*** P. T. Li, Acta Phytotax. Sin. 14(1): 110. 1976.

多脉暗罗 duo mai an luo

Trees to 10 m tall. Bark and branches grayish black, longitudinally striate. Branchlets glabrous. Petiole 1–1.5 cm, densely pubescent; leaf blade oblong to oblong-lanceolate, 7–18 × 2.5–5.5 cm, leathery, abaxially sparsely pubescent but denser along veins, adaxially glabrous except for pubescent midvein, midvein adaxially impressed, secondary veins 24–28 on each side

of midvein, closely parallel, and prominent on both surfaces, base attenuate to obtuse, apex shortly acuminate. Inflorescences axillary or terminal, 1- or 2-flowered. Flowers ca. 3 cm in diam. Pedicel ca. 2.5 cm, puberulent or glabrous. Sepals broadly ovate, ca.  $1.3 \times 1.5$  cm, outside puberulent, inside glabrous. Petals elliptic to ovate,  $2.5\text{--}3.5 \times$  ca. 1.6 cm, outside puberulent, inside glabrous; inner petals oblong,  $2.2\text{--}2.7 \times$  ca. 0.9 cm. Stamens oblong-cuneate, ca. 4 mm; connectives apically rounded, pubescent. Carpels many, oblong, ca. 2.5 mm, villous; ovule 1 per carpel, basal; stigmas capitate. Fruiting pedicel ca. 4 cm; monocarp stipes 2–4 cm, glabrous; monocarps purple, ellipsoid, ca.  $1.5 \times 1$  mm, apex mucronate. Fl. May, fr. Oct.

- Densely forested slopes; 1000–1500 m. S Yunnan.

*Polyalthia pingpiensis* is listed as Endangered (EN A2c) by the IUCN Red List of Threatened Species (Version 2010.3; <http://www.iucnredlist.org>; accessed on 7 Oct 2010). The epithet has been given incorrectly as “*pingpinensis*” in some standard indices.

**8. *Polyalthia cerasoides* (Roxburgh) Benth & J. D. Hooker ex Beddome**, Fl. Sylv. S. India, t. 1. 1869.

细基丸 xi ji wan

*Uvaria cerasoides* Roxburgh, Pl. Coromandel 1: 30. 1795; *Polyalthia crassipetala* Merrill.

Trees to 20 m tall. Bark grayish black. Branchlets densely pubescent, glabrescent, lenticellate with age. Petiole 2–3 mm, sparsely hispid; leaf blade oblong, oblong-lanceolate, or sometimes elliptic,  $6\text{--}19 \times 2.5\text{--}6$  cm, abaxially yellowish and pubescent, adaxially often bluish green when dry and glabrous except for minutely hairy midvein, secondary veins 7 or 8 on each side of midvein, base broadly cuneate to rounded, apex obtuse. Inflorescences axillary, 1-flowered. Flowers 1–2 cm in diam. Pedicel 1–2 cm, puberulent, with 1 or 2 leafy bracteoles below middle. Sepals oblong-ovate, 8–9 mm, outside pilose, apex acuminate. Petals green but black when dry, subequal or inner petals shorter than outer petals, oblong-ovate, 8–9 mm, thickly leathery, puberulent. Stamens cuneate; connectives apically truncate. Carpels oblong, pubescent; ovule 1 per carpel; stigmas ovoid, apex entire. Monocarp stipes 1.5–2 cm, weak; monocarps red but black when dry, ovoid to subglobose, ca. 6 mm in diam., glabrous. Fl. Mar–May, fr. Apr–Nov.  $2n = 18$ .

Sparsely forested slopes; 100–1100 m. S Guangdong, S Guangxi, Hainan, S Yunnan [Cambodia, India, Laos, Myanmar, Thailand, Vietnam].

A fine strong bast fiber obtained from the inner bark of *Polyalthia cerasoides* is used to make rope and sacks. The wood is used for farming tools and structural timbers. The flowers are very fragrant and are sometimes collected as a perfume.

**9. *Polyalthia littoralis* (Blume) Boerlage** in Hasskarl, Cat. Hort. Bot. Bogor. 34. 1844.

陵水暗罗 ling shui an luo

*Guatteria littoralis* Blume, Fl. Javae, Annonaceae, 99. 1830; *Polyalthia zhui* X. L. Hou & S. J. Li.

Shrubs or small trees, to 5 m tall. Branchlets dark purple, striate, appressed grayish yellow pubescent, soon glabrous. Petiole yellowish, 3–5 mm, puberulent; leaf blade oblong to

oblong-lanceolate,  $9\text{--}19 \times 2\text{--}6$  cm, leathery, glabrous, abaxially glossy pale green, adaxially dark green, often bluish green when dry, secondary veins 8–10 on each side of midvein, at  $60^\circ\text{--}80^\circ$  to midrib, arcuately ascending, and anastomosing 3–5 mm from margin, base cuneate to rounded, apex acuminate to bluntly acute. Inflorescences leaf-opposed, 1- or 2-flowered; peduncle ca. 1 mm. Flowers 1–2 cm in diam. Pedicel to 3 mm, pubescent; bracteole 1, broadly ovate,  $1\text{--}2 \times$  ca. 2 mm, apex acuminate. Sepals triangular, ca. 2 mm, outside pubescent, apex acute. Petals white, oblong-elliptic, 6–8 mm, spreading, subequal or inner petals slightly shorter than outer petals, slightly thick, outside pubescent, apex acute to obtuse. Stamens many; connectives apically truncate, puberulent. Carpels 7–11(–30), puberulent; ovule 1 per carpel, basal; stigmas obovate, shallowly 2-cleft. Monocarp stipes 2–5 mm, puberulent; monocarps 4–7(–11), red but purplish red when dried, ovoid-ellipsoid,  $1\text{--}1.5 \times 0.8\text{--}1$  cm, glabrous, densely minutely dotted. Seed 1 per monocarp, red, ellipsoid,  $10\text{--}12 \times 6\text{--}8$  mm. Fl. Apr–Jul, fr. Jul–Feb.  $2n = 36$ .

Forested slopes, margins of wet forests, along small streams; 100–800 m. Guangdong, Guangxi, Hainan, Yunnan [Indonesia, Thailand, Vietnam].

Molecular data (Mols et al., Amer. J. Bot. 91: 598. 2004) suggest that *Polyalthia littoralis* and related species are more closely related to the genus *Marsypopetalum* Scheffer rather than *Polyalthia* s.s. “*Polyalthia caloneura*,” proposed but not validly published by X. L. Hou (<http://www.abclunwen.com/lunwen-free-387606/>; accessed on 25 Nov 2010), belongs here. *Polyalthia zhui* was based on material with immature flowers.

小花暗罗 xiao hua an luo

Shrubs ca. 2 m tall. Branchlets pubescent when young, glabrescent. Petiole 2–4 mm, pubescent; leaf blade oblong-lanceolate to oblanceolate,  $5\text{--}14.5 \times 2.3\text{--}4$  cm, membranous, abaxially puberulent, adaxially glabrous except for minutely hairy midvein, secondary veins 10–13 on each side of midvein, obliquely ascending, and anastomosing near margin, base broadly cuneate, apex obtuse to acuminate. Inflorescences leaf-opposed, 1-flowered. Flowers ca. 0.4 cm in diam. Pedicel 1–10 mm, pubescent; bracteoles 2 at middle of pedicel, ovate-lanceolate, ca.  $3.5 \times 1$  mm, abaxially pubescent, adaxially glabrous. Sepals ovate, ca.  $2 \times 2$  mm, outside pubescent, inside glabrous. Petals yellowish green; outer petals ovate-lanceolate, ca.  $2.5 \times 1.5$  mm, concave, outside pubescent, inside glabrous; inner petals ovate, ca.  $3.5 \times 2$  mm, flat. Stamens cuneate, ca. 0.5 mm; connectives apically truncate, puberulent. Carpels ca. 7, oblong, ca. 0.8 mm, glabrous; ovule 1 per carpel, basal. Fruiting pedicel 1–1.5 cm; monocarp stipes 3–5 mm, pubescent; monocarps to 7, red, globose, ca. 8 mm in diam., glabrous. Fl. Dec–Feb, fr. Jun–Aug.

- Forested slopes; 1100–1400 m. S and W Yunnan.

**11. *Polyalthia laui* Merrill**, Lingnan Sci. J. 14: 5. 1935.

海南暗罗 hai nan an luo

Trees to 25 m tall, d.b.h. to 40 cm. Bark gray. Branches pubescent when young, glabrescent. Petiole 5–8 mm, trans-

versely rugosely striate, puberulent; leaf blade oblong to oblong-elliptic, 8–20 × 3.5–8 cm, thinly leathery to leathery, glabrous, adaxially shiny, secondary veins 14–18 on each side of midvein, parallel, ascending to margin, and adaxially conspicuous, base broadly cuneate to rounded, apex acuminate. Inflorescences axillary or on old branches, several flowered. Pedicel 1.5–3 cm, puberulent; bracteoles at base of pedicel, broadly ovate. Sepals broadly ovate, ca. 5 × 5 mm, outside puberulent, inside glabrous, apex obtuse to acute. Petals yellowish, oblong-ovate to ovate-lanceolate, 2–3.5 × 1–1.5 cm, outside puberulent or glabrous, inside glabrous; inner petals slightly longer than outer petals. Stamens cuneate; connectives apically obtuse. Carpels many, oblong, densely pubescent; ovule 1 per carpel, basal; stigmas capitate. Fruiting pedicel 3.5–4 cm; monocarp stipes 2.5–5 cm; monocarps red, ovoid-ellipsoid, 2.5–5 × 1–2 cm, glabrous, apex obtuse. Seed 1 per monocarp. Fl. Apr–Jul, fr. Oct–Dec.

Evergreen broad-leaved forests on slopes; 300–700 m. Hainan [Vietnam].

The wood of *Polyalthia laui* is used for making household implements and as structural timber.

**12. *Polyalthia suberosa*** (Roxburgh) Thwaites, Enum. Pl. Zeyl. 398. 1864.

*Uvaria suberosa* Roxburgh, Pl. Coromandel 1: 31. 1795; *Guatteria suberosa* (Roxburgh) Dunal.

Shrubs or small trees, to 5 m tall. Bark corky, ridged. Branchlets dark red, rust-colored pubescent when young, glabrescent, with pink lenticels and corky ridges when older. Petiole 2–4 mm, puberulent; leaf blade oblong, elliptic-oblong, or narrowly obovate-oblong, 5–11 × 2–4 cm, membranous to papery, abaxially pale brown when dry and glabrescent, adaxially gray and glabrous except for sparse pubescence along midvein, secondary veins 8–10 on each side of midvein, spreading, and inconspicuous on both surfaces, reticulate veins lax and inconspicuous, base narrowed and slightly oblique, apex subobtuse to rounded and sometimes abruptly shortly acuminate. Inflorescences extra-axillary, leaf-opposed, or slightly below leaf, 1 (or 2)-flowered. Pedicel 0.7–2.5 cm, puberulent; bracteole near base of pedicel, minute, apex acute. Sepals ovate-triangular, 2–2.5 mm, outside pubescent, inside glabrous. Petals yellowish green; outer petals oblong-lanceolate, shorter than inner petals, leathery, flat and spreading, outside slightly pubescent, inside glabrous, apex acute; inner petals oblong, erect and curved, ca. 10 mm, apex obtuse. Stamens many, ca. 1 mm; connectives apically convex. Carpels many, ca. 2 mm, pubescent; ovules 1 or 2 per carpel; styles widening into a thickly triangular blade-like glabrous stigma. Monocarp stipes 8–10 mm, slender; monocarps to 18, red, almost spherical, ca. 5 mm in diam., sparsely appressed pubescent or glabrescent. Seeds 1 or 2 per monocarp, with a longitudinal circumferential band. Fl. almost year-round, fr. Jun–Dec.  $2n = 18$ .

Open forests at lower elevations. S Guangdong, S Guangxi, Hainan [India, Laos, Malaysia, Myanmar, Philippines, Sri Lanka, Thailand, Vietnam].

**13. *Polyalthia longifolia*** (Sonnerat) Thwaites, Enum. Pl. Zeyl. 398. 1864.

*Uvaria longifolia* Sonnerat, Voy. Indes Orient. 2: 260. 1782; *Guatteria longifolia* (Sonnerat) Wallich; *Unona longifolia* (Sonnerat) Dunal.

Trees to 20 m tall; trunk straight. Branches finely striate, minutely puberulent when young, soon glabrous. Petiole 5–10 mm; leaf blade ovate-oblong to ovate-lanceolate, 11–31 × 2.5–8 cm, stiffly membranous to thinly leathery, glabrous, abaxially pale, adaxially dark glossy green, secondary veins 18–24 on each side of midvein, reticulate veins raised on both surfaces, base cuneate, obtuse, or rounded, margin undulate, apex acuminate. Inflorescences axillary, fasciculate and shortly pedunculate, racemose, or umbelliform and sessile, mostly many flowered; peduncle to 0.7–1.5 cm; rachis to 1 cm. Pedicel 2–4 cm; bracteole usually 1, at middle of petiole, to 1 mm, tomentulose. Sepals ovate-triangular, 1.5–3 × 1.5–1.8 mm, outside tomentulose, inside glabrous. Petals greenish yellow, narrowly triangular-lanceolate, 1.3–1.5 × 0.2–0.4 cm, subequal, spreading, inside puberulent except basally, base broad, apex acute. Stamens 8–10 cm; connectives apically convex. Carpels 20–25, ca. 1.5 mm, apex tomentulose; ovule 1 per carpel; stigmas sessile, rectangular to oblong, pubescent, with a groove on inner side and continuing down inner side of ovary. Monocarp stipes 1–2 cm; monocarps 4–8, purple, ovoid, 2–2.5 × ca. 1.5 cm, glabrous. Seed pale brown, ovoid, ca. 2 × 1.4 cm, usually with a longitudinal groove. Fl. May–Jun, fr. Jul–Sep.  $2n = 18$ .

Cultivated; 300–400 m. Hainan, Taiwan, Yunnan [native to India and Sri Lanka].

*Polyalthia longifolia* is grown for its wood and as an ornamental throughout SE Asia.

**14. *Polyalthia obliqua*** J. D. Hooker & Thomson, Fl. Ind. 1: 138. 1855.

沙煲暗罗 sha bao an luo

*Polyalthia consanguinea* Merrill.

Trees to 12 m tall. Bark dark gray. Branchlets reddish, minutely rust-colored pubescent, soon glabrous, with many lenticels when young. Petiole 3–5 mm, swollen, puberulent; leaf blade oblong-lanceolate to oblanceolate, 10–20 × 2.5–7 cm, thinly leathery to papery, abaxially dull, drying silvery green, and pubescent along midvein, adaxially glabrous and shiny, secondary veins 10–14 on each side of midvein, curving, forming a wide angle with midvein, anastomosing doubly, and adaxially flat, base narrowed and sometimes inequilateral, margin slightly revolute, apex bluntly acuminate. Inflorescences axillary, sometimes formed after leaf fall, 1–3-flowered. Pedicel 1–1.8 cm, pubescent; bracteoles 2 or 3, minute, 2 basal and other medial on pedicel. Sepals ovate-triangular, 2–3 mm, outside pubescent, inside glabrous, apex slightly obtuse. Petals white, oblong, 10–13 × 3–4.5 mm, subequal, outside pubescent, inside glabrous and rough, margins revolute, apex slightly obtuse. Stamens ca. 1 mm; connectives apically flat-topped to

convex, pubescent. Carpels ovate-oblong, ca. 1.5 mm, pubescent; ovules 2 per carpel; stigmas ovoid, pubescent. Monocarp stipes 0.7–2 cm; monocarps reddish brown, globose, 1–2 cm in diam., thinly walled, glabrous, densely minutely verrucate. Seeds 2 per monocarp, verrucose. Fl. Jan–Apr, fr. Jun–Dec.

Woodlands at middle elevations. Hainan [Malaysia].

Trees to 12 m tall. Branches dark brown, longitudinally reticulately striate when dried, glabrous. Petiole dark; leaf blade oblong-elliptic, 14–17 × 7–9 cm, thinly leathery, glabrous, midvein abaxially raised and adaxially flat, secondary veins 8 or 9, at ca. 45° to midrib, and then arcuately ascending, reticulate veins elevated on both surfaces, base rounded, apex acuminate. Inflorescences axillary, 1–6-flowered; peduncle 1–1.5 cm. Pedicel 2–3 cm, glabrous or sparsely shortly hairy. Sepals rounded-triangular, 3–5 mm. Petals green to yellowish green, narrowly lanceolate, 6–7 cm, subequal. Fruiting peduncle ca. 2 × 0.5 cm; pedicel 2.5–3 cm; monocarps black when mature, ellipsoid, 1.7–2.5 × 1.5–2 cm, longitudinally 2-grooved. Fl. Aug.  $2n = 18$ .

Thickets on coral limestone at low elevations. Taiwan (Lan Yu [Japan (Ryukyu Islands)]).

## 15. TRIVALVARIA (Miquel) Miquel, *Ann. Mus. Bot. Lugduno-Batavi* 2: 19. 1865.

海岛木属 hai dao mu shu

Li Bingtao (李秉滔 Li Ping-tao); Michael G. Gilbert

*Guatteria* sect. *Trivalvaria* Miquel, *Fl. Ned. Ind., Eerste Bijv.* 381. 1861.

Shrubs or small trees, indument of simple hairs, sometimes absent. Inflorescences extra-axillary or sometimes leaf-opposed, sometimes fasciculate on woody axes; flowers solitary or paired. Flowers polygamous or bisexual. Flower buds very broadly ovoid to cylindrical. Sepals 3, small, imbricate, free or united at base. Petals 6, in 2 whorls, unequal, each whorl minutely imbricate or valvate, outer petals spreading, inner petals larger, spreading or connivent and concave. Male flowers: torus conical, broadly conical-ovoid, or cylindrical; stamens many; connective apex shieldlike to tongue-shaped, minutely pubescent or glabrous. “Female” flowers: stamens few; carpels many, densely hairy; ovule 1, basal. Styles absent; stigmas ± globose. Bisexual flowers: torus cylindrical; stamens and carpels many. Fruit apocarpous; monocarps 2 to > 20, shortly stipitate, ellipsoid to oblong or ovoid, thin walled, glabrous or pubescent. Seeds solitary, ellipsoid to oblong, smooth, shiny, with circumferential, longitudinal groove.

Four species: Bangladesh, China, India, Indonesia, Laos, Malaysia, Myanmar, Thailand, Vietnam; one species in China.

*Trivalvaria* has not been recognized for China in previous Flora accounts, but see Heusden (*Nordic J. Bot.* 17: 169–180. 1997).

**1. *Trivalvaria costata*** (J. D. Hooker & Thomson) I. M. Turner, Kew Bull. 64: 577. 2009.

海島木 hai dao mu

*Guatteria costata* J. D. Hooker & Thomson, Fl. Ind. 1: 143. 1855; *Ellipeia costata* (J. D. Hooker & Thomson) King; *Polyalthia costata* (J. D. Hooker & Thomson) J. D. Hooker & Thomson; *P. nemoralis* Aug. Candolle; *P. oligogyna* Merrill & Chun.

Shrubs or small trees, to 5 m tall. Branches densely to very sparsely pubescent when young, glabrescent. Petiole 2–10 mm, densely pubescent to glabrous; leaf blade obovate to elliptic to (ovate-)oblong, 6–25 × 2–9 cm, membranous to thinly leathery, abaxially sparsely to densely pubescent, adaxially glabrous or rarely pubescent, base cuneate to ± rounded, apex acuminate to caudate, sometimes rounded, midvein adaxially impressed, lateral veins adaxially faint to indistinct. Inflorescences extra-axillary or sometimes ± leaf-opposed, rarely from old branches, often on woody axis with scars of previous flowers, 1- or 2-flowered; bracts 1 or 2, triangular to ovate, 1.5–3(–5) mm. Flowers polygamous (male and bisexual). Pedicel 2–5(–8) mm, pubescent. Buds 2.5–5(–8) mm. Sepals triangular to very broadly ovate, 2–3.5 × 1.5–4 mm, outside densely pubescent, apex acuminate to rounded. Petals white to dirty pale yellow, minute

ly imbricate, (ob)lanceolate, narrowly ovate to broadly triangular, 2–8(–12) × 1–4.5 mm, spreading outside pubescent, inside glabrous; inner petals obovate to lanceolate, 4–12 × 1–4 mm, apex rounded to bluntly acute. Male flowers: torus conical; stamens many, 1.3–2.6 mm; connective apex shieldlike, sometimes tongue-shaped on outer stamens, glabrous or densely puberulent. Bisexual flowers: torus cylindrical; stamens many; carpels 2–10, densely hairy; stigma pubescent. Fruiting pedicel 3–5(–8) mm; monocarp stipes 1–6 mm; monocarps to 5, sometimes glaucous, ripening red, ellipsoid to oblong, 10–28 × 5–11 mm, sparsely pubescent, verruculose, with circumferential longitudinal groove.

Hainan [India (Andaman Islands), Laos, Malaysia, Myanmar, Thailand, Vietnam].

The Chinese material of *Trivalvaria costata* was included within *Polyalthia nemoralis* (as the synonym *P. oligogyna*) in FRPS (30(2): 87. 1979). "*Polyalthia dubia*" (Kurz, Rep. Veg. Andaman Isl. 29. 1870) belongs here but is a nomen nudum and was therefore not validly published (*Vienna Code*, Art. 32.1(d)); as a result, "*P. dubia* var. *glabriuscula*" (Kurz, J. Asiat. Soc. Bengal, Pt. 2, Nat. Hist. 43(2): 53. 1874) was also not validly published (Art. 43.1). *Popowia kurzii* King (J. Asiat. Soc. Bengal, Pt. 2, Nat. Hist. 61(2): 96. 1892) was also applied to this species, but that name was nomenclaturally superfluous (and is therefore illegitimate: Art. 52.1), because the earlier name *Guatteria macrophylla* Blume was cited as a synonym in the protologue.

## 16. DISEPALUM J. D. Hooker, Trans. Linn. Soc. London 23: 156. 1860.

异萼花属 yi e hua shu

Li Bingtao (李秉滔 Li Ping-tao); Michael G. Gilbert

*Enicosantheum* Bân.

Trees or shrubs, indument of simple or stellate hairs. Petiole often short to absent. Inflorescences terminal or sometimes leaf-opposed, 1–3-flowered. Pedicel slender, pendent, without bracteoles. Sepals [2 or]3, relatively large, valvate, free, eventually ± reflexed. Petals [4–]6, in [1 or]2 whorls, ± equal, free [or united into cup, sometimes adnate to torus], sometimes imbricate at tips. Torus usually much wider than high, enlarged in fruit. Stamens many; connective depressed-globose, wider than anther locules. Carpels many; ovules (1 or)2(or 3), lateral. Styles oblong, often hairy at apex. Fruit apocarpous; monocarps usually many, each on long stipelike carpophore articulate at apex, usually ± ellipsoid, fleshy. Seeds usually 2, shiny chestnut-brown, ellipsoid or flattened-ellipsoid.

Nine species: China, Indonesia, Laos, Malaysia, Vietnam; two species in China.

The fruit of *Disepalum* are very distinct because of the different origin of the carpophores bearing the monocarps. In most members of the Annonaceae the monocarps are borne on stipes formed by extension of the monocarps themselves. In *Disepalum* the monocarps are borne on carpophores derived from the torus that differ in color and texture from the monocarps and are abruptly separated from them by an articulation at the apex. The Chinese species had previously been placed in *Polyalthia* or placed in their own genus *Enicosantheum*. *Disepalum* s.s. has extremely distinctive flowers, but Johnson (Brittonia 41: 356–378. 1989) argues that the very unusual fruit make a good case for including *Enicosantheum* within *Disepalum*.

1a. Leaf blade with translucent dots, membranous; petals oblong or oblanceolate, 1.3–2.6 × 0.6–1.2 cm; carpels

18–35; carpophores 0.7–1.3 cm ..... 1. *D. petelotii*

1b. Leaf blade without translucent dots, papery to thinly leathery; flowers 5–10 cm in diam.; petals broadly

obovate, 2.2–3.4 × 1.2–3 cm; carpels 60–200; carpophores 3–4.7 cm ..... 2. *D. plagioneurum*

**1. *Disepalum petelotii*** (Merrill) D. M. Johnson, Brittonia 41: 364. 1989.

窄叶异萼花 zhai ye yi e hua

*Polyalthia petelotii* Merrill, Univ. Calif. Publ. Bot. 13: 131. 1926; *Enicosantheum petelotii* (Merrill) Bân; *E. plagioneurum* (Diels) Bân var. *oblanceolatum* (W. T. Wang) Bân; *Uvaria oblanceolata* W. T. Wang.

Shrubs or small trees, 2–7 m tall. Branches dark gray, longitudinally wrinkled, puberulent when young, glabrescent. Petiole 5–7 mm, appressed pubescent; leaf blade narrowly elliptic, oblong, oblong-lanceolate, or oblanceolate, 8–20 × 2–4.5 cm, membranous and translucent punctate when young, later papery, abaxially golden to rust-colored sericeous but glabrescent or with scattered appressed hairs with age, adaxially shiny green and glabrous, secondary veins 7–13 on each side of mid-

vein, arcuately ascending, and slightly prominent on both surfaces, base cuneate to cuneate and decurrent onto petiole, apex acuminate and sometimes with a 1–2 cm acumen. Inflorescences terminal or sometimes leaf-opposed, 1-flowered. Flowers ca. 3 cm in diam. Pedicel 1–1.7 cm, ferruginous pubescent. Sepals ovate-triangular to subcordate, 1–1.2 × 0.8–1.2 cm, outside appressed pubescent, inside glabrous. Petals greenish to yellow with a purple base, oblong to rarely oblanceolate, 2–2.5 × 0.6–1.2 cm, subequal, outside sparsely puberulent or glabrous, inside glabrous, apex obtuse to acute. Stamens oblong, 2.2–2.7 mm; connectives apically broadly truncate, puberulent. Carpels 18–35, villous; ovules 1 or 2 per carpel, basal. Fruiting pedicel 2–5 cm; carpophore ± as long as monocarp, slender; monocarp to 20, dark purple when ripe, ellipsoid to cylindric-ellipsoid, 1.2–1.5 × 0.8–1 cm, ferruginous pubescent when young, glabrescent. Seeds 1 or 2, flat-ellipsoid, 10–13 × 6–8 mm. Fl. Mar–Nov, fr. Jul–Dec.

Forested slopes, often along moist valleys; 100–2000 m. Guangxi, S Guizhou, Hainan, SE Yunnan [N Vietnam].

**2. *Disepalum plagieneurum*** (Diels) D. M. Johnson, *Brittonia* 41: 366. 1989.

斜脉异萼花 *xie mai yi e hua*

*Polyalthia plagieneura* Diels, *Notizbl. Bot. Gart. Mus. Berlin-Dahlem* 10: 886. 1930; *Enicosanthellum plagieneurum* (Diels) Bân.

Trees to 15 m tall. Branches brown to dark gray, rust-colored sericeous, glabrescent. Petiole 5–10 mm, appressed sericeous, glabrescent; leaf blade narrowly elliptic, oblong, lanceolate, or oblanceolate, 8–22 × 3–7.5 cm, papery to thinly leathery, abaxially densely rust-colored sericeous but soon sparsely appressed pubescent to glabrescent, adaxially shiny and glabrous, secondary veins 8–12 on each side of midvein, arcuately ascending, and prominent on both surfaces, base broadly cuneate to decurrent, apex acute to shortly acuminate and sometimes with a 3–9 mm acumen. Inflorescences terminal or leaf-opposed, 1-flowered. Flowers 5–10 cm in diam. Pedicel 3–5 cm, rust-colored pubescent. Sepals broadly ovate, 1.5–2 × 1.3–1.7 cm, pubescent to sparsely pubescent, apex obtuse to apiculate. Petals yellowish green, broadly obovate, 2.2–4 × 1.2–3 cm, subequal, thickly papery when dry, appressed tomentulose, apex obtuse to rounded. Stamens oblong, base attenuate; connectives apically truncate, puberulent. Carpels linear, 1.5–2 mm, rust-colored appressed pubescent; ovules 1 or 2 per carpel, basal. Fruiting pedicel 4.5–10 cm × 2–5 mm; carpophores 2–7 cm, pinkish red, pubescent or glabrescent; monocarp to at least 20, ripening black but grayish black when dry, ellipsoid to ovoid, 1–1.6 × 0.8–1.1 cm, glabrescent, apex dilated. Seeds 1 or 2 per monocarp, ellipsoid, 11–12 × ca. 8 mm. Fl. Mar–Aug, fr. Sep–Dec.

Forested slopes, often in valleys; 500–1600 m. Guangdong, Guangxi, S Guizhou, Hainan [Vietnam].

## 17. *POPOWIA* Endlicher, Gen. Pl. 831. 1839.

嘉陵花属 *jia ling hua shu*

Li Bingtao (李秉滔 *Li Ping-tao*); Michael G. Gilbert

Shrubs or small trees. Leaf blade granular or subgranular in texture, glabrous, pubescent, or tomentose. Inflorescences leaf-opposed or extra-axillary and 1-flowered or fasciculate and several flowered. Flowers small, bisexual. Sepals 3, slightly smaller than petals, valvate. Petals 6, in 2 whorls, thick, sometimes outer and inner petals united at base forming a sympetalous corolla; outer petals small, valvate, spreading; inner petals larger than outer, sometimes connivent and erect, inside concave, base shortly clawed, margin adhering but later free, apically often incurved and valvate but occasionally imbricate. Stamens many; anther locules cuneate, extrorse; connectives apically broadly flat-topped to slightly concave. Carpels few to many; ovules 1 or 2 per carpel; styles very short; stigmas subcapitate to cuneate, grooved on top and down inner side. Fruit apocarpous; monocarp subsessile to stipitate, globose [or ovoid]. Seed often 1 per monocarp, rugose or pitted and with a circumferential ridge.

About 50 species: tropical Africa, tropical Asia, Oceania; one species in China.

**1. *Popowia pisocarpa*** (Blume) Endlicher in Walpers, *Repert. Bot. Syst.* 1: 252. 1842.

嘉陵花 *jia ling hua*

*Guatteria pisocarpa* Blume, *Bijdr.* 21. 1825.

Shrubs or small trees, 3–7 m tall. Branches spreading, slender, pliant; branchlets dark colored, striate, rufous pubescent when young, glabrescent, with many leaf scars when old. Petiole 2–5 mm; leaf blade ovate, elliptic, lanceolate, or sometimes slightly obovate, 5.5–14 × 2.5–7 cm, membranous, minutely granular, abaxially appressed rufous pubescent on midvein and secondary veins, adaxially glabrous except for slightly pubescent midvein, secondary veins 6–10 pairs, curving then

becoming straight, ascending steeply, and running some distance close to margin before terminating, base acute to subrounded and oblique, apex acute to shortly acuminate. Inflorescences 1-flowered or 2- or 3-fasciculate. Pedicel white or yellowish, 2–6 mm, slender, pubescent. Sepals broadly ovate, ca. 1 × 1 mm, outside pubescent. Petals yellowish green; outer petals ovate-triangular, ca. 2.5 × 2.5 mm, pubescent; inner petals ca. 2 × 2 mm. Stamen connectives apically truncate, puberulent. Carpels 5 or 6, ca. 1.5 mm, puberulent. Monocarps globose, 6–8 mm in diam. Fl. Jan–Jul, fr. Sep–Nov.  $2n = 18$ .

Forested slopes; 200–300 m. Guangdong, Hainan [Indonesia, Malaysia, Myanmar, Philippines, Thailand, Vietnam].

The flowers of *Popowia pisocarpa* are fragrant and are used as a perfume.

**18. ALPHONSEA** J. D. Hooker & Thomson, Fl. Ind. 1: 152. 1855.藤春属 *teng chun shu*Li Bingtao (李秉滔 *Li Ping-tao*); Michael G. Gilbert

Trees or shrubs, glabrous or with simple hairs. Petiole short; leaf blade usually leathery to thinly leathery, shiny. Inflorescences internodal, leaf-opposed, rarely extra-axillary or axillary, 1-flowered or flowers to 12 forming clusters. Flowers bisexual. Torus cylindrical to hemispheric, hairy. Sepals 3, much smaller than petals, valvate in bud. Petals 6, in 2 whorls, basally saccate, apically recurved and valvate in bud; outer petals spreading,  $\pm$  as long as inner petals but slightly wider. Stamens many, in several series; connectives produced but not concealing dorsal anther locules, apex apiculate. Carpels 1–8(–15), free; ovules 4–24 per carpel, in 2 series; styles cylindric, short; stigmas inconspicuously capitate, with a slit down inner side. Fruit apocarpous; monocarp stipes with thick walls or almost absent; monocarps few, globose or cylindric, succulent or woody, glabrous, tomentose, or verrucose. Seeds several per monocarp, not separating from fruit wall.

About 23 species: S and SE Asia; six species (four endemic) in China.

- 1a. Young stems and abaxial leaf surfaces densely villous to tomentose ..... 1. *A. mollis*
- 1b. Stems and abaxial leaf surfaces glabrous or obscurely puberulent only along midvein.
  - 2a. Leaf blade apex caudate with a 1–1.7 cm acumen, secondary veins 15–19 on each side of midvein; flowers solitary; monocarps cylindric ..... 6. *A. tsangyuanensis*
  - 2b. Leaf blade apex acute to acuminate but without an acumen, secondary veins 9–13 on each side of midvein; flowers fascicled; monocarps ovoid, subglobose, ellipsoid, or obovoid.
    - 3a. Peduncle with 4–12 bracts, pedicel with up to 8 persistent bracteoles; monocarp verrucose.
      - 4a. Peduncle with 8–12 bracts; sepals longer than wide, apex acuminate or acute ..... 2. *A. squamosa*
      - 4b. Peduncle with 4 or 5 bracts; sepals shorter than wide, apex rounded ..... 3. *A. boniana*
    - 3b. Peduncle and fruiting pedicel with not more than 2 bracts and bracteoles; monocarp smooth.
      - 5a. Leaf blade adaxially not glossy, glaucous when dry; outer petals glabrous inside; carpel 1, with ca. 22 ovules ..... 4. *A. monogyna*
      - 5b. Leaf blade adaxially glossy, yellowish green when dry; outer petals pubescent inside; carpels 3–5, with 10–12 ovules per carpel ..... 5. *A. hainanensis*

**1. *Alphonsea mollis*** Dunn, J. Linn. Soc., Bot. 35: 485. 1903.毛叶藤春 *mao ye teng chun*

Trees to 20 m tall, evergreen, d.b.h. to 40 cm. Bark grayish brown, bast reddish. Branches densely tomentose when young, glabrescent. Petiole 2–3 mm, pubescent; leaf blade elliptic to ovate-oblong, 6–12  $\times$  2.5–5.6 cm, papery, abaxially villous, adaxially glabrous except for puberulent area along midvein, secondary veins ca. 10 on each side of midvein and slender, reticulate veins conspicuous, base obtuse to rounded, apex shortly acuminate. Inflorescences 1- or 2-flowered. Pedicel 1–2 cm, pubescent, bracteolate. Sepals triangular, ca. 1  $\times$  1 mm. Petals yellowish white; outer petals ca. 11  $\times$  7 mm, outside tomentose, inside glabrescent, apex recurved; inner petals slightly shorter than outer petals. Stamens many; anthers ovoid; connectives apically acute. Carpels 3, tomentose. Monocarps 1 or 2, yellow when ripe, ovoid to ellipsoid, 2–4  $\times$  1.5–2.5 cm, fulvous tomentose. Seeds several per monocarp, grayish brown, orbicular and flat, 1–1.5 cm in diam. Fl. Mar–May, fr. Jun–Aug.

• Evergreen broad-leaved forests on slopes; 600–1000 m. Guangdong, SW Guangxi, Hainan, S Yunnan.

The fruit of *Alphonsea mollis* are edible when ripe. The wood is used for the construction of carts, agricultural implements, etc.

**2. *Alphonsea squamosa*** Finet & Gagnepain, Bull. Soc. Bot. France 53(Mém. 4): 161. 1906.多包藤春 *duo bao teng chun*

Trees to 5 m tall. Bark grayish white. Branches pubescent when young, glabrous and lenticellate with age. Petiole 3–4

mm, transversely striate, puberulent or glabrescent; leaf blade elliptic, ovate, or sometimes oblong-elliptic, 4.5–11.5  $\times$  2–4.5 cm, papery, puberulent or glabrous, midvein adaxially impressed, secondary veins 10–13 on each side of midvein and adaxially flat, base rounded, apex shortly acuminate to acute. Inflorescences superaxillary, 1- or 2-flowered; peduncle ca. 6 mm; bracts 11 or 12. Pedicel ca. 1 cm, with 7 or 8 persistent bracteoles. Sepals triangular, ca. 3  $\times$  2 mm, outside pubescent, inside glabrous, apex acuminate or acute. Outer petals ovate, ca. 7  $\times$  5 mm; inner petals slightly smaller than outer petals. Stamens ovoid; connectives apically acute. Carpels 1–5, ovoid-oblong, pubescent; ovules ca. 10 per carpel, in 2 series; stigmas subglobose, glabrous, apex 2-cleft. Fruiting pedicel ca. 1.3 cm, with 7 or 8 bracteoles; monocarps 1–5, ovoid to subglobose, 2–2.5  $\times$  1.2–2 cm, densely pubescent. Fl. Mar–Jun, fr. Jun–Sep.

Forested slopes, usually in ravines; 1500–2300 m. Guangxi, Yunnan [Vietnam].

*Alphonsea squamosa* was treated as a synonym of the following species, *A. boniana*, by Kessler (Bot. Jahrb. Syst. 118: 86–87. 1995).

**3. *Alphonsea boniana*** Finet & Gagnepain, Bull. Soc. Bot. France 53(Mém. 4): 162. 1906.金平藤春 *jin ping teng chun*

Shrubs to 3 m tall. Branches pubescent when young, glabrescent. Petiole ca. 3 mm, transversely striate, puberulent or glabrous; leaf blade elliptic to oblong-elliptic, 5–11  $\times$  1.4–3 cm, thinly leathery, abaxially greenish and glabrous except occasionally for puberulent midvein, adaxially shiny green and glabrous, secondary veins 10–13 on each side of midvein, slender,

abaxially slightly prominent, and adaxially flat, base broadly cuneate, apex acuminate to shortly acuminate. Inflorescences leaf-opposed or superaxillary, 1- or 2-flowered; peduncle 2–3 mm, glabrous, with 4 or 5 bracts. Pedicel 4–7 mm, puberulent, with several bracteoles from base to middle. Sepals broadly ovate-reniform, ca.  $1 \times 2$  mm, outside puberulent, inside glabrous, apex rounded. Outer petals ovate-lanceolate, ca.  $7 \times 4$  mm, incurved at base, outside densely pubescent, inside glabrous; inner petals lanceolate, ca.  $6 \times 3.5$  mm, incurved at base. Stamens 3, whorled; anther locules ovoid; connectives apically acute. Carpel 1, oblong, ca. 4 mm, densely villous; ovules 6–12, in 1 or 2 series; stigmas subglobose, glabrous, apex 2-cleft. Fruit not seen. Fl. Apr, fr. May–Jun.

Sparsely forested slopes; 300–700 m. SE Yunnan [Thailand, Vietnam].

Chinese material identified as *Alphonsea tonquinensis* Aug. Candolle (C. Y. Wu & W. T. Wang, Acta Phytotax. Sin. 6: 210. 1957) belongs here.

**4. *Alphonsea monogyna* Merrill & Chun, Sunyatsenia 2: 26. 1934.**

藤春 teng chun

Trees to 12 m tall. Peduncles, pedicels, sepals, and petals outside pubescent. Petiole 5–7 mm; leaf blade elliptic to oblong,  $7\text{--}14 \times 3\text{--}6$  cm, thinly leathery to papery, glaucous when dry, glabrous, secondary veins 9–11 on each side of midvein, slender, and slightly prominent, reticulate veins prominent on both surfaces, base broadly cuneate to slightly obtuse, apex acute to acuminate. Inflorescences leaf-opposed; bracts ovate, puberulent. Pedicel 5–10 mm, with 1 or 2 bracteoles at base. Sepals broadly ovate, ca. 2 mm. Outer petals oblong-ovate to ovate, ca. 1 cm, apex acute; inner petals smaller than outer petals. Stamens ca. 1 mm; connectives apically acute. Carpel 1, cylindric, puberulent; ovules ca. 22, in 2 series. Fruiting carpel subglobose to ellipsoid,  $2\text{--}4 \times 1\text{--}3$  cm, densely hispidulous when young, inconspicuously verruculose with age. Fl. Jan–Sep, fr. Sep–Dec.

- Forested slopes; 400–1200 m. Guangxi, Hainan, S Yunnan.

The flowers of *Alphonsea monogyna* are fragrant and are used for perfumes. Its wood is hard and used in construction as supporting timber.

*Alphonsea monogyna* is listed as Vulnerable (VU A2c) by the IUCN Red List of Threatened Species (Version 2010.3; <http://www.iucnredlist.org>; accessed on 8 Oct 2010).

**5. *Alphonsea hainanensis* Merrill & Chun, Sunyatsenia 5: 62. 1940.**

海南藤春 hai nan teng chun

Trees to 20 m tall, evergreen, d.b.h. to 30 cm. Bark grayish brown, smooth, 5–6 mm thick; inner bark reddish brown, fra-

grant. Branchlets appressed ferruginous puberulent when young, glabrescent. Petiole 3–5 mm, puberulent or glabrous; leaf blade broadly ovate to elliptic,  $4\text{--}9 \times 2\text{--}3.5$  cm, thickly papery, glabrous, adaxially shiny and green, secondary veins 7–10 on each side of midvein, slender, and prominent on both surfaces, base broadly cuneate to rounded, apex acute to shortly acuminate. Inflorescences leaf-opposed or subopposite, 2- or 3-flowered; peduncle subsessile; bracts broadly ovate. Pedicel 5–13 mm, pubescent, bracteolate at base. Sepals reniform, ca. 1 mm, outside pubescent, inside glabrous. Outer petals ovate to oblong-ovate, ca. 9 mm, pubescent, apex obtuse; inner petals smaller than outer petals, outside puberulent, inside glabrous or glabrescent. Stamens in 3 whorls; anther locules ovoid, ca. 1 mm; connectives apically acute. Carpels 3–5, densely pubescent; ovules 10–12 per carpel, in 2 series. Fruiting carpels yellowish green, subglobose to obovate, ca.  $4 \times 3\text{--}4$  cm, densely tomentose. Seeds flat, semiobicular. Fl. Oct–Mar, fr. Mar–Aug.

- Evergreen broad-leaved forests on slopes; 400–700 m. SW Guangxi, Hainan, Yunnan.

The fruit of *Alphonsea hainanensis* are edible when ripe. Its wood is hard and used for the construction of carts and agricultural implements, etc.

*Alphonsea hainanensis* is listed as Endangered (EN A2c) by the IUCN Red List of Threatened Species (Version 2010.3; <http://www.iucnredlist.org>; accessed on 8 Oct 2010).

**6. *Alphonsea tsangyuanensis* P. T. Li, Acta Phytotax. Sin. 14(1): 112. 1976 [*“tsangyuanensis”*].**

多脉藤春 duo mai teng chun

Trees to 12 m tall, glabrous except for flowers. Petiole 3–5 mm; leaf blade oblong,  $6\text{--}16 \times 2.5\text{--}4.5$  cm, papery, midvein abaxially elevated and adaxially impressed, secondary veins 15–19 on each side of midvein, abaxially slightly prominent, and adaxially flat, base broadly cuneate to obtuse, apex caudate with a 1–1.7 cm tip. Inflorescences leaf-opposed, 1-flowered. Pedicel ca. 3 mm, puberulent. Flower buds conic, ca.  $10 \times 8$  mm. Sepals triangular, outside tomentulose, inside glabrous. Outer petals ovate-triangular, ca.  $10 \times 6$  mm, outside tomentulose, inside glabrous; inner petals ca.  $9 \times 5$  mm. Stamens many, in 3 whorls, ca. 1.5 mm; connectives apically apiculate. Carpels 4 or 5, oblong, slightly flat, hirsute; ovules 5 per carpel, in 2 series; styles short; stigmas apically 2-cleft. Fruiting carpels oblong, ca.  $4 \times 2.5$  cm, densely tomentose. Fl. Apr–Jun, fr. Aug–Oct.

- Forested slopes; 700–1500 m. S Yunnan.

*Alphonsea tsangyuanensis* is listed as Endangered (EN B2ab (i,ii,v)) by the IUCN Red List of Threatened Species (Version 2010.3; <http://www.iucnredlist.org>; accessed on 8 Oct 2010). The type collection of this species (*Q. W. Wang 73312*) was originally identified as *A. lutea* J. D. Hooker & Thomson (C. Y. Wu & W. T. Wang, Acta Phytotax. Sin. 6: 210. 1957).

**19. CANANGA (Candolle) J. D. Hooker & Thomson, Fl. Ind. 1: 129. 1855, nom. cons., not Aublet (1775).**

依兰属 yi lan shu

Li Bingtao (李秉滔 Li Ping-tao); Michael G. Gilbert

*Unona* subsect. *Cananga* Candolle, Syst. Nat. 1: 485. 1817.

Trees or shrubs. Petiole short; leaf blade large. Inflorescences axillary or extra-axillary, forming cymes, racemes, or with several flowers clustered on a peduncle. Flowers large. Sepals 3, valvate. Petals 6, in 2 whorls, subequal or inner petals slightly smaller, spreading, flat, valvate in bud. Stamens many; anther locules linear-lanceolate, lateral or subintrorse; connectives ca. 1/3 size of stamens, apex apiculate. Carpels many, oblong; ovules many per carpel, in 2 series; styles slender; stigmas sticking together at anthesis, clavate. Fruit apocarpous; monocarps several to many, long stipitate, ovoid to subglobose. Seeds several per monocarp, in 2 series, pitted, sending spinose processes into albumen.

Two species: tropical Asia and Australia; one species (introduced) in China.

**1. *Cananga odorata*** (Lamarck) J. D. Hooker & Thomson, Fl. Ind. 1: 130. 1855.

依兰 yi lan

Trees or shrubs. Bark pale gray. Branchlets dark colored, striate with age, minutely pubescent when young, glabrescent. Petiole 1–2 cm, narrowly grooved; leaf blade in 2 ranks, ovate, oblong, or broadly elliptic, 9–23 × 4–14 cm, membranous to thinly papery, often drying black, glabrous when mature except for mostly whitish pubescence along midvein and secondary veins, secondary veins 7–15 on each side of midvein, base rounded, obtuse, or truncate and often inequilateral, apex acute to acuminate. Inflorescences axillary or on short woody branches, racemose or cymose, 1- or several flowered; peduncle 2–5 mm; bracts minute, deciduous. Flowers pendulous. Pedicel 1–5 cm, pubescent, bracteolate. Sepals ovate, ca. 0.7 mm, pubescent, connate at base, apex acute and reflexed. Petals green, turning yellow and inside basally with a purplish brown blotch, linear to linear-lanceolate, 5–8 × 0.5–1.8 cm, tomentose and with several veins minutely pubescent, basal claw small. Stamens oblong-oblongeolate, 0.7–1 mm; connectives apically acute, pubescent. Carpels 10–12, ca. 4 mm, puberulent when young, glabrescent; stigmas clavate, lamellate, fused, with a U-shaped groove on inner side running down to base of ovary to form a convex pileate disk. Monocarp stipes 1.2–1.8 cm; monocarps nearly black, ovoid, globose, or oblong, 1.5–2.3 × ca. 1 cm, pulpy, glabrous. Seeds 2–12 per monocarp, pale brown, in 2 series, surface pitted. Fl. Apr–Aug, fr. Oct–Mar.

Cultivated. Fujian, Guangdong, Guangxi, Hainan, Sichuan, Tai-

wan, Yunnan [native to NE Australia, India, Indonesia, Laos, Malaysia, Myanmar, Philippines, and Thailand].

The flowers of *Cananga odorata* are the source of an essential oil used in perfumery, soaps, and cosmetics. The flowers are also laid between cloth to impart an agreeable scent.

鹰爪花属 ying zhua hua shu

Li Bingtao (李秉滔 Li Ping-tao); Michael G. Gilbert

Climbing shrubs or woody lianas. Inflorescences 1- or few-flowered clusters; peduncle recurved, woody, persistent, forming a hook. Flowers bisexual, often fragrant. Torus flat or concave. Sepals 3, valvate, connate at base. Petals 6, in 2 whorls, pale yellowish, subequal, with each whorl valvate, base concave, apex connivent. Stamens many, outermost series sometimes forming staminodes; connectives apically dilated, apex truncate. Carpels 4 to many; ovules 2 per carpel, basal; stigmas ovoid, oblong, or clavate. Fruit apocarpous; monocarps fasciculate, sessile or shortly stipitate, ellipsoid-obovoid or globose, fleshy and berrylike. Seeds 1 or 2 per monocarp, without an aril.

About 100 species: Old World tropics and subtropics; eight species (four endemic, one introduced) in China.

Members of *Artabotrys* climb by means of the very distinctive, persistent, recurved, woody peduncles and pedicels, which hook onto the supporting vegetation.

- 1a. Monocarp apex long beaked; leaf blade base slightly oblique ..... 1. *A. rhynchocarpus*  
1b. Monocarp apex not beaked; leaf blade base symmetric.  
2a. Flowers many per peduncle; stamen connectives apically truncate ..... 2. *A. multiflorus*  
2b. Flowers 1–3 per peduncle; stamen connectives apically triangular, semiorbicular, or subtruncate.  
3a. Outer petals 1–1.8 cm.

- 4a. Leaf blade glabrous on both surfaces or only midrib abaxially puberulent; pedicel longer than peduncle ..... 3. *A. hongkongensis*
- 4b. Leaf blade abaxially densely tomentose or pubescent; pedicel shorter than peduncle.
- 5a. Leaf blade adaxially shiny, secondary veins 10–12 on each side of midvein; outer petals ovate to broadly triangular ..... 4. *A. fragrans*
- 5b. Leaf blade adaxially slightly glaucous, secondary veins 8 on each side of midvein; outer petals narrowly oblong ..... 5. *A. pilosus*
- 3b. Outer petals 2–4.5 cm.
- 6a. Leaf blade adaxially minutely punctate; outer petals oblong-ovate ..... 6. *A. punctulatus*
- 6b. Leaf blade adaxially not punctate; outer petals narrowly lanceolate or oblong-lanceolate.
- 7a. Leaf blade secondary veins 7–9 on each side of midvein; outer petals ca.  $2 \times 0.2$  cm ..... 7. *A. hainanensis*
- 7b. Leaf blade secondary veins 8–16 on each side of midvein; outer petals  $3\text{--}4.5 \times 0.9\text{--}1.6$  cm ..... 8. *A. hexapetalus*

**1. *Artabotrys rhynchocarpus*** C. Y. Wu ex S. H. Yuan, Acta Bot. Yunnan. 4: 261. 1982.

喙果鹰爪花 *hui guo ying zhua hua*

Shrubs to 10 m tall, climbing. Branchlets appressed pilose when young, glabrescent. Petiole 3–5 mm, appressed pilose; leaf blade oblong to oblong-lanceolate,  $8\text{--}13 \times 3\text{--}4$  cm, papery, abaxially puberulent, adaxially glabrous, secondary veins 12–14 on each side of midvein and adaxially prominent, base cuneate, apex acuminate. Inflorescences leaf-opposed, 2–5-flowered; peduncle 0.8–1.5 cm, pilose. Pedicel 1.2–1.5 cm, pubescent. Sepals broadly ovate,  $3\text{--}4 \times 3\text{--}4$  mm, both surfaces pilose. Petals ovate-oblong, ca.  $1.5 \times 0.6$  cm, tawny pubescent. Stamens cuneate, ca. 1.5 mm; connectives apically subtruncate, glabrous. Monocarp stipes 5–7 mm; monocarps oblong,  $4.5\text{--}5 \times 1.5\text{--}1.7$  cm, apex conspicuously beaked. Seeds 2 per monocarp, flat, ca.  $3 \times 1.2$  cm. Fl. Aug–Sep, fr. Oct.

• Dense woodlands; ca. 1200 m. SE Yunnan.

**2. *Artabotrys multiflorus*** C. E. C. Fischer, Bull. Misc. Inform. Kew 1937: 437. 1937.

多花鹰爪花 *duo hua ying zhua hua*

Lianas. Branchlets dark brown, minutely puberulent when young, minutely lenticellate. Petiole 5–8 mm; leaf blade elliptic to elliptic-oblong,  $10\text{--}16.5 \times 4\text{--}6.5$  cm, appressed pubescent when young especially abaxially on midvein, glabrescent, midvein abaxially prominent, secondary veins 9–12 on each side of midvein, base narrow, apex apiculate to bluntly acuminate. Inflorescences with 2 fascicles, one apical and another slightly below it on outer side, many flowered; peduncle 1.5–2 cm, stout, sharply curved, appressed bristly. Pedicel 0.8–1.5 cm, rufous hispid. Sepals ovate-triangular, 3–4 mm, outside rufous pubescent, inside glabrous. Petals green to yellow, oblong to oblong-lanceolate,  $1.8\text{--}2.5 \times 0.6\text{--}0.7$  cm, subequal, base deeply convex; inner petals slightly narrower and more deeply concave than outer petals, connivent over stamens and carpels, outside thinly pubescent but densely gray pubescent on basal concave part, inside glabrous. Stamens oblong-cuneate, ca. 1.5 mm; connectives apically truncate. Carpels 12–21, narrowly oblong to lanceolate-oblong, 1.3–1.5 mm, glabrous; styles oblong to narrowly clavate, 1.3–1.5 mm. Fruit not seen. Fl. May–Aug, fr. Jul–Oct.

Thickets on limestone; 800–1000 m. Guangdong, Guangxi, Guizhou, Yunnan [Myanmar].

**3. *Artabotrys hongkongensis*** Hance, J. Bot. 8: 71. 1870.

香港鹰爪花 *xiang gang ying zhua hua*

Shrubs, to 8 m tall, climbing. Branchlets hispid. Petiole 2–5 mm, puberulent; leaf blade elliptic-oblong to oblong,  $6\text{--}12 \times 2.5\text{--}4$  cm, leathery, glabrous or only midvein abaxially puberulent, adaxially lucid, secondary veins 8–10 on each side of midvein and adaxially prominent, base rounded and slightly oblique. Inflorescences 1-flowered. Pedicel slightly longer than hooked peduncle, puberulent. Sepals ovate-triangular, ca. 5 mm, glabrescent. Outer petals ovate-lanceolate, 1–1.8 cm, thickened, outside densely sericeous pubescent, base concave; inner petals basally concave. Stamens cuneate; connectives apically 3-angled, puberulent. Carpels ovate-oblong, glabrous; ovules 2 per carpel, basal; stigmas shortly clavate. Monocarps black when dry, ellipsoid,  $2\text{--}4 \times 1.5\text{--}3$  cm, apex subrounded. Fl. Mar–May, fr. May–Aug.

Dense woodlands, thickets; 300–1500 m. Guangdong, Guangxi, Guizhou, Hainan, Hunan, Yunnan [Vietnam].

**4. *Artabotrys fragrans*** Jovet-Ast, Notul. Syst. (Paris) 9: 77. 1940.

香鹰爪花 *xiang ying zhua hua*

Lianas to 20 m. Branchlets pubescent, glabrescent. Petiole 5–8 mm, pubescent; leaf blade oblong to lanceolate-oblong,  $13\text{--}17 \times 5\text{--}6$  cm, densely pubescent when young and sparsely puberulent with age, adaxially lucid and glabrous, secondary veins 10–12 on each side of midvein and adaxially prominent, base cuneate to obtuse, apex shortly acuminate to obtuse. Inflorescences 1–3-flowered; peduncle ca. 2 cm, glabrous. Pedicel 1–1.2 cm, pubescent. Sepals triangular, golden pubescent. Outer petals broadly ovate-triangular, ca.  $1.4 \times 0.9$  cm, densely villous except for base, base concave; inner petals triangular, 1–1.2 cm, pubescent except for base, base concave. Stamen connectives apically semiorbicular. Carpels 4–7, ovoid, glabrous. Monocarps ellipsoid, ca.  $4 \times 2$  cm, glabrous; epicarp smooth. Fl. Jul–Aug, fr. Sep–Oct.

Mixed woods; ca. 1000 m. Guangxi, Guizhou, S Yunnan [Vietnam].

The name *Artabotrys fragrans* was first published in 1938 (Fl. Indo-Chine Suppl. 1: 83) but not validly so.

**5. *Artabotrys pilosus*** Merrill & Chun, Sunyatsenia 2: 224. 1935.

毛叶鹰爪花 *mao ye ying zhua hua*

Shrubs to 5 m tall, climbing. Branches densely tomentose

when young. Petiole ca. 2 mm, densely tomentose; leaf blade oblong to oblong-elliptic, 5–17 × 2–7.5 cm, papery, abaxially densely tomentose, adaxially glabrous and slightly glaucous, secondary veins ca. 8 on each side of midvein and adaxially flat to slightly prominent, base rounded, apex acuminate to obtuse. Inflorescences leaf-opposed or extra-axillary, usually 1-flowered; peduncle longer than pedicel, flat, densely villous when young, glabrescent. Pedicel 6–12 mm, densely pubescent. Sepals ovate, ca. 4 mm, outside pubescent. Petals greenish to yellowish, narrowly oblong, 1.5–1.7 cm, pubescent. Stamens cuneate; connectives apically subtruncate. Carpels ca. 8, glabrous. Monocarps dark brown, oblong-ellipsoid, 1.5–2.2 × ca. 1.5 cm, glabrous. Fl. Apr–Jul, fr. May–Dec.

- Mixed woods; 200–500 m. Guangdong, Hainan.

The flowers of *Artabotrys pilosus* are fragrant and are used as perfume; its bast fiber is used to make ropes.

**6. *Artabotrys punctulatus*** C. Y. Wu ex S. H. Yuan, Acta Bot. Yunnan. 4: 260. 1982.

点叶鹰爪花 dian ye ying zhua hua

Shrubs to 4 m tall, climbing. Branchlets puberulent when young. Petiole 5–7 mm, puberulent; leaf blade oblong-elliptic, 7–13.5 × 3–5.5 cm, papery, glabrous except for abaxially puberulent midvein, adaxially minutely punctate, secondary veins 12–14 on each side of midvein and adaxially prominent, base cuneate to broadly cuneate and oblique, apex acuminate to obtuse. Peduncle puberulent. Flowers 3–4 cm in diam. Pedicel 1.5–2 cm. Sepals broadly ovate-triangular, 5–7 mm, puberulent, basally slightly attenuate. Petals brownish green; outer petals oblong-ovate, ca. 2.5 cm, base concave; inner petals ca. 2 cm, concave and connivent, horizontally spreading from apical 1/3, basally attenuate. Stamens many, cuneate, ca. 1.5 mm; connectives apically subtruncate, glabrous. Carpels ca. 20, oblong, glabrous; stigmas clavate, longer than ovaries, pubescent. Monocarps fusiform, slightly flattened, 3.5–4 × 1.5–1.7 cm. Fl. Apr–Jun, fr. Sep–Nov.

- Open woods; ca. 1500 m. S Yunnan.

**7. *Artabotrys hainanensis*** R. E. Fries, Ark. Bot., n.s., 3: 41. 1955.

海南鹰爪花 hai nan ying zhua hua

Based on *Artabotrys stenopetalus* Merrill & Chun, Sunyatsenia 2: 226. 1935, not Engler (1899).

Shrubs to 4 m tall, climbing. Branchlets glabrous. Petiole 4–8 mm, glabrous; leaf blade oblong to oblong-elliptic, 7–15 × 3–6 cm, papery, glabrous except for abaxially hairy main veins, secondary veins 7–9 on each side of midvein and adaxially prominent, base rounded to broadly cuneate, apex acuminate to acute. Inflorescences leaf-opposed, usually 1-flowered. Pedicel 1.2–1.5 cm. Sepals ovate, 4–5 mm, sparsely pubescent. Petals yellowish white, narrowly lanceolate, ca. 2 × 0.2 cm, subequal, base slightly broad and concave. Stamens oblong, ca. 14 × 2 mm; connectives apically rounded to subtruncate. Carpels 15, slightly longer than stamens; stigmas shortly clavate. Monocarps ellipsoid, ca. 2.5 × 1.2 cm. Fl. May–Jul, fr. Jul–Oct.

- Densely wooded slopes; 200–500 m. Guangdong, Guangxi, Hainan.

**8. *Artabotrys hexapetalus*** (Linnaeus f.) Bhandari, Bailey 12: 149. 1965.

鹰爪花 ying zhua hua

*Annona hexapetala* Linnaeus f., Suppl. Pl. 270. 1782; *A. uncinata* Lamarck; *Artabotrys odoratissimus* R. Brown, nom. illeg. superfl.; *A. uncatus* (Loureiro) Baillon; *A. uncinatus* (Lamarck) Merrill; *Unona uncinata* (Lamarck) Dunal; *Uvaria esculenta* Roxburgh ex Rottler; *U. odoratissima* Roxburgh; *U. uncata* Loureiro.

Shrubs to 10 m tall, climbing. Branchlets glabrous or glabrescent. Petiole 4–8 mm; leaf blade oblong to broadly lanceolate, 6–16(–25) × 2.5–6(–8) cm, papery, abaxially glabrous or only midvein puberulent, adaxially glabrous, secondary veins 8–16 on each side of midvein and adaxially prominent, base cuneate to acute, apex acuminate to acute. Inflorescences 1- or 2-flowered. Flowers 2.5–3 cm in diam., fragrant. Sepals green, ovate, 5–8 mm, sparsely puberulent. Petals greenish to yellowish, oblong-lanceolate, 3–4.5 × 0.9–1.6 cm, outside basally densely pubescent, contracted nearly to base but basally expanded. Stamens oblong; connectives apically 3-angular. Carpels oblong, glabrous. Monocarps ovoid, 2.5–4 × ca. 2.5 cm, glabrous, apex conspicuously apiculate. Seeds pale brown, 1.5–2 cm, smooth. Fl. May–Aug, fr. May–Dec.  $2n = 16$ .

Widely cultivated, rarely naturalized; 100–300 m. Fujian, Guangdong, Guangxi, Guizhou, Hainan, Jiangxi, Taiwan, Yunnan, Zhejiang [native to S India and Sri Lanka].

The flowers of *Artabotrys hexapetalus* are fragrant and are used as perfume and in tea; its fruit are used as medicine for scrofula.

## 21. FRIESODIELSIA Steenis, Bull. Jard. Bot. Buitenzorg, sér. 3, 17: 458. 1948.

尖花藤属 jian hua teng shu

Li Bingtao (李秉滔 Li Ping-tao); Michael G. Gilbert

*Polyalthia* sect. *Oxymitra* Blume, Fl. Javae, Annonaceae, 71. 1830; *Oxymitra* (Blume) J. D. Hooker & Thomson (1855), not Bischoff ex Lindenberg (1829).

Climbers [rarely trees], with simple hairs. Inflorescences leaf-opposed, extra-axillary, or superaxillary, 1-flowered, bracteate. Flowers (not known for only Chinese species) bisexual. Sepals 3, valvate, ± connate at base. Petals 6, in 2 whorls, free, valvate; outer petals flat or 3-ridged, long and narrow, leathery, basally broadened and concave; inner petals much shorter than outer, ovate, lanceolate, or oblong, narrowed at base and often with a gap between petals, cohering to cover stamens and carpels. Stamens many; connectives apically enlarged and concealing anther locules, apex truncate. Carpels many, oblong; ovules 1–5 per carpel, lateral;

styles clavate. Fruit apocarpous; monocarps stipitate, subglobose [or globose to ellipsoid-cylindric], moniliform when more than 1-seeded; epicarp thin to thick. Seed usually 1 per monocarp, subglobose.

About 50–60 species: Old World tropics; one species (endemic) in China.

There has been considerable confusion between *Friesodielsia* and the genus *Richella* A. Gray. Recent accounts (e.g. Kessler in Kubitzki, Fam. Gen. Fl. Pl. 2: 119. 1993) have restricted *Richella* to just 2 or 3 species, which molecular studies (Nakkuntod et al., Taxon 58: 127–132. 2009) show to be most closely related to *Goniothalamus*. Most species previously placed within *Richella* are now placed in *Friesodielsia*.

**1. *Friesodielsia hainanensis*** Tsiang & P. T. Li, Acta Phytotax. Sin. 9: 377. 1964.

尖花藤 jian hua teng

*Richella hainanensis* (Tsiang & P. T. Li) Tsiang & P. T. Li.

Climbers to 5 m tall, woody, glabrous except for slightly puberulent leaf blade midvein. Petiole 5–8 mm; leaf blade oblong to oblong-elliptic, 10–21.5 × 3.7–7.5 cm, papery, abaxially glaucous, secondary veins 13–15 on each side of midvein, base shallowly cordate, apex acute to shortly acuminate. Flow-

ers not seen. Monocarp stipes 5.3–7.5 cm, slender; monocarps subglobose, ca. 10 × 8 mm, apex apiculate. Seed 1 per monocarp, brown, subglobose, ca. 8 × 6 mm, testa thin. Fl. Aug–Sep, fr. Oct.

• Forested slopes; 300–500 m. Hainan (Baoting).

The generic placement of *Friesodielsia hainanensis* must remain in doubt without knowledge of the flowers. It is listed as Vulnerable (VU D2) by the IUCN Red List of Threatened Species (Version 2010.3; <http://www.iucnredlist.org>; accessed on 8 Oct 2010, as *Richella hainanensis*).

## 22. FISSISTIGMA Griffith, Not. Pl. Asiat. 4: 706. 1854.

瓜馥木属 gua fu mu shu

Li Bingtao (李秉滔 Li Ping-tao); Michael G. Gilbert

Climbers, with simple hairs, usually pubescent to tomentose and sometimes copiously so. Leaf blade with many stout parallel secondary veins. Inflorescences mostly leaf-opposed or terminal, less often axillary or infra-axillary, 1- to many flowered and forming cymes, glomerules, or branched panicles. Pedicel often with several bracteoles from base to middle. Flower buds ovoid or oblong-conic. Sepals 3, small, valvate, connate at very base. Petals 6, in 2 whorls, valvate, leathery, margin thickened; outer petals slightly larger than inner petals, erect or spreading, inside flat to convex; inner petals 3-edged, base concave. Stamens many; connectives slightly enlarged, apically oblique, obtuse, or slightly apiculate. Carpels many, free, often pubescent, slightly curved, grooved on inner side; ovules 1–16 per carpel, in 1 or 2 sutural series; styles sometimes narrowly clavate but usually not enlarging; stigmas very short and not clearly differentiated from style, apex 2-cleft or entire. Fruit apocarpous; monocarps few to many, stipitate, spherical, ovoid, or oblong, thick walled, usually pubescent to tomentose. Seeds 1–10 per monocarp, in 1 or 2 series, smooth, shiny.

About 75 species: Old World tropics and subtropics; 23 species (eight endemic) in China.

### 1a. Inflorescence 1- or 2-flowered.

2a. Flowers leaf-opposed, ca. 1.2 cm in diam.; outer petals rounded, ca. 6 mm; inner petals ca. 4 mm ..... 1. *F. cupreonitens*

2b. Flowers axillary or subaxillary, 3–4 cm in diam.; outer petals ovate-triangular or oblong, 14–24 mm; inner petals 10–14 mm.

3a. Leaf blade oblong; pedicel ca. 2 cm; stigmas apically entire; ripe carpels 4–5 × ca. 4 cm ..... 2. *F. uonicum*

3b. Leaf blade lanceolate to elliptic-lanceolate; pedicel ca. 0.5 cm; stigmas apically 2-cleft; ripe carpels ca. 1.8 × 1.5 cm ..... 3. *F. machurei*

### 1b. Inflorescence usually more than 2-flowered, often in cymes, glomerules, or panicles.

4a. Leaf blade abaxially glabrous or obscurely sparsely pubescent, glabrescent.

5a. Leaf blade abaxially grayish white or grayish green and glaucous when dry.

6a. Leaf blade 1.2–6 cm wide; inflorescences thyrses; petals 5–6 mm; ovaries 1-ovuled; stigmas apically 2-cleft ..... 4. *F. glaucescens*

6b. Leaf blade 6–8 cm wide; inflorescences cymes; petals ca. 15 mm; ovaries ca. 30-ovuled; stigmas apically entire ..... 5. *F. pallens*

5b. Leaf blade greenish or abaxially grayish green and not glaucous.

7a. Leaf blade base truncate to slightly cordate, secondary veins 18–20 on each side of midvein; stigmas apically entire; ripe monocarps 3.5–4 cm wide; ovules ca. 10 per carpel ..... 6. *F. chloroneurum*

7b. Leaf blade base rounded, obtuse, or broadly cuneate, secondary veins 13–15 on each side of midvein; stigmas apically 2-cleft; ripe monocarps 2–3 cm wide; ovules 4 or ca. 22 per carpel.

8a. Young branchlets ferruginous pubescent; cymes usually leaf-opposed or alternate; ovules 4 per carpel; ripe monocarps glabrescent ..... 7. *F. wallichii*

8b. Branchlets glabrous; panicles terminal or axillary; ovules ca. 22 per carpel; ripe monocarps densely fulvous tomentulose ..... 8. *F. tonkinense*

## 4b. Leaf blade abaxially densely tomentose, densely pubescent, or hispid.

## 9a. Flowers in panicles or cymes.

## 10a. Inflorescence rachides 1–28 cm.

11a. Leaf blade apex acute; flower buds ovoid; petals ovate; stamen connectives ovoid, apex obtuse ..... 9. *F. latifolium*

11b. Leaf blade apex rounded or retuse; flower buds conic or lanceolate; petals oblong-lanceolate or ovate-elliptic; stamen connectives conic or broadly ovoid, apex acuminate or truncate.

12a. Peduncle to 28 cm; pedicel 2–3 mm; petals ovate-elliptic to ovate-oblong; stamen connectives apically acuminate; stigma apex 2-cleft ..... 10. *F. tungfangense*12b. Peduncle ca. 1 cm; pedicel ca. 15 mm; petals oblong-lanceolate to narrowly lanceolate; stamen connectives apically truncate; stigma apex entire ..... 11. *F. tientangense*

## 10b. Inflorescence rachides 0.1–0.5 cm.

13a. Leaf blade secondary veins adaxially flattened; stigma apex 2-cleft.

14a. Sepals connate at base, broadly triangular, ca.  $3 \times 3.5$  mm; stamen connectives broadly triangular ..... 12. *F. polyanthoides*14b. Sepals free at base, ovate-triangular, ca.  $2 \times 2$  mm; stamen connectives obliquely triangular ..... 13. *F. poilanei*

13b. Leaf blade secondary veins adaxially concave; stigma apex entire.

15a. Leaf blade base cuneate to broadly cuneate; inner petals pubescent outside; ripe monocarps ca. 1.2 cm in diam. .... 14. *F. acuminatissimum*15b. Leaf blade base shallowly cordate; inner petals glabrous outside; ripe monocarps 2–2.5 cm in diam. .... 15. *F. cavaleriei*

## 9b. Flowers in glomerules.

16a. Leaf blade secondary veins 25–35 on each side of midvein; ripe monocarps ca. 4 cm in diam. .... 16. *F. balansae*

16b. Leaf blade secondary veins 13–20 on each side of midvein; ripe monocarps 1.5–3 cm in diam.

17a. Leaf blade secondary veins adaxially flattened.

18a. Branches and abaxial leaf blade surfaces densely tomentose; outer petals with a prominent abaxial midrib; stamen connectives subrounded or truncate ..... 17. *F. xylopetalum*

18b. Branches and abaxial leaf blade surfaces pubescent to glabrescent; outer petals without a prominent midrib; stamen connectives triangular or slightly obliquely triangular.

19a. Petals 2–2.1 cm; ovules 10 per carpel; stigmas apically 2-cleft ..... 18. *F. oldhamii*19b. Petals 0.9–1.2 cm; ovules 4–6 per carpel; stigmas apically entire ..... 19. *F. polyanthum*

17b. Leaf blade secondary veins adaxially concave.

20a. Bracteoles many, longer than or as long as sepals; stigmas apically 2-cleft ..... 20. *F. bracteolatum*

20b. Bracteoles few or absent, if present shorter than sepals; stigmas apically entire.

21a. Leaf blade oblong-lanceolate to narrowly oblong, apex slightly acute; stamen connectives long lanceolate ..... 21. *F. kwangsiense*

21b. Leaf blade broadly ovate, obovate, or obovate-oblong, apex rounded or retuse; stamen connectives broadly or obliquely triangular.

22a. Leaf blade base rounded, truncate, or shallowly cordate; inflorescences leaf-opposed; sepals ovate-lanceolate, ca. 1 cm; outer petals ovate-oblong, ca. 1.5 cm; ovules 4 per carpel; ripe monocarps globose ..... 22. *F. retusum*22b. Leaf blade base broadly cuneate or rounded; inflorescences extra-axillary; sepals broadly triangular, ca. 5 mm; outer petals ovate, ca. 1 cm; ovules 10 per carpel; ripe monocarps oblong ..... 23. *F. shangtzeense*1. *Fissistigma cupreonitens* Merrill & Chun, Sunyatsenia 2: 8. 1934.

金果瓜馥木 jin guo gua fu mu

Climbers to 13 m tall. Branchlets, petioles, and flowers densely appressed reddish brown pubescent, glabrescent. Petiole 0.8–1.2 cm; leaf blade oblong to oblong-elliptic, 5–10  $\times$  1.5–3 cm, leathery, abaxially densely appressed reddish brown pubescent, adaxially glabrous except for appressed pubescence on midvein, secondary veins 8–13 on each side of midvein, slender, and adaxially flat, base rounded, apex acute to shortly acuminate. Inflorescences leaf-opposed, 1-flowered; bracts tri-

angular. Flowers ca. 1.2 cm in diam. Pedicel ca. 1 cm. Sepals broadly triangular, ca. 6 mm, basally connate. Outer petals rounded, ca. 6 mm, incurved; inner petals ca. 4 mm, inside basally depressed. Stamens oblong, ca. 1 mm; connectives 3-angular. Carpels oblong, ca. 2 mm, sericeous pubescent; ovules ca. 14 per carpel, in 2 series; stigma apex entire. Fruiting pedicel ca. 2 mm, robust; monocarp stipes ca. 1.5 cm; monocarps globose, ovoid-ellipsoid, or ellipsoid, ca.  $3 \times 2$  cm, densely reddish brown tomentose, apex rounded or mucronulate. Seeds ca. 14 per monocarp, brown, in 2 series, ovoid, subflattened, ca.  $1.4 \times 0.9$  cm. Fl. Apr–Nov, fr. Jun–Dec.

• Densely forested slopes; 300–1000 m. SE Guangxi.

*Fissistigma cupreonitens* is listed as Endangered (EN B2ab(ii,iv)) by the IUCN Red List of Threatened Species (Version 2010.3; <http://www.iucnredlist.org>; accessed on 8 Oct 2010).

**2. *Fissistigma uonicum*** (Dunn) Merrill, Philipp. J. Sci. 15: 137. 1919.

香港瓜馥木 xiang gang gua fu mu

*Melodorum uonicum* Dunn, J. Bot. 48: 323. 1910; *Fissistigma clementis* Merrill.

Climbers to 5 m tall. Branches glabrous. Petiole 5–10 mm, blackish and minutely transversely wrinkled when dried; leaf blade oblong, 4–20 × 1–5 cm, papery, abaxially yellowish, very sparsely puberulent, and reddish yellow when dry, adaxially glabrous, secondary veins 8–12[–18] on each side of midvein and adaxially flat to slightly prominent, tertiary veins inconspicuously raised, base rounded to cuneate, apex acute. Inflorescences axillary or subaxillary, sometimes ± grouped into terminal thyrses, 1- or 2-flowered; peduncle 1–3 mm; bracts minute, scalelike. Flowers fragrant. Pedicel ca. 2 cm, minutely appressed pubescent, minutely bracteolate below middle. Sepals ovate-triangular, ca. 2 mm, outside pubescent, inside glabrous. Petals yellow; outer petals ovate-triangular, ca. 2.4 × 1.4 cm, thickened, outside fulvous pubescent, inside glabrous, apex obtuse; inner petals lanceolate, 1.2–1.4 × ca. 0.6 cm, inside basally concave and apically convex. Stamens oblong; connectives 3-angular. Carpels oblong, pubescent; ovules 9–16 per carpel, in 2 series; styles cylindric, short, glabrous; stigmas apically entire. Monocarp stipes short, thick; monocarps globose to shortly cylindric, 4–5 × ca. 4 cm, pubescent to glabrescent. Seeds 9–16 per monocarp, in 2 series. Fl. Mar–Jun, fr. Jun–Dec.

Forest margins, scrub; 100–800 m. Fujian, Guangdong, Guizhou, Hainan, Hunan [Indonesia].

The fruit of *Fissistigma uonicum* are edible; its leaves are used as yeast powder to start fermentation when making liquor in Guangxi and Hainan.

**3. *Fissistigma maclurei*** Merrill, Philipp. J. Sci. 21: 342. 1922.

毛瓜馥木 mao gua fu mu

*Meiogyne maclurei* (Merrill) Sinclair; *Melodorum maclurei* (Merrill) Jovet-Ast ["Ast"].

Climbers to 6 m tall, most parts fulvous to blackish brown tomentose. Petiole 5–8 mm, blackish brown tomentose; leaf blade lanceolate to elliptic-lanceolate, 7–12 × 2–3.5 cm, thinly leathery, abaxially fulvous to blackish brown tomentose, adaxially glabrous, secondary veins 13–17 on each side of midvein and adaxially flat, reticulate veins prominent, base obtuse, apex acute to acuminate. Inflorescences axillary, 1-flowered. Pedicel ca. 5 mm, robust. Sepals ovate-oblong, ca. 5 mm, blackish brown villous. Petals thickened; outer petals oblong, ca. 1.4 cm, villous; inner petals shorter than outer petals, pubescent. Stamens oblong, nearly as long as carpels; connectives 3-angular, apex acute. Carpels fulvous pubescent; ovules 10 per carpel, in 2 series; stigmas apically 2-cleft. Fruiting pedicel 2–2.5 cm, densely blackish brown tomentose; monocarps globose to subglobose, ca. 1.8 × 1.5 cm, densely blackish brown tomentose. Seeds 7–9 per monocarp, deep yellow, reniform, ca. 10 × 6 mm. Fl. Feb–Aug, fr. Apr–Oct.

Forested slopes, often in valleys or beside water; 200–1100 m. Guangxi, Hainan, S Yunnan [Vietnam].

**4. *Fissistigma glaucescens*** (Hance) Merrill, Philipp. J. Sci. 15: 132. 1919.

白叶瓜馥木 bai ye gua fu mu

*Melodorum glaucescens* Hance, J. Bot. 19: 112. 1881; *Fissistigma obtusifolium* Merrill.

Climbers to 6 m tall, most parts glabrous except for inflorescences. Petiole 4–12 mm, blackish and minutely transversely wrinkled when dried, pubescent when young, glabrescent; leaf blade oblong, oblong-elliptic, or sometimes obovate-oblong, 3–20 × 1.2–6 cm, thinly leathery, abaxially grayish green and glaucous when dry, secondary veins 10–15 on each side of midvein and adaxially very slightly prominent or flat, tertiary veins inconspicuously raised, base rounded, apex rounded to slightly retuse. Inflorescences terminal, thyrsoid, to 6 cm, sometimes continuing vegetatively and cymes apparently axillary, cymules 2- or 3-flowered, brownish tomentose; peduncle very short. Pedicel to 1.2 cm. Sepals broadly triangular, ca. 2 mm. Outer petals broadly ovate, ca. 6 mm, fulvous pubescent; inner petals ovate-oblong, ca. 5 mm, grayish white pubescent. Stamens oblong; connectives 3-angular. Carpels ca. 15, ellipsoid, fulvous pubescent; ovule 1 per carpel; styles elongate, glabrous; stigmas apically 2-cleft. Monocarp stipes ca. 3 mm; monocarps ca. 8 mm in diam., glabrous. Seed 1 per monocarp. Fl. Jan–Sep, fr. Mar–Dec.

Sparsely forested slopes, scrub, often in ravines; 100–1000 m. Fujian, Guangdong, Guangxi, Hainan, Taiwan [Vietnam].

A fine strong bast fiber obtained from the inner bark of *Fissistigma glaucescens* is used to make rope, sacks, and paper; its roots are used as medicine for rheumatism and injury; and its leaves are used as yeast powder to start fermentation when making liquor in Guangdong and Hainan.

**5. *Fissistigma pallens*** (Finet & Gagnepain) Merrill, Philipp. J. Sci. 15: 134. 1919.

苍叶瓜馥木 cang ye gua fu mu

*Melodorum pallens* Finet & Gagnepain, Bull. Soc. Bot. France 53(Mém. 4): 137. 1906; *Fissistigma petelotii* Merrill.

Climbers to 12 m tall. Branches robust, grayish black, glabrous. Petiole ca. 2 cm, rugose, glabrous; leaf blade oblong, 15–20 × 6–8 cm, papery, abaxially grayish white and sparsely puberulent, adaxially glabrous, secondary veins 13–16 on each side of midvein, reticulate veins apparent, base obtuse to rounded, apex obtuse to acute. Inflorescences leaf-opposed or terminal, 1–3-flowered; peduncle ca. 1.5 cm; bracts triangular. Pedicel ca. 2 cm, puberulent, with triangular bract at base. Sepals triangular, outside puberulent. Petals ovate, ca. 1.5 × 1 cm, puberulent; inner petals slightly smaller than outer petals. Stamens oblong, ca. 2.5 mm; connectives broadly triangular, apex obtuse. Carpels many, cylindric, ca. 5 mm, villous; ovules ca. 30 per carpel, in 2 series; styles oblique, glabrous; stigmas 3-angular, apex entire. Fruit not seen. Fl. Mar–May, fr. Jun–Aug.

Forested slopes; 600–800 m. W Guangxi [Vietnam].

**6. *Fissistigma chloroneurum*** (Handel-Mazzetti) Tsiang, J. Bot. Soc. China 2: 693. 1935.

阔叶瓜馥木 *kuo ye gua fu mu*

*Melodorum chloroneurum* Handel-Mazzetti, Anz. Akad. Wiss. Wien, Math.-Naturwiss. Kl. 61: 83. 1924.

Climbers to 12 m tall. Branches puberulent when young, glabrescent. Petiole 0.8–2 cm, abaxially grooved, glabrous; leaf blade oblong, 14–30 × 5.5–12 cm, papery, abaxially puberulent when young but glabrescent and greenish with age, adaxially dark green and glabrous, secondary veins 15–20 on each side of midvein and adaxially flat, reticulate veins conspicuous, base truncate to shallowly cordate, apex shortly acuminate. Inflorescences leaf-opposed or subopposed, cymose, 2–8-flowered; peduncle 1–2 mm; bracts ovate, pubescent. Pedicel 0.5–2.3 cm, fulvous pubescent, bracteolate at middle. Flower buds broadly ovoid. Sepals triangular, ca. 4 × 4 mm, outside pubescent. Petals yellowish white; outer petals ovate-oblong, ca. 12 × 5(–10) mm, outside fulvous pubescent, inside glabrous; inner petals ovate-triangular, ca. 8(–11) × 4(–7) mm, outside pubescent, inside glabrous. Stamens oblong, ca. 1.2 mm; connectives apically rounded. Carpels ca. 15, ovate-oblong, 2–3 mm, densely pubescent; ovules 10 per carpel, in 2 series; styles short; stigmas ellipsoid, apex entire. Fruiting monocarps globose, subglobose, ellipsoid, or obovoid, 3.5–6 × 3.5–4 cm, glabrous. Seeds 10–20 per monocarp, in 2 series. Fl. Mar–Nov, fr. Jul–Dec.

Open woodland slopes, moist disturbed scrub; 100–900 m. Guangxi, Guizhou, SW Hunan, Yunnan [Vietnam].

**7. *Fissistigma wallichii*** (J. D. Hooker & Thomson) Merrill, Philipp. J. Sci. 15: 137. 1919.

贵州瓜馥木 *gui zhou gua fu mu*

*Melodorum wallichii* J. D. Hooker & Thomson, Fl. Ind. 1: 118. 1855; *Fissistigma oligocarpum* W. T. Wang.

Climbers to 7 m tall. Branchlets ferruginous pubescent when young, glabrescent. Petiole 1–2.5 cm, blackish and minutely transversely wrinkled when dried, pubescent when young, glabrescent; leaf blade oblong-lanceolate, oblong-elliptic, or sometimes obovate-oblong, 7–24 × 2.4–6 cm, thinly leathery, abaxially ferruginous pubescent when young but glabrescent and grayish green with age, adaxially glabrous, secondary veins 10–14 on each side of midvein and adaxially flat, tertiary veins partly parallel and also often irregularly branched, reticulate veins inconspicuous, base rounded, obtuse, or sometimes broadly cuneate, apex obtuse to shortly acuminate. Inflorescences leaf-opposed or alternate, sometimes terminal, cymose, umbel-like, 3–7-flowered, ferruginous pubescent; peduncle short; bracts ovate, pubescent. Pedicel 0.3–2 cm, 1- or 2-bracteolate. Sepals ovate-triangular, ca. 3 × 2.3 mm, outside pubescent, inside glabrous. Petals leathery; outer petals ovate-oblong, 1.5–1.7 × ca. 0.7 cm, outside densely ferruginous pubescent, inside slightly puberulent; inner petals lanceolate, ca. 1.3 × 0.4 cm, inside basally glabrous and concave, apically puberulent. Stamens oblong; connectives ovoid. Carpels 2–6, densely pubescent; ovules 4 per carpel; styles cylindric, incurved; stigmas apically slightly 2-cleft. Monocarps subglobose, ca. 2.8 cm in diam., glabrescent. Fl. Mar–Nov, fr. Jul–Dec.

Densely forested slopes, open forests in valleys; 400–1600 m. W Guangxi, S Guizhou, S Yunnan [NE India].

**8. *Fissistigma tonkinense*** (Finet & Gagnepain) Merrill, Philipp. J. Sci. 15: 136. 1919.

东京瓜馥木 *dong jing gua fu mu*

*Melodorum tonkinense* Finet & Gagnepain, Bull. Soc. Bot. France 53(Mém. 4): 135. 1906; *Fissistigma globosum* C. Y. Wu ex P. T. Li.

Climbers to 8 m tall. Branches grayish black to grayish brown, glabrous. Petiole 0.5–1.5 cm, grayish black, verrucate, abaxially grooved; leaf blade oblong to oblong-ovate, 16–20 × 4–6 cm, papery, abaxially sparsely pubescent when young but glabrescent, adaxially glabrous, secondary veins 10–14 on each side of midvein, obliquely ascending to margin, and adaxially flat, reticulate veins prominent, base rounded, apex shortly acuminate. Inflorescences terminal or axillary, paniculate, puberulent; peduncle 1–3.5 cm, with bracts at base; bracts triangular, margins ciliate. Pedicel 0.5–1.5 cm, bracteolate at base and middle. Sepals broadly triangular, ca. 4 × 5 mm, outside puberulent. Outer petals ovate, ca. 10 × 7.5 mm, margins thickened, puberulent, apex obtuse; inner petals oblong-ovate, ca. 10 × 5 mm, thickened at middle, outside and inside puberulent from middle to apex, inside concave from base to middle. Stamens oblong, ca. 3 mm; connectives ovoid, apex subrounded. Carpels subcylindric, villous; ovules ca. 22 per carpel, in 2 series; styles short; stigmas obliquely ovoid, glabrous, apex 2-cleft. Fruiting pedicel ca. 1.2 cm, fulvous tomentulose; monocarp stipes 1.5–2 cm; monocarps globose, 2–3 cm in diam., densely fulvous tomentulose. Seeds ca. 7 per monocarp, reddish brown, shiny, oblong, flat, ca. 1.5 × 0.9 cm. Fl. Nov–Jan, fr. Mar–May.

Forested slopes; 200–800 m. SE Yunnan [Vietnam].

**9. *Fissistigma latifolium*** (Dunal) Merrill, Philipp. J. Sci. 15: 132. 1919.

大叶瓜馥木 *da ye gua fu mu*

*Unona latifolia* Dunal, Monogr. Anonac. 115. 1817; *Melodorum latifolium* (Dunal) J. D. Hooker & Thomson.

Climbers to 5 m tall. Branches tawny pubescent when young, glabrescent. Petiole 1–1.5 cm, robust, abaxially grooved, tawny pubescent; leaf blade oblong, oblong-elliptic, or obovate, 13–35 × 5–15 cm, papery, abaxially tawny pubescent and more densely so on veins, adaxially puberulent, secondary veins 18–22 on each side of midvein, at ca. 45° to midvein, anastomosing before margin, and adaxially impressed, reticulate veins dense and nearly at 90° to secondary veins, base rounded, apex acute. Inflorescences leaf-opposed, panicles borne on apical branches, to 20 cm, densely tawny pubescent; peduncle 1.5–1.8 cm; bracts broadly ovate, 3–4 × 3–4 mm, abaxially densely tawny pubescent. Pedicel ca. 2 cm, bracteolate at middle. Flower buds ovoid, recurved. Sepals broadly ovate, 5–6 × 5–6 mm, outside densely tawny pubescent. Outer petals outside reddish and basally orange, inside orangish red, ovate, 1.6–2.2 × 1.1–1.5 cm, thickened, outside brown pubescent, inside glabrous; inner petals ovate, 1.2–1.5 × 0.6–0.8 cm, glabrous. Stamens oblong,

ca. 2.5 mm; connectives ovoid, apex obtuse. Carpels oblong, densely villous; ovules 8 per carpel; stigmas pubescent. Monocarp stipes ca. 3 cm, pubescent; monocarp globose, ca. 2 cm in diam., densely brown pubescent. Seeds 4–8 per monocarp. Fl. Mar–Nov, fr. Jun–Jan.

Forested slopes; 500–1200 m. S Yunnan [India, Indonesia, Malaysia, Philippines, Thailand, Vietnam].

**10. *Fissistigma tungfangense*** Tsiang & P. T. Li, *Acta Phytotax.* Sin. 9: 377. 1964.

东方瓜馥木 *dong fang gua fu mu*

Climbers to 6 m tall, most parts densely red tomentose, glabrescent. Petiole 1–1.5 cm; leaf blade spatulate to elliptic-oblong, 5–11 × 1.9–4.1 cm, leathery, abaxially yellowish brown pilose, adaxially glabrous, secondary veins 16–22 on each side of midvein and adaxially impressed, reticulate veins inconspicuous, base rounded to broadly cuneate, margin revolute, apex rounded to retuse. Inflorescences terminal or leaf-opposed, paniculate; peduncle to 28 cm; bracts broadly triangular, red tomentose. Pedicel 2–3 mm, 1- or 2-bracteolate. Flower buds conic, ca. 1.1 cm. Sepals broadly triangular, ca. 4 × 3 mm, glabrous. Outer petals ovate-elliptic, ca. 11 × 5 mm, inside glabrous; inner petals ovate-oblong, ca. 8 × 4 mm. Stamens oblong, ca. 1 mm; connectives conic. Carpels oblong, 1.5–2 mm, sericeous pubescent; ovules 10 per carpel, in 2 series; stigmas glabrous, apex 2-cleft. Fruit not seen. Fl. Oct, fr. Nov–Dec.

• Sparsely forested slopes; 400–600 m. W Hainan.

*Fissistigma tungfangense* is listed as Critically Endangered (CR B1ab(i,ii)) by the *IUCN Red List of Threatened Species* (Version 2010.3; <http://www.iucnredlist.org>; accessed on 8 Oct 2010).

**11. *Fissistigma tientangense*** Tsiang & P. T. Li, *Acta Phytotax.* Sin. 10: 326. 1965.

天堂瓜馥木 *tian tang gua fu mu*

Climbers to 9 m tall. Branchlets densely yellowish pubescent when young, glabrous and lenticellate with age. Petiole 3–5 mm; leaf blade oblong to elliptic-oblong, 8.5–17.5 × 3.2–6 cm, leathery, abaxially yellowish pubescent, adaxially glabrous except for sparsely pubescent midvein, secondary veins 16–18 on each side of midvein, obliquely ascending, anastomosing before margin, and adaxially impressed, base rounded, apex rounded to retuse. Inflorescences leaf-opposed, paniculate, 1–4-flowered, yellowish pubescent; peduncle ca. 1 cm. Pedicel ca. 1.5 cm, bracteolate above middle. Flower buds lanceolate in outline, ca. 2.8 × 0.8 cm. Sepals triangular, ca. 4 × 4 mm, outside pubescent, inside glabrous. Outer petals oblong-lanceolate, ca. 2.5 × 0.8 cm, outside glabrous, inside sparsely pubescent; inner petals narrowly lanceolate, ca. 2.3 × 0.6 cm, glabrous. Stamens oblong; connectives apically truncate. Carpels ovate-oblong, ca. 2.5 mm, densely sericeous pubescent; ovules 6–8 per carpel, in 2 series; stigma apex entire. Monocarp stipes ca. 3 cm, robust; monocarp globose, ca. 1.6 cm in diam., densely yellowish pubescent. Fl. Mar–Nov, fr. Jul–Dec.

• Forested valley slopes; 300–600 m. SW Guangdong, SE Guangxi, Hainan, Yunnan.

**12. *Fissistigma polyanthoides*** (Aug. Candolle) Merrill, *Philipp. J. Sci.* 15: 135. 1919.

小萼瓜馥木 *xiao e gua fu mu*

*Melodorum polyanthoides* Aug. Candolle, *Bull. Herb. Boissier*, sér. 2, 4: 1070. 1904; *Fissistigma minuticalyx* (R. W. MacGregor & W. W. Smith) Chatterjee; *M. minuticalyx* R. W. MacGregor & W. W. Smith.

Climbers to 10 m tall. Branches fulvous pubescent when young, glabrous and lenticellate with age. Petiole 1–1.3 cm, fulvous tomentose; leaf blade oblong, oblong-lanceolate, or sometimes obovate-oblong, 10–23 × 4–10 cm, leathery, abaxially fulvous tomentose, adaxially pubescent or glabrous, secondary veins 14–20 on each side of midvein, obliquely ascending to margin, and adaxially flat, base rounded, apex acute to shortly acuminate. Inflorescences leaf-opposed, subopposed, or sometimes terminal, pseudo-cymose, densely red fulvous tomentulose; peduncle ca. 3 mm; bracts ovate, ca. 1.5 mm, abaxially reddish fulvous tomentulose. Pedicel 1–1.5 cm, 1- or 2-bracteolate above middle. Flower buds conic. Sepals broadly triangular, ca. 3 × 3.5 mm, basally connate, outside tomentose, inside pubescent. Outer petals ovate-triangular, ca. 1.2 × 0.9 cm, outside red fulvous tomentose, inside apically puberulent; inner petals ovate-lanceolate, ca. 10 × 6 mm, outside pubescent, inside glabrous. Stamens oblong-cuneate, ca. 1.5 mm; connectives broadly 3-angular. Carpels ca. 10, sericeous pubescent; stigma apex 2-cleft. Fruiting pedicel ca. 2 cm; monocarp stipes to 4 cm; monocarp globose, ca. 2 cm in diam., densely red fulvous tomentose. Seeds reddish brown, oblong, ca. 1.5 × 0.6 cm. Fl. May–Nov, fr. Aug–Mar.

Densely forested slopes; 500–1600 m. Guizhou, C and S Yunnan [Laos, Myanmar, N Thailand, Vietnam].

**13. *Fissistigma poilanei*** (Jovet-Ast) Tsiang & P. T. Li, *Acta Phytotax.* Sin. 10: 316. 1965.

火绳藤 *huo sheng teng*

*Melodorum poilanei* Jovet-Ast, *Notul. Syst. (Paris)* 9: 82. 1940.

Climbers to 7 m tall. Branches sparsely puberulent when young, glabrous and lenticellate with age. Petiole 1–1.5 cm, pubescent; leaf blade oblong-lanceolate, 6.5–16 × 2–4.5 cm, leathery to thickly papery, abaxially densely grayish brown pubescent, adaxially glabrous except for sparsely puberulent midvein, secondary veins 14–20 on each side of midvein, obliquely ascending, and adaxially flat, base cuneate to broadly cuneate, apex acuminate. Inflorescences leaf-opposed or subopposed, cymose, 2–8-flowered; peduncle 1–3 mm. Pedicel 7–8 mm, ochraceous pubescent, 1- or 2-bracteolate at base to middle. Flower buds broadly ovoid, 4–5 × 4–5 mm. Sepals ovate-triangular, ca. 2 × 2 mm, outside puberulent, inside glabrous. Outer petals ovate-triangular, ca. 9 × 6 mm, outside ochraceous pubescent, inside apically puberulent; inner petals ovate-oblong, ca. 7 × 4 mm, outside pubescent, inside glabrous. Stamens oblong, ca. 1.5 mm; connectives obliquely 3-angular. Carpels oblong, ca. 3 mm, densely hispid; ovules ca. 8 per carpel, in 2 series; stigma apex 2-cleft. Fruiting monocarp globose, ca. 2 cm in diam. Fl. Mar–Dec, fr. Jun–Apr.

Sparsely forested slopes, usually in valleys; 700–1000 m. S and SE Yunnan [Vietnam].

The basionym, *Melodorum poilanei*, was first published in 1938 (Fl. Indo-Chine Suppl. 1: 109) but not validly so.

**14. *Fissistigma acuminatissimum*** Merrill, J. Arnold Arbor. 19: 29. 1938.

尖叶瓜馥木 *jian ye gua fu mu*

Climbers to 8 m tall. Branchlets pubescent when young, glabrescent. Petiole 5–12 mm, densely appressed ferruginous pubescent; leaf blade lanceolate to oblong-lanceolate, 7–17 × 2–4 cm, papery to thinly leathery, abaxially ferruginous pubescent but denser on veins, adaxially glabrous except for pubescent midvein and secondary veins, secondary veins 14–21 on each side of midvein, obliquely ascending to margin, and adaxially impressed, base cuneate to broadly cuneate, apex acuminate. Inflorescences terminal or leaf-opposed, cymose, 1–4-flowered; peduncle 3–4 mm, pubescent; bracts ovate-lanceolate. Pedicel 1–1.5 cm, ferruginous pubescent, bracteolate between base and middle. Sepals ovate-triangular, 6–8 × 3–3.5 mm, outside ferruginous pubescent, inside glabrous. Petals greenish white; outer petals oblong-lanceolate, ca. 20 × 8 mm, outside ferruginous pubescent, inside puberulent; inner petals orbicular, to 16 mm, outside pubescent, inside glabrous, apex rounded. Stamens oblong, ca. 2 mm; connectives 3-angular, apex obtuse. Carpels oblong, pubescent; ovules 6 per carpel, in 2 series; styles oblong, pubescent; stigma apex entire. Monocarp stipes ca. 1 cm; monocarps globose, ca. 1.2 cm in diam., densely golden tomentose. Fl. Mar–Nov, fr. Jun–Dec.

Forested slopes; 900–2000 m. Guangxi, SW Guizhou, S Yunnan [Vietnam].

A fine strong bast fiber obtained from the inner bark of *Fissistigma acuminatissimum* is used to make rope in Yunnan.

**15. *Fissistigma cavaleriei*** (H. Léveillé) Rehder, J. Arnold Arbor. 10: 192. 1929.

独山瓜馥木 *du shan gua fu mu*

*Uvaria cavaleriei* H. Léveillé, Fl. Kouy-Tchéou, 29. 1914–1915.

Climbers to 8 m tall, most parts reddish pubescent. Petiole 6–8 mm; leaf blade oblong-lanceolate to oblong-elliptic, 6.5–16 × 1.8–3.8 cm, thinly leathery to thickly papery, abaxially glabrous, adaxially sparsely pubescent, secondary veins 14–21 on each side of midvein and adaxially impressed, base shallowly cordate, apex acute. Inflorescences leaf-opposed or alternate, cymose, 1–5-flowered. Pedicel 1.5–2 cm, 2-bracteolate at base. Sepals ovate-oblong, ca. 6 mm, reddish tomentose. Petals yellowish; outer petals ovate-oblong, ca. 18 × 7 mm, outside densely reddish tomentose, inside glabrous; inner petals ovate-lanceolate, ca. 13 × 4 mm, glabrous, inside basally concave. Stamens oblong; connectives broadly 3-angular. Carpels densely villous; ovules ca. 7 per carpel, in 2 series; styles oblong, pubescent; stigma apex entire. Fruiting pedicel ca. 1.2 cm, reddish pubescent; monocarp stipes ca. 2.7 cm; monocarps globose, 2–2.5 cm in diam., densely villous. Fl. Mar–Nov, fr. Jun–Dec.

• Densely forested slopes; 500–1500 m. W Guangxi, S Guizhou, SE Yunnan.

**16. *Fissistigma balansae*** (Aug. Candolle) Merrill, Philipp. J. Sci. 15: 130. 1919.

多脉瓜馥木 *duo mai gua fu mu*

*Melodorum balansae* Aug. Candolle, Bull. Herb. Boissier, sér. 2, 4: 1070. 1904; *Fissistigma guinanense* Y. Wan.

Climbers to 6 m tall. Branchlets densely fulvous pubescent when young, glabrescent. Petiole 0.8–2 cm, robust, abaxially grooved, densely brown pubescent; leaf blade oblong, oblong-elliptic, or obovate-oblong, 14–23 × 5–10 cm, thinly leathery, abaxially brown pubescent, adaxially sparsely appressed puberulent or puberulent only on midvein and secondary veins, secondary veins 25–35 on each side of midvein and adaxially flat to impressed when dry, reticulate veins prominent and at ca. 90° to secondary veins, base rounded to broadly cuneate, margin revolute, apex acute, obtuse, or retuse. Inflorescences leaf-opposed, terminal, or extra-axillary, in glomerules, many flowered, fulvous tomentulose; peduncle to 1 cm; bracts ovate, 3.5–5 × 2–3 mm, adaxially tomentulose. Flowers fragrant. Stigma apex entire. Fruiting pedicel ca. 2.5 cm, pubescent; monocarp stipes 1.5–2 cm, densely fulvous tomentulose; monocarps subglobose, ca. 4.4 × 4 cm, sparsely fulvous hispid and with slightly raised tubercles. Seeds brown, oblong, ca. 2.4 × 1.7 cm, with a winged margin. Fl. Mar–May, fr. May–Sep.

Forested slopes; 500–1200 m. SW Guangxi, SE Yunnan [Vietnam].

**17. *Fissistigma xylopetalum*** Tsiang & P. T. Li, Acta Phytotax. Sin. 10: 318. 1965.

木瓣瓜馥木 *mu ban gua fu mu*

Climbers to 8 m tall, most parts densely reddish brown to brown tomentose. Petiole ca. 1 cm; leaf blade ovate-oblong to ovate-elliptic, 7.5–17 × 3.5–6.5 cm, thickly papery, abaxially densely reddish brown to brown tomentose, adaxially glabrous except for pubescent midvein, secondary veins 14–18 on each side of midvein, ascending obliquely to margin, and adaxially flat, base rounded to broadly cuneate, apex acute to obtuse. Inflorescences axillary or leaf-opposed, in glomerules, 3–7-flowered; peduncle ca. 3 mm; bracts 1 or 2, lanceolate, 1.5–2 × ca. 0.3 cm, adaxially pubescent. Pedicel 2–2.5 cm. Sepals triangular, ca. 9 × 6 mm, inside glabrous. Petals yellow to grayish purple, thickened, woody when dry; outer petals ovate-lanceolate, ca. 19 × 7 mm, outside sparsely pubescent and prominently costate, inside glabrous. Stamens oblong, ca. 2 mm; connectives apically subrounded to truncate. Carpels oblong, ca. 4 mm, densely sericeous pubescent; ovules 6 per carpel, in 2 series; stigmas glabrous, apex 2-cleft. Fruiting pedicel ca. 2.5 cm; monocarp stipes ca. 3 mm; monocarps globose, 1.5–2 cm in diam. Seeds 6 per monocarp, in 2 series, reddish brown, ovoid to sometimes globose, flat, ca. 10 × 6–8 mm. Fl. Oct–Dec, fr. May–Jul.

Open woodlands, often on moist riverbanks; 300–500 m. S Guangxi, Hainan, S Yunnan [Vietnam].

**18. *Fissistigma oldhamii*** (Hemsley) Merrill, Philipp. J. Sci. 15: 134. 1919.

瓜馥木 *gua fu mu*

*Melodorum oldhamii* Hemsley, J. Linn. Soc., Bot. 23: 27. 1886; *Fissistigma oldhamii* var. *longistipitatum* Tsiang.

Climbers to 8 m tall. Branchlets fulvous pubescent. Petiole ca. 1 cm, pubescent; leaf blade obovate-elliptic to oblong, 6–13 × 2–5 cm, leathery, abaxially pubescent to glabrescent, adaxially glabrous, secondary veins 10–20 on each side of midvein and adaxially flat, base broadly cuneate to rounded, apex bluntly acute, rounded, or retuse. Inflorescences in glomerules, 1–8-flowered; peduncle ca. 2.5 cm. Flowers ca. 1.5 × 1–1.7 cm. Sepals broadly triangular, 3–5(–7) × 5–6 mm, brown tomentose, apex acute. Petals pale yellow to golden; outer petals ovate-elliptic, 21–24 × 11–12 mm, thicker, outside pubescent, inside glabrous; inner petals ovate-lanceolate, ca. 20 × 6 mm, outside puberulent, inside concave and puberulent, margin ciliate. Stamens oblong, ca. 2 cm; connectives slightly curved. Carpels 24–26, golden hairy; ovules 10 per carpel; styles white; stigma apex 2-cleft. Monocarp stipes 2.5–4 cm; monocarps globose, 1.5–1.8 cm in diam., densely fulvous tomentose. Seeds 4 per monocarp, orbicular. Fl. Apr–Sep, fr. Jul–Feb.

• On shrubs, often along ravines; 500–1500 m. Fujian, Guangdong, Guangxi, Hainan, Hunan, Jiangxi, Taiwan, SE Yunnan, S Zhejiang.

A fine strong bast fiber is obtained from the inner bark of *Fissistigma oldhamii* and is used to make rope, sacks, and paper; its flowers yield a perfumed oil; the seed oil is used in cosmetics and industry; and its roots are used as medicine for traumatic injury and arthritis.

**19. *Fissistigma polyanthum*** (J. D. Hooker & Thomson) Merrill, Philipp. J. Sci. 15: 135. 1919.

多花瓜馥木 duo hua gua fu mu

*Melodorum polyanthum* J. D. Hooker & Thomson, Fl. Ind. 1: 121. 1855.

Climbers to 8 m tall. Roots black, very aromatic. Branches dark gray to brown pubescent, glabrescent. Petiole 0.8–1.5 cm, blackish and transversely wrinkled when dried, pubescent; leaf blade oblong, obovate-oblong, or sometimes elliptic, 6–17.5 × 2–7.5 cm, thinly leathery, abaxially puberulent, adaxially glabrous, secondary veins 13–18 on each side of midvein and adaxially flat, base rounded to broadly cuneate, apex acute, rounded, or sometimes retuse. Inflorescences axillary, leaf-opposed, or extra-axillary, glomerulate, usually 3–7-flowered, yellowish pubescent; peduncle to 4 mm. Flowers small; pedicel to 1.5 cm, bracteolate between base and below middle. Flowers buds broadly 3-angular, apex acute. Sepals broadly triangular, outside pubescent. Outer petals ovate-elliptic, ca. 12 mm, outside densely fulvous pubescent, inside glabrous; inner petals oblong, ca. 9 mm, apex acuminate. Stamens oblong; connectives 3-angular, apex obtuse. Carpels oblong, villous; ovules 4–6 per carpel, in 2 series; stigma apex entire. Monocarp stipes to 2.5 cm, slender; monocarps globose, ca. 1.5 cm in diam., yellowish pubescent. Seeds reddish brown, ellipsoid, flat. Fl. Jan–Oct, fr. Mar–Dec.

Forested slopes, often in ravines; 100–1200 m. Guangdong, Guangxi, S Guizhou, Hainan, SE Xizang, S Yunnan [Bhutan, India, Myanmar, Vietnam].

The roots of *Fissistigma polyanthum* are used as medicine for rheumatism, traumatic injury, and scabies; its leaves are used for treating asthma and scabies; and the bast fibers are used to make rope. The taxon was first mentioned, but not validly published, as "*Uvaria polyantha*" by Wallich (Numer. List, no. 6467. 1832).

**20. *Fissistigma bracteolatum*** Chatterjee, Kew Bull. [3]: 58. 1948.

多苞瓜馥木 duo bao gua fu mu

Climbers to 10 m tall. Bark grayish black. Branches brown tomentose when young, glabrous and lenticellate with age. Petiole 1–1.5 cm, densely hispid to tomentose; leaf blade ovate-oblong, elliptic-oblong, or obovate-oblong, 9–18 × 3.2–8 cm, leathery, abaxially brown hispid, adaxially glabrous except for hispid midvein, secondary veins 16–20 on each side of midvein, obliquely ascending to margin, and adaxially impressed, main tertiary veins prominent and parallel, reticulate veins inconspicuous, base rounded to broadly cuneate, apex acute and apiculate. Inflorescences mostly leaf-opposed, in subumbellate glomerules, often 10-flowered or more; peduncle 3–10 mm; bracts oblong-ovate, 5–6 × 3–4 mm, abaxially brown tomentulose, adaxially glabrous. Pedicel 1–2 cm, fulvous tomentulose, 1- or 2-bracteolate below middle. Flower buds conic. Sepals ovate, 5–7 × 3–4 mm, outside tomentulose, inside glabrous. Outer petals ovate-triangular to ovate-lanceolate, 13–17 × 7–8 cm, outside fulvous tomentulose, inside glabrous; inner petals ovate-lanceolate, 10–11 × 4–5 mm, outside pubescent, inside glabrous. Stamens oblong; connectives ovoid-triangular. Carpels 4–6, ovate-oblong, ca. 3 mm, densely hispid; ovules 8–10 per carpel, in 2 series; styles elongate, inclining; stigma apex 2-cleft. Monocarp stipes ca. 3 cm; monocarps globose, ca. 1.5 cm in diam., tomentulose. Fl. Mar–Jun, fr. Aug–Nov.

Forested valley slopes, moist scrub; 800–1800 m. SE Yunnan [Myanmar].

**21. *Fissistigma kwangsiense*** Tsiang & P. T. Li, Acta Phytotax. Sin. 10: 323. 1965.

广西瓜馥木 guang xi gua fu mu

Climbers to 6 m tall. Branches densely ferruginous pubescent when young, glabrous and lenticellate with age. Petiole ca. 5 mm, ferruginous tomentose; leaf blade oblong-lanceolate to narrowly oblong, 7–18 × 1.7–3.8 cm, papery, abaxially ferruginous tomentose, adaxially sparsely pubescent but denser along midvein, secondary veins 13–19 on each side of midvein, obliquely ascending, and adaxially impressed, base rounded, apex slightly acute. Inflorescences usually leaf-opposed, sometimes pseudoterminal, in glomerules, several flowered, densely ferruginous tomentose; peduncle very short to almost absent. Pedicel 2-bracteolate. Flower buds ovoid, ca. 1 cm. Sepals ovate-oblong, ca. 6 mm. Outer petals ovate-elliptic, ca. 8 × 4 mm; inner petals oblong-elliptic, smaller than outer petals, margins connivent. Stamen connectives apically long acuminate. Carpels ovate-oblong, villous; ovules ca. 10 per carpel, in 2 series; styles filamentous; stigma apex entire. Fruit not seen. Fl. Feb–Sep, fr. Jun–Nov.

• Densely forested slopes, usually in valleys; 200–500 m. SW Guangxi, SE Yunnan.

**22. *Fissistigma retusum*** (H. Lévillé) Rehder, J. Arnold Arbor. 10: 191. 1929.

凹叶瓜馥木 ao ye gua fu mu

*Melodorum retusum* H. Lévillé, Repert. Spec. Nov. Regni Veg. 9: 458. 1911; *Fissistigma capitatum* Merrill ex H. L. Li.

Climbers to 10 m tall. Branches brown tomentose. Petiole 0.8–1.5 cm, abaxially grooved, densely tomentulose; leaf blade broadly ovate, obovate, or obovate-oblong, 9–26 × 4.5–13 cm, leathery to thinly leathery, abaxially brown tomentose, adaxially tomentulose only on midvein and secondary veins, secondary veins 15–22 on each side of midvein and adaxially ± impressed, tertiary veins prominently parallel, reticulate veins very dense, base rounded, truncate, or sometimes shallowly cordate, apex rounded to retuse and minutely apiculate. Inflorescences ± leaf-opposed, in umbel-like glomerules, 4–8-flowered or more; peduncle 5–10 mm; bracts caducous. Pedicel to 2 cm, bracteolate at middle. Sepals ovate-lanceolate, ca. 1 cm, as long as petals in bud, outside tomentulose, inside glabrous. Outer petals ovate-elliptic, ca. 15 mm, outside tomentulose, inside glabrous; inner petals ovate-lanceolate, shorter than outer petals, glabrous, slightly incurved at base. Stamens oblong; connectives broadly 3-angular. Carpels ca. 1.5 mm, densely sericeous pubescent; ovules ca. 4 per carpel, in 2 series; styles oblong, incurved, pubescent; stigma apex entire. Fruiting pedicel 1.5–2.2 cm, golden tomentulose; monocarp stipes very short; monocarps globose, ca. 3 cm in diam., golden tomentulose. Fl. May–Nov, fr. Jun–Dec.

• Densely forested slopes; 700–2000 m. S Guangdong, Guangxi, Guizhou, Hainan, SE Xizang, Yunnan.

**23. *Fissistigma shangtzeense*** Tsiang & P. T. Li, Acta Phytotax. Sin. 10: 324. 1965.

上思瓜馥木 shang si gua fu mu

Climbers to 8 m tall, most parts fulvous pubescent. Branches lenticellate and glabrous with age. Petiole ca. 1.5 cm; leaf blade obovate, obovate-oblong, or sometimes elliptic, 3–13(–25) × 2–5.5(–8) cm, papery, abaxially fulvous pubescent, adaxially glabrous except for fulvous pubescence on midvein, secondary veins 13–20 on each side of midvein and adaxially impressed, base broadly cuneate to sometimes rounded, apex rounded to retuse. Inflorescences extra-axillary, in glomerules, 2–5-flowered; peduncle to 6 mm; bracts ovate, ca. 1 × 1 mm. Pedicel bracteolate between base and middle. Sepals broadly triangular, ca. 5 × 3 mm. Outer petals ovate, ca. 10 × 6 mm, outside puberulent; inner petals oblong, ca. 6 × 2 mm, outside puberulent, inside glabrous. Stamens oblong; connectives obliquely 3-angular. Carpels oblong-lanceolate, densely sericeous-villous; ovules ca. 10 per carpel, in 2 series; stigmas apically entire. Fruiting pedicel ca. 2 cm; monocarps oblong, ca. 4 × 2 cm, densely brown tomentose. Seeds shiny black, oblong, ca. 5 mm in diam. Fl. Jul–Oct, fr. Oct–May.

• Forested slopes; 600–800 m. S Guangxi.

## 23. *ANNONA* Linnaeus, Sp. Pl. 1: 536. 1753.

番荔枝属 fan li zhi shu

Li Bingtao (李秉滔 Li Ping-tao); Michael G. Gilbert

*Guanabanus* Miller.

Trees or shrubs, with an indument of simple or stellate hairs. Inflorescences terminal, leaf-opposed, extra-axillary, or sometimes cauliflorous, never axillary, 1-flowered or in few-flowered clusters. Pedicel usually short. Sepals 3, small, valvate. Petals 6, in 2 whorls or inner whorl rudimentary or absent, free or connate at base; outer petals valvate, fleshy but leathery when dry, connivent or somewhat spreading, inside basally concave, margin thick; inner petals imbricate or valvate. Stamens many; filament short; connectives apically convex or apiculate. Carpels many, often connate; ovule 1 per carpel, basal; styles clavate; stigmas muriculate. Fruit syncarpous, surface covered with knobs, bulges, spines, or less often smooth. Seeds many per syncarp, embedded in edible pulp.

About 100 species: mostly in tropical America, a few in tropical Africa; seven species (all introduced) in China.

*Annona* includes several trees that have become widely grown for their fruit.

### 1a. Inner petals present.

2a. Carpels glabrous; ripe syncarp smooth ..... 1. *A. glabra*

2b. Carpels pubescent; ripe syncarp with soft prickles.

3a. Leaf blade elliptic, 14–24 cm, secondary veins punctate at base; inner petals glabrous ..... 2. *A. montana*

3b. Leaf blade obovate-oblong to ovate-elliptic, 5–18 cm, secondary veins not punctate at base; inner petals pubescent ..... 3. *A. muricata*

### 1b. Inner petals absent or reduced to minute scales.

4a. Leaf blade abaxially tomentose.

5a. Axillary vegetative buds glabrous; leaf blade adaxially pubescent; leaves associated with flowering branches not auriculate ..... 4. *A. cherimolia*

5b. Axillary vegetative buds pubescent; leaf blade adaxially glabrous; leaves associated with flowering branches auriculate ..... 5. *A. diversifolia*

4b. Leaf blade abaxially pubescent or puberulent when young, glabrescent.

6a. Outer petals outside surface and carpels hairy; ripe syncarp not pruinose, areoles flattened and separated by ± raised ridges; fruit pulp yellowish ..... 6. *A. reticulata*

6b. Outer petals and carpels glabrous; ripe syncarp slightly pruinose, areoles convex and separated by deep grooves; fruit pulp whitish ..... 7. *A. squamosa*

**1. *Annona glabra* Linnaeus, Sp. Pl. 1: 537. 1753.**圆滑番荔枝 *yuan hua fan li zhi*

Trees to 12 m tall, evergreen. Branches glabrous, lenticellate. Axillary leaf buds ovoid, fulvous pubescent, apex obtuse. Petiole 0.8–2.5 cm; leaf blade ovate, elliptic-ovate, elliptic, or oblong, 6–20 × 3–8 cm, papery to thinly leathery, glabrous at maturity, secondary veins 7–12 on each side of midvein and forming a ca. 60° angle with midvein, secondary and reticulate veins prominent on both surfaces when dry, base obtuse to rounded and slightly decurrent onto petiole, apex acute to obtuse. Inflorescences internodal or terminal on a short branchlet, 1-flowered. Flower buds ovoid to subglobose. Pedicel 1.5–2 cm, glabrous. Sepals broadly ovate, 3–4 × 3–4 mm, free, glabrous. Outer petals greenish yellow to pale yellow and inside basally with a red spot, broadly ovate, 1.5–3 × 1.3–2.5 cm, outside glabrous, inside minutely puberulent, apex obtuse; inner petals outside yellow, inside carmine, 1.2–2.5 × 0.7–1.5 cm, minutely puberulent. Stamens oblong, 3–4 mm; connectives apically slightly convex. Carpels connate at anthesis, glabrous. Syncarp yellow to orange, ovoid, 5–12 × 5–8 cm, smooth, apex rounded. Seeds pale reddish brown, 1.3–1.5 cm. Fl. May–Jun, fr. Jul–Aug.

Cultivated; 100–200 m. Fujian, Guangdong, Guangxi, Hainan, Taiwan, Yunnan, Zhejiang [native to tropical America].

The insipid fruit, pond apple, are mostly used for jellies or eaten raw. This tree is tolerant of saline soils and is considered a very troublesome invasive species in coastal areas of Australia.

**2. *Annona montana* Macfadyen, Fl. Jamaica 1: 7. 1837.**山地番荔枝 *shan di fan li zhi*

Trees to 10 m tall, evergreen. Bark purplish brown. Branchlets green and smooth when young. Petiole 1.2–2 cm, adaxially grooved; leaf blade elliptic, papery, abaxially smooth and pale green, adaxially light to dark green, secondary veins 11–16 on each side of midvein, basally punctate, and adaxially slightly concave, base cuneate, apex shortly acuminate. Inflorescences terminal or axillary on apical branchlets, 1- or 2-flowered. Pedicel 2.5–4 cm, robust. Sepals ovate, ca. 6 mm. Outer petals yellowish brown, broadly ovate, apex acute; inner petals orange, shorter than outer petals, apex obtuse. Stamens many; filaments white, flat; anther locules brown; connectives apically dilated. Carpels oblong, 6–7 mm, free at anthesis; ovaries pubescent. Syncarp brownish yellow, ovoid, subglobose, or cordate-ovoid, slightly oblique, 9.5–14 × 9.5–12.5 cm, with dense soft prickles and dark brown hairs; pulp yellowish, aromatic. Fl. May–Jun, fr. Jul–Sep.

Cultivated; 100–200 m. Guangdong, Taiwan [native to W tropical America].

The fruit, mountain soursop, are of a good flavor.

**3. *Annona muricata* Linnaeus, Sp. Pl. 1: 536. 1753.**刺果番荔枝 *ci guo fan li zhi*

Trees to 10 m tall, evergreen. Bark rugose. Petiole short; leaf blade obovate-oblong to ovate-elliptic, 5–18 × 2–7 cm, papery, abaxially greenish and glabrous, adaxially green and shiny, secondary veins 6–13 on each side of midvein and

slightly prominent on both surfaces, base broadly cuneate to rounded, apex acute to obtuse. Inflorescences axillary, 1- or 2-flowered. Flowers ca. 3.8 cm in diam. Pedicel 0.5–2.5 cm, pubescent. Sepals ovate-elliptic to ovate-triangular, 3–5 mm, petals green, later yellowish, inside basally without a red spot; outer petals thick, broadly triangular, 2.5–5 × 2–4 cm, inside finely pubescent, apex acute to obtuse; inner petals ovate-elliptic, 2–4 × 1.5–3.5 cm, slightly thin, imbricate, pubescent, base clawed, apex obtuse. Stamens 4–5 mm; filaments fleshy; connectives apically dilated. Carpels ca. 5 mm, pubescent. Syncarp green, ovoid and often oblique or curved, 10–35 × 7–15 cm, covered with soft prickles, base impressed, apex rounded; pulp white. Seeds brownish yellow, reniform, ca. 2 × 1 cm. Fl. Apr–Jul, fr. Jul–Dec.  $2n = 14, 16$ .

Widely cultivated; 100–400 m. Fujian, Guangdong, Guangxi, Hainan, Taiwan, Yunnan [native to tropical America].

The fruit, soursop, is the largest among *Annona* species. It is eaten raw, used in sherbets, and used in drinks. The pulp is also consumed with wine or cognac.

**4. *Annona cherimolia* Miller, Gard. Dict., ed. 8, *Annona* no. 5. 1768.**毛叶番荔枝 *mao ye fan li zhi*

Trees 3–7 m tall, deciduous. Branchlets tomentose, glabrescent. Axillary leaf buds ovoid, apex obtuse. Petiole 6–12 mm; leaf blade ovate, ovate-lanceolate, elliptic, obovate, or rarely orbicular, 5–25 × 2.5–10 cm, thinly papery, abaxially tomentose, adaxially pubescent, secondary veins 11–14 on each side of midvein and forming an angle from 60° to almost 90° with midvein, base rounded to obtuse and slightly decurrent onto petiole, apex obtuse to shortly acuminate. Inflorescences 1–3-flowered. Sepals ovate, 2–4 mm, outside tomentose, inside glabrous. Petals outside greenish yellow to reddish, inside yellowish to whitish and basally purple-spotted, linear-oblong, 1.5–3 cm, tomentose, apex obtuse; inner petals absent or reduced to minute scales. Stamens oblong, 1.2–1.7 mm. Syncarp mostly green, ovoid, cordate, conic, or rarely globose, to 20 × 15 cm, smooth or tuberculate but not furrowed between areoles; pulp white. Seeds blackish brown, turning paler when dry, obovoid, ca. 1 cm, slightly flattened, apex obliquely truncate. Fl. Mar–Jul, fr. Jun–Nov.

Widely cultivated; 100–300 m. Fujian, Guangdong, Guangxi, Hainan, Taiwan, Yunnan [native to tropical America].

The fruit, cherimoya, has good dessert qualities and is subacid and delicate. It is eaten raw, used in cooling drinks, and used in sherbets. It contains up to 18.4% sugar, 1.8% protein, and 0.4% fat.

**5. *Annona diversifolia* Safford, Science, n.s., 33: 471. 1911.**异叶番荔枝 *yi ye fan li zhi*

Trees to 8 m tall, deciduous. Branchlets tomentose, glabrescent. Axillary leaf buds ovoid, brown tomentose, apex obtuse. Petiole ca. 1 cm; leaf blade broadly obovate to ovate-lanceolate, 7.5–20 × 3–10 cm, papery, abaxially gray pruinose and brown tomentose, adaxially smooth and glabrous, secondary veins 11–14 on each side of midvein and adaxially flat, base rounded to obtuse, apex rounded. Flowering branches associated with large auriculate leaves. Inflorescences 1–3-flowered.

Flowers ca. 3 cm. Sepals ovate, 2–4 mm, outside tomentose, inside glabrous. Petals reddish; outer petals linear-oblong, 1.5–3 cm, tomentose; inner petals absent. Stamens oblong, ca. 1.5 mm. Syncarp green to reddish, conic, ovoid, or spherical, ca. 20 × 15 cm, tuberculate; pulp white or brownish when ripe. Seeds blackish brown, ovoid to obovoid, ca. 1 cm. Fl. Apr–Aug, fr. Jun–Nov.  $2n = 14$ .

Cultivated; 100–200 m. Guangdong [native to Central America and S Mexico].

This species is cultivated for the fine fruit, ilama, which are eaten raw.

**6. *Annona reticulata* Linnaeus, Sp. Pl. 1: 537. 1753.**

牛心番荔枝 niu xin fan li zhi

Trees to 6 m tall, evergreen. Branchlets grayish sericeous, glabrescent. Axillary leaf buds ovoid, apex obtuse. Petiole 1–1.5 cm; leaf blade oblong-lanceolate, 9–30 × 2–7 cm, papery, pubescent when young but glabrescent, secondary veins 9–18 on each side of midvein, forming an angle of 30°–60° with midvein, and flat, base cuneate to obtuse and slightly decurrent onto petiole, apex acuminate. Inflorescences leaf-opposed or internodal, cymose, several flowered. Flower buds lanceolate, apex obtuse. Sepals ovate, 2–3 mm, outside pubescent, inside glabrous. Petals yellowish green; outer petals oblong-lanceolate, fleshy, outside puberulent, inside glabrous; inner petals absent. Stamens oblong, 1–1.3 mm; connectives apically subtruncate. Carpels oblong, villous; stigmas muriculate. Syncarp turning yellow to reddish, spherical to ovoid, 5–12.5 cm in diam.; areoles ± flat, separated by a reticulation of often raised ridges; pulp yellowish. Seeds blackish brown. Fl. Nov–Feb, fr. Mar–Jun.  $2n = 14$ .

Widely cultivated; 100–200 m. Fujian, Guangdong, Guangxi, Hainan, Taiwan, Yunnan [native to tropical America].

The fruit, bullock's-heart or custard-apple, are edible, containing nearly 17% sugar, 1.6% protein, and 0.26% fat.

**7. *Annona squamosa* Linnaeus, Sp. Pl. 1: 537. 1753.**

番荔枝 fan li zhi

Trees, deciduous, to 8 m tall. Bark thin. Branchlets pubescent, glabrescent. Petiole 4–15 mm; leaf blade elliptic-lanceolate, narrowly elliptic, or oblong, 5–17.5 × 2–7.5 cm, thinly papery to membranous, abaxially pale green and puberulent when young but glabrate in age, base obtuse to rounded and slightly decurrent, apex acute to obtuse, lateral veins 8–15 on each side of midvein, adaxially flat. Inflorescences 1-flowered or 2–4-fasciculate. Flowers 2–3 cm, puberulent. Sepals triangular. Outer petals basally green to purple, oblong-lanceolate, 1.5–3 × 0.5–0.8 cm, fleshy, thick, inside concave, keeled on apical half; inner petals absent or reduced to scales, as long as stamens. Stamens oblong, ca. 1 mm; connective broad, apex subtruncate. Carpels oblong, distinct at anthesis; stigmas ovate-lanceolate. Syncarp greenish yellow, slightly pruinose, spherical to ovoid, 5–10 cm in diam., areoles rounded, convex, separated by deep grooves; pulp white. Seeds black-brown, ca. 14 mm. Fl. May–Jul, fr. Jun–Nov.

Widely cultivated; near sea level to 200 m. Fujian, Guangdong, Guangxi, Hainan, Taiwan, Yunnan, Zhejiang [native to tropical America].

The fruit, sugar-apple or sweetsop, is edible. It contains more than 20% sugar, 2.3% protein, and 0.3% fat. The bast fiber is used for paper making; the roots are used medicinally for dysentery; and the seeds yield up to 20% oil.

**24. ROLLINIA A. Saint-Hilaire, Fl. Bras. Merid., ed folio, 1: 23; ed. quarto, 1: 28. 1824.**

萎林果属 lou lin guo shu

Li Bingtao (李秉滔 Li Ping-tao); Michael G. Gilbert

Trees or shrubs, indument of simple or rarely stellate hairs. Inflorescences few flowered or rarely 1-flowered. Sepals 3, small, valvate, free or rarely connate at base into a cup. Petals 6, in 2 whorls, with each whorl valvate, connate at base; outer petals outside with a spur or wing; inner petals minute. Stamens many; connectives disklike, apex dilated. Carpels many; ovule 1 per carpel, basal. Fruit syncarpous, globose to ovoid. Seeds many per syncarp, usually dark brown to almost black, flat, embedded in edible pulp.

About 42 species: Central America, tropical South America; one species (introduced) in China.

Rainer (Ann. Naturhist. Mus. Wien, B, 108: 191–205. 2007) transferred all species of *Rollinia* to *Annona*, mainly on the basis of preliminary molecular data that nested the two species of *Rollinia* investigated within *Annona*.

**1. *Rollinia mucosa* (Jacquin) Baillon, Adansonia 8: 268. 1868.**

米糕萎林果 mi gao lou lin guo

*Annona mucosa* Jacquin, Observ. Bot. 1: 16. 1764; *Rollinia orthopetala* A. Candolle.

Trees to 10 m tall. Bark grayish brown, with rose-colored tissue below. Petiole 5–10 mm; leaf blade oblong-elliptic, 15–25 × 8–11 cm, leathery, abaxially pubescent, adaxially smooth and glossy, midvein prominent, secondary veins 11–16 on each side of midvein, base slightly cuneate, apex acuminate. Inflorescences 1-flowered. Flowers 2–3.5 cm in diam. Pedicel ca. 2 cm, thick and widening at apex. Sepals broadly triangular, 3–4

mm. Outer petals with conspicuous winglike dorsal appendage; inner petals small and scalelike. Stamens many, ca. 1 mm. Carpels many; styles terminal, short, densely hairy. Syncarp dark green at first, ripening yellow to pale yellow, spherical to oblong, 10–20 × 7–20 cm, with soft protuberances ending in a brown to black fleshy point at apex of each carpel; pulp white or cream, fleshy, with a soft fibrous and mucilaginous texture, juicy and with a pleasant aroma. Seeds dark brown to almost black, ca. 10 × 5 mm. Fl. May–Jun, fr. Jul–Nov.

Cultivated; 100–200 m. Guangdong [native to tropical South America].

This species is grown for the fine fruit, biriba. The abundant fleshy pulp surrounding the seeds is eaten.

## BERBERIDACEAE

小檗科 xiao bo ke

Ying Junsheng (应俊生 Ying Tsun-shen)<sup>1</sup>; David E. Boufford<sup>2</sup>, Anthony R. Brach<sup>3</sup>

Herbs, perennial, or shrubs, rarely small trees, evergreen or deciduous, sometimes rhizomatous or tuberous. Stems with or without spines. Leaves alternate, opposite, or basal, simple, or 1–3 × pinnately or 2–3 × ternately compound; stipules present or absent; venation pinnate or palmate. Inflorescences terminal or axillary, racemes, spikes, umbels, cymes, or panicles, or flowers fascicled or solitary. Flowers pedicellate or sessile, bisexual, radially symmetric; bracteoles or bracts present or absent. Perianth usually 2- or 3-merous, rarely absent. Sepals 6–9, often petaloid, distinct, in 2 or 3 whorls. Petals 6, distinct, flat, hooded, pouched, or spurred; nectary present or absent. Stamens 6, opposite petals; anthers 2-celled, dehiscing by valves or longitudinal slits. Ovary superior, apparently 1-carpellate; ovules numerous, rarely solitary; placentation marginal or appearing basal; style present or absent, sometimes persistent in fruit as a beak. Fruit a berry, capsule, follicle, or utricle. Seeds 1 to numerous, sometimes arillate; endosperm abundant.

Seventeen genera and ca. 650 species: mainly in the north temperate zone and on subtropical mountains; 11 genera and 303 species (272 endemic, one introduced) in China; 17 additional species (15 endemic) are insufficiently known.

Editors' note. The Berberidaceae were to be published in *Flora of China* Volume 7 (2008). However, a problem with the treatment of *Berberis* necessitated postponing publication of the family until the present volume. See the comments under *Berberis*, below.

The family Berberidaceae presents an interesting, distinctive biogeography. The two species of *Achlys* Candolle are disjunctly distributed between E Asia and North America, with one in Japan and Korea and one along the west coast of North America. *Caulophyllum* and *Diphylleia* each contain three species; the former has one species in E Asia and two in North America, the latter has two in E Asia and one in North America. *Sinopodophyllum* and *Plagiorhegma* (if maintained separate from *Podophyllum* Linnaeus and *Jeffersonia* Barton, respectively) are endemic to E Asia, but their closest relatives, *Podophyllum* and *Jeffersonia*, are widely disjunct in E North America. *Epimedium* has a wide, fragmented range from Japan westward to Algeria; the nearest relative, *Vancouveria* C. Morren & Decaisne, is endemic to the Pacific Northwest of North America. *Dysosma* and *Nandina* are endemic to China, and *Ranzania* T. Ito is endemic to Japan.

*Podophyllum cavaleriei* H. Léveillé (Bull. Acad. Int. Géogr. Bot. 14: 142. 1914) is the replaced synonym of *Pilea panzhihuaensis* C. J. Chen et al. (Novon 17: 24. 2007) in the Urticaceae.

Ying Tsunshen. 2001. Berberidaceae. In: Ying Tsunshen, ed., Fl. Reipubl. Popularis Sin. 29: 50–310.

### 1a. Shrubs.

- 2a. Leaves 2 or 3 × pinnately compound; margins of leaflets entire; anthers dehiscing by longitudinal slits; placentation parietal ..... 1. *Nandina*
- 2b. Leaves simple or pinnately compound; margins of leaflets toothed; anthers dehiscing by 2 apically hinged valves; placentation basal.
  - 3a. Leaves simple; branches spiny ..... 2. *Berberis*
  - 3b. Leaves pinnately compound; branches without spines ..... 3. *Mahonia*

### 1b. Perennial herbs.

- 4a. Leaves simple; petals without nectary.
  - 5a. Flowers solitary.
    - 6a. Rhizomes stout; flowers appearing before leaves; fruit a berry, indehiscent ..... 4. *Sinopodophyllum*
    - 6b. Rhizomes slender; flowers appearing with the leaves; fruit a dehiscent capsule ..... 5. *Plagiorhegma*
  - 5b. Flowers 2 or more, in fascicles, umbels, or cymes.
    - 7a. Inflorescences fascicles or umbels; leaves 3–9-parted or -lobed; seeds numerous ..... 6. *Dysosma*
    - 7b. Inflorescences terminal cymes or umbelliform; leaves 2-parted; seeds 2–4 ..... 7. *Diphylleia*
- 4b. Leaves compound (except in few species of *Epimedium*); petals with nectary.
  - 8a. Fruit resembling a berry, actually a naked seed at maturity; inflorescences compound cymes ..... 11. *Caulophyllum*
  - 8b. Fruit capsules or achenes; seeds contained within fruit; inflorescences racemes or panicles.
    - 9a. Plants from rhizomes; margins of leaflets toothed; petals 4, often spurred ..... 8. *Epimedium*
    - 9b. Plants from tubers; margin of leaflets entire; petals 6, nectary-like, spurs absent.
      - 10a. Tubers producing 1 or rarely 2 leaves per year; fruit a dehiscent capsule; seeds with arils ..... 9. *Gymnospermium*
      - 10b. Tubers producing 2–5 leaves per year; fruit an achene, globose, utricular; seeds without arils ..... 10. *Leontice*

# 1. *NANDINA* Thunberg, Nov. Gen. Pl. 14. 1781.

南天竹属 *nan tian zhu shu*

Ying Junsheng (应俊生 Ying Tsun-shen); David E. Boufford, Anthony R. Brach

Shrubs, evergreen, without rhizomes. Leaves alternate, 2 or 3 × pinnately compound, estipulate; petioles and petiolules swollen at base; leaflets entire, venation pinnate. Inflorescences terminal or axillary panicles of dozens to hundreds of flowers. Flowers bisexual, 3-merous; bracteoles present. Sepals numerous, spirally arranged. Petals 6, larger than sepals, basally without nectaries. Anthers dehiscing by longitudinal slits; pollen grains prolate, 3-polyporate, exine distinctly reticulate. Ovary ellipsoid; placentation submarginal; style short; stigma entire or crisped. Fruit berries, globose. Seeds 1–3; aril absent.  $2n = 20$ .

One species: E Asia.

*Nandina* is occasionally treated as a separate family, Nandinaceae (Takhtajan, Divers. Classific. Fl. Pl. 1997), or subfamily, Nandinoideae (Loconte in Kubitzki et al., Fam. Gen. Vasc. Pl. 2: 147–151. 1993).

## 1. *Nandina domestica* Thunberg, Nov. Gen. Pl. 14. 1781.

南天竹 *nan tian zhu*

*Nandina domestica* var. *linearifolia* C. Y. Wu ex S. Y. Bao.

Shrubs, evergreen, erect, to 3 m tall, glabrous, few branched. Branchlets reddish when young. Leaves 30–50 cm; leaflets nearly sessile; blades elliptic or elliptic-lanceolate, 2–10 × 0.5–2 cm, weakly leathery, glabrous, base cuneate, apex acuminate. Inflorescences erect, 20–35 cm. Flowers cream or white. Sepals ovate-triangular or ovate-oblong, 1–4 mm. Petals

oblong, ca. 4.2 × 2.5 mm, apex obtuse. Stamens ca. 3.5 mm; anther connective prolonged. Ovary locules 1; ovules 1–3. Carpodium 4–8 mm. Berry red or purplish, 6–8 mm in diam. Seeds grayish or brownish, oblate-spheroidal. Fl. Mar–Jun, fr. May–Nov.  $2n = 20^*$ .

Streamsides in montane forests, roadsides, thickets; below 1000 m. Anhui, Fujian, Guangdong, Guangxi, Guizhou, Henan, Hubei, Hunan, Jiangsu, Jiangxi, Shaanxi, Shandong, Shanxi, Sichuan, Yunnan, Zhejiang [India, Japan; probably not native in SE North America, West Indies, and South America (Peru)].

# 2. *BERBERIS* Linnaeus, Sp. Pl. 1: 330. 1753.

小檗属 *xiao bo shu*

Ying Junsheng (应俊生 Ying Tsun-shen)

Shrubs, evergreen or deciduous. Branches glabrous or tomentose, spinose or not; spines simple or usually 3–5-fid. Leaves on short shoots, simple, alternate, usually petiolate. Inflorescences solitary or fascicled flowers, racemes, umbels, or panicles. Flowers 3-merous; bracteoles usually 3, caducous, scalelike. Sepals 6, rarely 3 or 9, yellow. Petals 6, yellow, bases nectariferous. Stamens opposite petals; anthers dehiscing by valves; pollen grains subspheroidal, exine reticulate. Ovary symmetrically club-shaped; ovules 1–12, rarely to 15, subbasal; styles very short. Fruit a berry, usually red, dark red, or black, globose, ellipsoid, oblong, ovoid, or obovoid. Seeds 1–10, tan to red-brown or black; aril absent.  $2n = 14$ .

About 500 species: north temperate regions, a few in the S Hemisphere; 215 species (197 endemic, one introduced) in China.

Many species of the genus are grown as ornamental shrubs and used for medicinal purposes.

Editors' note. This treatment of *Berberis* was written solely by the Chinese author, Ying Junsheng. The non-Chinese co-author of the genus was to be Julian Harber (Mytholmroyd, West Yorkshire, U.K.), and the Berberidaceae were to be included in *Flora of China* Volume 7 (2008), but two months before that volume was sent to the printer, Ying rejected Harber's revision, with the result that the Berberidaceae were postponed until the present volume. The treatment provided here is an edited version of the English manuscript provided by Ying and is essentially a translation of his earlier treatment in FRPS (29: 54–214. 2001). It has been edited only to follow the *Flora of China* format, to correct the usage of English, and to correct nomenclatural errors, including errors of bibliographic citation. The taxonomy and data provided in the descriptions and distributions have not been changed. The editors observe that 49 names based on Chinese material have apparently been overlooked or disregarded in this treatment. They are provided as an appendix at the end of the genus. Harber is currently preparing a thorough revision of Chinese *Berberis*, expanded from the joint treatment that was intended to appear in the *Flora of China*; it will include all taxa known to occur in China, will account for all names based on Chinese material, and will be published by Missouri Botanical Garden Press.

1a. Inflorescence an umbel, raceme, or panicle.

2a. Inflorescence an umbel.

3a. Branches densely pubescent ..... 119. *B. weiningensis*

3b. Branches glabrous.

4a. Inflorescences not pedunculate (flowers fascicled at base of peduncle).

5a. Stems, pedicels, and leaves abaxially pruinose, each leaf margin 2–7-aristate-dentate ..... 124. *B. multiserrata*

5b. Stems, pedicels, and leaves abaxially not pruinose, each leaf margin 1–4-spinose-serrate or entire.

6a. Shrubs evergreen; spines 3-fid; each leaf margin 1–4-spinose-serrate, rarely entire, veins raised

on both surfaces; ovules 4 or 5 ..... 125. *B. pulangensis*

- 6b. Shrubs deciduous; spines simple; leaves entire, veins inconspicuous; ovules 1 or 2 ..... 126. *B. thunbergii*
- 4b. Inflorescences pedunculate (flowers not fascicled at base of peduncle).
  - 7a. Sepals in 3 whorls; fruit contracted at middle part, apex usually bent ..... 120. *B. johannis*
  - 7b. Sepals in 2 whorls; fruit not bent at apex.
    - 8a. Leaves narrowly elliptic or obovate-elliptic; fruit contracted at lower part, style persistent; ovules 2 ..... 121. *B. leboensis*
    - 8b. Leaves obovate, obovate-lanceolate, or oblong; fruit not contracted, style not persistent; ovules 4 or 5.
      - 9a. Petals emarginate at apex; leaves obovate or obovate-lanceolate ..... 122. *B. umbratica*
      - 9b. Petals entire at apex; leaves oblong or elliptic ..... 123. *B. gilungensis*
- 2b. Inflorescence a raceme or panicle.
  - 10a. Inflorescence a panicle.
    - 11a. Inflorescence a corymbose panicle.
      - 12a. Leaf blade narrowly obovate or obovate-lanceolate, margin entire; sepals in 3 whorls; petals emarginate at apex; ovules 3 or 4 ..... 198. *B. jiulongensis*
      - 12b. Leaf blade narrowly elliptic, margin 1–4-spinose-serrate on each side; sepals in 2 whorls; petals entire at apex; ovules 1 ..... 199. *B. contracta*
    - 11b. Inflorescence a panicle.
      - 13a. Inflorescence a congested panicle; pedicels 1–2(–3) mm; fruit subglobose ..... 200. *B. aggregata*
      - 13b. Inflorescence a loose panicle; pedicels longer than 2 mm.
        - 14a. Sepals in 3 whorls.
          - 15a. Rachis and peduncle pubescent ..... 201. *B. luhuoensis*
          - 15b. Rachis and peduncle glabrous.
            - 16a. Leaves entire.
              - 17a. Rachis conspicuously flexuose; fruit oblong-ovoid, pruinose, style not persistent ..... 202. *B. sherriffii*
              - 17b. Rachis not flexuose; fruit ovoid, not pruinose, style persistent ..... 203. *B. prattii*
            - 16b. Leaves spinose-serrate.
              - 18a. Leaves abaxially pruinose; inflorescences 2–4 cm; petals entire or slightly emarginate at apex; style not persistent; ovules 3 or 4 ..... 204. *B. beaniana*
              - 18b. Leaves abaxially not pruinose; inflorescences 5–12 cm; petals incised at apex; style persistent; ovules 2 ..... 205. *B. francisci-ferdinandi*
    - 14b. Sepals in 2 whorls.
      - 19a. Branches and rachises pubescent.
        - 20a. Bracts shorter than pedicels; anther connective apiculate; ovules 2 ..... 206. *B. trichiata*
        - 20b. Bracts longer than pedicels; anther connective truncate; ovules usually 3 or 4 ..... 207. *B. gyalica*
      - 19b. Branches and rachises glabrous.
        - 21a. Shrubs deciduous.
          - 22a. Leaves narrowly oblanceolate, thinly papery; petals entire or emarginate at apex ..... 215. *B. beijingensis*
          - 22b. Leaves obovate, papery; petals emarginate at apex.
            - 23a. Leaves up to 6.5 cm; pedicels 5–12 mm; fruit red, pruinose, style not persistent ..... 213. *B. xanthophlaea*
            - 23b. Leaves up to 2.7 cm; pedicels 2–3 mm; fruit dark red to purple-red, not pruinose, style persistent ..... 214. *B. concolor*
        - 21b. Shrubs evergreen or semi-evergreen.
          - 24a. Shrubs evergreen; leaves oblanceolate; fruit black, pruinose ..... 208. *B. kerriana*
          - 24b. Shrubs semi-evergreen; leaves spatulate-cuneate, obovate, or oblong-obovate.
            - 25a. Leaf margin spinose-serrate; style 1–1.5 mm.
              - 26a. Spines usually simple; inflorescences 5–15 cm; petals incised at apex; ovules 2 ..... 209. *B. polyantha*
              - 26b. Spines 3-fid; inflorescences 3–5 cm; petals entire at apex; ovules 4 ..... 210. *B. sikkimensis*
            - 25b. Leaves entire; style 0.5–0.75 mm.
              - 27a. Leaves spatulate-cuneate, apex retuse; bracts shorter than pedicels ..... 211. *B. coryi*
              - 27b. Leaves obovate, apex rounded; bracts subequal to pedicels in length ..... 212. *B. metapolyantha*
    - 10b. Inflorescence a raceme.
      - 28a. Inflorescence a spikelike raceme.
        - 29a. Leaves glabrous.
          - 30a. Leaf margin 2–15-spinose-serrate on each side; fruit black ..... 131. *B. purdomii*
          - 30b. Leaf margin entire; fruit red.
            - 31a. Petals entire at apex ..... 132. *B. vernae*
            - 31b. Petals incised at apex ..... 133. *B. poiretii*
        - 29b. Leaves pubescent.

- 32a. Sepals in 3 whorls.  
 33a. Adaxial surface of leaf rugose, both surfaces pubescent ..... 127. *B. brachypoda*  
 33b. Adaxial surface of leaf not rugose, only abaxially pubescent ..... 128. *B. salicaria*
- 32b. Sepals in 2 whorls.  
 34a. Leaves entire; petals entire at apex; pedicels glabrous ..... 129. *B. gilgiana*  
 34b. Leaf margin aristate-dentate; petals incised at apex; pedicels pubescent ..... 130. *B. stenostachya*
- 28b. Inflorescence a racemose subumbel or raceme.  
 35a. Inflorescence a racemose subumbel.  
 36a. Inflorescences not pedunculate.  
 37a. Sepals in 3 whorls ..... 134. *B. pallens*  
 37b. Sepals in 2 whorls.  
 38a. Leaf margin closely spinose-serrate; petals slightly emarginate at apex; berry ovoid ..... 135. *B. reticulata*  
 38b. Leaves entire or 1–4-spinose-serrate; petals entire or deeply emarginate at apex.  
 39a. Leaves oblong-obovate; spines simple; ovules solitary ..... 136. *B. pruinocarpa*  
 39b. Leaves lanceolate or broadly ovate; spines 3-fid; ovules 2–5.  
 40a. Leaves lanceolate; spines stout, 1–3 cm; petals entire at apex; ovules 2 or 3 ..... 137. *B. hemsleyana*  
 40b. Leaves broadly obovate; spines slender, ca. 1 cm; petals emarginate at apex;  
 ovules 3–5 ..... 138. *B. platyphylla*
- 36b. Inflorescences pedunculate.  
 41a. Sepals in 3 whorls.  
 42a. Inflorescences with leaflike bracts; fruit globose, style persistent ..... 139. *B. sichuanica*  
 42b. Inflorescences without leaflike bracts; fruit oblong, style not persistent.  
 43a. Leaves obovate or broadly obovate; stamens truncate at apex ..... 140. *B. mekongensis*  
 43b. Leaves oblanceolate or narrowly elliptic; stamens apiculate at apex; fruit contracted  
 below middle ..... 141. *B. pseudoamoena*
- 41b. Sepals in 1 or 2 whorls.  
 44a. Sepals in 1 whorl; leaves narrowly oblanceolate, less than 5 mm wide ..... 142. *B. lepidifolia*  
 44b. Sepals in 2 whorls.  
 45a. Stems, rachises, and pedicels conspicuously pruinose ..... 143. *B. calcipratorum*  
 45b. Stems, rachises, and pedicels not pruinose.  
 46a. Leaves leathery.  
 47a. Leaves abaxially not pruinose; fruit obovoid-oblong ..... 146. *B. derongensis*  
 47b. Leaves abaxially pruinose; fruit globose or oblong.  
 48a. Leaves elliptic or oblong-obovate, reticulate veins conspicuous; fruit subglobose;  
 seeds 3 ..... 144. *B. weisiensis*  
 48b. Leaves narrowly obovate, reticulate veins inconspicuous; fruit oblong; seeds 1 ..... 145. *B. amoena*
- 46b. Leaves papery.  
 49a. Leaves entire.  
 50a. Petals incised at apex; stamens truncate at apex ..... 147. *B. papillifera*  
 50b. Petals entire at apex; stamens shortly apiculate at apex.  
 51a. Leaves acute at apex; petals obovate, clawed at base ..... 148. *B. virescens*  
 51b. Leaves obtuse at apex; petals elliptic, not clawed at base ..... 149. *B. integripetala*
- 49b. Leaves spinose-serrate or entire and 1–10-spinose-serrate.  
 52a. Branches and pedicels pubescent ..... 150. *B. tomentulosa*  
 52b. Branches and pedicels glabrous.  
 53a. Leaves oblanceolate, abaxially brown ..... 154. *B. atroviridiana*  
 53b. Leaves abaxially pale green, grayish, or pruinose.  
 54a. Leaves abaxially pruinose; ovules 3 or 4 ..... 151. *B. tischleri*  
 54b. Leaves abaxially not pruinose; ovules 1 or 2.  
 55a. Petals entire at apex; fruit globose ..... 152. *B. silva-taroucana*  
 55b. Petals emarginate at apex; fruit oblong-ellipsoid ..... 153. *B. tsarongensis*
- 35b. Inflorescence a raceme.  
 56a. Racemes not pedunculate.  
 57a. Evergreen or semi-evergreen shrubs.  
 58a. Semi-evergreen shrubs; leaves entire ..... 50. *B. wilsoniae*  
 58b. Evergreen shrubs; leaves spinose-serrate or aristate-dentate.  
 59a. Leaves 1–4-aristate-dentate; stem spines 1.5–6 cm ..... 182. *B. potaninii*  
 59b. Leaves 10–25-spinose-serrate on each side; stem spines 0.6–1.5 cm.  
 60a. Leaves 3–9 × 1–3 cm; fruit oblong-ellipsoid; style persistent, short ..... 183. *B. centiflora*

- 60b. Leaves 0.8–2(–3.5) × 0.5–1.2 cm; fruit subglobose; style not persistent ..... 184. *B. tenuipedicellata*
- 57b. Deciduous shrubs.
- 61a. Sepals in 3 whorls.
- 62a. Leaves rounded or retuse at apex; reticulate veins distinctly raised; anther connective truncate ..... 196. *B. batangensis*
- 62b. Leaves acute or rounded at apex; reticulate veins inconspicuous; anther connective apiculate ..... 197. *B. ignorata*
- 61b. Sepals in 1 or 2 whorls.
- 63a. Sepals in 1 whorl; leaves entire or 1–8-spinose-serrate ..... 185. *B. mouillacana*
- 63b. Sepals in 2 whorls.
- 64a. Leaves entire or rarely few spinose-serrate.
- 65a. Leaves entire.
- 66a. Fruit usually bent, style persistent; petals acute at apex ..... 186. *B. franchetiana*
- 66b. Fruit not bent, style not persistent.
- 67a. Petals incised at apex; leaf margin not revolute, 1.2–3.5 × 0.5–1.4 cm ..... 187. *B. lecomtei*
- 67b. Petals rounded, entire at apex; leaf margin revolute, 1–2 × 0.4–0.8 cm ..... 188. *B. microtricha*
- 65b. Leaves entire, occasionally 1–7-spinose-serrate.
- 68a. Fruit red; style persistent, short ..... 189. *B. dawoensis*
- 68b. Fruit black; style not persistent.
- 69a. Leaves obovate; petals entire at apex ..... 190. *B. heteropoda*
- 69b. Leaves lanceolate; petals slightly emarginate at apex ..... 191. *B. kaschgarica*
- 64b. Leaves spinose-serrate.
- 70a. Petals deeply incised at apex; leaves elliptic, glabrous ..... 192. *B. dielsiana*
- 70b. Petals entire at apex.
- 71a. Ovules 7–11; leaves oblong-orbicular, abaxially grayish white, usually pruinose ..... 42. *B. aemulans*
- 71b. Ovules 1 or 2.
- 72a. Leaf blade elliptic or obovate-elliptic, margin spinose-serrate; bracts ca. 1 mm ..... 193. *B. dictyoneura*
- 72b. Leaf blade obovate, margin remotely spinose-serrate; bracts 4–5 mm.
- 73a. Spines to 2.5 cm; leaves to 5 × 2 cm ..... 194. *B. nutanticarpa*
- 73b. Spines to 5 cm; leaves to 4 × 1.7 cm ..... 195. *B. bracteata*
- 56b. Racemes pedunculate.
- 74a. Leaves entire.
- 75a. Leaves pubescent.
- 76a. Rachises, peduncles, and pedicels pubescent ..... 155. *B. daochengensis*
- 76b. Rachises, peduncles, and pedicels glabrous ..... 156. *B. pubescens*
- 75b. Leaves glabrous.
- 77a. Leaves abaxially pruinose.
- 78a. Leaves oblanceolate; petals slightly emarginate at apex ..... 157. *B. kongboensis*
- 78b. Leaves obovate; petals entire at apex ..... 158. *B. agricola*
- 77b. Leaves not pruinose.
- 79a. Sepals in 3 whorls.
- 80a. Peduncles 1–4 cm; fruit not pruinose, style not persistent ..... 159. *B. forrestii*
- 80b. Peduncles 3–7 cm; fruit pruinose, style persistent ..... 160. *B. racemulosa*
- 79b. Sepals in 2 whorls.
- 81a. Leaves cuneate, obcordate, or oblong-rhombic.
- 82a. Leaves cuneate or obcordate, 0.8–1.4 × 0.6–0.9 cm ..... 161. *B. retusa*
- 82b. Leaves oblong-rhombic, 3.5–8 × 1.5–3.5(–7) cm ..... 162. *B. virgetorum*
- 81b. Leaves elliptic, oblong, obovate, oblong-obovate, or obovate-lanceolate.
- 83a. Style persistent.
- 84a. Leaves oblong-obovate; fruit obovoid, pruinose when mature ..... 163. *B. humidoubrosa*
- 84b. Leaves narrowly obovate; fruit oblong, not pruinose ..... 164. *B. sabulicola*
- 83b. Style not persistent.
- 85a. Fruit oblong or oblong-ellipsoid.
- 86a. Fruit oblong; inflorescences 5–18 cm; leaves subleathery, obovate or oblong-obovate ..... 165. *B. feddeana*
- 86b. Fruit oblong-ellipsoid; inflorescences 2.5–3.5 cm; leaves papery, narrowly obovate-lanceolate or narrowly elliptic ..... 166. *B. haoi*
- 85b. Fruit globose or subglobose.
- 87a. Fruit globose, apex lacunose ..... 167. *B. jamesiana*

- 87b. Fruit ovoid-ellipsoid or subglobose, apex flat ..... 168. *B. iliensis*
- 74b. Leaves spinose-serrate or sometimes entire.
- 88a. Leaves spinose-serrate, sometimes entire; petals entire at apex ..... 169. *B. farreri*
- 88b. Leaves spinose-serrate.
- 89a. Sepals in 3 or 4 whorls.
- 90a. Sepals in 3 whorls; leaves thinly papery, abaxially pale green ..... 170. *B. honanensis*
- 90b. Sepals in 4 whorls; leaves thickly papery, abaxially brown when dry ..... 171. *B. pingwuensis*
- 89b. Sepals in 2 whorls.
- 91a. Style persistent.
- 92a. Petals elliptic, apex emarginate; leaves abaxially not pruinose ..... 172. *B. tianshuiensis*
- 92b. Petals oblong-obovate, apex incised; leaves abaxially pruinose ..... 173. *B. henryana*
- 91b. Style not persistent.
- 93a. Leaves suborbicular to broadly elliptic.
- 94a. Petals emarginate at apex; stem spines simple or 3-fid ..... 174. *B. kansuensis*
- 94b. Petals entire at apex; stem spines absent or simple.
- 95a. Leaves abaxially whitish, slightly pruinose ..... 175. *B. anhweiensis*
- 95b. Leaves abaxially yellow-green, not pruinose ..... 176. *B. dasystachya*
- 93b. Leaves oblong, elliptic, ovate, or obovate.
- 96a. Leaves obovate.
- 97a. Leaves narrowly obovate, abaxially whitish; style persistent, short ..... 180. *B. pseudotibetica*
- 97b. Leaves oblong-obovate, abaxially pale yellow-green; style not persistent ..... 181. *B. dubia*
- 96b. Leaves oblong or elliptic.
- 98a. Leaves oblong to ovate, 5–10 × 2.5–5 cm, abaxially pale green; spines 3-fid ..... 177. *B. amurensis*
- 98b. Leaves elliptic, 1.5–5 × 0.6–1.8 cm; spines absent, simple, or 3-fid.
- 99a. Petals entire at apex; anther connective slightly prolonged, shortly apiculate;  
ovules 5 or 6 ..... 178. *B. shensiensis*
- 99b. Petals slightly emarginate at apex; anther connective not prolonged, truncate;  
ovules 2 ..... 179. *B. hersii*
- 1b. Flowers solitary or fascicled.
- 100a. Flowers solitary.
- 101a. Leaves abaxially pruinose.
- 102a. Sepals in 3 whorls.
- 103a. Petals entire at apex; ovules 3 or 4 ..... 1. *B. candidula*
- 103b. Petals 2-lobate at apex; ovules 6–12.
- 104a. Petals emarginate at apex; fruit ovoid, black, with strict style ..... 2. *B. chrysosphaera*
- 104b. Petals incised at apex; fruit oblong-ovoid, red, with bent style at apex ..... 3. *B. temolaica*
- 102b. Sepals in 2 whorls.
- 105a. Leaves entire; anther connective shortly apiculate; fruit ovoid; ovules 3 or 4(–6) ..... 4. *B. dictyophylla*
- 105b. Leaf margin 1–6-spinose-serrate; anther connective truncate; fruit globose or subglobose;  
ovules 5–8.
- 106a. Plants 1–1.5 m tall; leaf margin 1–7-spinose-serrate; pedicels 3–7 mm; fruit pruinose,  
style persistent ..... 5. *B. approximata*
- 106b. Plants 10–20 cm tall; leaf margin 1- or 2-spinose-serrate; fruiting pedicels to 23 mm;  
fruit not pruinose, style not persistent ..... 6. *B. medogensis*
- 101b. Leaves abaxially not or slightly pruinose.
- 107a. Leaves entire.
- 108a. Sepals in 3 whorls ..... 7. *B. parisepala*
- 108b. Sepals in 2 whorls.
- 109a. Shoots pubescent; petals entire at apex; ovules 6 ..... 8. *B. angulosa*
- 109b. Shoots glabrous; petals 2-lobate at apex; ovules 3–5.
- 110a. Leaves oblong-oblongeolate, oblanceolate, or oblong-obovate.
- 111a. Leaves oblong-oblongeolate; style not persistent ..... 9. *B. qiaojiaensis*
- 111b. Leaves oblanceolate or oblong-obovate; style persistent ..... 10. *B. woomungensis*
- 110b. Leaves obovate, oblong, or elliptic.
- 112a. Leaf blade leathery, margin thickened; anther connective truncate ..... 11. *B. crassilimba*
- 112b. Leaf blade herbaceous, margin not thickened; anther connective apiculate.
- 113a. Fruit obovoid, style persistent; ovules 4 or 5 ..... 14. *B. tsarica*
- 113b. Style not persistent; ovules 3 or 4.
- 114a. Fruit globose; spines 5-fid, conspicuously longer than leaves; pedicels 3–5 mm ..... 12. *B. longispina*

- 114b. Fruit oblong-ovoid or ovoid; spines 3-fid, subequal to or shorter than leaves;  
pedicels 10–30 mm ..... 13. *B. muliensis*
- 107b. Leaf margin spinose-serrate or entire and sometimes 1–6-spinose-serrate.
- 115a. Leaves entire and sometimes 1–6-spinose-serrate.
- 116a. Pedicels 15–30 mm.
- 117a. Pedicels stout, tip bent; fruit large (1.3–1.5 × 1.2–1.3 cm); ovules 11 ..... 15. *B. daiana*
- 117b. Pedicels slender, straight; fruit small (ca. 6.5 × 4–5 mm); ovules 4 or 5 ..... 16. *B. asmyana*
- 116b. Pedicels shorter than 10 mm.
- 118a. Shoots pubescent.
- 119a. Plants 20–30 cm tall; fruit elliptic-ovoid, style persistent; ovules 4 ..... 17. *B. multicaulis*
- 119b. Plants ca. 1 m tall; fruit subglobose, style not persistent; ovules 6 or 7 ..... 18. *B. kangdingensis*
- 118b. Shoots glabrous.
- 120a. Fruit oblong, tip bent; leaves elliptic or oblanceolate ..... 19. *B. campylotropia*
- 120b. Fruit ovoid, oblong-ovoid, or ovoid-globose, tip not bent; leaves obovate or narrowly  
oblanceolate.
- 121a. Petals entire at apex; fruit ovoid; spines 3–5-fid ..... 20. *B. everestiana*
- 121b. Petals emarginate or incised at apex; spines 1–3-fid.
- 122a. Leaves slightly papery, elliptic; ovules solitary ..... 21. *B. mianningensis*
- 122b. Leaves subleathery or papery, narrowly obovate or oblanceolate; ovules 2.
- 123a. Leaf margin applanate; anther connective prolonged; pedicels 5–10 mm;  
style not persistent ..... 22. *B. minutiflora*
- 123b. Leaf margin revolute; anther connective not prolonged; pedicels 1–3 mm;  
style persistent or not ..... 23. *B. graminea*
- 115b. Leaf margin spinose-serrate.
- 124a. Sepals in 3 whorls.
- 125a. Pedicels 4–10 mm; stems densely verruculose; leaves abaxially grayish green ..... 24. *B. verruculosa*
- 125b. Pedicels 15–20 mm; stems sometimes scarcely verruculose; leaves abaxially slightly glaucous ... 25. *B. concinna*
- 124b. Sepals in 2 whorls.
- 126a. Style persistent.
- 127a. Leaves elliptic; fruit ellipsoid, black, not pruinose ..... 26. *B. alpicola*
- 127b. Leaves oblong-ovate; fruit ovoid or oblong-ovoid, red, pruinose ..... 4. *B. dictyophylla*
- 126b. Style not persistent.
- 128a. Spines of stems 3–9-fid.
- 129a. Spines 3–7-fid; petals obtusely emarginate at apex; leaf margin coarsely aristate-dentate ..... 27. *B. sibirica*
- 129b. Spines 3–9-fid; petals entire at apex; leaf margin spinose-serrate ..... 28. *B. erythroclada*
- 128b. Spines of stems 3-fid.
- 130a. Leaves oblanceolate, subleathery; fruit black; ovules 1 or 2 ..... 30. *B. paraspecta*
- 130b. Leaves obovate or elliptic; fruit red.
- 131a. Leaves narrowly obovate; fruit ovoid or oblong-ovoid, 1–1.4 cm; ovules 3 or 4 ..... 13. *B. muliensis*
- 131b. Leaves elliptic or obovate; fruit broadly ellipsoid, to 2 cm; ovules 6 or 7 ..... 29. *B. fengii*
- 100b. Flowers fascicled.
- 132a. Shrubs deciduous.
- 133a. Leaf margin entire or only 1- or 2-spinose-serrate.
- 134a. Shoots, pedicels, and leaf margins pubescent ..... 31. *B. hobsonii*
- 134b. Shoots, pedicels, and leaf margins glabrous.
- 135a. Sepals in 3 whorls ..... 32. *B. reticulineris*
- 135b. Sepals in 2 whorls.
- 136a. Pedicels 20–40 mm; flowers 2–4-fascicled ..... 33. *B. yunnanensis*
- 136b. Pedicels 2–12 mm.
- 137a. Pedicels 2–5 mm; fruit black or red ..... 34. *B. ulicina*
- 137b. Pedicels 8–12 mm; fruit red.
- 138a. Leaf blade elliptic or oblanceolate, margin rarely 1- or 2-spinose-serrate; fruit slightly  
pruinose; ovules 2 ..... 35. *B. mullineris*
- 138b. Leaf blade obovate or suborbicular, margin entire; fruit not pruinose; ovules 3 ..... 36. *B. hypericifolia*
- 133b. Leaf margin spinose-serrate.
- 139a. Pedicels 2–4 mm; ovules solitary ..... 37. *B. tsienii*
- 139b. Pedicels 12–30 mm; ovules 2–11.
- 140a. Petals incised or emarginate at apex.
- 141a. Petals emarginate at apex; veins not conspicuous ..... 38. *B. morrisonensis*

- 141b. Petals incised at apex; veins conspicuous or raised.
- 142a. Leaves oblanceolate; sepals in 3 whorls; ovules 2 ..... 39. *B. yui*
- 142b. Leaves oblong or obovate-oblong; sepals in 2 whorls; ovules 6–10 ..... 40. *B. diaphana*
- 140b. Petals entire at apex.
- 143a. Sepals in 3 whorls ..... 41. *B. circumserrata*
- 143b. Sepals in 2 whorls.
- 144a. Leaf margin 15–40-spinose-serrate; petals obovate; anther connective truncate ..... 41. *B. circumserrata*
- 144b. Leaf margin 5–12-spinose-serrate; petals oblong; anther connective apiculate ..... 42. *B. aemulans*
- 132b. Shrubs evergreen.
- 145a. Leaf margin entire or 1- or 2-spinose-serrate.
- 146a. Stems without spines or with very weak spines.
- 147a. Stems without spines; leaves broadly oblong-ovate, abaxially not pruinose, stramineous when dry; branches dark gray ..... 43. *B. hypoxantha*
- 147b. Stems without spines or with very weak spines; leaves abaxially pruinose or glaucous.
- 148a. Leaves leathery, oblong-obovate or oblong-elliptic, apex obtuse, abaxially glaucous; shoots stramineous ..... 44. *B. holocraspedon*
- 148b. Leaves thickly leathery, elliptic, narrowly elliptic, or oblanceolate, apex acuminate, abaxially slightly pruinose; shoots dark purple ..... 45. *B. ziyunensis*
- 146b. Stems with spines, usually 3-fid.
- 149a. Ovules 3–5.
- 150a. Leaves obovate or obovate-spatulate, 0.6–2.5 cm; fruit globose ..... 50. *B. wilsoniae*
- 150b. Leaves elliptic, lanceolate, or oblanceolate, to 3–7 cm; fruit ellipsoid or oblong.
- 151a. Leaf blade elliptic or oblanceolate, to 3 cm, margin conspicuously revolute; style not persistent ..... 51. *B. taliensis*
- 151b. Leaf blade lanceolate or oblong-elliptic, to 7 cm, margin not revolute; style persistent, short ..... 52. *B. subholophylla*
- 149b. Ovules 1 or 2.
- 152a. Petals entire at apex; leaves 3.5–7 cm wide ..... 46. *B. pingshanensis*
- 152b. Petals emarginate at apex; leaves less than 2 cm wide.
- 153a. Flowers 2–4-fascicled; leaves obovate ..... 47. *B. obovatifolia*
- 153b. Flowers 6–15-fascicled; leaves oblong-elliptic, oblong-lanceolate, or oblanceolate.
- 154a. Leaves oblanceolate, 8–16 mm wide, abaxially not pruinose ..... 48. *B. wuyiensis*
- 154b. Leaves oblong-elliptic to oblong-lanceolate, 3–5(–8) mm wide, abaxially pruinose ..... 49. *B. replicata*
- 145b. Leaf margin spinose-serrate or spinose-dentate, rarely entire.
- 155a. Leaves elliptic, oblong, ovate, or obovate.
- 156a. Petals entire at apex.
- 157a. Sepals in 3 whorls.
- 158a. Leaf margin 1–3-aristate-dentate on each side; pedicels to 3.5 cm ..... 90. *B. dongchuanensis*
- 158b. Leaf margin spinose-serrate; pedicels to 2 cm.
- 159a. Leaf margin flat, 2–6-spinose-serrate on each side; pedicels 10–20 mm; ovules 3 or 4 .... 91. *B. parapruinosa*
- 159b. Leaf margin slightly revolute, 12–16-spinose-serrate on each side; pedicels 1–4 mm; ovules solitary ..... 92. *B. jinshajiangensis*
- 157b. Sepals in 2 whorls.
- 160a. Flowers 7–15-fascicled; sepals lanceolate; petals oblong; leaves elliptic, ovate, or obovate .... 93. *B. kawakamii*
- 160b. Flowers 3–8-fascicled; sepals ovate, obovate, or ovate-elliptic; petals obovate.
- 161a. Leaf margin 10–25-spinose-serrate on each side; berry not pruinose ..... 94. *B. bicolor*
- 161b. Leaf margin 3–10-spinose-serrate on each side; berry pruinose.
- 162a. Leaves ovate-elliptic, abaxially not pruinose; outer sepals ovate ..... 95. *B. chunanensis*
- 162b. Leaves elliptic, abaxially pruinose; outer sepals obovate ..... 96. *B. jinfoshanensis*
- 156b. Petals emarginate or incised at apex.
- 163a. Petals incised at apex.
- 164a. Ovules solitary.
- 165a. Leaf margin flat, 3–7-spinose-serrate; flowers 2–6-fascicled; petals obovate ..... 97. *B. hayatana*
- 165b. Leaf margin revolute, 6–15-spinose-serrate; flowers 5–20-fascicled; petals ovate ..... 98. *B. cavaleriei*
- 164b. Ovules 2 or 3.
- 166a. Leaf blade rhombic-elliptic to lanceolate, margin 20–40-spinulose-serrate on each side; petals obovate-spatulate ..... 99. *B. aristatoserrulata*
- 166b. Leaf blade elliptic or elliptic to obovate, margin 1–16-spinose-serrate on each side; petals ovate or obovate.

- 167a. Leaf blade elliptic, margin 12–16-spinose-serrate on each side, abaxially not pruinose; flowers 2–5-fascicled; style persistent, short ..... 100. *B. silvicola*
- 167b. Leaf blade elliptic to obovate, margin 1–6-aristate-dentate on each side, rarely entire, abaxially pruinose; flowers 8–25-fascicled; style not persistent ..... 101. *B. pruinosa*
- 163b. Petals emarginate at apex.
- 168a. Sepals in 3 whorls.
- 169a. Leaf blade elliptic or narrowly elliptic, margin revolute, abaxially pruinose; ovules 4 ..... 102. *B. laojunshanensis*
- 169b. Leaf blade oblong or oblong-elliptic, margin flat, abaxially not pruinose.
- 170a. Leaf margin 15–25-spinose-serrate on each side; berry not pruinose, style not persistent; ovules 1 or 2 ..... 103. *B. sargentiana*
- 170b. Leaf margin 5–18-spinose-serrate on each side; berry pruinose, style persistent; ovules 2 or 3.
- 171a. Flowers 3–7-fascicled; petals cuneate at base; berry dark purple ..... 104. *B. lempergiana*
- 171b. Flowers 7–20-fascicled; petals clawed at base; berry red ..... 105. *B. soulieana*
- 168b. Sepals in 2 whorls.
- 172a. Stem spines absent or very weak; leaves oblong or narrowly elliptic ..... 106. *B. impedita*
- 172b. Stem spines 3-fid.
- 173a. Flowers 30–50-fascicled; ovules 5 or 6 ..... 107. *B. hsiyunensis*
- 173b. Flowers less than 25-fascicled; ovules 1–5.
- 174a. Ovules solitary.
- 175a. Leaf margin 20–30-spinose-serrate on each side; flowers 6–20-fascicled; style not persistent ..... 108. *B. deinacantha*
- 175b. Leaf margin 6–16-spinose-serrate on each side; flowers 3–7-fascicled; style persistent, short.
- 176a. Leaves abaxially not pruinose; flowers 3–5-fascicled; berry not pruinose ..... 109. *B. valida*
- 176b. Leaves abaxially pruinose; flowers 5–7-fascicled; berry pruinose ..... 110. *B. nemorosa*
- 174b. Ovules 2–5.
- 177a. Style persistent.
- 178a. Leaf margin 1–6-spinose-serrate on each side.
- 179a. Leaf blade oblong-elliptic, margin 2–10-spinose-serrate on each side; berry ellipsoid or obovoid, not pruinose ..... 111. *B. chingii*
- 179b. Leaf blade elliptic, broadly elliptic, or obovate, margin 1–4-spinose-serrate on each side, rarely entire; berry ovoid, pruinose ..... 112. *B. vinifera*
- 178b. Leaf margin 7–40-spinose-serrate on each side.
- 180a. Leaf blade elliptic, margin 20–40-spinose-serrate on each side; ovules 1 or 2; berry pruinose ..... 113. *B. dumicola*
- 180b. Leaf blade oblong-elliptic to lanceolate, margin 7–15-spinose-serrate on each side; ovules 4 or 5; berry not pruinose ..... 114. *B. fallax*
- 177b. Style not persistent.
- 181a. Flowers 10–17-fascicled; pedicels to 35 mm; ovules 2; leaf margin spinose-serrate ..... 118. *B. malipoensis*
- 181b. Flowers 2–6-fascicled; pedicels less than 15 mm; ovules 3–5; leaf margin sinuate or flat.
- 182a. Leaf margin sinuate, conspicuously revolute, abaxially brown, not pruinose ... 115. *B. guizhouensis*
- 182b. Leaf margin flat, abaxially pruinose or slightly so.
- 183a. Leaf blade oblong-obovate, margin 3- or 4-spinose-serrate on each side; pedicels 12–15 mm; berry pruinose ..... 116. *B. lijiangensis*
- 183b. Leaf blade elliptic or ovate-oblong, margin 12–25-spinose-serrate on each side; pedicels 7–13 mm; berry not pruinose ..... 117. *B. xanthoclada*
- 155b. Leaves linear, lanceolate, elliptic-lanceolate, or oblanceolate.
- 184a. Leaves linear or linear-lanceolate.
- 185a. Leaf blade 4–15 cm × 2–10 mm, margin conspicuously revolute, 3–26-spinulose-serrate on each side; ovules 1 or 2 ..... 53. *B. insolita*
- 185b. Leaf margin not conspicuously revolute; ovules 2–4.
- 186a. Leaf blade 1.5–16 cm × 3–6 mm, margin 4–17-spinulose-serrate on each side, adaxially dark green; ovules 2 or 3 ..... 54. *B. sanguinea*
- 186b. Leaf blade 6–9 cm × 10–15 mm, margin 12–24-spinose-serrate on each side, adaxially shiny; ovules 4 ..... 55. *B. lubrica*

- 184b. Leaves lanceolate, elliptic-lanceolate, or oblanceolate.
- 187a. Sepals in 3 whorls.
- 188a. Petals emarginate or incised at apex.
- 189a. Pedicels 5–15 mm; ovules 4 or 5.
- 190a. Leaves  $1.5-3 \times 0.3-0.5$  cm; petals elliptic or oblong; style persistent, short ..... 62. *B. multiovula*
- 190b. Leaves  $5-11 \times 1-2$  cm; petals obovate; style not persistent ..... 63. *B. gagnepainii*
- 189b. Pedicels 10–35 mm; ovules 2(–4).
- 191a. Leaves oblong-lanceolate or narrowly elliptic, abaxially slightly pruinose; flowers 2–6-fascicled ..... 64. *B. triacanthophora*
- 191b. Leaves lanceolate, abaxially not pruinose; flowers 4–16-fascicled.
- 192a. Leaves  $6-15 \times 1.3-4$  cm; petals emarginate at apex; anther connective truncate; ovules 2 ..... 65. *B. xingwenensis*
- 192b. Leaves  $5-11 \times 1-2$  cm; petals incised at apex; anther connective rounded; ovules 2–4 ..... 66. *B. veitchii*
- 188b. Petals entire at apex.
- 193a. Berry subglobose; ovules 5–7; shoots dark red ..... 56. *B. insignis*
- 193b. Berry ellipsoid, oblong, or obovoid; ovules 1–5.
- 194a. Ovules 2–5; style not persistent.
- 195a. Petals obtusely emarginate at apex, clawed at base; ovules 4 or 5 ..... 60. *B. delavayi*
- 195b. Petals rounded, entire at apex, not clawed at base; ovules 2 ..... 61. *B. davidii*
- 194b. Ovules solitary; style persistent, conspicuous.
- 196a. Pedicels 8–12(–20) mm; petals elliptic; berry red ..... 57. *B. wangii*
- 196b. Pedicels 15–22 mm; petals obovate or ovate-elliptic; berry black.
- 197a. Leaf margin pectinate-spinose-serrate; petals ovate-elliptic; berry not pruinose ..... 58. *B. pectinocraspedon*
- 197b. Leaf margin spinose-serrate, petals obovate; berry pruinose ..... 59. *B. kunmingensis*
- 187b. Sepals in 2 whorls.
- 198a. Stems without spines.
- 199a. Leaf margin 15–20-spinose-serrate on each side; berry globose, red, not pruinose, style not persistent ..... 67. *B. pingbienensis*
- 199b. Leaf margin 2–4-aristate-dentate on each side; flowers 2–10-fascicled; berry pomiform or ellipsoid, purplish black, pruinose, style persistent ..... 68. *B. griffithiana*
- 198b. Stems with 3-fid spines.
- 200a. Ovules solitary.
- 201a. Funicles  $3-6 \times$  longer than ovules; berry ovoid, red ..... 69. *B. sublevis*
- 201b. Funicles equal to or shorter than ovules; berry ellipsoid, oblong, obovoid, or globose.
- 202a. Petals entire at apex.

- 213a. Petals deeply incised; berry ovoid ..... 82. *B. atrocarpa*
- 213b. Petals emarginate; berry ellipsoid or obovoid.
- 214a. Berry obovoid.
- 215a. Leaf blade lanceolate, margin 10–20-spinose-serrate on each side; flowers 5–30-fascicled; style persistent ..... 83. *B. zanlanscianensis*
- 215b. Leaf blade elliptic-lanceolate, margin 15–30-spinose-serrate on each side; flowers 2–5-fascicled; style not persistent ..... 84. *B. fallaciosa*
- 214b. Berry ellipsoid.
- 216a. Leaf margin conspicuously revolute; flowers 6–25-fascicled ..... 85. *B. amabilis*
- 216b. Leaf margin flat; flowers 2–8-fascicled.
- 217a. Leaf margin 30–60-spinose-serrulate on each side; berry not pruinose; pedicels red ..... 86. *B. arguta*
- 217b. Leaf margin 4–25-spinose-serrate on each side; berry pruinose.
- 218a. Leaf blade abaxially pruinose, margin 4–7-spinose-serrate on each side; pedicels 6–10 mm; style persistent, short ..... 87. *B. jiangxiensis*
- 218b. Leaf blade abaxially not pruinose, margin 8–25-spinose-serrate on each side; pedicels 10–25 mm; style not persistent.
- 219a. Leaf blade leathery, lanceolate, 10–17 × 2–2.5 cm, margin 10–25-spinose-serrate on each side ..... 88. *B. weixinensis*
- 219b. Leaf blade subleathery, lanceolate or elliptic-lanceolate, 4–9 × 1.2–2.2 cm, margin 8–15-spinose-serrate on each side ..... 89. *B. subacuminata*

**1. *Berberis candidula*** (C. K. Schneider) C. K. Schneider, Bull. Herb. Boissier, sér. 2, 5: 402. 1905.

单花小檗 *dan hua xiao bo*

*Berberis hookeri* Lemaire var. *candidula* C. K. Schneider, Ill. Handb. Laubholz. 1: 303. 1904.

Shrubs, evergreen, ca. 1 m tall. Stems gray-brown, verruculose; young shoots pale green; spines 3-fid, subterete, 1–1.5 cm. Petiole very short or leaf subsessile; leaf blade adaxially very shiny, deep green, elliptic to ovate, 1–2 × 0.5–1 cm, thickly leathery, abaxially white pruinose, both surfaces inconspicuously reticulate veined, base cuneate, margin conspicuously revolute, 1–4-spinose-serrate on each side, apex acuminate. Flowers solitary. Pedicels 4–10 mm, glabrous. Sepals in 3 whorls; outer sepals yellowish red, oblong-ovate, ca. 4 × 2 mm, apex acute; median sepals oblong-obovate, ca. 7 × 5 mm; inner sepals obovate, ca. 10 × 8 mm. Petals obovate, ca. 8 × 6 mm, base cuneate, glands ovate, apex entire. Stamens ca. 5 mm; anther connective prolonged, truncate. Ovules 3 or 4. Berry ellipsoid, 8–9 × 4–5 mm, thinly pruinose, style not persistent. Fl. Apr–May, fr. Jun–Sep.

• Montane roadsides, thickets; 1200–3000 m. Hubei, Sichuan.

**2. *Berberis chrysosphaera*** Mulligan, Bull. Misc. Inform. Kew 1940: 77. 1940.

黄球小檗 *huang qiu xiao bo*

Shrubs, evergreen. Mature stems dark red, sparsely verruculose; internodes 1.5–3 cm; spines 3-fid, 1–2 cm, sulcate. Leaves subsessile; leaf blade adaxially shiny, dark green, elliptic or obovate-elliptic, 1.5–4 cm × 4–10 mm, leathery, abaxially pruinose, not veined, finely papillose, adaxially ± not veined, base attenuate, margin conspicuously revolute, 5–12-spinose-serrate on each side, apex acuminate. Flowers solitary. Pedicels 1.8–2.5 cm. Sepals in 3 whorls; outer sepals ovate, ca. 4 × 3 mm, apex acute; median sepals obovate-elliptic, ca. 7 × 6 mm; inner sepals ca. 10 × 8 mm. Petals obovate, ca. 8 × 6 mm, basal glands oblong, apex slightly emarginate. Stamens ca. 5 mm; anther connective slightly prolonged, truncate. Ovules 9–12. Berry black, ovoid, ca. 10 × 6 mm, slightly pruinose, style not persistent. Fl. May, fr. Oct–Nov.

• Granite cliffs in valleys, forest understories; 2700–3000 m. SE Xizang.

**3. *Berberis temolaica*** Ahrendt, Gard. Chron., ser. 3, 109: 101. 1941 [*“telomaica”*].

林芝小檗 *lin zhi xiao bo*

*Berberis temolaica* var. *artiseppala* Ahrendt.

Shrubs, deciduous, to 2 m tall. Stems dark purple, terete, glabrous, not verruculose; internodes 1.5–3 cm; spines 3-fid, pale purplish brown, 5–15 mm, slightly sulcate. Petiole 1–4 mm or leaf subsessile; leaf blade adaxially dark blue-green, slightly pruinose, oblong-obovate, 2–4.2 × 0.8–1.5 cm, papery, abax-

ially white pruinose, adaxially slightly pruinose, abaxially inconspicuously reticulate veined, adaxially with branched veins, base cuneate, margin entire, sometimes 1–5-aristate-dentate on each side, apex rounded. Flowers solitary. Pedicels 8–13 mm, pruinose. Sepals in 3 whorls; outer sepals ovate, ca.  $5 \times 3.2$  mm, pruinose, apex acute; median sepals obovate, ca.  $7 \times 5$  mm; inner sepals obovate-orbicular, ca.  $8 \times 7.5$  mm. Petals broadly obovate, ca.  $7 \times 6$  mm, base with separate glands, apex emarginate. Stamens ca. 4 mm; anther connective slightly prolonged, truncate or obtuse. Ovules 7–9. Berry red when mature, oblong-ovoid,  $11\text{--}14 \times 6\text{--}7$  mm, pruinose, apex bent; style persistent, short. Fl. Jun–Jul, fr. Aug–Sep.

- *Abies* forests; ca. 4000 m. Xizang.

#### 4. *Berberis dictyophylla* Franchet, Pl. Delavay. 39. 1889.

刺红珠 ci hong zhu

Shrubs, deciduous, 1–2.5 m tall. Stems blackish gray or yellow-brown; young shoots purplish red, subterete, pruinose or not; spines 3-fid, sometimes simple, pale yellow or grayish, 1–3 cm. Leaves subsessile; leaf blade adaxially dark green, narrowly obovate, oblong, or elliptic,  $1\text{--}2.5 \text{ cm} \times 6\text{--}8$  mm, thickly papery or subleathery, abaxially white pruinose or not pruinose, both surfaces with raised lateral and reticulate veins, base cuneate, margin entire, apex rounded or obtuse. Flowers solitary. Pedicels 3–10 mm, sometimes pruinose. Sepals in 2 whorls; outer sepals linear-oblong, ca.  $6.5 \times 2.5$  mm; inner sepals oblong-elliptic,  $8\text{--}9 \times \text{ca. } 4$  mm. Petals narrowly obovate, ca.  $8 \times 3\text{--}6$  mm, base clawed, with widely separated glands, apex entire. Stamens 4.5–5 mm; anther connective slightly prolonged, shortly apiculate. Ovules 3–6. Berry red, ovoid, ovoid-globose, or oblong-ovoid,  $9\text{--}14 \times 6\text{--}8$  mm, pruinose; style persistent, sometimes bent. Fl. May–Jun, fr. Jul–Sep.

- Mountain slopes, thickets, forest understories, river beaches, streamsides, forest margins, roadsides; 2500–4800 m. Qinghai, Sichuan, Xizang, Yunnan.

- 1a. Branchlets usually pruinose; leaf blade narrowly obovate or oblong, abaxially pruinose; ovules 3 or 4; fruit ovoid or ovoid-globose ..... 4a. var. *dictyophylla*
- 1b. Branchlets not pruinose; leaf blade elliptic, abaxially not pruinose; ovules 5 or 6; fruit oblong-ovoid ..... 4b. var. *epruinosa*

#### 4a. *Berberis dictyophylla* var. *dictyophylla*

刺红珠(原变种) ci hong zhu (yuan bian zhong)

Branchlets subterete, usually pruinose. Leaf blade narrowly obovate or oblong, abaxially pruinose. Ovules 3 or 4. Fruit ovoid or ovoid-globose.

- Mountain slopes, thickets, forest understories, river beaches, forest margins; 2500–4000 m. Sichuan, Xizang, Yunnan.

#### 4b. *Berberis dictyophylla* var. *epruinosa* C. K. Schneider in Sargent, Pl. Wilson. 1: 353. 1913.

无粉刺红珠 wu fen ci hong zhu

*Berberis ambrozyana* C. K. Schneider.

Branchlets slightly sulcate, not pruinose. Leaf blade elliptic, abaxially not pruinose. Ovules 5 or 6. Fruit oblong-ovoid.

- Mountain thickets, forest margins, forest understories, roadsides, streamsides; 2500–4800 m. Qinghai, Sichuan, Xizang, Yunnan.

#### 5. *Berberis approximata* Sprague, Bull. Misc. Inform. Kew 1909: 256. 1909.

近似小檗 jin si xiao bo

*Berberis dictyophylla* Franchet var. *approximata* (Sprague) Rehder; *B. stiebriana* C. K. Schneider.

Shrubs, deciduous, 1–1.5 m tall. Stems dark brown, angulate, glabrous, sparsely verruculose; shoots reddish brown; spines 3-fid, gray or pale yellow, 1–2.1 cm, adaxially subsulcate. Leaf blade adaxially pale green, narrowly obovate, obovate, or narrowly elliptic,  $1\text{--}2.2 \text{ cm} \times 4\text{--}7$  mm, papery, abaxially pruinose, conspicuously reticulate veined, base cuneate, margin entire or 1–7-spinose-serrate on each side, apex rounded or acute. Flowers solitary. Pedicels 3–7 mm, glabrous. Sepals in 2 whorls; outer sepals elliptic, ca.  $4.5 \times 3$  mm; inner sepals obovate,  $6\text{--}7 \times 3.5\text{--}4$  mm. Petals obovate or elliptic, ca.  $5 \times 3.2$  mm, base clawed, with closely spaced glands, apex slightly emarginate; lobes acute. Stamens ca. 3.5 mm; anther connective truncate. Ovules 4–6, shortly funiculate. Berry red, ovoid,  $8\text{--}10 \times 6\text{--}7$  mm, slightly pruinose, style persistent. Fl. May–Jun, fr. Sep–Oct.

- Mountain slopes, thickets, forests, forest margins; 2900–4300 m. Qinghai, Sichuan, Xizang, Yunnan.

This species is a dominant species of thickets in the Xiangcheng region of Sichuan.

#### 6. *Berberis medogensis* T. S. Ying, Acta Phytotax. Sin. 37: 350. 1999.

矮生小檗 ai sheng xiao bo

Shrubs, low, 10–20 cm tall. Stems pale yellow, shiny, glabrous, sulcate; young branchlets dark purple, conspicuously sulcate; spines 3-fid, concolorous, 3–13 mm. Leaves subsessile; leaf blade adaxially dark green, obovate,  $7\text{--}13 \times 3\text{--}5$  mm, papery, abaxially thickly pruinose, abaxially with conspicuously raised midvein and lateral veins, reticulate veins inconspicuous, adaxially with slightly raised midvein, base cuneate, margin thickened but not revolute, 1- or 2-spinose-serrate on each side, apex aristate-cuspidate. Flowers unknown. Fruit solitary; fruit stalks dark purple, to 2.3 cm, glabrous; berry red, subglobose, ca.  $1.1 \times 1$  cm, not pruinose, style not persistent; seeds 6 or 7. Fl. unknown, fr. Nov.

- Alpine thickets; 3300–3400 m. Xizang (Mêdog).

#### 7. *Berberis parisepala* Ahrendt, Gard. Chron., ser. 3, 109: 100. 1941.

等萼小檗 deng e xiao bo

*Berberis everestiana* Ahrendt var. *nambuensis* Ahrendt.

Shrubs, deciduous, to 1.5 m tall. Branches dark gray-brown, pubescent, markedly sulcate, not verruculose; shoots brownish; spines weak, 3-fid, rarely simple or 5-fid, 4–16 mm.

Petiole 2–5 mm; leaf blade shiny, abaxially pale green, adaxially yellow-green, obovate or narrowly obovate, 1.5–2.8 × 0.6–1.2 cm, papery, abaxially with slightly raised midvein, both surfaces with inconspicuous lateral and reticulate veins, base cuneate, margin entire or rarely 1–3-spinose-serrate on each side, apex rounded. Flowers solitary. Pedicels 5–12 mm, pubescent; bracteoles yellow, ovate, ca. 1.3 mm, apex acute. Sepals in 3 whorls, equal in size, 8–9 × 6.5–7.5 mm. Petals ca. 7.5 × 4 mm, basal glands separate, apex emarginate. Stamens ca. 5 mm; anther connective not prolonged, truncate. Ovules 4. Berry red, ellipsoid, 10–11 × 7–8 mm, not pruinose, style persistent. Fl. May–Jun, fr. Sep–Oct.

Thickets, alpine meadows; 3600–3900 m. Xizang [Bhutan, Myanmar, Nepal].

**8. *Berberis angulosa*** Wallich ex J. D. Hooker & Thomson, Fl. Ind. 1: 227. 1855.

有棱小檗 *you leng xiao bo*

Shrubs, deciduous, to 2 m tall. Branches dark brown, pubescent, sulcate; shoots yellow-brown, puberulous; spines simple or 3(or 5)-fid, 7–12 mm, slender, rarely puberulous. Leaf blade abaxially shiny, pale yellow-green, adaxially shiny, yellow-green, obovate, 1.5–2.5 × 0.7–1.4 cm, papery, both surfaces glabrous, inconspicuously veined, base cuneate, margin entire, apex obtuse or acute. Flowers solitary. Pedicels pendulous, 3–5 mm, pubescent; bracteoles ovate, ca. 3.5 × 2 mm, apex acuminate. Sepals in 2 whorls; outer sepals elliptic, ca. 5.5 × 3.5 mm; inner sepals obovate, ca. 9.2 × 6.1 mm. Petals obovate, ca. 6 × 4.8 mm, base clawed, glands separate and oblong, apex entire, rounded. Stamens ca. 4 mm; anther connective slightly prolonged, rounded. Ovules 6, subsessile. Berry shiny, red, subglobose, 10–12 × 9–12 mm, not pruinose, style persistent or not. Fl. May–Jun, fr. Jul–Aug.

Sparse forests, thickets, grasslands; 3500–4500 m. Qinghai, Xizang [NE India, Nepal].

**9. *Berberis qiaojaensis*** S. Y. Bao, Bull. Bot. Res., Harbin 5(3): 1. 1985.

巧家小檗 *qiao jia xiao bo*

Shrubs, deciduous, small, 30–50 cm tall. Branches dark brown, terete, black verruculose; shoots purplish red, angulate; spines 3-fid, concolorous, slender, adaxially slightly sulcate. Leaves subsessile; leaf blade abaxially pale green, adaxially shiny, deep green, oblong-oblancheolate, 1–1.3 cm × 4–5 mm, papery, abaxially with markedly raised midvein and lateral veins, reticulate veins inconspicuous, not pruinose, purplish red, base cuneate, margin thickened, entire, apex rounded. Flowers unknown. Berry solitary, ellipsoid or oblong-ellipsoid, 1–1.2 cm × 5–7 mm, slightly pruinose, style not persistent; seeds 4. Fl. unknown, fr. Oct.

• Grasslands at mountain summits; ca. 3300 m. Yunnan.

**10. *Berberis woomungensis*** C. Y. Wu ex S. Y. Bao, Bull. Bot. Res., Harbin 5(3): 4. 1985.

乌蒙小檗 *wu meng xiao bo*

Shrubs, deciduous, to 1 m tall. Branches brown, black

verruculose; shoots curved, brownish red, sulcate; spines 3-fid, 1–1.7 cm, adaxially slightly sulcate, yellow-brown. Leaves sessile; leaf blade abaxially pale green, adaxially green, oblong-obovate or oblanceolate, 1–2 cm × 5–7 mm, papery, abaxially not pruinose, midvein raised, reticulate veins not conspicuous on both surfaces, base attenuate, margin entire, apex rounded or acute. Flowers solitary. Pedicels 5–10 mm, glabrous. Sepals in 2 whorls; outer sepals oblong, ca. 7 × 3–4 mm; inner sepals oblong-elliptic, ca. 6 × 4 mm. Petals oblong-obovate, ca. 4 × 2 mm, base clawed and with approximate oblanceolate glands, apex emarginate with acute lobes. Stamens ca. 4 mm; anther connective not prolonged, truncate. Ovules 3, shortly funiculate. Berry red, oblong, ca. 10 × 5–6 mm, slightly pruinose, style not persistent. Fl. May, fr. Nov.

• Thickets; 3700–4400 m. Yunnan.

**11. *Berberis crassilimba*** C. Y. Wu ex S. Y. Bao, Bull. Bot. Res., Harbin 5(3): 2. 1985.

厚檐小檗 *hou yan xiao bo*

Shrubs, evergreen, to 1 m tall. Branches gray-brown, terete, not verruculose; shoots purplish red, sulcate; spines 3-fid, dark yellow-brown, ca. 1.5 cm, adaxially slightly sulcate. Leaves subsessile; leaf blade adaxially green, oblong to obovate, ca. 1.2 × 0.5 cm, leathery, adaxially not pruinose, midvein and lateral veins conspicuous, base cuneate, margin thickened, entire, apex rounded, mucronate. Flowers solitary. Pedicels 4–8 mm, glabrous. Sepals in 2 whorls; outer sepals oblong-elliptic, ca. 7 × 3.5 mm, apex obtuse; inner sepals broadly obovate, ca. 7 × 5 mm, apex rounded. Petals obovate, 5–6 × 2.5–3 mm, base clawed, with separate oblong glands, apex emarginate. Stamens 3–3.5 mm; anther connective truncate. Ovules 3, funiculate. Berry globose or ellipsoid, 5–7 × 5–6 mm, not pruinose, style not persistent. Fl. Mar–Jun, fr. Oct.

• Open slopes; ca. 3600 m. Sichuan, Yunnan.

**12. *Berberis longispina*** T. S. Ying in C. Y. Wu, Fl. Xizang. 2: 148. 1985.

长刺小檗 *chang ci xiao bo*

Shrubs, deciduous, 70–80 cm tall. Branches purplish red, sulcate, not verruculose; spines 5-fid, pale brown, 1.3–2 cm, adaxially sulcate. Leaves subsessile; leaf blade abaxially pale yellow-green, adaxially dark green, oblong-obovate, 4–9 × 2–3 mm, papery, abaxially not pruinose, veins inconspicuous, adaxially glabrous, base attenuate, margin entire, apex acute. Flowers solitary. Pedicels 3–5 mm, glabrous; bractlets lanceolate, ca. 3 × 1 mm. Sepals in 2 whorls; outer sepals oblong, ca. 4 × 2 mm; inner sepals obovate, ca. 4.5 × 2.2 mm. Petals obovate, ca. 3.8 × 1.5 mm, base with separate glands, apex emarginate. Stamens ca. 2.1 mm; anther connective acute. Ovules 3. Berry red, globose, ca. 7 × 7 mm, not pruinose, style not persistent. Fl. May, fr. Jun–Aug.

• Beside springs on shaded slopes; 4000–4100 m. Xizang.

**13. *Berberis muliensis*** Ahrendt, Bull. Misc. Inform. Kew 1939: 268. 1939.

木里小檗 *mu li xiao bo*

Shrubs, deciduous, to 2 m tall. Branches gray-brown, sulcate, not pruinose; shoots shiny, red; internodes 2–5 cm; spines 3-fid, yellow-brown, 1.5–3 cm, slender, sometimes absent. Petiole 2–3 mm; leaf blade abaxially sometimes grayish green, adaxially dark green, narrowly obovate or oblong-obovate, 1.5–3 × 0.3–1.1 cm, papery, abaxially pruinose, midvein raised, adaxially with slightly impressed midvein, both surfaces with conspicuous lateral and reticulate veins, base cuneate, margin applanate-entire or spinose-serrate, apex rounded or acute. Flowers solitary. Pedicels 1–3 cm, not pruinose; bractlets yellow, broadly obovate, ca. 2.5 × 2.5 mm. Sepals in 2 whorls; outer sepals ovate, 7–8 × 4–5 mm, apex acute; inner sepals obovate, 9–10 × 6–7 mm. Petals obovate, ca. 6.5 × 5.5 mm, base with narrowly elliptic glands, apex shortly emarginate. Stamens ca. 5 mm; anther connective prolonged, apiculate. Ovules 3 or 4. Berry red, ovoid or oblong-ovoid, 10–14 × 6–9 mm, not pruinose, style not persistent. Fl. May–Jun, fr. Aug–Sep.

• Thickets, forests, river beaches by forest margins, grassy slopes, rocky slopes; 2800–4300 m. Sichuan, Xizang, Yunnan.

- 1a. Leaves entire ..... 13a. var. *muliensis*  
1b. Leaves spinose-serrate ..... 13b. var. *atuntzeana*

Leaf margin 2–7-spinose-serrate on each side.

• Thickets, grassy slopes, rocky slopes, forests, forest margins; 3100–4200 m. Sichuan, Xizang, Yunnan.

14. *Berberis tsarica* Ahrendt, J. Bot. 79(Suppl.): 48. 1941.

隐脉小檗 yin mai xiao bo

Shrubs, deciduous, low, less than 1 m tall. Branches dark purplish red or dark black, sometimes pale yellow, sulcate; shoots pubescent; internodes 5–10 mm; spines 3–5-fid, weak, 3–11 mm. Leaves sessile; leaf blade abaxially grayish or grayish white, adaxially dark green, obovate, 5–12 × 2–5 mm, herbaceous, abaxially pruinose, base cuneate, margin entire, apex obtuse. Flowers solitary. Pedicels 4–7 mm, glabrous or sparsely puberulous; bractlets red, ovate, ca. 2.3 × 1 mm, apex acute.

Sepals in 2 whorls; outer sepals ovate, 3.5–5 × 2.5–3 mm, apex acute; inner sepals oblong-obovate, 5–6.5 × 3.5–4 mm. Petals oblong-obovate, 3.5–4 × 2–2.3 mm, base cuneate with oblong-elliptic glands, apex emarginate with 2 acute lobes. Stamens 2.5–3 mm; anther connective slightly prolonged, truncate or rounded. Ovules 3 or 4, shortly funiculate. Berry obovoid, 8–9 × ca. 6 mm; style persistent, short. Fl. Jun, fr. Oct.

• Alpine thickets, thicket-meadows; 3900–4400 m. Xizang.

15. *Berberis daiana* T. S. Ying, Acta Phytotax. Sin. 37: 345. 1999.

城口小檗 cheng kou xiao bo

Shrubs, semi-evergreen, 0.5–1 m tall. Branches gray-brown, sulcate, sparsely black verruculose; shoots pale yellow, glabrous; spines 3(or 5)-fid, concolorous, 5–12 mm, slender. Petiole usually red, 2–5 mm; leaf blade abaxially pale yellow-green, adaxially deep green, elliptic-obovate or obovate, 2–5 × 1.2–2.2 cm, papery, both surfaces glabrous, abaxially not pruinose, midvein conspicuously raised, adaxially with complanate midvein, both surfaces with markedly raised reticulate veins, base cuneate, margin entire or inconspicuously 3–8(–20)-spinose-serrate on each side, sometimes conspicuously 10–20-spinose-serrate on each side, apex rounded. Flowers solitary. Pedicels 1.5–2.5 cm, stout, glabrous, tip bent. Sepals in 2 whorls; outer sepals elliptic, 7.5–8 × 4.5–5 mm; inner sepals broadly obovate-elliptic, 7–7.2 × ca. 5 mm. Petals obovate, ca. 6 × 4 mm, base clawed and with separate elliptic glands, apex narrowly incised with acute lobes. Stamens ca. 3 mm; anther connective prolonged, rounded. Ovules 11. Fruit stalk curved at apex, stout, glabrous. Berry red, subglobose, 1.3–1.5 × 1.2–1.3 cm, slightly pruinose, style not persistent; seeds 6 or 7. Fl. Jun, fr. Aug–Sep.

• Thickets on mountain slopes, weedy places, rock crevices; 2200–2500 m. Sichuan.

16. *Berberis asmyana* C. K. Schneider in Sargent, Pl. Wilson. 1: 357. 1913.

直梗小檗 zhi geng xiao bo

Shrubs, evergreen, to 1.5 m tall. Branches brownish gray, sulcate, sparsely black verruculose; spines 3-fid, weak, pale yellow, terete, 3–9 mm. Leaves subsessile; leaf blade abaxially pale green, adaxially shiny, deep green, elliptic or obovate-elliptic, 1–3 × 0.6–1 cm, thinly leathery, abaxially not pruinose, midvein markedly raised, adaxially with impressed midvein, both surfaces with inconspicuous secondary and reticulate veins, base cuneate, margin occasionally entire, otherwise 1–4-spinose-serrate on each side, apex acute. Flowers solitary. Pedicels straight, 2–4 cm, slender, glabrous; bractlets ovate, ca. 1.8 mm. Sepals in 2 whorls; outer sepals ovate, ca. 3 × 2.5 mm; inner sepals obovate-orbicular, ca. 5 × 4.5 mm. Petals obovate, ca. 4.5 × 3.2 mm, base clawed and with approximate glands, apex slightly emarginate. Stamens ca. 3.2 mm; anther connective truncate. Ovules 4 or 5, sessile. Berry ellipsoid, (6.5–)7–8 × 4–5 mm, slightly pruinose, style not persistent. Fl. May–Jun, fr. Jul–Sep.

• Mountain thickets, grassy slopes; 3000–3200 m. Sichuan.

**17. *Berberis multicaulis*** T. S. Ying in C. Y. Wu, Fl. Xizang. 2: 147. 1985.

多枝小檗 duo zhi xiao bo

Shrubs, small, 20–30 cm tall, much branched. Branches dark gray, sulcate; shoots pale yellow, puberulous, sparsely verruculose; spines 3-fid, pale brown or pale yellow, 5–14 mm, slender, puberulous. Leaves subsessile; leaf blade abaxially shiny, pale yellow-green, adaxially green, obovate or elliptic, 7–16 × 4–6 mm, papery, abaxially with conspicuously raised midvein, adaxially with slightly raised midvein, lateral veins 2–4 pairs, both surfaces with inconspicuous reticulate veins, not pruinose, base cuneate, margin slightly thickened, puberulous, becoming glabrous, margin entire or 1–3-spinose-serrate on each side, apex obtuse, acute, or mucronate. Flowers solitary. Pedicels 2–3 mm, glabrous; bractlets oblong-lanceolate, ca. 4 × 1.8 mm. Sepals in 2 whorls; outer sepals oblong, ca. 5 × 3 mm, apex acute; inner sepals obovate-oblong, ca. 8 × 4 mm. Petals elliptic, ca. 6 × 3.2 mm, base clawed and with separate glands, apex emarginate. Stamens ca. 4 mm; anther connective prolonged, shortly apiculate and with 1 tooth. Ovules 4. Berry red, ovoid-ellipsoid, ca. 8 × 4 mm, slightly pruinose, with short style. Fl. Jun, fr. Aug.

• Thickets on sunny slopes, grassy slopes; 3500–4200 m. Xizang.

**18. *Berberis kangdingensis*** T. S. Ying, Acta Phytotax. Sin. 37: 349. 1999.

康定小檗 kang ding xiao bo

Shrubs, deciduous, ca. 1 m tall. Stems with closely spaced branches; branches pale yellow-brown, terete or subangular, puberulous, sparsely black verruculose; spines (3 or) 5-fid, pale yellow, 5–10 mm, slender. Leaves subsessile; leaf blade abaxially yellow-green, adaxially green, narrowly elliptic or obovate-elliptic, 7–11 × 2–4 mm, papery, abaxially not pruinose, midvein conspicuously raised, adaxially with raised midvein, both surfaces with markedly raised reticulate veins, base cuneate, margin entire or occasionally 1- or 2-spinose-serrate on each side, apex acute. Flowers solitary. Pedicels 4–5 mm, glabrous. Sepals in 2 whorls; outer sepals elliptic, ca. 4.5 × 3.5 mm; inner sepals obovate-oblong, ca. 5.5 × 4.1 mm. Petals obovate, ca. 5 × 3.1 mm, base cuneate and with separate elliptic glands, apex emarginate. Stamens ca. 3 mm; anther connective slightly prolonged, rounded, obtuse. Ovules 6 or 7. Berry subglobose, ca. 9 × 8 mm, thickly pruinose, style not persistent. Fl. Jun, fr. Oct–Nov.

• Rock crevices on mountain slopes; 2600–3400 m. Sichuan.

**19. *Berberis campylotropa*** T. S. Ying in C. Y. Wu, Fl. Xizang. 2: 152. 1985.

弯果小檗 wan guo xiao bo

Shrubs, deciduous, to 1.3 m tall. Branches dark gray or purplish brown, subsulcate, black verruculose; shoots pale red; spines 3-fid or simple, weak, 4–8 mm. Leaves subsessile; leaf blade abaxially grayish white, adaxially dark green, elliptic or oblanceolate, 0.8–2 cm × 3–8 mm, papery, abaxially with markedly raised midvein, adaxially with complanate midvein,

lateral veins 3 or 4 pairs, both surfaces not pruinose, with conspicuous reticulate veins, base cuneate, margin entire or remotely 1–5-spinose-serrate on each side, apex acute. Flowers solitary, sometimes 2- or 3-fascicled. Ovules 2 or 3. Berry red, oblong, 1–1.2 cm × 4–5 mm, slightly pruinose, with bent style. Fl. unknown, fr. Aug.

• Mountain slopes, roadsides; ca. 3700 m. Xizang.

**20. *Berberis everestiana*** Ahrendt, J. Linn. Soc., Bot. 57: 116. 1961.

珠峰小檗 zhu feng xiao bo

Shrubs, deciduous, 20–30 cm tall. Branches purplish black, sulcate, glabrous; shoots pale purplish red; internodes 6–10(–20) mm; spines 3–5-fid, sometimes simple, 8–12 mm. Leaves shortly petiolate; leaf blade abaxially pale yellow-green, adaxially green, obovate, ca. 12 × 4 mm, papery, abaxially not pruinose, base attenuate, margin entire, apex rounded or acute. Flowers solitary. Pedicels 5–9 mm, glabrous; bractlets lanceolate, ca. 4 × 1 mm. Sepals in 2 whorls; outer sepals 6–7 × 4–4.5 mm; inner sepals 7–8 × 5–6 mm. Petals 6–6.5 × 3–3.5 mm, apex entire. Stamens ca. 3 mm; anther connective slightly prolonged, truncate. Ovules 3 or 4. Berry ovoid, 7–10 × 4–6 mm, without or with an extremely short style; seeds purple. Fl. Jun, fr. Aug–Sep.

Narrow valley slopes, valley floors, rocky soils, alpine thickets, alpine meadows; 3800–5000 m. Xizang [Nepal].

**21. *Berberis mianningensis*** T. S. Ying, Acta Phytotax. Sin. 37: 347. 1999.

冕宁小檗 mian ning xiao bo

Shrubs, deciduous, ca. 50 cm tall. Branches dark gray, sulcate, not verruculose; shoots pale yellow, glabrous; spines simple or 3-fid, pale yellow, terete, ca. 1 cm, slender. Leaves subsessile; leaf blade abaxially pale yellow-green, adaxially green, elliptic or narrowly elliptic, occasionally oblanceolate, 1–2 cm × 2–4 mm, papery, abaxially not pruinose, with conspicuously raised midvein, adaxially with slightly raised midvein, with 3 or 4 pairs of lateral veins, both surfaces with inconspicuous reticulate veins, base cuneate, margin entire or 1–3-spinose-serrate on each side, apex acute or rounded. Flowers solitary. Fruit green (immature), obovoid-ellipsoid, 8–9 × 4–5 mm, not pruinose, style persistent and short; seeds 1. Fl. unknown, fr. Jul–Aug.

• Thickets; 2600–2700 m. Sichuan.

**22. *Berberis minutiflora*** C. K. Schneider, Ill. Handb. Laubholz. 2: 914. 1912.

小花小檗 xiao hua xiao bo

*Berberis angulosa* Wallich ex J. D. Hooker & Thomson var. *brevipes* Franchet; *B. brevipes* (Franchet) C. K. Schneider (1908), not Greene (1901); *B. minutiflora* var. *glabramea* Ahrendt; *B. minutiflora* var. *yulungshanensis* S. Y. Bao.

Shrubs, deciduous, to 1.5 m tall. Branches pale yellow, glabrous, sulcate, scarcely black verruculose; shoots dark purple, initially pubescent, becoming glabrous; spines 3-fid, 4–12

mm. Leaves subsessile; leaf blade adaxially deep green, narrowly obovate or oblanceolate, 10–20 × 2.5–4 mm, thickly papery or subleathery, abaxially papillate, not pruinose, adaxially glabrous, both surfaces with inconspicuous reticulate veins, base cuneate, margin entire or 1–3-spinose-serrate on each side, apex acute. Flowers solitary. Pedicels 5–10 mm, slender; bractlets red, ovate, ca. 1.4 cm, apex acute. Sepals in 2 whorls; outer sepals oblong-ovate, ca. 4 × 2.2 mm, apex obtuse; inner sepals oblong-obovate, ca. 5.5 × 3 mm. Petals ca. 4.5 × 2.5 mm, base not clawed, with separate glands, apex incised with acute lobes. Stamens ca. 2.2 mm; anther connective slightly prolonged, rounded. Ovules 2. Berry red, ovoid or ovoid-ellipsoid, 6–9(–12) × 5–7 mm, sometimes slightly pruinose, style not persistent. Fl. Apr–Jun, fr. Sep–Oct.

• Thickets, grassy slopes, rocky slopes, *Pinus densata* forests; 2500–3800 m. Sichuan, Xizang, Yunnan.

**23. *Berberis graminea*** Ahrendt, J. Bot. 80(Suppl.): 110. 1942.

狭叶小檗 *xia ye xiao bo*

Shrubs, deciduous, low, ca. 30 cm tall. Branches purplish brown; shoots dark green, sparsely black verruculose, glabrous; spines simple, 3(or 5)-fid, concolorous, 6–12 mm. Leaves subsessile; leaf blade abaxially grayish green, adaxially dark green, narrowly obovate, 8–20 × 2–6 mm, papery, abaxially slightly pruinose, scarcely papillose, adaxially with veins branched, scarcely reticulate, base cuneate, margin entire, occasionally 2- or 3-spinose-serrulate on each side, conspicuously revolute, apex acute or near rounded. Flowers solitary. Pedicels 1–3 mm, glabrous; bractlets oblong-elliptic, ca. 2.5 mm. Sepals in 2 whorls; outer sepals oblong-ovate, ca. 5 × 3 mm; inner sepals elliptic-obovate, 6–6.5 × 5–5.3 mm. Petals ca. 5.3 × 4–4.5 mm, base with separate, elliptic glands, apex incised with rounded lobes. Stamens ca. 2 mm; anther connective not prolonged, truncate. Ovules 2. Berry red, oblong, 6–8 × 4–5 mm, not pruinose; style persistent and short, or not persistent. Fl. May–Jun, fr. Sep–Oct.

• Grassy mountain slopes, *Pinus* forests; 3000–3600 m. Sichuan.

**24. *Berberis verruculosa*** Hemsley & E. H. Wilson, Bull. Misc. Inform. Kew 1906: 151. 1906.

疣枝小檗 *you zhi xiao bo*

Shrubs, evergreen, to 1 m tall. Branches brownish yellow, terete, densely verruculose; shoots yellow green, densely pubescent and verruculose; spines pale yellow, 1–2 cm, adaxially subsulcate. Leaves subsessile; leaf blade abaxially grayish green, adaxially shiny, dark green, obovate-elliptic or elliptic, 1–2 × 0.6–1.1 cm, leathery, abaxially pruinose, densely papillose, midvein conspicuously raised, lateral veins 3 or 4 pairs, adaxially with midvein impressed, both surfaces with inconspicuous reticulate veins, base cuneate, margin slightly revolute, 2–4-spinose-serrate on each side, apex acute. Flowers solitary. Pedicels 4–10 mm, glabrous. Sepals in 3 whorls; outer sepals ovate, ca. 4 × 3 mm; median sepals ovate, ca. 6 × 5 mm; inner sepals obovate, ca. 10 × 8 mm. Petals elliptic or obovate, 5.5–6 × ca. 3 mm, base cuneate, with separate glands, apex emarginate or retuse with rounded lobes. Stamens ca. 3.5 mm; anther connective slightly prolonged, rounded. Ovules 4–6.

Berry oblong-ovoid, 10–12 × 6–7 mm, pruinose, style not persistent. Fl. May–Jun, fr. Jul–Sep.

• Thickets, rock crevices, forests; 1900–3200 m. Gansu, Sichuan, Yunnan.

**25. *Berberis concinna*** J. D. Hooker, Bot. Mag. 79: t. 4744. 1853.

雅洁小檗 *ya jie xiao bo*

Shrubs, semi-evergreen, low. Stems stout, glabrous, very sulcate; branches shiny, dark red, sometimes scarcely verruculose; internodes 1–2 cm; spines 3-fid, orange, 1–1.3 cm, sulcate. Petiole 1–5 mm; leaf blade abaxially grayish white, adaxially shiny, dark green, oblong-obovate, 1–3 × 0.5–1.4 cm, abaxially papillate, adaxially lateral veins 3 or 4 pairs, base cuneate, margin 3–5-spinose-serrate, apex rounded, mucronulate. Flowers solitary. Pedicels 1.5–2 cm; bractlets red, oblong-triangular, 2–2.5 × 1.5–2 mm. Sepals in 3 whorls; outer sepals oblong-ovate, 4–6 × 3–4 mm, apex subacute; median and inner sepals obovate, equal in size, 9–10 × 6–7 mm. Petals obovate, ca. 6.5 × 4–5 mm, base with concolorous glands, apex emarginate with rounded lobes. Stamens 4–4.5 mm; anther connective not prolonged, truncate. Ovules 6–8. Berry dark red, oblong, 13–16 × 6–8 mm. Fl. Jun–Jul, fr. Sep–Oct.

Habitat unknown; ca. 3700 m. Xizang [India (Sikkim), Nepal].

**26. *Berberis alpicola*** C. K. Schneider, Repert. Spec. Nov. Regni Veg. 46: 253. 1939.

高山小檗 *gao shan xiao bo*

Shrubs, evergreen, to 1.3 m tall. Branches pale gray, sulcate; spines 3-fid, terete, 1–1.5 cm. Leaves shortly petiolate; leaf blade abaxially shiny, pale green, adaxially shiny, green, elliptic to oblong-elliptic, 1–2.5 × 0.7–1 cm, leathery, abaxially not pruinose, midvein and lateral veins markedly raised, adaxially with impressed midvein, lateral veins conspicuous, base cuneate, margin sometimes revolute, 2–8-spinose-serrate on each side, apex acute. Flowers solitary. Pedicels 1.2–1.6 cm, glabrous. Sepals in 2 whorls; outer sepals smaller than inner sepals. Petals 6, base with separate glands. Stamens 9. Ovules 4, sessile. Berry black, ellipsoid, ca. 8 × 5 mm, not pruinose; style persistent, short. Fl. May–Jun, fr. Sep–Oct.

• Streamsides in mountain regions; ca. 3600 m. Taiwan.

**27. *Berberis sibirica*** Pallas, Reise Russ. Reich. 2: 737. 1773.

西伯利亚小檗 *xi bo li ya xiao bo*

*Berberis borealisinensis* Nakai.

Shrubs, deciduous, to 1 m tall. Branches dark gray, glabrous; shoots reddish brown, puberulous, sulcate; spines 3–9-fid, 3–11 mm, slender, spreading at base to 2 mm wide, or partly leaflike. Petiole 3–5 mm; leaf blade abaxially pale yellow-green, adaxially deep green, obovate, oblanceolate, or obovate-oblong, 1–2.5 cm × 5–8 mm, papery, abaxially not pruinose, both surfaces with conspicuous raised veins, lateral veins 4 or 5 pairs, base cuneate, margin sometimes repand, coarsely 4–7-aristate-dentate on each side, apex rounded, obtuse, or aristate. Flowers solitary. Pedicels 7–12 mm, glabrous. Sepals in 2

whorls; outer sepals oblong-ovate, ca.  $4 \times 2$  mm; inner sepals obovate, ca.  $4.5 \times 2.5$  mm. Petals obovate, ca.  $4.5 \times 2.5$  mm, base with separate glands, apex shortly emarginate. Stamens 2.5–3 mm; anther connective truncate. Ovules 5–8. Berry red, obovoid,  $7-9 \times 6-7$  mm, not pruinose, style not persistent. Fl. May–Jul, fr. Aug–Sep.

Alpine slopes, talus slopes, desert regions, forests; 1400–3000 m. Hebei, Nei Mongol, Shanxi, Xinjiang, NE China [Mongolia, Russia (Siberia)].

**28. *Berberis erythroclada*** Ahrendt, J. Bot. 79(Suppl.): 49. 1941.

红枝小檗 hong zhi xiao bo

*Berberis erythroclada* var. *trulungensis* Ahrendt.

Shrubs, deciduous, to 1.5 m tall. Branches shiny, dark red, glabrous, sulcate; internodes 8–25 mm; spines (3–)5–7(–9)-fid, orange, 5–10 mm. Leaves subsessile; leaf blade abaxially ultimately pale dark green, adaxially dark green, obovate or obovate-elliptic,  $1-2.8 \text{ cm} \times 3-15 \text{ mm}$ , papery, abaxially initially slightly grayish pruinose, midvein conspicuously raised, adaxially veins obviously branched or openly reticulate, base cuneate, margin 1–15-spinose-serrate on each side, apex rounded or obtuse. Flowers solitary. Pedicels  $1.5-2.5 \text{ cm}$ , very slender. Sepals in 2 whorls; outer sepals oblong-elliptic,  $5.5-6.5 \times 3-3.7 \text{ mm}$ ; inner sepals obovate,  $7-8 \times 4-4.5 \text{ mm}$ , (sometimes outer and inner sepals equal). Petals obovate,  $5-6.5 \times 2.5-4.5 \text{ mm}$ , base with separate narrowly oblong glands, apex subentire. Stamens 3–4 mm; anther connective slightly prolonged, subretuse. Ovules 6–9, often funiculate. Berry unknown. Fl. Jun–Jul, fr. unknown.

• Slopes; 4000–4300 m. Xizang.

**29. *Berberis fengii*** S. Y. Bao, Bull. Bot. Res., Harbin 5(3): 3. 1985.

大果小檗 da guo xiao bo

Shrubs, deciduous, to 1 m tall. Branches dark brown, sulcate, black verruculose; spines 3-fid, yellow-brown,  $1.5-2.5 \text{ cm}$ , slender, adaxially slightly sulcate. Petiole 2–3 mm; leaf blade adaxially olivaceous, elliptic or obovate,  $1.5-2.5 \times 0.5-1.5 \text{ cm}$ , papery, abaxially slightly pruinose, midvein and lateral veins obviously raised, reticulate veins conspicuous, adaxially with slightly raised midvein, lateral and reticulate veins conspicuous, base cuneate, margin closely spinulose-subserulate, apex rounded, mucronate. Flowers unknown. Fruit solitary; stalk ca. 1 cm, stout; berry red, broadly ellipsoid, ca.  $2 \times 1.2-1.4 \text{ cm}$ , blue pruinose, style not persistent; seeds 6 or 7. Fl. unknown, fr. Oct.

• Grassy slopes; 3000–3700 m. Yunnan.

**30. *Berberis paraspecta*** Ahrendt, J. Linn. Soc., Bot. 57: 47. 1961.

鸡脚连 ji jiao lian

Shrubs, evergreen, to 2 m tall. Branches brown; shoots stramineous, glabrous, sulcate; spines 3-fid, concolorous, to 3 cm, stout. Leaves subsessile; leaf blade lanceolate,  $3-6.5 \times 0.7-1 \text{ cm}$ , subleathery, abaxially with raised midvein, lateral veins inconspicuous, adaxially with complanate or slightly impressed

midvein, lateral veins conspicuous, base cuneate, margin 7–15-spinose-serrate on each side, apex acute or shortly acuminate. Flowers solitary. Pedicels 3–4 mm. Berry black, oblong,  $9-12 \times 6-7 \text{ mm}$ , blue pruinose, style not persistent; seeds 1 or 2. Fl. unknown, fr. Nov.

• Forest understories; 2500–2700 m. Yunnan.

**31. *Berberis hobsonii*** Ahrendt, J. Linn. Soc., Bot. 57: 137. 1961.

毛梗小檗 mao geng xiao bo

Shrubs, deciduous, to 2 cm tall. Branches deep gray, sulcate, puberulous; spines simple or 3-fid, weak, 0.6–1.7 cm. Leaves subsessile; leaf blade abaxially pale green, adaxially deep green, obovate or oblanceolate,  $1.5-3.5 \times 0.8-1.5 \text{ cm}$ , abaxially not pruinose, midvein and lateral veins markedly raised, adaxially veins inconspicuous, base cuneate, margin puberulous, entire, occasionally 1- or 2-spinose-serrate on each side, apex obtuse. Flowers 5–10-fascicled or subfascicled. Pedicels 6–12 mm, densely puberulous. Sepals in 2 whorls; outer sepals ca.  $3.5 \times 2 \text{ mm}$ ; inner sepals ca.  $5 \times 3 \text{ mm}$ . Petals ca.  $4.5 \times 3 \text{ mm}$ , base with separate glands, apex entire. Stamens ca. 3 mm; anther connective not prolonged, truncate. Ovules 5 or 6. Berries red, subglobose,  $8-9 \times 7-8 \text{ mm}$ , not pruinose, style not persistent. Fl. Jun–Jul, fr. Aug–Sep.

• *Abies* forests, *Quercus* forests, thickets; 3400–4300 m. Xizang.

**32. *Berberis reticulineris*** T. S. Ying, Acta Phytotax. Sin. 37: 305. 1999, not *B. reticulineria* (C. Y. Wu ex S. Y. Bao) Laferrière (1997).

芒康小檗 mang kang xiao bo

Shrubs, deciduous, 1–2 m tall. Branches terete, glabrous; shoots pale gray, sulcate; spines 3-fid, pale yellow,  $1-2.5 \text{ cm}$ . Leaves subsessile; leaf blade abaxially pale green, adaxially dark green, oblanceolate or elliptic,  $0.7-2.1 \text{ cm} \times 3-8 \text{ mm}$ , papery, abaxially not pruinose, adaxially glabrous, both surfaces with conspicuous reticulate veins, base attenuate, margin entire or 1–4-spinose-serrate on each side, apex acute. Flowers 3- or 4-fascicled. Pedicels 1–2 mm or 1–1.5 cm, slender, glabrous. Sepals in 3 whorls; outer sepals lanceolate-oblong, ca.  $3 \times 1 \text{ mm}$ ; median sepals elliptic, ca.  $4 \times 2 \text{ mm}$ ; inner sepals oblong-elliptic or obovate-oblong,  $5.5-6 \times 2.5-2.7 \text{ mm}$ . Petals elliptic, base cuneate, with separate glands, apex acute, incised with acute lobes. Stamens ca. 2.5 mm; anther connective prolonged, rounded. Ovules (2 or)3, very shortly funiculate. Fruit unknown. Fl. Jun–Jul, fr. Aug–Oct.

• Forest margins, sunny slopes; ca. 1600 m or 3400–3900 m. Gansu, Sichuan, Xizang.

1b. Pedicels 1–2 mm; inner sepals obovate-oblong ..... 32b. var. *brevipedicellata*

**32a. *Berberis reticulineris* var. *reticulineris***

芒康小檗(原变种) mang kang xiao bo (yuan bian zhong)

Pedicels 1–1.5 cm, slender, glabrous. Inner sepals oblong-elliptic.

- Forest margins; 3400–3900 m. Sichuan, Xizang.

**32b. *Berberis reticulineris* var. *brevipedicellata*** T. S. Ying, *Acta Phytotax. Sin.* 37: 307. 1999.

无梗小檗 wu geng xiao bo

Pedicels very short, 1–2 mm, glabrous. Inner sepals obovate-oblong.

- Sunny slopes; ca. 1600 m. Gansu.

**33. *Berberis yunnanensis*** Franchet, *Bull. Soc. Bot. France* 33: 388. 1886.

云南小檗 yun nan xiao bo

Shrubs, deciduous, to 1 m tall. Branches yellow-brown; shoots dark red, sulcate, black verruculose; spines 3-fid, 1–2.5 cm, slender. Leaves shortly petiolate; leaf blade abaxially pale green, adaxially dark green, becoming purplish red in autumn, obovate or oblong-obovate, 3–6 × 1–2 cm, papery, abaxially papillose, midvein and lateral veins slightly raised, adaxially with 3 or 4 pairs of lateral veins, base attenuate, cuneate, margin usually entire, occasionally 2- or 3-spinose-serrate on each side, apex rounded or mucronate. Flowers usually 2–4-fascicled, sometimes to 10-flowered. Pedicels 2–4 cm, glabrous. Sepals in 2 whorls; outer sepals oblong-obovate, ca. 5 × 2.5 mm; inner sepals similar to outer sepals in form, 7–8 × 4–5 mm. Petals obovate, ca. 5 × 3 mm, base with separate glands, apex emarginate, with rounded lobes. Stamens ca. 4 mm; anther connective prolonged, subapiculate. Ovules 2 or 3. Berry purplish red, oblong-ovoid, 10–12 × 5–7 mm, not pruinose, style not persistent. Fl. May–Jun, fr. Aug–Oct.

- Understories of *Picea* forests, margins of *Abies* forests, thickets, grassy slopes; 3100–4200 m. Sichuan, Xizang, Yunnan.

**34. *Berberis ulicina*** J. D. Hooker & Thomson, *Fl. Ind.* 1: 227. 1855.

尤里小檗 you li xiao bo

Shrubs, deciduous, to 1 m tall. Branches and shoots pale purplish red, sometimes slightly grayish white, terete; spines 3-fid, pale yellow, 0.8–2.5 cm, stout, adaxially sulcate. Leaves subsessile; leaf blade abaxially gray-green, adaxially dark green, linear-oblancoate, 0.8–2.2 cm × 1–4 mm, abaxially not pruinose, midvein slightly raised, lateral and reticulate veins inconspicuous, adaxially inconspicuously veined, base attenuate, margin 1–3-spinose-serrate on each side, occasionally entire, apex aristate. Flowers 3–5-fascicled, sometimes forming a subracemose inflorescence. Pedicels 2–5 mm. Sepals in 2 whorls; outer sepals lanceolate, 4–4.5 × 0.8–1 mm; inner sepals obovate-oblong, 6–6.5 × 3–3.5 mm. Petals oblancoate, 5–5.1 × 2–2.2 mm, base clawed, with very separate glands, apex incised with acute lobes. Stamens 3–3.5 mm; anther connective not prolonged, shortly apiculate. Ovary 3–3.2 mm; ovules 3–5. Berry black or red, globose, 3–3.5 × ca. 3 mm, not pruinose, style ca. 0.8 mm; seeds 5. Fl. May–Jun, fr. Jul–Aug.  $2n = 28$ .

- Slopes, floodlands, mixed forests, streamsides; 2500–3700 m. Xinjiang, W Xizang [Kashmir].

**35. *Berberis nullinervis*** T. S. Ying in C. Y. Wu, *Fl. Xizang*. 2: 141. 1985.

无脉小檗 wu mai xiao bo

Shrubs, deciduous, to 1.5 m tall. Branches dark gray; shoots red, slightly sulcate, glabrous; spines 3-fid, 5–11 mm. Leaves subsessile; leaf blade adaxially green, elliptic or oblanceolate, 1.2–2.1 cm × 5–8 mm, papery, abaxially rugose, veins very inconspicuous, adaxially smooth, midvein impressed, base cuneate, margin entire, occasionally 1- or 2-spinose-serrate on each side, apex acuminate or acute. Flowers 3- or 4-fascicled. Ovules 2. Fruit stalk 8–11 mm, glabrous; berry red, ellipsoid, ca. 9 × 5 mm, scarcely pruinose; style not persistent, sometimes apex slightly bent; seeds 2. Fl. unknown, fr. Aug–Sep.

- Streamsides in thickets, foot of mountains; 4200–4300 m. Xizang (Namling).

**36. *Berberis hypericifolia*** T. S. Ying in C. Y. Wu, *Fl. Xizang*. 2: 140. 1985.

异叶小檗 yi ye xiao bo

Shrubs, deciduous, 1–2 m tall. Branches shiny, purplish red, not sulcate, sparsely black verruculose; internodes 1.2–3 cm; spines simple, concolorous, 6–10 mm. Petiole 2–5 mm; leaf blade abaxially pale yellow-green, brown when dry, adaxially dark green, obovate, occasionally suborbicular, 0.7–2.5 × 0.4–1.7 cm, papery, abaxially with conspicuous midvein and lateral veins, adaxially inconspicuously veined, base cuneate, margin entire, occasionally 1- or 2-spinose-serrate on each side, apex obtuse or rounded, mucronate. Flowers 3–6-fascicled. Pedicels 8–14 mm. Ovules 3. Berry red, oblong, ca. 10 × 5 mm, not pruinose, style not persistent; seeds 3. Fl. unknown, fr. Aug–Sep.

- In slash; ca. 4300 m. Xizang.

**37. *Berberis tsienii*** T. S. Ying, *Acta Phytotax. Sin.* 37: 307. 1999.

永思小檗 yong si xiao bo

Shrubs, deciduous, ca. 1.5 m tall. Branches and shoots dark brown, very conspicuously sulcate, glabrous; spines 3-fid, weak, pale yellow, 2–5 mm. Leaves subsessile; leaf blade abaxially yellow-green, adaxially shiny, dark green, elliptic or obovate-elliptic, sometimes obovate, 7–15 × 3–6 mm, papery, abaxially midvein slightly raised, lateral and reticulate veins inconspicuous, not pruinose, adaxially veins inconspicuous, base cuneate, margin 1–3-spinose-serrulate on each side, apex acute. Flowers unknown. Inflorescence with 3–6-fascicled berries; fruit stalk purplish red, 3–4 mm, glabrous; berry ellipsoid, 6–8 × ca. 3 mm, not pruinose; style persistent, short; seeds 1. Fl. Jun–Jul, fr. Jul–Aug.

- Thickets; ca. 2100 m. Guizhou.

**38. *Berberis morrisonensis*** Hayata, *J. Coll. Sci. Imp. Univ. Tokyo* 30(1): 25. 1911.

玉山小檗 yu shan xiao bo

Shrubs, deciduous. Branches dark red, sparsely verrucu-

lose; shoots green; spines 3-fid, 1–1.5 cm. Leaves shortly petiolate; leaf blade abaxially pale green, sometimes gray-white, adaxially dark green, obovate or obovate-lanceolate, 1.5–2.5 × 0.5–1 cm, both surfaces with conspicuously raised reticulate veins, base attenuate, margin 4–7-spinose-serrate on each side, apex rounded, obtuse. Flowers 2–5-fascicled, rarely solitary. Pedicels often pendulous, 1.2–2.5 cm, slender. Sepals in 3 whorls; outer sepals lanceolate or narrowly ovate, 4–4.5 × 1.5–2.5 mm, apex acuminate; median sepals oblong-elliptic, 5.5–6.5 × 3–3.5 mm; inner sepals narrowly obovate, ca. 7.5 × 4 mm. Petals broadly elliptic, 5–6 × 3.5–4 mm, apex emarginate. Anther connective obtuse or truncate. Ovules 4–7. Berry scarlet, subglobose, 8–9 × 7–8 mm. Fl. and fr. unknown.

● Alpine areas; 3000–4300 m. Taiwan.

**39. *Berberis yui*** T. S. Ying, Acta Phytotax. Sin. 37: 309. 1999 [“yuii”].

德浚小檗 de jun xiao bo

Shrubs, deciduous, ca. 1.5 m tall. Branches deep gray, not verruculose; shoots pale gray, sulcate; spines 3-fid, pale yellow, 0.5–1.6 cm. Leaves subsessile; leaf blade abaxially pale green, adaxially dark green, oblanceolate or obovate-elliptic, 1–2.5 cm × 4–9 mm, papery, abaxially not pruinose, both surfaces with markedly raised reticulate veins, base attenuate, margin closely 9–16-spinulose-serrulate on each side, apex rounded, obtuse, occasionally acute. Flowers 5–8-fascicled. Pedicels 1.2–1.7 cm, glabrous; bractlets lanceolate, ca. 2.5 × 0.6 mm. Sepals in 3 whorls; outer sepals lanceolate, ca. 4.2 × 1.5 mm; median sepals elliptic, ca. 4.5 × 2 mm; inner sepals elliptic, ca. 4 × 2 mm. Petals obovate, ca. 3.5 × 2 mm, base clawed, with separate glands, apex incised. Stamens ca. 2.5 mm; anther connective prolonged, rounded, obtuse. Ovules 2, funiculate. Fruit unknown. Fl. Jun, fr. unknown.

● Thickets, alpine meadows, grassy slopes; 3600–4200 m. Sichuan.

**40. *Berberis diaphana*** Maximowicz, Bull. Acad. Imp. Sci. Saint-Petersbourg 23: 309. 1877.

鲜黄小檗 xian huang xiao bo

峨眉小檗 e mei xiao bo

*Berberis diaphana* Maximowicz var. *tachiensis* Ahrendt, p.p.

Shrubs, deciduous, to 2 m tall. Branches dark purple, black verruculose; shoots green, sulcate; spines 3-fid, orange, 6–10 mm, adaxially slightly sulcate. Petiole 2–5 mm; leaf blade abaxially pale gray, adaxially dark green, oblong-obovate or elliptic, 2–4 × 1–2 cm, papery, abaxially pruinose, adaxially

with reticulate veins, base cuneate, margin 5–12-spinose-serrate on each side, apex rounded, obtuse. Flowers 2–4-fascicled, occasionally solitary or 2 or 3 flowers in simple racemes. Pedicels 2–3 cm. Sepals in 2 whorls, oblong-elliptic; outer sepals 7–7.5 × 4–4.5 mm; inner sepals 7.5–8 × 4.5–5 mm. Petals oblong, ca. 5 × 3.7 mm, base with separate glands, apex entire. Stamens ca. 4 mm; anther connective prolonged, apiculate. Ovules 7–11. Berry orange, ovoid, 1.5–1.6 cm × 7–8 mm, not pruinose, style not persistent. Fl. May–Jun, fr. Jul–Oct.

- Thickets, roadsides, slopes; 2900–3200 m. Sichuan.

**43. *Berberis hypoxantha*** C. Y. Wu ex S. Y. Bao, Bull. Bot. Res., Harbin 5(3): 6. 1985.

黄背小檗 huang bei xiao bo

Shrubs, evergreen, to 2 m tall. Branches black-gray, terete, not spinose. Petiole 4–6 mm; leaf blade abaxially becoming stramineous when dry, adaxially green, oblong or broadly ovate, 3–4 × 2–2.5 cm, leathery, abaxially not pruinose, with inconspicuous lateral and reticulate veins, adaxially with slightly conspicuous lateral veins, base cuneate, apex rounded. Flowers unknown. Fruit stalk 1.8–2 cm, glabrous; berry green (immature), 4–12-fascicled, oblong, pruinose, style not persistent. Fl. unknown, fr. May.

- Forest margins at mountain summits. SE Yunnan (Xichou).

**44. *Berberis holocraspedon*** Ahrendt, J. Bot. 79(Suppl.): 22. 1941.

风庆小檗 feng qing xiao bo

Shrubs, evergreen, 1–2 m tall. Stems terete; branches grayish brown; shoots pale yellow, glabrous, sparsely black verruculose; spines 3-fid, pale yellow, 7–20 mm. Petiole 2–3 mm; leaf blade abaxially gray, adaxially dark green and shiny, oblong-lanceolate or oblong-elliptic, 4–10 × 1.5–2.5 cm, leathery, abaxially sometimes slightly pruinose, with raised midvein, lateral veins conspicuous, adaxially with slightly impressed midvein, lateral veins slightly conspicuous, both surfaces with inconspicuous reticulate veins, base cuneate, margin very slightly revolute, entire or 1- or 2-spinose-subserulate on each side, apex obtuse, apiculate. Flowers unknown. Inflorescence with 3–12 fascicled berries; fruit stalk reddish, 1–1.5 cm, stout; berry black, ellipsoid, 7–10 × ca. 6 mm, not pruinose, style not persistent; seeds 2. Fl. unknown, fr. Jun–Nov.

- Dry slopes, thickets, bamboo forests; 1700–3100 m. Yunnan.

**45. *Berberis ziyunensis*** P. K. Hsiao & Z. Yu Li, Acta Bot. Yunnan. 21: 30. 1999.

紫云小檗 zi yun xiao bo

Shrubs, evergreen, 1.5–2.5 m tall. Branches dark gray, terete, glabrous; shoots purplish black, shiny; spines absent or very weak, 3-fid, pale yellow, 5–6 mm. Petiole 2–3 mm; leaf blade abaxially pale yellow, adaxially deep green, elliptic or narrowly elliptic, occasionally oblanceolate, 4–11 × 1–3 cm, thickly leathery, abaxially slightly pruinose, midvein conspicuously raised, lateral veins inconspicuous, adaxially with impressed midvein, lateral veins inconspicuous, base cuneate, margin slightly revolute, entire or inconspicuously 1–3-spinu-

lose-subserulate on each side, apex acuminate or acute. Flowers 4–10-fascicled, sometimes to 25 flowers. Pedicels purplish brown when dry, 1.5–2 cm, glabrous; bractlets triangular-ovate, ca. 2.2 × 1 mm. Outer sepals oblong, ca. 2.2 × 1.9 mm; inner sepals obovate, ca. 4 × 2.5 mm. Petals obovate, ca. 3.5 × 3 mm, base not clawed, with separate glands, apex entire. Stamens ca. 2.3 mm; anther connective truncate. Ovules 2, shortly funiculate. Berry dark red, ellipsoid; style persistent, short. Fl. Mar–Apr, fr. Apr–May.

- Thickets; 1000–1300 m. Guizhou.

**46. *Berberis pingshanensis*** W. C. Sung & P. K. Hsiao, Acta Phytotax. Sin. 12: 387. 1974.

屏山小檗 ping shan xiao bo

Shrubs, evergreen, to 2 m tall. Branches gray; shoots purplish brown, sulcate, glabrous; spines 3-fid, concolorous with shoots, ca. 5 mm. Petiole 2–3 mm; leaf blade abaxially brown when dry, adaxially deep green, elliptic, 8–17 × 3.5–7 cm, subleathery, abaxially not pruinose, midvein conspicuously raised, lateral and reticulate veins slightly raised, adaxially with impressed midvein, lateral veins slightly raised, base broadly cuneate or subrounded, margin entire, apex acute. Flowers 8–20-fascicled. Pedicels purplish brown, 1.5–3 cm, glabrous; bractlets ovate-triangular, ca. 1 mm. Sepals in 2 whorls; outer sepals broadly elliptic, ca. 4 × 3 mm; inner sepals suborbicular or reniform-orbicular, ca. 4 × 4–5 mm. Petals suborbicular, base with separate glands, apex entire or obtusely emarginate. Stamens ca. 2 mm; anther connective truncate. Ovules 2, funicles ca. as long as ovules. Berry black, not or slightly pruinose. Fl. May–Jun, fr. Jun–Jul.

- Roadsides, sides of rocks; ca. 800 m. Sichuan.

**47. *Berberis obovatifolia*** T. S. Ying in C. Y. Wu, Fl. Xizang. 2: 146. 1985.

裂瓣小檗 lie ban xiao bo

Shrubs, evergreen, low, ca. 0.5 m tall. Stems sulcate; branches gray; shoots pale red, glabrous; spines 3-fid, pale yellow, 8–20 mm. Leaves sessile; leaf blade abaxially shiny, green, adaxially dark green, obovate, 1–2.3 × 0.5–1.4 cm, thinly leathery, abaxially openly reticulate, not pruinose, adaxially openly veined, base cuneate, margin entire, apex rounded, mucronate. Flowers 2–4-fascicled. Sepals in 2 whorls; outer sepals elliptic, ca. 3.6 × 1.6–2 mm; inner sepals oblong-elliptic, ca. 6.5 × 4 mm. Petals broadly elliptic, ca. 4.7 × 3.1 mm, base clawed, with separate glands, apex emarginate. Stamens ca. 3 mm; anther connective truncate. Ovules 2, shortly funiculate. Immature fruit seen, style not persistent. Fl. May, fr. Jun–Jul.

- Beside ditches on mountains; ca. 3900 m. Xizang.

Shrubs, evergreen, 1–2 m tall. Stems terete; branches gray; shoots pale yellow, angulate, sparsely black verruculose; spines 3-fid, pale yellow, ca. 4 cm. Leaves subsessile; leaf blade adaxially dark green, linear-oblong or linear, 4–15 cm × 1.5–10 mm, thinly leathery, adaxially not pruinose, midvein conspicuously raised, lateral veins conspicuous, reticulate veins inconspicuous, base attenuate, margin strongly revolute, 3–26-spinulose-serrulate on each side, apex acuminate. Flowers unknown. Infructescence with 3–11-fascicled berries; fruit stalk dark purplish red, 4–20 mm, glabrous; berry red, ellipsoid, ca. 7 × 4 mm, not or slightly white pruinose; style persistent, short; seeds 1 or 2. Fl. unknown, fr. May–Oct.

- Thickets, forests, roadsides; 1000–2500 m. Guizhou, Sichuan, Yunnan.

**54. *Berberis sanguinea*** Franchet, Nouv. Arch. Mus. Hist. Nat., sér. 2, 8: 194. 1885.

血红小檗 *xue hong xiao bo*

*Berberis panlanensis* Ahrendt.

Shrubs, evergreen, to 3 m tall. Stems very sulcate; branches dark gray; shoots pale yellow, sparsely black verruculose; spines 3-fid, pale yellow, 1–3 mm. Leaves subsessile; leaf blade abaxially shiny, pale yellow-green, adaxially dark green, linear-lanceolate, 1.5–6 cm × 3–6 mm, slightly leathery, abaxially not pruinose, midvein conspicuously raised, adaxially with obviously impressed midvein, both surfaces with inconspicuous lateral and reticulate veins, base cuneate, margin 7–14-spinulose-serrulate on each side, apex acute or acuminate, aristate. Flowers 2–7-fascicled. Pedicels reddish, 7–20 mm; bractlets red. Sepals in 3 whorls; outer sepals red, ovate, ca. 3 × 2 mm, apex acute; median and inner sepals yellow, elliptic, ca. 5 × 4.5 mm. Petals obovate, ca. 4 × 3 mm, base with separate lanceolate glands, apex slightly emarginate. Stamens ca. 3 mm; anther connective not prolonged, rounded or truncate. Ovules 2 or 3. Berry purplish red, ellipsoid, 7–12 × 4–5 mm, not pruinose, style not persistent. Fl. Apr–May, fr. Jul–Oct.

- Thickets, forests, roadsides, streamsides, sunny slopes, grassy slopes; 1100–2700(–3800) m. Hubei, Sichuan.

**55. *Berberis lubrica*** C. K. Schneider, Repert. Spec. Nov. Regni Veg. 46: 265. 1939.

亮叶小檗 *liang ye xiao bo*

Shrubs, evergreen, to 1 m tall. Stems angulate-sulcate, black verruculose; spines 3-fid, concolorous, flat. Petiole 1–3 mm; leaf blade abaxially pale yellow-green, adaxially green, both surfaces shiny, narrowly lanceolate, 6–9 × 1–1.5 cm, leathery, abaxially lateral and reticulate veins inconspicuous, not pruinose, margin markedly revolute, 12–24-spinose-serrate on each side, apex acuminate. Flowers 6–10-fascicled. Pedicels 5–10 mm, glabrous; bractlets ovate, ca. 2.5 × 1.5 mm, apex acute. Sepals in 2 whorls; outer sepals ovate, ca. 3.5 × 2 mm, apex acute; inner sepals obovate, 6–7 × ca. 4.5 mm. Petals oblong-obovate, ca. 3.5 × 2 mm, base cuneate, with separate glands, apex subentire. Stamens ca. 3.5 mm; anther connective conspicuously prolonged, truncate. Ovules 4. Fruit unknown. Fl. May–Jun, fr. unknown.

- Habitat unknown; ca. 2800 m. Sichuan.

**56. *Berberis insignis*** J. D. Hooker & Thomson subsp. *incrassata* (Ahrendt) D. F. Chamberlain & C. M. Hu, Notes Roy. Bot. Gard. Edinburgh 42: 537. 1985.

球果小檗 *qiu guo xiao bo*

*Berberis incrassata* Ahrendt, Gard. Chron., ser. 3, 105: 371. 1939; *B. incrassata* var. *bucahwangensis* Ahrendt; *B. incrassata* var. *fugongensis* S. Y. Bao.

Shrubs, evergreen, 1–2 m tall. Branches brownish yellow to dark red, terete, glabrous; spines absent. Petiole 2–4 mm; leaf blade abaxially shiny, pale yellow-green, adaxially dark grayish green, elliptic to elliptic-lanceolate, 5–16 × 2–6 cm, leathery, both surfaces not pruinose, abaxially with raised midvein, adaxially with impressed midvein, both surfaces with visible lateral veins, base cuneate, margin coarsely 12–24-aristate-dentate on each side, apex acuminate. Flowers (4–)8–15-fascicled. Pedicels 1–2.4 cm, slender, slightly thickened toward apex, glabrous. Sepals in 3 whorls; outer sepals ovate, ca. 4 × 3 mm, apex acute; median sepals ovate-elliptic, ca. 6 × 5 mm, apex obtuse; inner sepals obovate, ca. 7 × 6 mm. Petals obovate, ca. 6 × 4 mm, base cuneate, with separate glands, apex entire. Stamens ca. 4 mm; anther connective truncate. Ovules 5–7. Berry purplish red or black, subglobose, 6–7 × 5–6 mm, not pruinose, style persistent and conspicuous. Fl. Apr–May, fr. Aug–Oct.

- Thickets, broad-leaved forests, mixed forests, bamboo forests; 1200–2400 m. Xizang, Yunnan.

**57. *Berberis wangii*** C. K. Schneider, Repert. Spec. Nov. Regni Veg. 46: 246. 1939.

西山小檗 *xi shan xiao bo*

*Berberis pruinosa* Franchet var. *viridifolia* C. K. Schneider, p.p.; *B. schneideriana* Ahrendt.

Shrubs, evergreen, 1.5–2 m tall. Stems and branches brownish gray, terete, sulcate; shoots densely black or yellow-brown verruculose; spines 3-fid, terete, 1–3.5 cm. Petiole 2–4 mm; leaf blade abaxially yellow-green, adaxially shiny, dark green, elliptic or elliptic-lanceolate, 6–10 × 1.2–2 cm, leathery, both surfaces not pruinose, abaxially with conspicuously raised midvein, adaxially with slightly impressed midvein, both sur-

faces with conspicuous lateral veins, reticulate veins fine, base cuneate, margin flat, 5–18-spinose-serrate on each side, apex acute, aristate. Flowers 6–17-fascicled. Pedicels 0.8–2 cm. Sepals in 3 whorls; outer sepals triangular, ca. 2.5 mm, apex caudate-acuminate; median sepals oblong, ca. 3 mm, apex acute; inner sepals elliptic, 4–4.5 × 2–2.5 mm, apex obtuse. Petals elliptic, 3–3.5 mm, base not clawed, with ovate glands, apex entire, rounded. Stamens ca. 2.5 mm; anther connective subtruncate. Ovules solitary, shortly funiculate. Berry red, ellipsoid, 7–8 × ca. 3.5 mm, not pruinose, style persistent. Fl. Mar, fr. Aug–Nov.

- Thickets, mixed forests, sandy slopes; 1600–2300 m. Yunnan.

**58. *Berberis pectinocraspedon*** C. Y. Wu ex S. Y. Bao, Bull. Bot. Res., Harbin 5(3): 11. 1985.

疏齿小檗 shu chi xiao bo

Shrubs, evergreen, 2–3 m tall. Branches black gray, terete; shoots brownish gray, scarcely black verruculose; spines 3-fid, concolorous, 7–10 mm, slender. Leaves shortly petiolate; leaf blade abaxially pale brown when dry, adaxially slightly shiny, oblong-elliptic or lanceolate, 4–12 × 1.5–3 cm, leathery, abaxially with obviously raised veins, adaxially with slightly impressed midvein, lateral veins conspicuous, base cuneate, margin closely 25–30-spinulose-suberrulate on each side, apex obtuse. Flowers (10–)15–20-fascicled. Pedicels 1.6–2.2 cm, weak, glabrous; bractlets triangular, apex acute. Sepals in 3 whorls; outer sepals triangular-ovate, ca. 3 × 3 mm, apex acute; median sepals oblong-ovate, ca. 4 × 2 mm, apex mucronate; inner sepals oblong, ca. 4 × 2 mm, apex mucronate. Petals ovate-elliptic, ca. 4 × 3 mm, base attenuate, with separate glands, apex subrounded, mucronate. Stamens ca. 3 mm; anther connective truncate. Ovules solitary; funicles ca. as long as ovules. Berry oblong, not pruinose, style persistent. Fl. and fr. Apr–Aug.

- Thickets; 700–1900 m. Yunnan.

**59. *Berberis kunmingensis*** C. Y. Wu ex S. Y. Bao, Bull. Bot. Res., Harbin 5(3): 8. 1985.

昆明小檗 kun ming xiao bo

Shrubs, evergreen, ca. 2 m tall. Branches yellow-brown, terete, sulcate, black verruculose; spines 3-fid, weak, yellow-brown, 1–1.5 cm. Petiole 8–10 mm; leaf blade abaxially yellow-brown, adaxially dark brown when dry, oblong-lanceolate or oblong-elliptic, 8–14 × 3–5 cm, leathery, abaxially with flat midvein, adaxially with slightly impressed midvein, lateral and reticulate veins conspicuously raised, base cuneate, margin 20–25-spinose-serrate on each side, apex obtuse. Flowers 10–20-fascicled. Pedicels 1.5–1.8 cm, slender. Sepals in 3 whorls; outer sepals ovate, ca. 2.5 × 1.5 mm, apex acute; median sepals lanceolate, ca. 10 × 3 mm; inner sepals obovate-oblong, ca. 12 × 4 mm. Petals obovate, ca. 10 × 2.5 mm, base cuneate, with oblong glands, apex entire. Stamens ca. 3 mm; anther connective truncate. Ovules solitary, shortly funiculate. Berry oblong, ca. 7 × 3 mm, pruinose, style persistent. Fl. and fr. unknown.

- Thickets, forest margins. Yunnan.

**60. *Berberis delavayi*** C. K. Schneider in Sargent, Pl. Wilson. 1: 364. 1913.

显脉小檗 xian mai xiao bo

*Berberis delavayi* var. *wachinensis* Ahrendt; *B. phanera* C. K. Schneider; *B. subcoriacea* Ahrendt.

Shrubs, evergreen, 1–3 m tall. Branches brownish gray or brownish yellow, terete, glabrous, black verruculose; spines 3-fid, concolorous, 1–3 cm, adaxially sulcate. Leaves shortly petiolate; leaf blade abaxially shiny, both surfaces deep green, oblong-elliptic or elliptic-lanceolate, 4.5–7 × 1.2–1.8 cm, leathery, both surfaces not pruinose, abaxially with raised midvein, adaxially with impressed midvein, both surfaces with conspicuous lateral and reticulate veins, base cuneate, margin undulate, slightly revolute, 7–12-spinose-serrulate on each side, apex acute. Flowers 2–6-fascicled. Pedicels green in flower, red in fruit, slender. Sepals in 3 whorls; outer sepals ovate, ca. 3 × 1.5 mm, apex obtuse; median sepals suborbicular or ovate-orbicular, ca. 5 × 4 mm; inner sepals similar to median sepals in form, ca. 7 × 5.5 mm. Petals oblong-obovate, ca. 5.5 × 4.5 mm, base clawed, with separate glands, apex subrounded, obtusely emarginate. Stamens ca. 3.5 mm; anther connective slightly prolonged, truncate. Ovules 3 or 4. Berry ellipsoid, ca. 1.2 × 0.6 cm, thickly blue pruinose, style not persistent. Fl. Jun–Sep, fr. Oct–Dec.

- *Abies* forests, thickets, streamsides, *Pinus* forests; 1800–4000 m. Sichuan, Yunnan.

**61. *Berberis davidii*** Ahrendt, J. Linn. Soc., Bot. 57: 56. 1961.

密叶小檗 mi ye xiao bo

Shrubs, evergreen, ca. 1 m tall. Branches brownish gray, sulcate, black verruculose; shoots brownish yellow, glabrous; spines 3-fid, concolorous, ca. 2 cm, slender, adaxially sulcate. Petiole 2–5 mm; leaf blade abaxially yellowish green, adaxially dark green, elliptic or elliptic-lanceolate, 2–4.5 × 1–1.5 cm, leathery, abaxially not pruinose, midvein obviously raised, lateral veins 4–6 pairs, reticulate veins inconspicuous, base cuneate, apex obtuse, aristate. Flowers 6–8-fascicled. Pedicels weak, to 3 cm, glabrous. Sepals in 3 whorls; outer sepals suborbicular, ca. 2 × 2 mm; median sepals suborbicular, ca. 4 × 4 mm; inner sepals oblong-elliptic, ca. 6 × 3 mm. Petals obovate-elliptic, ca. 5.5 × 3.2 mm, base attenuate, with separate glands, apex rounded, entire. Stamens ca. 4 mm; anther connective prolonged, truncate. Ovules 2. Berry ellipsoid, 8–9 × ca. 7 mm, gray pruinose, style not persistent. Fl. May–Jun, fr. Jul–Sep.

- Grassy slopes, grasslands, riversides; 2000–3500 m. Yunnan.

**62. *Berberis multiovula*** T. S. Ying, Acta Phytotax. Sin. 37: 309. 1999.

多珠小檗 duo zhu xiao bo

Shrubs, evergreen, ca. 1 m tall. Branches and shoots pale gray, sulcate; spines 3-fid, pale yellow, 1–2.3 cm. Leaves sub-

sessile; leaf blade abaxially pale green, adaxially deep green, linear-lanceolate or narrowly elliptic, 1.5–3 cm × 3–5 mm, thinly leathery, both surfaces not pruinose, abaxially with conspicuously raised midvein, adaxially with slightly raised midvein, both surfaces with inconspicuous lateral and reticulate veins, base abruptly narrowed, margin 3–7-spinose-serrate on each side, apex aristate. Flowers 2–4-fascicled. Pedicels 5–11 mm, slender, glabrous. Sepals in 3 whorls; outer sepals triangular-ovate, ca. 3 × 2 mm; median sepals ovate, ca. 4 × 3 mm; inner sepals obovate, ca. 5.5 × 4 mm. Petals elliptic or oblong, ca. 4.1 × 2.2 mm, base not clawed, with separate glands, apex emarginate, lobes rounded. Stamens ca. 3 mm; anther connective prolonged, truncate. Ovules 5. Berry ellipsoid, 8–10 × 3–5 mm, not pruinose, style persistent. Fl. May, fr. Jun–Jul.

- Forest margins; 2900–3000 m. Sichuan.

**63. *Berberis gagnepainii*** C. K. Schneider, Bull. Herb. Boissier, sér. 2, 8: 196. 1908 [*"gagnepainii"*].

湖北小檗 hu bei xiao bo

Shrubs, evergreen, 1–2 m tall. Stems terete. Branches dark gray; shoots stramineous, sulcate, scarcely verruculose; spines concolorous, 1–4 cm, stout, adaxially flat or sulcate. Leaves subsessile; leaf blade abaxially yellow-green, adaxially dark green, sometimes grayish green or shiny, lanceolate or ovate-lanceolate to elliptic-lanceolate, 3.5–14 × 0.4–2.5 cm, leathery, abaxially not pruinose, midvein conspicuously raised, lateral veins slightly raised, reticulate veins inconspicuous, adaxially with slightly impressed midvein, lateral and reticulate veins conspicuous, base cuneate, margin 6–20(–40)-spinose-serrate on each side, apex acuminate. Flowers 2–8(–15)-fascicled. Pedicels ca. 3 mm. Sepals in 3 whorls; outer sepals oblong-ovate, ca. 4.5 × 4 mm, apex acute; median sepals elliptic to ovate, ca. 6.5 × 5.5 mm; inner sepals obovate, ca. 8 × 7 mm. Petals obovate, ca. 7 × 6 mm, base cuneate, with separate glands, apex emarginate or obtusely emarginate with obtuse lobes. Ovules 4 or 5. Berry red, oblong-ovoid, 8–10 × ca. 6 mm, slightly blue pruinose, style not persistent. Fl. May–Jun, fr. Jun–Oct.

- Montane thickets, forest margins, forest understories, on sides of rocks; 700–2800 m. Guizhou, Hubei, Sichuan, Yunnan.

- 1a. Leaf blade lanceolate, adaxially dark green, margin 6–20-spinose-serrate on each side ..... 63a. var. *gagnepainii*
- 1b. Leaf blade ovate-lanceolate or elliptic-lanceolate, adaxially very shiny, margin 20–40-spinose-serrate on each side ..... 63b. var. *omeiensis*

眉山小檗 mei shan xiao bo

Leaf blade adaxially very shiny, ovate-lanceolate or elliptic-lanceolate, margin 20–40-spinose-serrate on each side.

- Forest understories, forest margins; 1700–2800 m. Sichuan.

**64. *Berberis triacanthophora*** Fedde, Bot. Jahrb. Syst. 36(Beibl. 82): 43. 1905.

芒齿小檗 mang chi xiao bo

Shrubs, evergreen, 1–2 m tall. Stems terete; branches dark gray or brown; shoots reddish, scarcely verruculose; spines 3-fid, concolorous, 1–2.5 cm. Leaves subsessile; leaf blade abaxially gray-green, adaxially deep green, shiny, linear-lanceolate, oblong-lanceolate, or narrowly elliptic, 2–6 cm × 2.5–8 mm, leathery, abaxially papillose, sometimes slightly pruinose, midvein raised, both surfaces with inconspicuous lateral and reticulate veins, base cuneate, margin occasionally entire or 2–8-spinose-serrate on each side, apex acuminate or acute, aristate. Flowers 2–6-fascicled. Pedicels 1.5–2.5 cm, glabrous; bractlets reddish, ovate, ca. 1 mm. Sepals in 3 whorls; outer sepals ovate-orbicular, ca. 2 × 1.8 mm; median sepals ovate, ca. 3.5 × 2.5 mm, apex acute; inner sepals obovate, ca. 5 × 4 mm, apex obtuse. Petals obovate, ca. 4 × 3 mm, base cuneate, with separate oblong glands, apex emarginate. Stamens ca. 2 mm; anther connective prolonged, truncate. Ovules 2 or 3. Berry blue-black, ellipsoid, 6–8 × 4–5 mm, slightly pruinose. Fl. May–Jun, fr. Jun–Oct.

- Mixed forests; 500–2100 m. Guizhou, Hubei, Hunan, Shaanxi, Sichuan.

**65. *Berberis xingwenensis*** T. S. Ying, Acta Phytotax. Sin. 37: 311. 1999.

兴文小檗 xing wen xiao bo

Shrubs, evergreen, to 2.5 m tall. Branches gray-brown, terete, glabrous; spines 3-fid, yellow-brown, ca. 1 cm, slender, adaxially flat. Petiole ca. 5 mm, sometimes leaf subsessile; leaf blade abaxially yellow-green, adaxially dark green, shiny, elliptic-lanceolate or lanceolate, 6–15 × 1.3–4 cm, leathery, abaxially not pruinose, midvein and lateral veins obviously raised, reticulate veins visible, adaxially with slightly impressed midvein, lateral and reticulate veins slightly raised, base cuneate, margin 10–15-spinose-serrate on each side, apex acuminate. Flowers 5–16-fascicled, red. Pedicels 2–2.7 cm, slender. Sepals in 3(or 4) whorls; outer sepals ovate, 2.5–2.8 × 1.5–2 mm, apex acute; median sepals broadly elliptic, 4.5–5 × ca. 4 mm, apex obtuse; inner sepals elliptic, 5–5.2(–6) × 3.5–4 mm, rounded. Petals obovate, 4.5–5.1 × 3.2–4 mm, base clawed, with separate glands, apex emarginate. Stamens ca. 2.8 mm; anther connective prolonged, truncate. Ovules 2. Berry red, pyriform, ca. 6 × 3 mm, not pruinose; style persistent, short. Fl. Apr–May, fr. Jul–Sep.

- Mixed forests on slopes; ca. 1800 m. Sichuan.

**66. *Berberis veitchii*** C. K. Schneider in Sargent, Pl. Wilson. 1: 363. 1913.

巴东小檗 *ba dong xiao bo*

Shrubs, evergreen, 1–1.5 m tall. Stems terete; branches pale grayish yellow, not verruculose; shoots reddish, glabrous; spines 3-fid, pale yellow, 1.5–3 cm, adaxially sulcate. Leaves subsessile; leaf blade abaxially pale yellow, shiny, adaxially dark green, lanceolate, 5–11 × 1–2 cm, thinly leathery, abaxially not pruinose, midvein raised, lateral veins slightly raised, adaxially with impressed midvein, base cuneate, margin slightly undulate, slightly revolute, 10–30-spinose-serrate on each side, apex acuminate. Flowers 2–10-fascicled. Pedicels 1.5–3.5 cm, glabrous; bractlets ovate, ca. 2 × 2 mm. Sepals in 3 whorls; outer sepals reddish brown, oblong-ovate, ca. 3.5 × 3 mm; median sepals obovate, concave, ca. 5 × 4 mm; inner sepals obovate, concave, ca. 7.5 × 5.5 mm. Petals obovate, base clawed, with approximate glands, apex rounded and narrowly incised. Stamens ca. 4 mm; anther connective slightly prolonged, obtuse. Ovules 2–4. Berry ovoid to ellipsoid, ca. 9 × 6 mm, blue pruinose, style not persistent. Fl. May–Jun, fr. Aug–Oct.

- Thickets, forests, forest margins, streamsides; 2000–3300 m. N Guizhou, Hubei, Sichuan.

**67. *Berberis pingbienensis*** S. Y. Bao, Bull. Bot. Res., Harbin 5(3): 12. 1985.

屏边小檗 *ping bian xiao bo*

Shrubs, evergreen, to 2 m tall. Branches brownish gray, terete, sulcate, not verruculose; spines absent. Petiole short; leaf blade abaxially brownish yellow, adaxially yellow-green, not shiny, oblanceolate or obovate, 5–11 × 1.5–2.5 cm, leathery, abaxially with raised midvein and lateral veins, reticulate veins not visible, adaxially with slightly impressed midvein, reticulate veins conspicuous, base cuneate, margin 15–20-spinose-serrate on each side, apex acute. Flowers unknown. Fruit 2- or 3-fascicled; fruit stalk 1.5–2 cm; berry red, subglobose, 5–7 × ca. 4 mm, not pruinose, style not persistent. Fl. unknown, fr. Apr.

- Forest margins on limestone mountains; ca. 1900 m. Yunnan.

**70. *Berberis wuliangshanensis*** C. Y. Wu ex S. Y. Bao, Bull. Bot. Res., Harbin 5(3): 14. 1985.

无量山小檗 wu liang shan xiao bo

Shrubs, evergreen, to 3 m tall. Branches purplish brown, terete, sulcate, glabrous; internodes 5–8 cm; spines 3-fid, colorous, 1–3.5 cm, stout, adaxially sulcate, sometimes weak or absent. Petiole 3–5 mm, sometimes leaf subsessile; leaf blade abaxially brownish red, adaxially yellow-green, lanceolate, elliptic-lanceolate, or elliptic, 6–13 × 2–3.5 cm, leathery, abaxially with raised midvein and lateral veins, reticulate veins visible, adaxially with slightly impressed midvein, lateral veins visible, reticulate veins inconspicuous, base cuneate, margin 15–35-spinose-serrate on each side, apex acuminate. Flowers 6–12-fascicled. Pedicels 1.5–2 cm. Sepals in 2 whorls; outer sepals suborbicular, ca. 4 × 3.5 mm, apex rounded; inner sepals elliptic, ca. 7 × 5 mm. Petals obovate, ca. 6 × 3.5 mm, base cuneate, with separate glands, apex entire, rounded. Stamens ca. 4.5 mm; anther connective prolonged, truncate. Ovules solitary. Berry black, oblong-ellipsoid, 7–8 × ca. 3 mm, not or slightly pruinose, style not persistent. Fl. Apr–May, fr. Oct–Nov.

● Evergreen broad-leaved forests, slopes; 1800–2500 m. Yunnan.

**71. *Berberis vernalis*** (C. K. Schneider) D. F. Chamberlain & C. M. Hu, Notes Roy. Bot. Gard. Edinburgh 42: 554. 1985.

春小檗 chun xiao bo

*Berberis ferdinandi-coburgii* C. K. Schneider var. *vernalis* C. K. Schneider, Repert. Spec. Nov. Regni Veg. 46: 249. 1939.

Shrubs, evergreen, 1–2 m tall. Branches brownish yellow or stramineous, sulcate, sparsely black verruculose; spines colorous, terete, 1.5–3.5 cm, stout. Petiole 2–4 mm; leaf blade abaxially brownish yellow, adaxially deep green, shiny, elliptic to elliptic-lanceolate or oblong-elliptic, 3–12 × 0.7–3 cm, leathery, abaxially not pruinose, midvein conspicuously raised, adaxially with slightly impressed midvein, both surfaces with conspicuous lateral veins, reticulate veins slightly visible, base cuneate, margin sometimes slightly revolute, 10–24-spinose-serrate on each side, apex acute, aristate. Flowers 8–30-fascicled. Pedicels 1–2 cm, slender, glabrous. Sepals in 2 whorls; outer sepals ovate, ca. 3 × 1.3 mm, apex acute; inner sepals broadly elliptic, ca. 5 × 3 mm, apex acuminate. Petals obovate, 3.5–4.5 × 1.5–2.5 mm, base clawed, with separate glands, apex entire, rounded. Stamens ca. 3 mm; anther connective truncate. Ovules solitary, subsessile. Berry black, ellipsoid, 5–7 × ca. 4 mm, not pruinose, style persistent. Fl. and fr. Jun–Oct.

● Thickets, forests; 1300–2600 m. Hunan, Yunnan.

**72. *Berberis levis*** Franchet, Bull. Soc. Bot. France 33: 386. 1886.

平滑小檗 ping hua xiao bo

*Berberis levis* var. *brachyphylla* Ahrendt; *B. willeana* C. K. Schneider; *B. willeana* var. *serrulata* C. K. Schneider.

Shrubs, evergreen, 0.5–1.5 m tall. Branches brownish gray, terete; shoots brownish yellow, sulcate, densely black verruculose; spines 3-fid, 1–4 cm, stout, terete or adaxially flat. Leaves subsessile; leaf blade adaxially dark yellow-green, elliptic, narrowly elliptic, or lanceolate, 3–10 × 0.7–1.7 cm, leathery, adaxially not pruinose, midvein raised, both surfaces with lateral and reticulate veins inconspicuous, base cuneate, margin 5–15(–20)-spinose-serrate on each side, apex shortly acuminate, aristate. Flowers 7–25-fascicled. Pedicels 1–2 cm, glabrous. Sepals in 2 whorls; outer sepals obovate or triangular, 3–5 × 1–1.5 mm; inner sepals obovate or lanceolate, 4–5 × 1–2 mm. Petals obovate or broadly obovate, 5–6 × ca. 2.5 mm, base cuneate, with separate glands, apex entire or slightly emarginate, rounded or mucronate. Stamens 3–4 mm; anther connective prolonged, obtuse. Ovules solitary, shortly funiculate. Berry black, ellipsoid, 7–8 × 5–6 mm, not or scarcely pruinose, style persistent. Fl. Apr–May, fr. Sep–Nov.

● Evergreen broad-leaved forests, *Pinus* forests, slopes; 2100–2900 m. Sichuan, Yunnan.

**73. *Berberis bergmanniae*** C. K. Schneider in Sargent, Pl. Wilson. 1: 362. 1913.

汉源小檗 han yuan xiao bo

Shrubs, evergreen, 1–2 m tall. Branches brownish yellow or brown, sulcate, sparsely black verruculose; spines 3-fid, pale yellow, 1.5–2.5 cm, stout. Petiole short, or leaf subsessile; leaf blade abaxially pale green, adaxially deep green, shiny on both surfaces, oblong-elliptic or elliptic, 3–7 × 1–2 cm, thickly leathery, both surfaces not pruinose, abaxially with markedly raised midvein, adaxially with conspicuously impressed midvein, both surfaces with slightly raised lateral veins, reticulate veins inconspicuous, base cuneate, margin thickened, slightly revolute, not or sometimes undulate, 2–12-spinose-serrate on each side, apex acute or acuminate. Flowers 5–20-fascicled. Pedicels 7–15 mm. Sepals in 2 whorls; outer sepals ovate, ca. 5.5 × 3.5 mm; inner sepals obovate, ca. 7 × 5 mm. Petals obovate, ca. 6 × 5 mm, base clawed, with separate glands, apex rounded, incised. Stamens ca. 4.5 mm; anther connective truncate. Ovules 1 or 2. Fruit stalk dark brown, to 2 cm; berry black, ovoid-ellipsoid or ovoid-globose, 8–9 × ca. 6 mm, blue pruinose, style persistent and conspicuous; seeds 1 or 2. Fl. Mar–May, fr. May–Oct.

● Thickets, forests, sunny slopes; 1200–2500 m. Sichuan.

- 1a. Leaf margin not undulate, 2–12-spinose-serrate on each side ..... 73a. var. *bergmanniae*
- 1b. Leaf margin undulate, 2–6-spinose-dentate on each side ..... 73b. var. *acanthophylla*

**73a. *Berberis bergmanniae* var. *bergmanniae***

汉源小檗(原变种) han yuan xiao bo (yuan bian zhong)

Leaf blade shiny on both surfaces, margin not undulate, 2–12-spinose-serrate on each side.

- Thickets, forests; 1200–2000 m. Sichuan.

**73b. *Berberis bergmanniae* var. *acanthophylla*** C. K. Schneider in Sargent, Pl. Wilson. 1: 362. 1913.

汶川小檗 *wen chuan xiao bo*

Leaf blade dark colored adaxially, margin undulate, 2–6-spinose-dentate on each side.

- Sunny slopes, thickets; 2000–2500 m. Sichuan.

**74. *Berberis iteophylla*** C. Y. Wu ex S. Y. Bao, Bull. Bot. Res., Harbin 5(3): 7. 1985.

鼠叶小檗 *shu ye xiao bo*

Shrubs, evergreen, to 1.5 m tall. Branches brownish gray, terete, sulcate, sparsely black verruculose; shoots pale yellow; spines 3-fid, 1–1.2 cm, slender. Leaves compactly fascicled; petiole ca. 5 mm; leaf blade abaxially pale yellow-green, linear-lanceolate, 9–16 × 1.4–2.4 cm, leathery, abaxially not pruinose, midvein and lateral veins raised, adaxially with conspicuously impressed midvein, lateral veins slightly visible, both surfaces with inconspicuous reticulate veins, base cuneate, margin closely 25–35-spinose-serrate on each side, apex acute. Flowers 12–20-fascicled. Pedicels ca. 1.5 cm, slender, glabrous. Sepals in 2 whorls; outer sepals triangular-ovate, ca. 3 × 2 mm, apex acute; inner sepals oblong, ca. 4 × 3 mm, apex acuminate. Petals obovate, ca. 3 × 2 mm, base attenuate, clawed, with approximate glands, apex rounded, slightly emarginate. Stamens ca. 2 mm; anther connective truncate. Ovules solitary, shortly funiculate. Berry (immature) ellipsoid, not pruinose, style persistent. Fl. and fr. Apr–Aug.

- Slopes, streamside, thickets, forests; ca. 2200 m. Yunnan (Shuangbai).

**75. *Berberis ferdinandi-coburgii*** C. K. Schneider in Sargent, Pl. Wilson. 1: 364. 1913.

大叶小檗 *da ye xiao bo*

Shrubs, evergreen, to 2 m tall. Branches sulcate, scarcely black verruculose; spines 3-fid, 7–15 mm, slender, adaxially sulcate. Petiole 2–4 mm; leaf blade abaxially brownish yellow, adaxially shiny, castaneous, elliptic-oblongate, 4–9 × 1.5–2.5 cm, leathery, both surfaces not pruinose, abaxially with raised midvein and lateral veins, adaxially with impressed midvein and lateral veins, both surfaces with visible reticulate veins, base cuneate, margin sometimes slightly revolute, 35–60-spinose-serrate on each side, apex acute, aristate. Flowers 8–18-fascicled. Pedicels 1–2 cm, slender, glabrous; bractlets reddish, ca. 1.5 mm. Sepals in 2 whorls, ovate, ca. 5 × 3 mm. Petals narrowly obovate, 3.5–4.5 × 1.5–2.5 mm, base clawed, with separate glands, apex emarginate. Stamens ca. 3 mm; anther connective truncate. Ovules solitary, sessile. Berry black, ellipsoid or ovoid, 7–8 × 5–6 mm, not or sometimes slightly pruinose, style persistent. Fl. and fr. Jun–Oct.

- Thickets; 100–2700 m. Yunnan.

**76. *Berberis grodtmanniana*** C. K. Schneider, Oesterr. Bot. Z. 67: 32. 1918 [*“grodtmannia”*].

安宁小檗 *an ning xiao bo*

Shrubs, evergreen, 1–1.5 m tall. Branches dark gray or yellow, stout, very sulcate, not verruculose; spines 3-fid, 1–3 cm, stout, adaxially flat. Leaves sessile; leaf blade abaxially pale green, adaxially deep green, lanceolate, 3–6 × 0.4–1.2 cm, leathery, abaxially not pruinose, midvein conspicuously raised, lateral and reticulate veins inconspicuous, adaxially with impressed midvein, lateral veins slightly visible, base cuneate, margin conspicuously revolute or not, 7–12(–15)-spinose-serrate on each side, apex acute or acuminate, aristate. Flowers 5–10-fascicled. Pedicels (3–)4–12 mm; bractlets ca. 1 mm, apex acuminate. Sepals in 2 whorls; outer sepals ovate, ca. 2 × 1 mm, apex acute; inner sepals ovate-elliptic, ca. 5.5 × 3 mm. Petals obovate, 4.5–5 × 2.5–3 mm, apex emarginate. Stamens ca. 3 mm; anther connective not prolonged, truncate. Ovules solitary, sessile. Berry ellipsoid, 8–9 × ca. 4 mm, not or sometimes slightly pruinose; style persistent, short. Fl. Apr–May, fr. May–Aug.

- Forests, thickets, roadsides, runlet sides; 1900–3500 m. Sichuan, Yunnan.

- 1a. Branches dark gray; leaf margins revolute; pedicels 4–12 mm ..... 76a. var. *grodtmanniana*
- 1b. Branches yellow; leaf margins not revolute; pedicels 3–4 mm ..... 76b. var. *flavoramea*

**76a. *Berberis grodtmanniana* var. *grodtmanniana***

安宁小檗(原变种) *an ning xiao bo* (yuan bian zhong)

Branches dark gray. Leaf margin conspicuously revolute. Pedicels 4–12 mm.

- *Quercus* forests, thickets, roadsides, mixed forests, runlet sides; 1900–3100 m. Sichuan.

**76b. *Berberis grodtmanniana* var. *flavoramea*** C. K. Schneider in Sargent, Pl. Wilson. 1: 360. 1913.

黄茎小檗 *huang jing xiao bo*

Branches yellow. Leaf margin not revolute. Pedicels 3–4 mm.

- Forests; 3300–3500 m. Yunnan.

**77. *Berberis julianae*** C. K. Schneider in Sargent, Pl. Wilson. 1: 360. 1913.

豪猪刺 *hao zhu ci*

*Berberis julianae* var. *oblongifolia* Ahrendt; *B. julianae* var. *patungensis* Ahrendt.

Shrubs, evergreen, 1–3 m tall. Branches yellow-brown or gray-brown; shoots pale yellow, sulcate, scarcely black verruculose; spines 3-fid, concolorous, 1–4 cm, stout, adaxially sulcate. Petiole 1–4 mm; leaf blade abaxially pale green, adaxially deep green, elliptic, lanceolate, or oblanceolate, 3–10 × 1–3 cm, leathery, both surfaces not pruinose, abaxially with raised midvein, lateral veins slightly raised or not, adaxially with im-

pressed midvein, lateral veins slightly visible, both surfaces with inconspicuous reticulate veins, base cuneate, margin 10–20-spinose-serrate on each side, apex acuminate. Flowers 10–25-fascicled. Pedicels 8–15 mm; bractlets ovate, ca.  $2.5 \times 1.5$  mm, apex acute. Sepals in 2 whorls; outer sepals ovate, ca.  $5 \times 3$  mm, apex acute; inner sepals oblong-elliptic, ca.  $7 \times 4$  mm, apex rounded, obtuse. Petals oblong-elliptic, ca.  $6 \times 3$  mm, base clawed, with oblong glands, apex emarginate. Anther connective not prolonged. Ovules solitary. Berry blue-black, oblong,  $7-8 \times 3.5-4$  mm, white pruinose, style persistent. Fl. Mar, fr. May–Nov.  $2n = 28+2B^*$ .

● Slopes, forests, thickets, bamboo groves; 1100–2100 m. Guangxi, Guizhou, Hubei, Hunan, Sichuan.

**78. *Berberis liophylla*** C. K. Schneider, Repert. Spec. Nov. Regni Veg. 46: 247. 1939.

滑叶小檗 hua ye xiao bo

Shrubs, evergreen, 1–2 m tall. Branches brownish gray, terete; shoots brownish yellow, sulcate, glabrous; spines 3-fid, concolorous, 1–2.5 cm, slender, adaxially flat. Leaves subsessile; leaf blade abaxially brownish yellow, adaxially dark yellow-green, elliptic to lanceolate,  $2.5-6 \times 1-1.5$  cm, leathery, both surfaces not pruinose, abaxially with raised midvein, adaxially with slightly impressed midvein, both surfaces with visible lateral veins, reticulate veins inconspicuous, base cuneate, margin sometimes slightly revolute, 5–10-spinose-serrate on each side, apex acute. Flowers 2–10-fascicled. Pedicels 8–15 mm; bractlets ovate, apex acute. Sepals in 2 whorls; outer sepals ovate, ca.  $4 \times 1.5$  mm, apex acute; inner sepals obovate, ca.  $4 \times 2$  mm. Petals obovate, ca.  $3 \times 1.5$  mm, base clawed, with separate glands, apex emarginate. Stamens ca. 3 mm; anther connective prolonged, obtuse. Ovules solitary, subsessile. Berry ellipsoid,  $7-8 \times 3-4$  mm, sometimes pruinose, style persistent. Fl. Mar–Apr, fr. Jun–Sep.

● Forest margins, thickets; 2100–2800 m. Sichuan, Yunnan.

**79. *Berberis taronensis*** Ahrendt, J. Bot. 79(Suppl.): 23. 1941.

独龙小檗 du long xiao bo

Shrubs, evergreen, 1–2 m tall. Branches dark gray, subterete, not verruculose; shoots pale yellow, sometimes sulcate; spines 3-fid, pale yellow, 5–15 mm, adaxially slightly sulcate. Leaves subsessile; leaf blade abaxially pale yellow-green, adaxially shiny, deep green, narrowly oblong-elliptic or oblong-lanceolate,  $2.5-6 \times 0.6-1.5$  cm, leathery, abaxially slightly pruinose, papillose, midvein conspicuously raised, lateral veins slightly raised, adaxially with impressed midvein, lateral veins slightly visible, both surfaces with inconspicuous reticulate veins, base cuneate, margin sometimes slightly revolute, 2–7-spinose-serrate on each side or aristate-dentate, apex acute. Flowers 2–12-fascicled. Pedicels dark red, 1–2.5 cm, slender; bractlets red, ovate, ca. 1 mm, apex acute. Sepals in 2 whorls, obovate; outer sepals ca.  $4 \times 2.5$  mm; inner sepals ca.  $6 \times 4$  mm. Petals ovate, ca.  $5.5 \times 3$  mm, base clawed, with approximate glands, apex entire. Stamens ca. 4 mm; anther connective distinctly prolonged, obtuse. Ovules 3. Berry yellow-green (immature), becoming red (mature), obovoid,  $7-8 \times 4-5$  mm, blue pruinose, style persistent. Fl. May, fr. Jun–Aug.

● Thickets, forests, forest margins; 2000–2600 m. Xizang, Yunnan.

**80. *Berberis photiniifolia*** C. M. Hu, Bull. Bot. Res., Harbin 6(2): 4. 1986 [*“photiniaefolia”*].

石楠小檗 shi nan xiao bo

Shrubs, evergreen, to 2 m tall. Branches dark gray; shoots deep purple, terete, glabrous; internodes 3–6 cm; spines 3-fid, 1–2 cm. Petiole very short; leaf blade adaxially green, shiny, lanceolate,  $4-8.5 \times 1.5-2.8$  cm, leathery, abaxially glaucous, not pruinose, midvein distinctly raised, lateral and reticulate veins conspicuous, adaxially with slightly impressed midvein, lateral veins slightly raised, reticulate veins inconspicuous, base cuneate, margin flat, 8–15-spinose-serrate on each side, apex acuminate. Flowers (2–)4–8-fascicled. Pedicels 1–1.5 cm; bractlets triangular-ovate. Sepals in 2 whorls; outer sepals ovate-oblong, 3–3.5 mm; inner sepals obovate or suborbicular, ca.  $4 \times 3.2$  mm. Petals obovate, ca. 3 mm, base clawed, with separate glands, apex subentire. Stamens ca. 2.5 mm; anther connective truncate. Ovules 3 or 4. Berry ovoid-ellipsoid,  $7-8 \times 4-5$  mm, slightly pruinose, style not persistent. Fl. and fr. unknown.

● Mountain summits; ca. 1000 m. Guangdong.

**81. *Berberis fujianensis*** C. M. Hu, Bull. Bot. Res., Harbin 6(2): 5. 1986.

福建小檗 fu jian xiao bo

Shrubs, evergreen, ca. 1 m tall. Branches deep gray, sulcate; shoots pale yellow, terete, sparsely black verruculose; spines 3-fid, 1–2 cm, adaxially flat or slightly sulcate. Petiole 3–5 mm; leaf blade abaxially shiny, adaxially green, slightly shiny, elliptic or elliptic-lanceolate,  $3-5(-7) \times 1-2(-2.5)$  cm, leathery, both surfaces not pruinose, abaxially glaucous, midvein obviously raised, adaxially with slightly impressed midvein, lateral veins slightly raised, both surfaces with inconspicuous reticulate veins, base attenuate, margin 8–14-spinose-serrate on each side, apex acute or subacuminate. Flowers (2–)4–8-fascicled. Pedicels 4–7 mm, slender; bractlets triangular-ovate, ca. 1.5 mm, apex acute. Sepals in 2 whorls; outer sepals broadly obovate or suborbicular, ca. 3.5 mm, apex rounded. Petals obovate, ca. 3 mm, base clawed, with approximate glands, apex entire, rounded, or slightly emarginate. Stamens ca. 2 mm; anther connective shortly apiculate. Ovules 2 or 3. Berry green (immature), ellipsoid,  $6-7 \times 3-4$  mm, sometimes pruinose, style not persistent. Fl. May–Jun, fr. Jul–Sep.

● Thickets, forest margins, sparse forests; 1400–2100 m. Fujian.

**82. *Berberis atrocarpa*** C. K. Schneider in Sargent, Pl. Wilson. 3: 437. 1917.

黑果小檗 hei guo xiao bo

*Berberis atrocarpa* var. *subintegra* Ahrendt; *B. silvicola* C. K. Schneider var. *angustata* Ahrendt.

Shrubs, evergreen, 1–2 m tall. Branches brownish gray or brownish black, angulate to sulcate, finely black verruculose; spines 3-fid, pale yellow, 1–4 cm, adaxially flat. Petiole short; leaf blade abaxially pale green, adaxially deep green, shiny,

lanceolate or oblong-elliptic,  $3-7 \times 0.7-1.4$  cm, thickly leathery, both surfaces not pruinose, abaxially with obviously raised midvein, adaxially with impressed midvein, both surfaces with indistinct lateral and reticulate veins, base cuneate, margin remotely 5-10-spinose-serrate on each side, occasionally subentire, apex acute. Flowers 3-10-fascicled. Pedicels reddish, 5-10 mm, glabrous. Sepals in 2 whorls; outer sepals oblong-obovate, ca.  $4 \times 2$  mm; inner sepals obovate, ca.  $7 \times 4$  mm. Petals obovate, ca.  $6 \times 4.5$  mm, base cuneate, with separate glands, apex rounded, deeply incised. Stamens ca. 4 mm. Ovules 2, sessile or very shortly funiculate. Berry black, ovoid, ca.  $5 \times 4$  mm, not pruinose, style persistent. Fl. Apr, fr. May-Aug.

• Thickets, *Pinus* forests, margins of evergreen broad-leaved forests, on rocks; 600-2800 m. Hunan, Sichuan, Yunnan.

**83. *Berberis zanlanscianensis*** Pampanini, Nuovo Giorn. Bot. Ital., n.s., 22: 293. 1915.

鄂西小檗 *e xi xiao bo*

Shrubs, evergreen, 1-2.5 m tall. Branches dark gray, angulate, not verruculose; shoots purplish red, glabrous; spines 3-fid, pale yellow, 1-1.5 cm, sometimes absent. Petiole 2-6 mm; leaf blade abaxially pale green or reddish brown, adaxially deep green, lanceolate, elliptic-lanceolate, or obovate-lanceolate,  $3-13 \times 1-2.2$  cm, leathery, both surfaces not pruinose, abaxially with conspicuously raised midvein and lateral veins, adaxially with impressed midvein, lateral veins slightly raised, both surfaces with slightly visible reticulate veins, base attenuate, margin slightly revolute when dry, 10-20-spinose-serrate on each side, apex subacuminate. Flowers 5-30-fascicled. Pedicels purplish red, 1-2.5 cm. Petals longer than outer sepals. Ovules 1-3. Berry black, ovoid,  $7-9 \times 4-5$  mm, not pruinose; style persistent, short. Seeds 1-3. Fl. Mar-May, fr. May-Sep.

• Roadsides, forests, thickets; 1400-1700 m. Hubei, Sichuan.

**84. *Berberis fallaciosa*** C. K. Schneider, Repert. Spec. Nov. Regni Veg. 46: 258. 1939.

南川小檗 *nan chuan xiao bo*

Shrubs, evergreen, 1-3 m tall. Branches dark gray, terete, glabrous; shoots gray, sulcate, scarcely verruculose; spines 3-fid, pale yellow, 1-4 cm. Petiole 2-6 mm; leaf blade abaxially yellow-green, adaxially deep green, lanceolate, elliptic-lanceolate, or obovate-lanceolate,  $3-13 \times 1-2.2$  cm, leathery, abaxially with conspicuously raised midvein, lateral veins slightly raised, adaxially with obviously impressed midvein, lateral veins slightly visible, both surfaces with inconspicuous reticulate veins, base attenuate, margin often revolute, 15-30-spinose-serrate on each side, apex subacuminate. Flowers 2-5-fascicled. Pedicels reddish, 1-2.5 cm; bractlets broadly ovate, apex obtuse. Sepals in 2 whorls, obovate; outer sepals ca.  $3.5 \times 3$  mm; inner sepals ca.  $5 \times 4$  mm. Petals oblong-obovate, ca.  $4 \times 2.3$  mm, base clawed, with approximate glands, apex emarginate. Stamens ca. 3 mm; anther connective slightly prolonged, apiculate. Ovules 2, sessile. Berry obovoid,  $6-9 \times 5-6$  mm, not pruinose, style not persistent. Fl. Apr-May, fr. Jun-Oct.

• Thickets, forests, roadsides, streamsides; 1000-2700 m. Hubei, Sichuan.

**85. *Berberis amabilis*** C. K. Schneider, Repert. Spec. Nov. Regni Veg. 46: 257. 1939.

可爱小檗 *ke ai xiao bo*

*Berberis amabilis* var. *holophylla* C. Y. Wu & S. Y. Bao.

Shrubs, evergreen, 1-2 m tall. Branches brownish gray, terete; shoots pale yellow, angulate, verruculose, glabrous; spines 3-fid, subterete, sometimes adaxially sulcate, 1-3 cm. Petiole 1-2 mm; leaf blade adaxially green, oblong-elliptic, elliptic-lanceolate, or oblanceolate,  $4-8 \times 1-1.5$  cm, leathery, abaxially white pruinose, with obviously raised midvein, lateral veins conspicuous, adaxially with obviously impressed midvein, lateral veins inconspicuous, both surfaces with inconspicuous reticulate veins, base cuneate, margin usually revolute, 3-6-spinose-serrate on each side, sometimes entire, apex acute, aristate. Flowers 6-25-fascicled. Pedicels red, 1-1.8 cm, slender, glabrous; bractlets ovate, ca.  $2 \times 1.5$  mm, apex acuminate. Sepals in 2 whorls; outer sepals broadly ovate, ca.  $5 \times 4$  mm; inner sepals elliptic or elliptic-oblong,  $6-7 \times$  ca. 4 mm. Petals obovate,  $6-7 \times$  ca. 4 mm, base clawed, with separate glands, apex emarginate. Stamens ca. 5 mm; anther connective prolonged, apiculate. Ovules 2, sessile. Berry black, ellipsoid,  $6-8 \times 3-5$  mm, not pruinose, style not persistent. Fl. and fr. Jun-Aug.

Thickets, forest margins, shaded places on slopes; 1800-3300 m. Yunnan [N Myanmar].

**86. *Berberis arguta*** (Franchet) C. K. Schneider, Bull. Herb. Boissier, sér. 2, 8: 197. 1908.

锐齿小檗 *rui chi xiao bo*

*Berberis wallichiana* Candolle f. *arguta* Franchet, Bull. Soc. Bot. France 33: 388. 1886.

Shrubs, evergreen, 1-1.5 m tall. Branches stramineous to brownish gray, terete, glabrous; spines 3-fid, concolorous, 2.5-4 cm, stout, adaxially sulcate. Leaves subsessile; leaf blade abaxially pale green, adaxially dark green, lanceolate to oblong-lanceolate,  $4.5-14 \times 1.5-2.5$  cm, leathery, abaxially not pruinose, lateral veins 13-16 pairs, both surfaces with obviously raised reticulate veins, base cuneate, margin 30-60-spinose-serrulate on each side, apex acuminate. Flowers 6-8-fascicled. Pedicels red, to 1.5 cm, glabrous. Sepals in 2 whorls; outer sepals broadly ovate, ca.  $3.5 \times 3$  mm, apex obtuse; inner sepals oblong-elliptic, ca.  $5 \times 3.5$  mm, apex obtuse. Petals obovate, ca.  $4.5 \times 3.5$  mm, base clawed, with oblong glands, apex rounded, emarginate. Stamens ca. 4 mm; anther connective truncate. Ovules 2, sessile. Berry black, ellipsoid to globose,  $6-8 \times 4-5$  mm, not pruinose, style persistent and very short; seeds 2. Fl. May-Jun, fr. Sep-Oct.

• Margins of valley forests; 1600-1800 m. Guizhou, Yunnan.

**87. *Berberis jiangxiensis*** C. M. Hu, Bull. Bot. Res., Harbin 6(2): 9. 1986.

江西小檗 *jiang xi xiao bo*

Shrubs, evergreen, ca. 1 m tall. Branches dark brown; shoots pale yellow-green, sulcate, not verruculose; spines 3-fid,

concolorous, 1–2.5 cm. Petiole 1–3 mm; leaf blade adaxially shiny, green, elliptic-oblongate, narrowly lanceolate, or oblong, 1.4–4 × 0.5–1.2 cm, thinly leathery, abaxially pruinose, midvein obviously raised, lateral veins conspicuous, reticulate veins inconspicuous, adaxially with slightly impressed midvein, lateral veins 2–4 pairs, obviously raised, base attenuate, margin 4–7-spinose-serrate on each side, apex acute. Flowers (2 or) 3- or 4-fascicled. Pedicels 6–10 mm, slender or stout; bractlets ovate, ca. 3 × 2 mm, apex acuminate. Sepals in 2 whorls; outer sepals ovate or suborbicular, 4–4.5 × ca. 4 mm; inner sepals broadly elliptic, ca. 7 × 4.5–5 mm. Petals obovate, 4–4.5 × ca. 2.5 mm, base shortly clawed, with approximate glands, apex emarginate, lobes rounded, obtuse. Stamens ca. 3.5 mm; anther connective truncate. Ovules 2–4. Berry ellipsoid, ca. 9 × 5.5 mm, slightly pruinose; style persistent, short. Fl. Apr–Jun, fr. Jul–Sep.

• Roadsides, rock crevices, sides of rocks, forests, runlet sides; 1500–1800 m. Jiangxi.

- 1a. Leaves elliptic-oblongate or narrowly lanceolate; flowers 3- or 4-fascicled; pedicels slender ..... 87a. var. *jiangxiensis*  
 1b. Leaves oblong; flowers 2- or 3-fascicled; pedicels stout ..... 87b. var. *pulchella*

#### 87a. *Berberis jiangxiensis* var. *jiangxiensis*

江西小檗(原变种) *jiang xi xiao bo* (yuan bian zhong)

Leaves elliptic-oblongate or narrowly lanceolate. Flowers 3- or 4-fascicled. Pedicels slender.

• Roadsides, rock crevices, forests, runlet sides; 1500–1800 m. Jiangxi.

87b. *Berberis jiangxiensis* var. *pulchella* C. M. Hu, Bull. Bot. Res., Harbin 6(2): 10. 1986.

短叶江西小檗 *duan ye jiang xi xiao bo*

Leaves oblong. Flowers 2- or 3-fascicled. Pedicels stout.

• Sides of rocks; ca. 1600 m. Jiangxi.

88. *Berberis weixinensis* S. Y. Bao, Bull. Bot. Res., Harbin 5(3): 13. 1985.

威信小檗 *wei xin xiao bo*

Shrubs, evergreen, 1–2 m tall. Branches blackish gray, angulate; spines 3-fid, 5–7 mm, slender. Leaves subsessile; leaf blade abaxially yellow-green, adaxially olivaceous when dry, lanceolate, 10–17 × 2–2.5 cm, leathery, abaxially not pruinose, midvein raised, adaxially with slightly impressed midvein, lateral veins 14–16 pairs, both surfaces with conspicuous reticulate veins, base cuneate, margin flat, 10–25-spinose-serrate on each side, apex acuminate. Flowers unknown. Inflorescence with 4–8-fascicled berries; fruit stalk 2–2.5 cm glabrous; berry ellipsoid, 5–6 × 4–5 mm, blue pruinose, style not persistent; seeds 2. Fl. unknown, fr. Jun–Aug.

• Mixed forests; 1400–1500 m. Yunnan.

89. *Berberis subacuminata* C. K. Schneider in Sargent, Pl. Wilson. 1: 363. 1913.

亚尖小檗 *ya jian xiao bo*

Shrubs, evergreen, to 2.5 m tall. Branches brownish gray or brownish yellow, terete; shoots pale yellow, sulcate, glabrous; spines simple or 3-fid, pale yellow, 1–2 cm, slender, sometimes absent. Petiole 2–5 mm; leaf blade abaxially yellow-green, adaxially green, lanceolate or elliptic-lanceolate, 4–9 × 1.2–2.2 cm, subleathery, abaxially with raised midvein and lateral veins, adaxially with slightly impressed or flat midvein, lateral veins conspicuous, both surfaces with inconspicuous reticulate veins, base broadly cuneate, margin 8–15-spinose-serrate on each side, apex acuminate. Flowers 2–6-fascicled. Pedicels 1.8–2.2 cm; bractlets ca. 2 × 1.5 mm. Sepals in 2 whorls; outer sepals obovate, ca. 4 × 2 mm; inner sepals broadly obovate, ca. 7 × 5 mm. Petals obovate, ca. 5 × 2.5 mm, base clawed, with approximate glands, apex emarginate. Stamens ca. 4.5 mm; anther connective truncate. Ovules 2 or 3, sessile. Berry subglobose or ellipsoid, 6–7 × ca. 5 mm, slightly pruinose, style not persistent. Fl. Mar–Apr, fr. May–Nov.

• Dry slopes, thickets, mixed forests; 1400–2500 m. Guizhou, Hunan, Yunnan.

90. *Berberis dongchuanensis* T. S. Ying, Acta Phytotax. Sin. 37: 312. 1999.

东川小檗 *dong chuan xiao bo*

Shrubs, evergreen, 0.6–1 m tall. Branches dark gray, terete, not verruculose; spines 3-fid, pale yellow, to 1 cm. Leaves subsessile; leaf blade adaxially yellow-green, narrowly elliptic, 3.5–8 × 1–2 cm, thickly leathery, abaxially thickly pruinose, midvein raised, lateral and reticulate veins indistinct, adaxially with obviously impressed midvein, lateral veins slightly conspicuous, base cuneate, margin slightly revolute, coarsely 1–4-aristate-dentate on each side, apex acute. Flowers 3–5-fascicled. Pedicels to 3.5 cm, slender, glabrous. Sepals in 3 whorls; outer sepals triangular-ovate, ca. 2 × 1.5 mm, apex acuminate; median sepals ovate-elliptic, ca. 5.1 × 3 mm; inner sepals broadly elliptic, ca. 6 × 5 mm. Petals obovate, ca. 5 × 4 mm, base clawed, with separate glands, apex rounded, entire. Stamens ca. 3.5 mm; anther connective rounded, obtuse. Ovules 4, shortly funiculate. Fruit unknown. Fl. Apr–May, fr. unknown.

• Rocky cliffs; ca. 2600 m. Yunnan.

91. *Berberis parapruinosa* T. S. Ying in C. Y. Wu, Fl. Xizang. 2: 145. 1985.

拟粉叶小檗 *ni fen ye xiao bo*

Shrubs, evergreen, 1–2 m tall. Branches pale gray; shoots pale yellow, terete; spines 3-fid, concolorous, 1.4–2.7 cm, stout. Leaves subsessile; leaf blade abaxially pale green, adaxially shiny, green, elliptic or oblong-elliptic, 3–8 × 1–2.5 cm, thickly leathery, abaxially not pruinose, midvein and lateral veins raised, adaxially with conspicuous midvein and lateral veins, both surfaces with indistinct reticulate veins, base cuneate, margin sometimes revolute, coarsely 2–6-aristate-dentate on each side, apex acute, aristate. Flowers 2–6-fascicled. Pedicels 1–2 cm, glabrous; bractlets triangular-ovate, ca. 3 × 1.5 mm. Sepals in 3 whorls; outer sepals obovate or ovate-elliptic, ca. 5.1 × 3.8 mm; median sepals elliptic, ca. 8 × 5 mm; inner sepals obovate,

ca.  $7 \times 5$  mm, apex obtuse. Petals obovate, ca.  $5.2 \times 4$  mm, base clawed, with approximate glands, apex entire. Stamens ca. 4 mm; anther connective prolonged, truncate. Ovules 3 or 4, shortly funiculate. Berry green (immature), ellipsoid,  $7-9 \times$  ca. 5 mm, not pruinose, style not persistent. Fl. May–Jun, fr. Jul–Sep.

● *Tsuga* forests; 2600–2900 m. Xizang.

**92. *Berberis jinshajiangensis*** X. H. Li, J. Trop. Subtrop. Bot. 15: 553. 2007.

小瓣小檗 *xiao ban xiao bo*

*Berberis micropetala* T. S. Ying, Acta Phytotax. Sin. 37: 313. 1999, not C. K. Schneider (1939).

Shrubs, evergreen, to 1 m tall. Shoots gray, sulcate, not verruculose; spines 3-fid, pale yellow, 1–1.2 cm, terete. Petiole 2–3 mm; leaf blade abaxially brown, adaxially dark green, elliptic or narrowly elliptic,  $1.5-4.5 \times 0.6-1.2$  cm, leathery, both surfaces not pruinose, abaxially papillose, midvein conspicuously raised, adaxially with impressed midvein, both surfaces with indistinct lateral and reticulate veins, base attenuate, cuneate, margin slightly revolute, 12–16-spinose-serrate on each side, apex acute or obtuse. Flowers 5-fascicled. Pedicels stout, 1.2–1.4 mm, but one to 3–4 mm; bractlets rose-pink, ovate, apex acuminate. Sepals in 3 whorls; outer sepals lanceolate,  $2.1-3 \times 1-1.1$  mm, upper part rose-pink; median sepals ovate-elliptic, ca.  $4.1 \times 2$  mm, margin membranous, hyaline, apex rose-pink; inner sepals obovate-elliptic, ca.  $4.3 \times 2$  mm. Petals obovate,  $2.2-2.5 \times 1-1.1$  mm, base clawed, with separate oblong glands, apex entire. Stamens ca. 1.5 mm; anther connective prolonged, truncate. Ovules solitary, shortly funiculate. Fruit unknown. Fl. Apr, fr. unknown.

● Sunny slopes, mixed forests; 2800–3200 m. Yunnan.

**93. *Berberis kawakamii*** Hayata, J. Coll. Sci. Imp. Univ. Tokyo 30(1): 24. 1911.

台湾小檗 *tai wan xiao bo*

*Berberis brevisepala* Hayata; *B. chingshuiensis* T. Shimizu; *B. densifolia* Bijhouwer (1928), not Rusby (1920); *B. formosana* Ahrendt (1941), not H. L. Li (1952); *B. kawakamii* var. *formosana* Ahrendt; *B. nantoensis* C. K. Schneider.

Shrubs, evergreen, 1–2 m tall. Branches dark gray, terete; shoots pale yellow, sulcate, verruculose; spines 3-fid, concolorous, 1.5–2 cm, not sulcate. Leaves subsessile; leaf blade abaxially pale green, adaxially dark green, elliptic, ovate-oblong, or oblong-lanceolate to obovate-oblong or oblanceolate,  $2.5-4.5 \times 1-1.5$  cm, leathery, both surfaces not pruinose, abaxially with obviously raised midvein, lateral veins impressed, adaxially with obviously impressed midvein, lateral veins visible, both surfaces with conspicuous reticulate veins, base cuneate, margin 3–8-spinose-serrate on each side, sometimes coarsely 1- or 2-aristate-dentate on each side, apex acute, aristate. Flowers 7–15-fascicled. Pedicels 7–15 mm; bractlets lanceolate, ca.  $2.5 \times 1$  mm, apex acuminate. Sepals in 2 whorls; outer sepals lanceolate or ovate, ca.  $3.5 \times 2$  mm, apex acuminate; inner sepals lanceolate or oblong-elliptic,  $8-9 \times$  ca. 3.5 mm, apex acuminate or obtuse. Petals oblong or oblong-obo-

vate,  $4-5 \times$  ca. 3.2 mm, base cuneate, with separate glands, apex entire or slightly incised. Anther connective slightly prolonged, truncate. Ovules 2 or 3, shortly funiculate. Berry ovoid, ca.  $9 \times 5$  mm, slightly pruinose, style persistent. Fl. Mar–May, fr. Aug–Oct.

● Thickets, forests; 2500–3500 m. Taiwan.

**94. *Berberis bicolor*** H. Léveillé, Repert. Spec. Nov. Regni Veg. 9: 454. 1911.

二色小檗 *er se xiao bo*

Shrubs, evergreen, 1–2 m tall. Branches pale yellow-brown or slightly gray, terete, glabrous; spines 3-fid, concolorous, 1–1.5 cm. Leaves shortly petiolate; leaf blade abaxially pale green, adaxially deep green, narrowly elliptic or elliptic-lanceolate,  $6-10 \times 1.7-2.2$  cm, thinly leathery, abaxially pruinose, midvein obviously raised, lateral veins slightly raised, adaxially with obviously impressed midvein, lateral veins slightly raised, both surfaces with indistinct reticulate veins, base cuneate, margin 10–25-spinose-serrate on each side, apex acuminate. Flowers 3–6-fascicled, reddish yellow. Pedicels 1–1.2 cm, slender; bractlets triangular-ovate,  $2-2.5 \times 1-1.5$  mm, apex acute. Sepals in 2 whorls; outer sepals elliptic, ca.  $5 \times 3$  mm, apex acute; inner sepals obovate, ca.  $6.2 \times 4$  mm. Petals obovate, ca.  $5 \times 3$  mm, base clawed, with approximate glands, apex emarginate or subentire. Stamens ca. 3 mm; anther connective not prolonged, truncate. Ovules 2. Berry (immature) green, ellipsoid, slightly pruinose, style not persistent. Fl. Apr–May, fr. Jun–Aug.

● Forests, shaded places on slopes; 1400–1500 m. Guizhou.

**95. *Berberis chunanensis*** T. S. Ying in S. Y. Jin & Y. L. Chen, Cat. Type Spec. Herb. China (Suppl. II), 52. 2007.

淳安小檗 *chun an xiao bo*

Shrubs, evergreen, ca. 1 m tall. Branches dark gray, terete; shoots pale yellow; spines 3-fid, pale yellow, 1.2–1.7 cm. Leaves subsessile; leaf blade abaxially pale yellow, adaxially dark green, ovate-elliptic,  $1.5-3.5 \times 0.5-1.3$  cm, leathery, both surfaces not pruinose, abaxially with raised midvein, adaxially with slightly impressed midvein, lateral veins conspicuous, reticulate veins indistinct, base broadly cuneate, margin 3–7-spinose-serrate on each side, apex acuminate, aristate. Flowers 4–8-fascicled. Pedicels pale brownish yellow, 1.2–2 cm, glabrous. Sepals in 2 whorls; outer sepals ovate or ovate-elliptic,  $2.1-3.2 \times 1.1-2.2$  mm; inner sepals elliptic,  $6.5-7.2 \times 4.2-5$  mm. Petals obovate,  $6-6.5 \times 3-3.5$  mm, base broadly cuneate, with separate glands, apex entire, sometimes slightly emarginate. Stamens ca. 5 mm; anther connective prolonged, rounded. Ovules 2 or 3, funiculate. Fruit stalk reddish brown; berry ellipsoid,  $8-12 \times 5-6$  mm, pruinose, style ca. 1 mm. Fl. Apr–May, fr. Jul–Oct.

● Forests, rocky crevices; ca. 500 m. Zhejiang (Chun'an).

**96. *Berberis jinfoshanensis*** T. S. Ying, Acta Phytotax. Sin. 37: 316. 1999.

金佛山小檗 *jin fo shan xiao bo*

Shrubs, evergreen, 1.5–2 m tall. Branches dark gray,

terete, not verruculose; shoots stramineous, glabrous; spines 3-fid, concolorous, 1–3.5 cm, adaxially slightly sulcate. Petiole 2–4 mm; leaf blade abaxially grayish white or yellow-green, adaxially dark green, elliptic, 3–7 × 1.3–2.5 cm, leathery, abaxially slightly pruinose, midvein and lateral veins raised, adaxially with impressed midvein, lateral veins 5–7 pairs, slightly raised, both surfaces with indistinct reticulate veins, base cuneate, margin 3–10-spinose-serrate on each side, apex acute. Flowers 5–8-fascicled; bracts ovate-triangular, ca. 2 × 1 mm. Pedicels 1.5–2 cm, glabrous; bractlets ovate, ca. 2 × 2 mm. Sepals in 2 whorls; outer sepals obovate, ca. 5 × 3.5 mm; inner sepals oblong, ca. 5.5 × 4 mm. Petals obovate, 5–6 × 4–5.5 mm, base clawed, with approximate ovate glands, apex entire. Stamens 4.2–5 mm; anther connective slightly prolonged, obtuse. Ovules (2 or) 3. Berry (immature) black, ellipsoid, 7–8 × 5–6 mm, densely white pruinose, style persistent. Fl. Mar–Apr, fr. May–Aug.

- Mixed forests, weedy slopes; ca. 1600 m. Chongqing.

**97. *Berberis hayatana*** Mizushima, Misc. Rep. Res. Inst. Nat. Resources 35: 31. 1954.

南湖小檗 *nan hu xiao bo*

*Berberis formosana* H. L. Li (1952), not Ahrendt (1941).

Shrubs, evergreen, low. Branches pale gray, slender, sulcate, glabrous; spines 3-fid, weak, 1–1.5 cm, adaxially sulcate. Leaves shortly petiolate; leaf blade abaxially shiny, green, oblong, oblong-lanceolate, or elliptic, 1.5–3 × 0.6–1.2 cm, leathery, abaxially not pruinose, midvein obviously raised, lateral veins 5–7 pairs, adaxially glaucous, midvein slightly impressed, base broadly cuneate, margin flat, 3–7-spinose-serrate on each side, apex acute, aristate. Flowers 2–6-fascicled. Pedicels 8–10 mm, slender, glabrous; bractlets triangular-ovate, ca. 1.5 mm, apex acute. Sepals in 2 whorls; outer sepals broadly ovate or obovate-elliptic, ca. 5 mm, apex acute; inner sepals obovate-elliptic or obovate, ca. 5 mm, apex rounded. Petals obovate, ca. 4 mm, base attenuate, with separate glands, apex emarginate. Stamens ca. 2.5 mm; anther connective slightly prolonged, truncate. Ovules solitary, funiculate. Berry black, ellipsoid or ovoid, 4–6 × ca. 2 mm, pruinose, style not persistent. Fl. and fr. unknown.

- Slopes. Taiwan.

**98. *Berberis cavaleriei*** H. Lévêillé, Repert. Spec. Nov. Regni Veg. 9: 454. 1911.

*Berberis dolichostemon* Ahrendt; *B. emilii* C. K. Schneider; *B. liophylla* C. K. Schneider var. *conglobata* Ahrendt; *B. praecipua* C. K. Schneider var. *major* Ahrendt.

Shrubs, evergreen, ca. 2 m tall. Branches brownish gray; shoots brownish yellow, very sulcate, sparsely black verruculose; spines 3-fid, 1–2.5 cm, adaxially slightly sulcate or flat. Petiole 1–2.5 mm; leaf blade abaxially yellow-green, adaxially dark green, elliptic or oblong-elliptic, 2.5–6 × 1–1.5 cm, leathery, both surfaces not pruinose, abaxially with conspicuously raised midvein, adaxially with obviously impressed midvein,

both surfaces with slightly prominent lateral veins, reticulate veins indistinct, base cuneate, margin slightly revolute, 6–15-spinose-serrate on each side, apex obtuse or subacute. Flowers 5–20-fascicled. Pedicels 8–20 mm, slender; bractlets ovate, ca. 2.5 mm, apex acuminate. Sepals in 2 whorls; outer sepals ovate or narrowly ovate, ca. 3 × 1 mm, apex obtuse or acute; inner sepals obovate or narrowly obovate, 2–4.5 × 1–1.5 mm, apex subacute. Petals ovate or obovate, ca. 5.5 × 2.8 mm, base with separate glands, apex incised. Stamens 2.5–4 mm; anther connective truncate. Ovules solitary, shortly funiculate. Berry black, oblong, 7–8 × ca. 4 mm, not pruinose, style persistent. Fl. Apr–May, fr. Jul–Oct.

- Thickets, roadsides, forests; 900–1800 m. Guizhou, Yunnan.

**99. *Berberis aristatoserrulata*** Hayata, Icon. Pl. Formosan. 3: 13. 1913 [*“aristato-serrulata”*].

密齿小檗 *mi chi xiao bo*

*Berberis mingetsensis* Hayata.

Shrubs, evergreen, ca. 1 m tall. Branches slender, sulcate; spines 3-fid, 2–4 mm, slender. Petiole 2–4 mm; leaf blade adaxially shiny, green, oblong-lanceolate, 5–7 × 1–1.5 cm, thinly leathery, abaxially glaucous, reticulate veins obviously raised, adaxially with indistinct reticulate veins, base cuneate, margin slightly revolute, closely 20–40-spinulose-serrulate on each side, apex obtuse, aristate. Flowers 10–15-fascicled, green-yellow. Pedicels ca. 1 cm; bractlets oblong-ovate, ca. 2.5 mm, apex acuminate. Sepals in 2 whorls, obovate; outer sepals ca. 5 × 4 mm; inner sepals to 5.5 mm. Petals obovate-spatulate, 3–5 × 2–2.5 mm, base with separate glands, apex rounded, incised. Ovules 2, funicles ca. as long as or to 2 × as long as ovules. Berry dark blue-black, ovoid, ca. 7 × 4 mm. Fl. and fr. May–Aug.

- Thickets; 2000–3000 m. Taiwan.

**100. *Berberis silvicola*** C. K. Schneider in Sargent, Pl. Wilson. 3: 438. 1917.

兴山小檗 *xing shan xiao bo*

Shrubs, evergreen, 1–3 m tall. Branches deep gray, angulate, not verruculose; shoots stramineous, glabrous; internodes 3.5–5.5 cm; spines 3-fid, 3–10 mm, slender, sometimes absent. Petiole 1–3 mm; leaf blade abaxially pale green, adaxially deep green, shiny, elliptic or oblong, 2–5 × 1–2 cm, thinly leathery, abaxially not pruinose, midvein obviously raised, lateral and reticulate veins conspicuous, adaxially with obviously impressed midvein, lateral and reticulate veins indistinct, base cuneate or shortly attenuate, margin 12–16-spinose-serrate on each side, apex acute. Flowers 2–5-fascicled. Pedicels 5–12 mm, slender; bractlets ovate, ca. 2.5 × 1 mm, apex acute. Sepals in 2 whorls; outer sepals ovate, ca. 4 × 1.8 mm, apex obtuse; inner sepals obovate, ca. 6 × 3.5 mm, apex rounded. Petals obovate, ca. 5 × 3 mm, base cuneate, with separate glands, apex incised. Stamens 5–8 mm; anther connective slightly prolonged, truncate. Ovules 2. Fruit stalk to 1.5 cm; berry black, oblong, ca. 8 × 4–5 mm, slightly pruinose; style persistent, short. Fl. May–Jun, fr. Jul–Oct.

- Thickets; 1200–2400 m. Hubei.

**101. *Berberis pruinosa*** Franchet, Bull. Soc. Bot. France 33: 387. 1886.

粉叶小檗 *fen ye xiao bo*

Shrubs, evergreen, 1–2 m tall. Branches brownish gray or brownish yellow, terete, black verruculose; spines 3-fid, concolorous, 2–3.3 cm, stout, adaxially sulcate or flat. Leaves subsessile; leaf blade adaxially shiny, yellow-green or grayish green, elliptic to obovate, 2–6 × 1–2.5 cm, rigidly leathery, abaxially pruinose or not, midvein obviously raised, lateral veins indistinct, adaxially with flat midvein, lateral veins slightly raised, both surfaces with indistinct reticulate veins, base cuneate, margin slightly revolute or flat, usually coarsely 1–6-aristate-dentate on each side, occasionally entire or 3–5-spinose-serrate on each side, apex obtuse or shortly acuminate. Flowers (8–)10–20-fascicled. Pedicels 1–2 cm, slender; bractlets lanceolate, ca. 2 mm, apex acuminate. Sepals in 2 whorls; outer sepals oblong-elliptic, ca. 4 × 2 mm, apex obtuse, rounded; inner sepals obovate, ca. 6.5 × 5 mm, apex rounded. Petals obovate, ca. 7 × 4–5 mm, base clawed, with completely basal glands, apex deeply incised or entire. Stamens ca. 6 mm; anther connective not prolonged, rounded-truncate. Ovules 2 or 3. Berry ellipsoid or subglobose, 6–7 × 4–5 mm, densely white pruinose, style not persistent; seeds 2. Fl. Mar–Apr, fr. Jun–Aug.

• Thickets, forests, forest margins, roadsides; 1800–4000 m. Guizhou, Sichuan, Xizang, Yunnan.

- 1a. Petals deeply incised at apex; leaf margin usually coarsely 1–6-aristate-dentate on each side, occasionally entire ..... 101a. var. *pruinosa*

刺黑珠 *ci hei zhu*

*Berberis recurvata* Ahrendt; *B. simulans* C. K. Schneider.

Shrubs, evergreen, 1–3 m tall. Stems terete; branches grayish brown; shoots reddish, usually not verruculose, rarely scarcely black verruculose; internodes 3–6 cm; spines 3-fid, 1–4 cm, adaxially sulcate. Leaves subsessile; leaf blade abaxially yellow-green or pale green, adaxially shiny, dark green, oblong-elliptic, 4–15 × 1.5–6.5 cm, thickly leathery, abaxially with conspicuously raised midvein, lateral and reticulate veins prominent, adaxially with impressed midvein, lateral veins slightly raised, reticulate veins indistinct, base cuneate, margin 15–25-spinose-serrate on each side, apex acute. Flowers 4–10-fascicled. Pedicels 1–2 cm; bractlets red, ca. 2 × 2 mm. Sepals in 3 whorls; outer sepals with a red band along middle, ovate, ca. 3.5 × 3 mm, apex subacute; median sepals rhombic-elliptic, ca. 5 × 4.5 mm; inner sepals obovate, ca. 6.5 × 5 mm. Petals obovate, ca. 6 × 4.5 mm, base cuneate, with contiguous, orange glands, apex emarginate with rounded lobes. Stamens ca. 4.5 mm; anther connective truncate. Ovules 1 or 2. Berry black, oblong or oblong-ellipsoid, 6–8 × 4–6 mm, not pruinose, style not persistent. Fl. Apr–May, fr. Jun–Nov.

• Thickets, roadsides, bamboo forests, streamsides of forest understories; 700–2100 m. Hubei, Sichuan.

**104. *Berberis lempergiana*** Ahrendt, Gard. Chron., ser. 3, 109: 101. 1941.

天台小檗 *tian tai xiao bo*

Shrubs, evergreen, 1–2 m tall. Branches deep gray, sparsely black verruculose; shoots pale grayish yellow; spines 3-fid, subterete, 1–3 cm, stout. Petiole 1–5 mm; leaf blade abaxially pale green, brownish yellow when dry, slightly shiny, adaxially shiny, dark green, oblong-elliptic or lanceolate, 3.5–8 × 1–2.5 cm, leathery, abaxially not pruinose, midvein obviously raised, lateral and reticulate veins indistinct, adaxially with impressed midvein, lateral veins slightly visible, reticulate veins indistinct, base cuneate, margin 5–12-spinose-serrate on each

side, apex acuminate. Flowers 3–7-fascicled. Pedicels reddish, 7–15 mm; bractlets red, ovate, ca. 1.3 mm. Sepals in 3 whorls; outer sepals ovate-elliptic, ca.  $2.5 \times 2$  mm; median sepals ovate-elliptic, ca.  $5.5 \times 4$  mm; inner sepals obovate, ca.  $7 \times 6$  mm. Petals oblong-obovate, ca.  $6 \times 4$  mm, base cuneate, with contiguous glands, apex emarginate with rounded lobes. Stamens ca. 5 mm; anther connective obviously prolonged, truncate. Ovules 2 or 3, subsessile. Berry deep purple, oblong-ellipsoid or ellipsoid,  $7-10 \times 5-5.5$  mm, pruinose, style persistent; seeds 2 or 3, obovoid-globose or ellipsoid. Fl. Apr–May, fr. Jul–Oct.

- Forests, thickets, streamsides; ca. 1200 m. Zhejiang.

**105. *Berberis soulieana*** C. K. Schneider, Bull. Herb. Boissier, sér. 2, 5: 449. 1905.

假豪猪刺 jia hao zhu ci

*Berberis soulieana* var. *paucinervata* Ahrendt; *B. stenophylla* Hance (1882), not Lindley (1864).

Shrubs, evergreen, 1–2(–3) m tall. Branches dark gray, terete, sometimes sulcate, scarcely verruculose; shoots grayish yellow, terete; spines 3-fid, adaxially flat, 1–2.5 cm, stout. Petiole 1–2 mm; leaf blade abaxially yellow-green, adaxially dark green, oblong, oblong-elliptic, or oblong-obovate,  $3.5-10 \times 1-2.5$  cm, very rigidly leathery, abaxially not pruinose, midvein obviously raised, adaxially with impressed midvein, both surfaces with indistinct lateral and reticulate veins, base cuneate, margin 5–18-spinose-serrate on each side, apex acute, aristate. Flowers 7–20-fascicled. Pedicels 5–11 mm; bractlets 2, reddish, ovate-triangular, ca.  $2.2 \times 1.5$  mm, apex acute. Sepals in 3 whorls; outer sepals ovate, ca.  $3 \times 2.4$  mm; median sepals sub-orbicular, ca.  $5 \times 4$  mm; inner sepals obovate-oblong, ca.  $7 \times 5$  mm. Petals obovate, ca.  $5 \times 3.8-4$  mm, base shortly clawed, with separate glands, apex emarginate. Stamens ca. 3 mm; anther connective slightly prolonged, rounded. Ovules 2 or 3. Berry red when mature, obovoid-oblong,  $7-8 \times$  ca. 5 mm, pruinose, style persistent; seeds 2 or 3. Fl. Mar–Apr, fr. Jun–Sep.

- Thickets, streamsides, forests, slopes; 600–1800 m. Gansu, Hubei, Shaanxi, Sichuan.

**106. *Berberis impedita*** C. K. Schneider, Repert. Spec. Nov. Regni Veg. 46: 263. 1939.

南岭小檗 nan ling xiao bo

Shrubs, evergreen, 0.5–1 m tall. Branches dark gray, angulate, not verruculose; shoots pale yellow; spines absent or very weak, 3-fid, pale yellow, ca. 1 cm. Petiole 5–8 mm; leaf blade abaxially grayish green or yellowish green, adaxially dark green, elliptic, oblong, or narrowly elliptic,  $4-9 \times 1.8-3.5$  cm, leathery, abaxially with obviously raised midvein and lateral veins, reticulate veins inconspicuous, adaxially with impressed midvein, lateral veins slightly raised, reticulate veins indistinct, base attenuate, margin 8–12-spinose-serrate on each side, apex obtuse or acute. Flowers 2–4-fascicled. Pedicels 8–18 mm; bractlets ovate, ca. 2.5 mm, apex acute. Sepals in 2 whorls; outer sepals elliptic-oblong,  $3.5-4.5 \times 1.8-2.5$  mm; inner sepals elliptic,  $5-5.5 \times 3-3.5$  mm, apex rounded. Petals obovate, ca.  $4 \times 2.5$  mm, apex emarginate. Stamens ca. 3 mm; anther connective slightly thickened with 2 small teeth. Ovules 4–6. Fruit stalk

often reddish. Berry black, oblong,  $8-9 \times 5-6$  mm, not pruinose, style not persistent. Fl. Apr–May, fr. Jun–Oct.

- Sunny places on mountain summits, forests, thickets, sparse forests, roadsides; 1400–2800 m. Guangdong, Guangxi, Hunan, Jiangxi, Sichuan.

**107. *Berberis hsuyunensis*** P. K. Hsiao & W. C. Sung, Acta Phytotax. Sin. 12: 388. 1974.

叙永小檗 xu yong xiao bo

Shrubs, evergreen, 1–2 m tall. Branches gray; shoots purplish brown, slightly angulate; internodes 5–6 cm; spines 3-fid, to 1 cm, slender. Petiole 2–3 mm; leaf blade abaxially yellow-green, adaxially green, oblong-elliptic, elliptic, or broadly elliptic,  $6-9 \times 3-5$  cm, thickly leathery, abaxially pruinose, midvein and lateral veins conspicuously raised, adaxially with slightly raised midvein and lateral veins, reticulate veins visible, base cuneate, margin 5–9-spinose-serrate on each side, or above middle 3–5-spinose-serrate on each side, apex acute. Flowers 30–50-fascicled. Pedicels 1.5–2 cm; bractlets triangular, ca.  $1 \times 1$  mm. Sepals in 2 whorls; outer sepals triangular-ovate, ca.  $3 \times 2.5$  mm; inner sepals broadly ovate, ca.  $4 \times 4$  mm, apex obtuse. Petals obovate, ca.  $4.5 \times 3.5$  mm, base clawed, with separate glands, apex slightly emarginate to subrounded. Stamens ca. 2 mm; anther connective prolonged, truncate. Ovules 5 or 6, shortly funiculate or subsessile. Berry black, subglobose, ca.  $7 \times 6$  mm, pruinose, style not persistent. Fl. May–Jun, fr. Jul–Sep.

- Forests, streamsides; 1200–1600 m. Sichuan.

**108. *Berberis deinacantha*** C. K. Schneider, Repert. Spec. Nov. Regni Veg. 46: 259. 1939.

壮刺小檗 zhuang ci xiao bo

Shrubs, evergreen, 1–2 m tall. Branches brownish gray, angulate, black verruculose, glabrous; shoots brownish yellow; spines 3-fid, 2.5–5 cm, stout, adaxially sulcate. Petiole 2–4 mm; leaf blade abaxially yellow-green, adaxially dark castaneous, oblong-elliptic,  $3-12 \times 1.5-3$  cm, leathery, both surfaces not pruinose, abaxially with obviously raised midvein, lateral veins slightly raised, adaxially with obviously impressed midvein, lateral veins 12–15 pairs, both surfaces with prominent reticulate veins, base cuneate, margin sometimes slightly revolute, 20–30-spinose-serrate on each side, apex obtuse, aristate. Flowers 6–15(–20)-fascicled, deep yellow. Pedicels 12–15(–20) mm. Sepals in 2 whorls; outer sepals ovate, ca.  $4 \times 3.5$  mm, apex rounded, obtuse; inner sepals obovate or obovate-orbicular, ca.  $5.5 \times 5$  mm. Petals oblong-obovate, ca.  $4.5 \times 3$  mm, base not clawed, with separate glands, apex slightly emarginate. Stamens ca. 3 mm; anther connective prolonged, slightly retuse. Ovules solitary. Berry purplish black, ellipsoid,  $6-7 \times$  ca. 4 mm, slightly pruinose, style not persistent. Fl. May, fr. Nov.

- Thickets, forests; 1700–3100 m. Guizhou, Sichuan, Yunnan.

**109. *Berberis valida*** (C. K. Schneider) C. K. Schneider, Mitt. Deutsch. Dendrol. Ges. 55: 40. 1942.

宁远小檗 ning yuan xiao bo

*Berberis deinacantha* C. K. Schneider var. *valida* C. K. Schneider, Repert. Spec. Nov. Regni Veg. 46: 260. 1939.

Shrubs, evergreen, ca. 1.5 m tall. Branches brownish gray, angulate, scarcely black verruculose, glabrous; shoots brownish yellow, glabrous; spines 3-fid, brownish yellow, 1–2 cm, stout, adaxially flat. Petiole 2–3 mm or leaf sessile; leaf blade abaxially yellow-green, adaxially shiny, deep green, elliptic or oblong-elliptic, 4–7 × 1.5–3 cm, leathery, abaxially not pruinose, midvein obviously raised, lateral and reticulate veins conspicuous, adaxially with obviously impressed midvein, lateral and reticulate veins prominent, base cuneate, margin sometimes slightly revolute, 8–16-spinose-serrate on each side, apex acute or rounded, obtuse. Flowers 3–5-fascicled. Pedicels 6–10 mm; bractlets ca. 2 mm. Sepals in 2 whorls; outer sepals ovate, ca. 4 × 3.5 mm; inner sepals obovate-orbicular, ca. 5.5 × 5 mm. Petals oblong-obovate, ca. 4.5 mm, base attenuate, with separate glands, apex emarginate. Ovules solitary. Berry purplish black, ellipsoid, 8–9 × 5–6 mm, not pruinose; style persistent, short. Fl. May–Jun, fr. Nov.

• Thickets; ca. 2000 m. Sichuan, Yunnan.

**110. *Berberis nemorosa*** C. K. Schneider, Repert. Spec. Nov. Regni Veg. 46: 246. 1939.

林地小檗 *lin di xiao bo*

Shrubs, evergreen, ca. 1.5 m tall. Branches gray; shoots pale yellow-gray, angulate; internodes 2.5–3 cm; spines yellow-brown, terete, 1–2 cm, slender. Petiole 1–4 mm; leaf blade abaxially ultimately slightly brown, adaxially shiny, green, oblong-elliptic, 2–4 × 1–1.5 cm, leathery, abaxially initially glaucous, pruinose, both surfaces with indistinct reticulate veins, base attenuate, margin slightly revolute, 7–16-spinose-serrate on each side, apex obtuse. Flowers unknown. Ovules solitary, sessile. Inflorescence with 5–7-fascicled berries; fruit stalk reddish, 1.2–1.5 cm; berry ellipsoid, 6–7 mm, white pruinose; style persistent, short. Fl. unknown, fr. Jun.

• Thickets; ca. 1400 m. Guangxi.

**111. *Berberis chingii*** S. S. Cheng, Contr. Biol. Lab. Sci. Soc. China, Bot. Ser. 9: 191. 1934.

华东小檗 *hua dong xiao bo*

*Berberis cavaleriei* H. Léveillé var. *pruinosa* Bijhouwer; *B. chingii* subsp. *subdentata* C. M. Hu; *B. chingii* subsp. *wulingensis* C. M. Hu.

Shrubs, evergreen, 1–2 m tall. Branches dark gray; shoots pale yellow, terete or slightly angulate, sparsely black verruculose; spines 3-fid, concolorous, 1–2.5 cm, stout. Petiole 2–4 mm; leaf blade adaxially dark green, sometimes shiny, oblong-oblancoate or narrowly oblong-elliptic, 2–8 × 0.8–2.5 cm, thinly leathery, abaxially pruinose, midvein raised, lateral veins indistinct, adaxially with obviously impressed midvein, lateral veins 5–10 pairs, both surfaces with inconspicuous reticulate veins, base cuneate, margin above middle 2–10-spinose-serrate on each side, occasionally entire, apex acute. Flowers 4–14-fascicled. Pedicels 7–18 mm; bractlets triangular. Sepals in 2 whorls; outer sepals elliptic, 5–5.5 mm, apex obtuse; inner sepals obovate-oblong, ca. 6.5 mm. Petals obovate, ca. 5.5 × 3 mm, base clawed, with approximate glands, apex emarginate. Stamens ca. 4.5 mm; anther connective prolonged, obtuse.

Ovules 2 or 3. Berry ellipsoid or obovoid-ellipsoid, 6–8 × 4–5 mm, pruinose, style persistent. Fl. Apr–May, fr. Jun–Sep.

• Mixed forests, thickets, runlet sides, limestone slopes; 200–2000 m. Fujian, Guangdong, Hunan, Jiangxi.

**112. *Berberis vinifera*** T. S. Ying in C. Y. Wu, Fl. Xizang. 2: 142. 1985.

可食小檗 *ke shi xiao bo*

Shrubs, evergreen, 1–3 m tall. Branches grayish black, terete; shoots dark gray, angulate, puberulous; spines 3-fid, concolorous, 4–10 mm. Leaves sessile; leaf blade abaxially pale gray-brown, adaxially dark green, elliptic or broadly elliptic, rarely obovate, 1.5–4.5 × 0.6–1.8 cm, leathery, abaxially not pruinose, midvein and lateral veins obviously raised, adaxially with slightly raised midvein and lateral veins, both surfaces with conspicuously raised dense reticulate veins, base broadly cuneate, margin 1–4-spinose-serrate on each side, occasionally entire, apex rounded. Flowers unknown. Inflorescence with 4–20-fascicled berries; fruit stalk 7–18 mm; berry purplish black, ovoid-globose, 8–10 × 5–7 mm, white pruinose, style 1–2 mm; seeds 4 or 5. Fl. unknown, fr. May–Jul.

• Thickets, mixed forests; 2200–2500 m. Xizang.

**113. *Berberis dumicola*** C. K. Schneider, Repert. Spec. Nov. Regni Veg. 46: 249. 1939.

威宁小檗 *wei ning xiao bo*

Shrubs, evergreen, ca. 1 m tall. Branches grayish brown; shoots pale yellow, angulate, densely puberulous; spines 3-fid, pale yellow, 5–10 mm, slender. Leaves subsessile; leaf blade adaxially deep green, narrowly obovate-elliptic, narrowly elliptic, or obovate, 0.4–2 cm × 2–5 mm, papery, adaxially not pruinose, midvein and lateral veins raised, reticulate veins inconspicuous, base cuneate, margin thickened, slightly revolute, entire or 1–6-spinose-serrate on each side, apex acute or obtuse, aristate. Inflorescence a subumbel, 4–6-flowered, 2–3 cm including peduncle 1.3–2.3 cm; bracts ovate, apex acuminate. Pedicels 3–4 mm, slender, glabrous; bractlets triangular-ovate, 1–1.7 × 0.8–1.1 mm. Flowers golden-yellow, 4–5 mm in diam. Sepals in 2 whorls; outer sepals elliptic, ca. 3.2 × 2.5 mm; inner sepals broadly obovate, ca. 3.5 × 3.2 mm. Petals obovate, ca. 3.1 × 2 mm, base attenuate, not clawed, with separate lanceolate glands, apex incised, lobes acute. Stamens ca. 2.5 mm; anther connective prolonged, rounded. Ovules 3, subsessile. Berry red, ovoid-oblong, 7–9 × 4–6 mm, not pruinose, style ca. 0.5 mm. Fl. May, fr. Jul–Sep.

- Thickets, weedy places on mountain summits; 2100–2500 m. Guizhou.

**120. *Berberis johannis*** Ahrendt, Gard. Chron., ser. 3, 109: 101. 1941.

腰果小檗 *yao guo xiao bo*

Shrubs, deciduous, 1.5–2 m tall. Branches gray; shoots pale brown, slightly sulcate, glabrous, scarcely black verruculose; spines 3-fid, 0.5–1.5 cm, slender, flat. Leaves subsessile; leaf blade abaxially gray, adaxially dark green, oblanceolate or obovate, 0.8–3 × 0.3–1.2 cm, papery, abaxially slightly pruinose, both surfaces with obviously raised reticulate veins, base cuneate, margin entire, sometimes 2–5-spinose on each side, apex acute or obtuse. Inflorescence an umbel, 3–10-flowered, 2–3 cm including peduncles 3–10 mm, often base with 1 or several fascicled flowers; bracts triangular-ovate, ca. 1 mm. Pedicels 5–12 mm, slender. Sepals in 3 whorls; outer sepals oblong-triangular, ca. 2.5 × 1.5 mm, apex acute; median sepals oblong-ovate, ca. 4 × 2 mm, apex subobtuse; inner sepals elliptic, ca. 5 × 2.5 mm. Petals obovate, ca. 4.5 × 3 mm, base clawed, with approximate obovate glands, apex emarginate, lobes acute. Stamens ca. 2.5 mm; anther connective slightly prolonged, truncate. Ovules 4, funiculate; funicles ca. as long as ovules. Berry shiny, red, oblong-ellipsoid or oblong-ovoid, 11–13 × 3–4.5 mm, contracted at middle, not pruinose, apex usually bent, style not persistent. Fl. May–Jun, fr. Jul–Oct.

- Forests, thickets; 3000–4000 m. Xizang.

**121. *Berberis leboensis*** T. S. Ying, Acta Phytotax. Sin. 37: 328. 1999.

雷波小檗 *lei bo xiao bo*

Shrubs, deciduous, 1.3–2 m tall. Branches gray-brown, angulate, not verruculose; shoots dark purplish brown, glabrous; spines 3-fid, pale yellow, 1–1.5 cm. Leaves subsessile; leaf blade abaxially grayish white, adaxially dark green, narrowly elliptic or narrowly obovate, 1–1.8 cm × 3–5 mm, papery, abaxially with obviously raised midvein, lateral and reticulate veins conspicuous, adaxially with raised midvein and lateral veins, reticulate veins conspicuous, base attenuate, margin entire or 1–4-spinose-serrate on each side, apex acute, aristate. Inflorescence an umbel or subumbel, 3–7-flowered, 4–5 cm including dark brown peduncle 2.5–3.5 cm; bracts leaflike, ca. 7 mm; bractlets ovate-lanceolate, ca. 2.5 mm. Sepals in 2 whorls; outer sepals ovate-elliptic, ca. 2.8 × 1.5 mm; inner sepals broadly elliptic, 4–4.3 × ca. 3 mm. Petals broadly elliptic, 4–4.5 × ca. 3 mm, base clawed, with separate elliptic glands, apex slightly incised. Stamens ca. 3 mm; anther connective prolonged, rounded, obtuse. Ovules 2, subsessile. Berry (immature) green, obovoid-oblong, 9–10 × 5–6 mm, contracted at lower part, not pruinose, style persistent; seeds 2. Fl. Jun–Jul, fr. Jul–Oct.

- Slopes, thickets, roadsides, weedy places on mountain summits; 2700–3500 m. Sichuan.

**122. *Berberis umbratica*** T. S. Ying in C. Y. Wu, Fl. Xizang. 2: 135. 1985.

阴生小檗 *yin sheng xiao bo*

Shrubs, deciduous, ca. 1.2 m tall. Branches gray; shoots shiny, reddish brown, subsulcate, scarcely black verruculose; spines simple or 3-fid, weak, 6–9 mm. Petiole ca. 1 cm; leaf blade abaxially pale green, adaxially deep green, obovate or obovate-lanceolate, 1.5–5 × 0.6–2.1 cm, papery, both surfaces indistinctly veined, base cuneate, margin entire, apex rounded, obtuse, or acute. Inflorescence an umbel, 3–5-flowered, 2–3 cm including glabrous peduncle 6–12 mm. Pedicels 5–11 mm, slender; bractlets ovate, ca. 1.8 × 1 mm. Sepals in 2 whorls; outer sepals ovate-lanceolate, ca. 5.5 × 3 mm; inner sepals elliptic, ca. 6.2 × 4 mm. Petals obovate, ca. 5 × 3 mm, base slightly clawed, with separate glands, apex slightly emarginate or entire. Stamens ca. 3.2 mm; anther connective prolonged, rounded. Ovules 4, shortly funiculate. Fruit unknown. Fl. Jun, fr. unknown.

- *Abies* forests; ca. 3300 m. SE Xizang.

**123. *Berberis gilungensis*** T. S. Ying in C. Y. Wu, Fl. Xizang. 2: 134. 1985.

吉隆小檗 *ji long xiao bo*

Shrubs, deciduous, 1–2 m tall. Branches pale purplish red, subterete, not verruculose, glabrous; spines simple or 3-fid, 0.2–2 cm. Leaves subsessile; leaf blade abaxially grayish green, adaxially dark green, oblong or elliptic, 1.5–5 × 1–2.2 cm, papery, abaxially not pruinose, midvein and lateral veins raised, adaxially with flat midvein, lateral veins conspicuous, both surfaces with inconspicuous reticulate veins, base cuneate, margin entire, apex obtuse. Inflorescence a subumbel, 4- or 5-flowered, 2–3.5 cm (including peduncle). Pedicels 5–9 mm, glabrous;

bractlets oblong, ca.  $3.2 \times 1.2$  mm. Sepals in 2 whorls, oblong-elliptic; outer sepals ca.  $5.5 \times 3$  mm; inner sepals ca.  $8 \times 6$  mm. Petals obovate, ca.  $5.2 \times 4$  mm, base with separate glands, apex entire. Stamens ca. 3 mm; anther connective slightly prolonged. Ovules 4. Berry red, oblong, not pruinose, style not persistent. Fl. Jun, fr. Aug–Sep.

• Forests, forest margins; 3200–3400 m. Xizang.

**124. *Berberis multiserrata*** T. S. Ying in C. Y. Wu, Fl. Xizang. 2: 139. 1985.

粗齿小檗 *cu chi xiao bo*

Shrubs, deciduous, 1–2 m tall. Branches purplish black, subterete, pruinose; spines weak, orange-yellow, flat, 5–7 mm. Leaves subsessile; leaf blade abaxially grayish white, adaxially dark green, broadly obovate, occasionally orbicular,  $1.7\text{--}5.5 \times 1.5\text{--}3.5$  cm, thickly papery, abaxially pruinose, midvein and lateral veins raised, adaxially with raised midvein and lateral veins, reticulate veins conspicuous or slightly raised, base cuneate, margin coarsely 2–7-aristate-dentate on each side, rarely entire, apex rounded, sometimes emarginate. Inflorescence a subumbel, 4–8-flowered, ca. 2 cm including purplish black peduncles 3–5 mm. Pedicels 1–1.7 cm, stout, slightly pruinose; bractlets ovate, ca. 2 mm, pruinose, obtuse. Sepals in 2 whorls; outer sepals oblong-elliptic, ca.  $8 \times 4$  mm; inner sepals broadly obovate, ca.  $6 \times 4.1$  mm. Petals obovate, ca.  $6 \times 3.2$  mm, base with separate glands, apex emarginate. Stamens ca. 3.1 mm; anther connective prolonged, rounded, obtuse. Ovules 4. Berry oblong, ca.  $14 \times 5$  mm, pruinose, style not persistent. Fl. Jun, fr. Aug–Sep.

• Forests; 3100–3900 m. Xizang.

**125. *Berberis pulangensis*** T. S. Ying in C. Y. Wu, Fl. Xizang. 2: 133. 1985.

普兰小檗 *pu lan xiao bo*

Shrubs, evergreen, ca. 1.2 m tall. Branches pale yellow, terete, glabrous; internodes 5–10 mm; spines 3-fid, concolorous, 1–1.5 cm. Leaves sessile; leaf blade abaxially grayish green, adaxially dark green, obovate,  $1\text{--}1.2 \times 5\text{--}10$  mm, thinly leathery, abaxially not pruinose, both surfaces with veins obviously raised, base cuneate, margin flat, 1–4-spinose-serrate on each side, occasionally entire, apex mucronate. Inflorescence a subumbel, 2–4-flowered, 1.5–2.5 cm, sometimes with few fascicled flowers at base of peduncle; bracts ovate, apex acuminate. Flowers unknown. Fruit stalk 6–10 mm, glabrous; berry red, oblong-ellipsoid,  $8\text{--}9 \times$  ca. 4 mm, not pruinose, style not persistent; seeds 4 or 5. Fl. unknown, fr. Jul.

• Mountain slopes; ca. 3700 m. Xizang.

**126. *Berberis thunbergii*** Candolle, Syst. Nat. 2: 9. 1821.

日本小檗 *ri ben xiao bo*

Shrubs, deciduous, compact, usually ca. 1 m tall. Branches angulate, dark red, not verruculose; shoots reddish green, glabrous; spines simple, occasionally 3-fid, 5–15 mm; internodes 1–1.5 cm. Petiole 2–8 mm; leaf blade abaxially grayish green, adaxially green, obovate, spatulate, or rhombic-ovate,  $1\text{--}2 \times 0.5\text{--}1.2$  cm, thinly papery, abaxially with slightly raised mid-

vein, both surfaces glabrous, with indistinct reticulate veins, base attenuate, cuneate, margin entire, apex mucronate or obtuse. Inflorescence an umbel with subfascicled flowers, (1 or) 2–5-flowered, 1–2 cm. Pedicels 5–10 mm, glabrous; bractlets reddish, ovate-lanceolate, ca. 2 mm. Sepals in 2 whorls; outer sepals reddish, ovate-elliptic,  $4\text{--}4.5 \times 2.5\text{--}3$  mm, apex obtuse; inner sepals broadly elliptic,  $5\text{--}5.5 \times 3.3\text{--}3.5$  mm, apex obtuse. Petals oblong-obovate,  $5.5\text{--}6 \times 3\text{--}4$  mm, base clawed, with approximate glands, apex obtusely emarginate. Stamens 3–3.5 mm; anther connective not prolonged, truncate. Ovules 1 or 2, sessile. Berry shiny, red, ellipsoid, ca.  $8 \times 4$  mm, style not persistent; seeds 1 or 2, brown. Fl. Apr–Jun, fr. Jul–Oct.

Commonly cultivated for ornament in China, especially in large cities [native to Japan].

This is one of the most widely cultivated species of *Berberis*.

**127. *Berberis brachypoda*** Maximowicz, Bull. Acad. Imp. Sci. Saint-Petersbourg 23: 308. 1877.

短柄小檗 *duan bing xiao bo*

Shrubs, deciduous, 1–3 m tall. Branches yellowish gray, glabrous or sparsely pubescent; shoots pale brown, angulate, glabrous or pubescent, sparsely black verruculose; spines 3-fid, rarely simple, concolorous, 1–3 cm, adaxially sulcate. Petiole 3–10 mm, pubescent; leaf blade abaxially yellow-green, adaxially dark green, elliptic, obovate, or oblong-elliptic,  $3\text{--}8(14) \times 1.5\text{--}3.5(5)$  cm, thickly papery, abaxially densely villous on veins, adaxially rugose, sparsely puberulous, base cuneate, margin flat, 20–40-spinose-serrate on each side, apex acute or obtuse. Inflorescence a spikelike raceme, 20–50-flowered, 5–12 cm including peduncle 1.5–4 cm. Pedicels ca. 2 mm, pubescent; bractlets red, lanceolate; flowers yellow. Sepals in 3 whorls, margin puberulous; outer sepals reddish, ovate, ca.  $2 \times 1.5$  mm, apex acute; median sepals oblong-obovate, ca.  $3 \times 2.5$  cm; inner sepals obovate-elliptic, ca.  $4.5 \times 3$  mm, apex obtuse. Petals elliptic, ca.  $5 \times 3$  mm, base clawed, with separate glands, apex emarginate or entire, lobes acute. Stamens ca. 2 mm; anther connective not prolonged, truncate. Ovules 1 or 2. Berry shiny, scarlet, oblong,  $6\text{--}9 \times$  ca. 5 mm, not pruinose, style persistent. Fl. May–Jun, fr. Jul–Sep.

• Thickets, forests, forest margins, roadsides, wet places; 800–2500 m. Gansu, Henan, Hubei, Qinghai, Shaanxi, Shanxi, Sichuan.

**128. *Berberis salicaria*** Fedde, Bot. Jahrb. Syst. 36(Beibl. 82): 42. 1905.

柳叶小檗 *liu ye xiao bo*

*Berberis brachypoda* Maximowicz var. *salicaria* (Fedde) C. K. Schneider; *B. giraldii* Hesse; *B. mitifolia* Stapf.

Shrubs, deciduous, 1–2.5 m tall. Branches yellow-gray, angulate, sparsely pubescent; shoots pale yellow, glabrous, not verruculose; spines 3-fid, rarely simple, concolorous, 1–5 cm. Petiole 1–3 cm; leaf blade abaxially shiny, pale green, adaxially dark green, lanceolate,  $6\text{--}12 \times 1\text{--}4$  cm, papery, abaxially puberulous, veins raised, adaxially glabrous, midvein flat, lateral and reticulate veins conspicuous, base attenuate, margin 15–40-spinose-serrate on each side, apex acute or subacuminate. Inflorescence a spikelike raceme, 25–50-flowered, 7–17 cm;

rachises reddish, sometimes pedunculate; bracts lanceolate, 3–4 mm. Pedicels ca. 2 mm, stout, glabrous; bractlets ovate, apex acute. Sepals in 3 whorls; outer sepals oblong-ovate, ca.  $2.5 \times 1.5$  mm; median sepals oblong-elliptic, ca.  $3 \times 2$  mm; inner sepals obovate, ca.  $5 \times 4$  mm. Petals oblong-obovate,  $5-6 \times 2.5-3$  mm, base clawed, with separate glands, apex emarginate. Stamens 4–4.5 mm; anther connective not prolonged, truncate. Ovules 2. Berry red, obovoid-ellipsoid,  $9-10 \times$  ca. 6 mm, slightly pruinose, style not persistent; seeds 1 or 2, brown, oblong, ca.  $6 \times 2-2.5$  mm. Fl. Apr–Jun, fr. Aug–Sep.

• Sparse forests, forest margins; ca. 1200 m. Gansu, Hubei, Shaanxi.

**129. *Berberis gilgiana*** Fedde, Bot. Jahrb. Syst. 36(Beibl. 82): 43. 1905.

涝峪小檗 lao yu xiao bo

Shrubs, deciduous, 1–2 m tall. Branches gray-brown, terete; shoots purplish red, sometimes slightly pubescent; spines simple or 3-fid, concolorous, 5–15 mm. Petiole 1–2 mm; leaf blade abaxially pale green, adaxially dark green, obovate-lanceolate or obovate,  $1.5-4 \times 0.4-1.5$  cm, papery, abaxially densely pubescent, midvein obviously raised, lateral veins slightly raised, adaxially sparsely puberulous, midvein slightly impressed, lateral veins conspicuous, both surfaces with conspicuous reticulate veins, base attenuate, margin entire or 2–9-spinulose-serrulate on each side, apex acute. Inflorescence a spikelike raceme, 10–25-flowered, 3–6 cm including pubescent peduncle 1–3 cm; bracts lanceolate, 1–2 mm. Pedicels 3–5 mm, slender, glabrous; bractlets ovate, apex acute. Sepals in 2 whorls; outer sepals obovate-orbicular,  $2-2.3 \times$  ca. 1.5 mm; inner sepals obovate, ca.  $2.5 \times 2$  mm. Petals elliptic, ca.  $3 \times 2$  mm, base clawed, with separate glands, apex emarginate or entire. Stamens ca. 2 mm; anther connective rounded, obtuse. Ovules 1 or 2. Berry red, oblong,  $8-9 \times 5-6$  mm, slightly pruinose, style not persistent; seeds 1 or 2, purplish brown. Fl. Apr–May, fr. Aug–Oct.

• Slopes, valleys; 800–2000 m. Hubei, Shaanxi.

**130. *Berberis stenostachya*** Ahrendt, J. Linn. Soc., Bot. 57: 197. 1961.

短梗小檗 duan geng xiao bo

Shrubs, deciduous, ca. 2 m tall. Branches pale yellow, sulcate, glabrous; young shoots pale red, angulate, puberulous, glabrous when mature; spines 3-fid, 1–3 cm, adaxially sulcate. Petiole 4–10 mm; leaf blade abaxially pale green, adaxially dark green, obovate or obovate-oblong,  $2-8 \times 0.8-3.5$  cm, papery, abaxially densely puberulous and mixed tomentulose, midvein and lateral veins obviously raised, adaxially sparsely puberulous, midvein flat, lateral veins slightly raised, both surfaces with conspicuous reticulate veins, margin very sinuate, 10–20-spinose-serrate on each side, apex obtuse or acute. Inflorescence a spikelike raceme, nutant, 4–6 cm, 20–35-flowered; rachis puberulous. Pedicels 1–2 cm, puberulous; bracts 2–3 mm, puberulous; bractlets red, ovate, ca. 1 mm, apex acute. Sepals in 2 whorls; outer sepals ovate, ca.  $2 \times 1$  mm; inner sepals obovate-elliptic, ca.  $3.5 \times 1.5$  mm. Petals elliptic, ca.  $3 \times 1.3$  mm, base cuneate, with separate elliptic glands, apex emar-

ginate. Stamens ca. 2 mm; anther connective not prolonged, truncate. Ovules 2. Berry red, ellipsoid, ca.  $6 \times 3.5$  mm, not pruinose, style not persistent; seeds brown. Fl. May–Jun, fr. Aug–Oct.

• Thickets; ca. 1500 m. Gansu.

**131. *Berberis purdomii*** C. K. Schneider in Sargent, Pl. Wilson. 1: 372. 1913.

延安小檗 yan an xiao bo

Shrubs, deciduous, ca. 1 m tall. Branches dark gray or purplish red, subterete, sometimes sulcate; shoots often purplish brown, glabrous, not verruculose; spines simple, sometimes 3-fid, pale yellow, 1–2(–5) cm. Petiole 2–3 mm, or leaf subsessile; leaf blade adaxially green, narrowly obovate to oblanceolate,  $1-4 \times 0.4-0.8$  cm, papery, both surfaces glabrous, adaxially with slightly raised midvein, both surfaces with conspicuous lateral and reticulate veins, base attenuate, margin entire or 2–15-spinose-serrate on each side, apex acute. Inflorescence a spikelike raceme, 15–25-flowered, 3–5 cm including peduncle 1–2 cm, glabrous; bracts lanceolate, ca. 2 mm. Pedicels 4–5 mm, glabrous; bractlets reddish, subulate-lanceolate, apex caudate. Sepals in 2 whorls; outer sepals obovate-orbicular or ovate-elliptic, ca.  $2.2 \times 1.5$  mm; inner sepals oblong,  $3.2-4 \times$  ca. 2.6 mm. Petals obovate-oblong,  $3-3.2 \times 1.6-2$  mm, base clawed, with separate glands, apex emarginate. Stamens ca. 2.2 mm; anther connective not prolonged, truncate. Ovules 1 or 2. Berry black, oblong,  $5-6 \times 3-4$  mm, slightly pruinose, style not persistent; seeds usually 1. Fl. Jun, fr. Jul–Aug.

• Slopes, thickets, hills; 1100–2500 m. Gansu, Qinghai, Shaanxi, Shanxi.

**132. *Berberis vernae*** C. K. Schneider in Sargent, Pl. Wilson. 1: 372. 1913.

匙叶小檗 chi ye xiao bo

*Berberis caroli* C. K. Schneider var. *hoanghensis* C. K. Schneider.

Shrubs, deciduous, 0.5–1.5 m tall. Branches dark gray, slender, angulate, glabrous, black verruculose; shoots reddish purple; spines simple, pale yellow, 1–3 cm, stout. Petiole 2–6 mm; leaf blade abaxially pale green, adaxially shiny, dark green, oblanceolate or spatulate-oblanceolate,  $1-5 \text{ cm} \times 3-10$  mm, papery, both surfaces glabrous, not pruinose, not papillose, abaxially with slightly raised midvein and reticulate veins, adaxially with flat midvein, lateral veins slightly conspicuous, both surfaces with conspicuous reticulate veins, base attenuate, margin entire, occasionally 1–3-spinose-serrate on each side, apex rounded, obtuse. Inflorescence a spikelike raceme, 15–35-flowered, 2–4 cm including peduncle 5–10 mm, glabrous; bracts ca. 1.3 mm. Pedicels 1.5–4 mm, glabrous; bractlets reddish, lanceolate, ca. 1 mm. Sepals in 2 whorls; outer sepals ovate,  $1.5-2.1 \times$  ca. 1 mm, apex acute; inner sepals obovate,  $2.5-3 \times 1.5-2$  mm. Petals obovate-elliptic,  $1.8-2 \times$  ca. 1.2 mm, base clawed, with separate glands, apex subacute, entire. Stamens ca. 1.5 mm; anther connective not prolonged, truncate. Ovules 1 or 2, sessile. Berry pale red, oblong, 4–5 mm, not pruinose, style not persistent. Fl. May–Jun, fr. Aug–Sep.

● Floodlands, thickets on slopes; 2200–3900 m. Gansu, Qinghai, Sichuan.

**133. *Berberis poiretii*** C. K. Schneider, Mitt. Deutsch. Dendrol. Ges. 15: 180. 1906 [*"poireti"*].

细叶小檗 xi ye xiao bo

*Berberis poiretii* var. *bisemilis* P. Y. Li.

Shrubs, deciduous, 1–2 m tall. Branches grayish yellow; shoots purplish brown, angulate, black verruculose; spines absent or simple, sometimes 3-fid, 4–9 mm. Leaves subsessile; leaf blade abaxially pale green or grayish green, adaxially deep green, oblanceolate to narrowly oblanceolate, occasionally lanceolate-spatulate, 1.5–4 cm × 5–10 mm, papery, both surfaces glabrous, abaxially with raised midvein, lateral and reticulate veins conspicuous, adaxially with impressed midvein, base attenuate, margin entire, occasionally few spinulose-serrulate on each side, apex acuminate or acute, mucronulate. Inflorescence a spikelike raceme, 8–15-flowered, 3–6 cm including peduncle 1–2 cm; bracts linear, 2–3 mm. Pedicels 3–6 mm, glabrous; bractlets lanceolate, 1.8–2 mm. Sepals in 2 whorls; outer sepals elliptic or oblong-ovate, ca. 2 × 1.3–1.5 mm; inner sepals oblong-elliptic, ca. 3 × 2 mm. Petals obovate or elliptic, ca. 3 × 1.5 mm, base clawed, with separate glands, apex incised. Stamens ca. 2 mm; anther connective not prolonged, truncate. Ovules 1 (or 2). Berry red, oblong, ca. 9 × 4–5 mm, not pruinose, style not persistent. Fl. May–Jun, fr. Jul–Sep.  $2n = 28$ .

Thickets, forests, deserts, riverbanks in valleys, talus places; 600–2300 m. Hebei, Jilin, Liaoning, Nei Mongol, Qinghai, Shaanxi, Shanxi [Korea, Mongolia, Russia (Far East)].

**134. *Berberis pallens*** Franchet, Pl. Delavay. 36. 1889.

淡色小檗 dan se xiao bo

Shrubs, deciduous, 1–1.2 m tall. Branches dark reddish, angulate, sometimes slightly pruinose; spines 3-fid, weak, concolorous, 1–2 cm, adaxially flat or sulcate. Leaves subsessile; leaf blade abaxially grayish white, adaxially green, oblanceolate or oblong-ovate, 1.5–3.5 × 0.7–1 cm, thickly papery, abaxially pruinose, midvein conspicuously raised, adaxially with slightly impressed midvein, both surfaces with conspicuous reticulate veins, base cuneate, margin entire, apex rounded, obtuse, aristate. Inflorescence an umbellate raceme, 3–8-flowered, 3–5 cm, not pedunculate. Pedicels 1–1.5 cm, pruinose. Sepals in 3 whorls; outer sepals ovate-lanceolate, 4–4.5 × ca. 1.5 mm; median and inner sepals broadly ovate, both equal in size, 6–6.5 × ca. 5 mm. Petals obovate, ca. 5.5 × 4.5 mm, base attenuate, with separate glands, apex obtusely emarginate. Stamens ca. 3 mm; anther connective prolonged, shortly apiculate. Ovules 1 or 2. Berry red, oblong-ellipsoid, ca. 10 × 4–5 mm, pruinose; style persistent, short. Fl. and fr. May–Aug.

● Thickets; 3000–3500 m. Yunnan.

**135. *Berberis reticulata*** Bihouwer, J. Arnold Arbor. 9: 132. 1928.

网脉小檗 wang mai xiao bo

Shrubs, deciduous, 1–2.5 m tall. Branches brownish gray or purplish red, terete, angulate, not verruculose; shoots often

purplish red, glabrous; spines simple or 3-fid, weak, to 1 cm. Petiole 2–12 mm; leaf blade abaxially grayish white, adaxially dark green, obovate, 2–5 × 1–2.5 cm, papery, both surfaces glabrous, abaxially not pruinose, midvein obviously raised, adaxially with impressed midvein, both surfaces with conspicuously raised reticulate veins, base cuneate, margin flat, 10–20-spinose-serrate on each side, apex rounded, obtuse. Inflorescence a subumbellate raceme, 5–10-flowered, 1.5–3 cm, not pedunculate; rachis reddish; bracts ca. 1 mm. Pedicels reddish, 4–7 mm, glabrous. Sepals in 2 whorls; outer sepals elliptic, ca. 6 × 3 mm; inner sepals oblong, 7–7.5 × 4–4.5 mm. Petals obovate, ca. 6 × 3 mm, base clawed, with separate glands, apex obtusely emarginate. Stamens ca. 3.5 mm; anther connective apiculate. Ovules 5 or 6, sessile. Berry scarlet, ovoid, 7–8 × 5–6 mm, not pruinose, style not persistent. Fl. Jun–Jul, fr. Aug–Sep.

● Thickets, forests, slopes; 1400–3000 m. Shaanxi.

**136. *Berberis pruinocarpa*** C. Y. Wu ex S. Y. Bao, Bull. Bot. Res., Harbin 5(3): 16. 1985.

粉果小檗 fen guo xiao bo

Shrubs, deciduous, ca. 1 m tall. Branches brownish gray, angulate, black verruculose; spines usually simple, occasionally 3-fid, weak, concolorous, 8–10 mm. Petiole 1–3 mm; leaf blade abaxially pale green, adaxially dark green, oblong-ovate, ca. 1.2 × 0.4 cm, thickly papery, abaxially not pruinose, midvein and lateral veins conspicuously raised, adaxially with flat midvein, lateral veins 2 or 3 pairs, slightly raised, base cuneate, margin slightly thickened, entire, or 1- or 2-spinose-serrate on each side, apex rounded, apiculate. Flowers unknown. Inflorescence an umbellate raceme, with 3–5 fruit; fruit stalk 5–6 mm, slender, glabrous; berry oblong, 6–7 × 3–4 mm, slightly pruinose, style not persistent; seeds 1. Fl. unknown, fr. Aug.

● Sparse forests; ca. 2700 m. Yunnan.

**137. *Berberis hemsleyana*** Ahrendt, J. Linn. Soc., Bot. 57: 213. 1961.

拉萨小檗 la sa xiao bo

Shrubs, deciduous, to 2 m tall. Branches dark gray, angulate, black verruculose; shoots pale red, sometimes puberulous, sulcate; spines 3-fid, usually orange, 1–3 cm, stout, adaxially sulcate. Leaves subsessile; leaf blade abaxially grayish or pale green, shiny, adaxially dark green, ultimately both surfaces pale green, oblanceolate, 1–2.5 cm × 5–7 mm, papery, both surfaces initially slightly pruinose, often ultimately not pruinose, abaxially with slightly raised midvein and lateral veins, adaxially with flat midvein, lateral veins slightly impressed, both surfaces with inconspicuous reticulate veins, margin entire, sometimes 1–3-spinulose-serrulate on each side, apex obtuse or acuminate. Inflorescence a subumbellate raceme, 4–8-flowered, 1–2.5 cm. Pedicels 8–15 mm, stout, glabrous; bractlets lanceolate, ca. 3.5 × 1 mm. Sepals in 2 whorls; outer sepals elliptic, ca. 5.1 × 2.8 mm; inner sepals obovate, ca. 5.5 × 4 mm, apex obtuse. Petals narrowly obovate, ca. 4.8 × 2 mm, base clawed, with separate glands, apex entire. Stamens ca. 3 mm; anther connective prolonged, truncate. Ovules 2 or 3. Berry oblong, ca. 10 × 5 mm, slightly pruinose, style not persistent. Fl. May, fr. Sep.

• Thickets, grassy slopes on mountains, rock fractures; 3600–4400 m. Xizang.

**138. *Berberis platyphylla*** (Ahrendt) Ahrendt, J. Linn. Soc., Bot. 57: 145. 1961.

阔叶小檗 *kuo ye xiao bo*

*Berberis yunnanensis* Franchet var. *platyphylla* Ahrendt, J. Bot. 79(Suppl.): 61. 1941.

Shrubs, deciduous, 1–1.5 m tall. Branches brownish gray, angulate, sparsely black verruculose; shoots dark purple, glabrous; spines 3-fid, weak, ca. 1 cm, adaxially sulcate. Petiole 2–5 mm, or leaf sessile; leaf blade abaxially pale green, adaxially deep green, broadly obovate or elliptic, 2–5 × 1–1.4 cm, papery, abaxially sometimes slightly pruinose, midvein obviously raised, adaxially with flat midvein, both surfaces with conspicuous lateral and reticulate veins, base cuneate, margin entire or 2–4-spinose-serrate on each side, apex rounded, aristate. Inflorescence an umbellate raceme, 3–7-flowered, 3–5 cm, including peduncle 2–10 mm, sometimes with few fascicled flowers at base of peduncle. Pedicels 1.2–2 cm, glabrous; bractlets purplish red, lanceolate, ca. 3 mm. Sepals in 2 whorls; outer sepals ovate, ca. 6 × 3 mm; inner sepals oblong-obovate, 6–7 × 3.5–4 mm. Petals obovate, ca. 6 × 3 mm, base clawed, with separate glands, apex emarginate. Stamens ca. 5 mm; anther connective obviously prolonged, apiculate. Ovules 3–5. Berry oblong, ca. 10 × 7 mm, not pruinose, style not persistent. Fl. Jun, fr. Aug–Oct.

• Thickets, forests, forest margins; 3100–3500 m. Sichuan, Xizang, Yunnan.

四川小檗 *si chuan xiao bo*

Shrubs, evergreen, 1–1.5 m tall. Branches purplish red or gray, angular; shoots pale yellow, glabrous, not verruculose; spines simple or 3-fid, pale yellow, 1–1.5 cm. Leaves sessile; leaf blade abaxially grayish white, adaxially shiny, green, obovate or obovate-elliptic, 0.8–2 × 0.5–1.1 cm, thinly leathery, abaxially with obviously raised midvein and lateral veins, adaxially with slightly raised midvein and lateral veins, base attenuate, margin entire or 1–5-spinose-serrate on each side, apex rounded, obtuse. Inflorescence an umbellate raceme, 6–15-flowered, 3–4.5 cm including peduncle 4–12 mm, sometimes with few fascicled flowers at base; bracts leaflike, obovate, apex aristate. Pedicels 4–12 mm, glabrous. Sepals in 3 whorls; outer sepals ovate-lanceolate, 1.6–2 × ca. 1 mm; median sepals obovate-elliptic, 2.8–3.1 × 1.5–1.7 mm; inner sepals elliptic, 4–5 × 3–3.2 mm. Petals obovate-elliptic, 4–4.1 × 2.1–2.2 mm, base clawed, with separate glands, apex entire, rounded, obtuse. Stamens ca. 3 mm; anther connective rounded, obtuse. Ovules 3 or 4, sessile. Berry black, subglobose, 8–10 × 6–8 mm, pruinose, style persistent. Fl. Jun–Jul, fr. Aug–Sep.

• Thickets, slopes; 2600–3600 m. Sichuan, Yunnan.

**140. *Berberis mekongensis*** W. W. Smith, Notes Roy. Bot. Gard. Edinburgh 9: 82. 1916.

湄公小檗 *mei gong xiao bo*

Shrubs, deciduous, 1–2 m tall. Branches brownish gray, angulate, sparsely black verruculose; shoots initially puberulous, often ultimately glabrous; spines 3-fid, pale yellow, 1–2.5 cm, adaxially slightly sulcate. Petiole 3–10 mm; leaf blade adaxially deep yellow-green, obovate or broadly obovate, 1.5–4.5 × 1–2 cm, papery, abaxially papillose, not pruinose, midvein and lateral veins obviously raised, adaxially with slightly raised midvein and lateral veins, both surfaces with conspicuous reticulate veins, base cuneate, margin entire or 10–15-spinose-serrate on each side, apex rounded. Inflorescence an umbellate raceme, 6–12-flowered, 3–7 cm; with few fascicled flowers at base; bracts 1–1.5 mm. Pedicels 4–15 mm, glabrous. Sepals in 3 whorls; outer sepals lanceolate, ca. 4 × 1.4 mm; median sepals oblong-elliptic, 5–5.5 × 2–3 mm; inner sepals obovate, 6–6.5 × 3.5–4 mm. Petals obovate, 4–5 × 2.5–3.5 mm, base clawed, with separate glands, apex acute, incised. Stamens ca. 3.5 mm; anther connective prolonged, truncate. Ovules 2–4. Berry red, oblong, 8–10 × 4–6 mm, not pruinose, style not persistent. Fl. Jun–Jul, fr. Oct–Nov.

• Alpine thickets, *Abies* or *Picea* forests, sunny places; 3000–4000 m. Sichuan, Xizang, Yunnan.

假美丽小檗 *jia mei li xiao bo*

Shrubs, deciduous, 0.4–2 m tall. Branches dark gray or dark purplish red, sulcate, black verruculose; spines 3-fid, yellow-brown, 5–10 mm. Leaves sessile; leaf blade abaxially pale gray, adaxially green, oblanceolate or narrowly elliptic, 1–2 × 0.3–0.4 cm, papery, abaxially not pruinose, midvein conspicuously raised, lateral veins distinct, adaxially with slightly raised midvein and lateral veins, both surfaces with conspicuous reticulate veins, base cuneate, margin slightly thickened, entire or 1–5-spinose-serrate on each side, apex acute or acuminate, occasionally rounded, obtuse. Inflorescence an umbellate raceme, 3–6-flowered, 2.5–5 cm including peduncle 1.5–3 cm; bracts leaflike, ca. 1.3 cm. Pedicels 4–8 mm, glabrous; bractlets lanceolate, ca. 3 mm. Sepals in 3 whorls; outer sepals lanceolate, 3–3.1 × 1–1.2 mm; median sepals obovate, 4.5–4.9 × 3.1–3.5 mm; inner sepals elliptic, 5–5.5 × 3.2–4 mm. Petals obovate, 4–4.2 × 3–3.2 mm, base attenuate, not clawed, with separate glands, apex emarginate or entire, rounded, obtuse. Stamens ca. 2 mm; anther connective apiculate. Ovules 1–3. Fruit stalk to 1.2 cm; berry oblong, 10–12 × 3–5 mm, contracted below middle, not pruinose, style not persistent; seeds 2 or 3. Fl. Jun–Jul, fr. Aug–Sep.

• Alpine thickets, roadsides, weedy places on mountain summits; 2900–3500 m. Sichuan.

**142. *Berberis lepidifolia*** Ahrendt, Bull. Misc. Inform. Kew 1939: 269. 1939.

鳞叶小檗 *lin ye xiao bo*

Shrubs, deciduous, 1–1.5 m tall. Branches dark gray, slender, angulate, black verruculose; shoots pale purplish brown, sulcate, sparsely black verruculose, sometimes puberulous;

spines simple, weak, 3–6(–15) mm, occasionally absent. Leaves subsessile; leaf blade abaxially gray-green, adaxially dark green, narrowly oblanceolate, 1.7–4.5 cm × 1.5–5 mm, papery, abaxially not pruinose, midvein obviously raised, lateral veins slightly raised, reticulate veins indistinct, adaxially with slightly raised midvein and lateral veins, reticulate veins indistinct, base attenuate, margin slightly revolute, entire, apex obtuse or acute. Inflorescence an umbellate raceme, 5–8-flowered, 2–4.5 cm including peduncle 1–2 cm; bracts lanceolate, ca. 1.5 mm. Pedicels 5–10 mm, slender, glabrous. Flowers ca. 4 mm in diam. Sepals in 1 whorl of 3, center red with a yellow margin, ovate, 2–2.5 × 1.3–1.5 mm, subacute. Petals oblong-elliptic, ca. 2.5 × 1.5 mm, base cuneate, with separate ovate-elliptic glands, apex emarginate with acute lobes. Stamens ca. 2 mm; anther connective truncate. Ovules 2, shortly funiculate. Berry black, ovoid-oblong, 8–11 × 5–7 mm, slightly blue pruinose; style persistent, short. Fl. May, fr. Aug.

● Thickets, *Pinus* forests; 3000–3700 m. Sichuan, Yunnan.

**143. *Berberis calcipratorum*** Ahrendt, J. Linn. Soc., Bot. 57: 130. 1961.

钙原小檗 *gai yuan xiao bo*

Shrubs, deciduous, 1–3 m tall. Branches dark red, sulcate, white pruinose; spines simple or 3-fid, orange-yellow, shiny, 8–15 mm, stout. Leaves subsessile; leaf blade abaxially brown, adaxially dark green, narrowly obovate, 1–2.5 × 0.4–1.1 cm, thinly papery, abaxially white pruinose, occasionally not pruinose, midvein and reticulate veins raised, adaxially sometimes with slightly raised reticulate veins, base cuneate, margin slightly thickened, entire, apex obtuse, mucronate. Inflorescence an umbellate raceme or subumbel, 2–5-flowered, 2–3 cm, sometimes with few fascicled flowers at base; rachis pruinose; bracts lanceolate, ca. 2 mm, pruinose, apex acuminate. Pedicels 5–10 mm, white pruinose; bractlets ovate, ca. 3 mm, apex acuminate. Flowers orange. Sepals in 2 whorls; outer sepals elliptic, ca. 5.5 × 4 mm; inner sepals obovate, ca. 7.5 × 4 mm. Petals oblong-obovate, ca. 5.5 × 3.5 mm, base clawed, with separate elliptic glands, apex emarginate. Stamens ca. 3.5 mm; anther connective slightly prolonged, apiculate. Ovules 2–4, shortly funiculate. Berry unknown. Fl. May–Jun, fr. unknown.

● Forests, thickets; 3300–3700 m. Yunnan.

**144. *Berberis weisiensis*** C. Y. Wu ex S. Y. Bao, Bull. Bot. Res., Harbin 5(3): 17. 1985.

维西小檗 *wei xi xiao bo*

Shrubs, evergreen, ca. 1 m tall. Branches dark gray, sparsely black verruculose; shoots purplish red, angulate, pruinose; spines 3-fid, weak, concolorous, 1–1.2 cm, adaxially sulcate. Leaves subsessile; leaf blade adaxially green, elliptic or oblong-obovate, 1.5–2 cm × 6–7 mm, leathery, abaxially pruinose, midvein obviously raised, adaxially midvein slightly raised, lateral veins 2 or 3 pairs, both surfaces with conspicuous reticulate veins, base cuneate, margin slightly thickened, entire, apex rounded, mucronate. Flowers unknown. Infructescence an umbellate raceme with 6 or 7 berries, 2.5–3.5 cm, pedunculate; bracts leaflike, ca. 5 mm; fruit stalk purplish red, 5–12 mm,

glabrous; berry subglobose, ca. 7 × 5 mm, not pruinose, style persistent; seeds 3. Fl. unknown, fr. Oct.

● Roadsides, riversides; ca. 2000 m. Yunnan.

**145. *Berberis amoena*** Dunn, J. Linn. Soc., Bot. 39: 422. 1911.

美丽小檗 *mei li xiao bo*

*Berberis amoena* var. *umbelliflora* Ahrendt; *B. elegans* (Franchet) C. K. Schneider (1905), not K. Koch (1869), nor H. Léveillé (1904); *B. leptoclada* Diels; *B. schneideri* Rehder; *B. sinensis* Desfontaines var. *elegans* Franchet.

Shrubs, deciduous, 0.5–1 m tall. Branches grayish black, sparsely black verruculose; shoots dark red, angulate; spines simple or 3-fid, concolorous, 4–12 mm, adaxially sulcate. Leaves subsessile; leaf blade adaxially dark green, narrowly obovate-elliptic or narrowly elliptic, 10–16 × 3–4 mm, leathery, abaxially pruinose, midvein obviously raised, papillose, lateral veins 2 or 3 pairs, adaxially with conspicuous midvein, base cuneate, margin slightly thickened, entire, occasionally 1- or 2-spinose-serrate on each side, apex obtuse, mucronate. Inflorescence an umbellate raceme, 4–8-flowered, 3–5 cm including peduncle 1–2 cm. Pedicels 4–7 mm, glabrous; bractlets lanceolate, 1.5–2 mm. Sepals in 2 whorls; outer sepals obovate to oblong-elliptic, 2–2.5 × 1–2 mm; inner sepals elliptic, 4–4.5 × 3–3.5 mm. Petals obovate, 3.5–4 × ca. 2.5 mm, base cuneate, with separate glands, apex emarginate, with 2 rounded lobes. Stamens ca. 2.5 mm; anther connective prolonged, apiculate. Ovules 1 or 2. Berry red, oblong, ca. 6 × 3 mm, not pruinose, style persistent; seeds 1. Fl. May–Jun, fr. Jul–Aug.

● Thickets, forests, weedy places; 1600–3100 m. Sichuan, Yunnan.

**146. *Berberis derongensis*** T. S. Ying, Acta Phytotax. Sin. 37: 333. 1999.

柔毛小檗 *rou mao xiao bo*

Shrubs, deciduous, ca. 1 m tall. Branches grayish yellow, glabrous; shoots reddish, pubescent; internodes 1–2 cm; spines simple, 1–2.5 cm, adaxially sulcate. Petiole 7–10 mm; leaf blade abaxially pale green, adaxially deep green, obovate, 2–4 × 0.5–1 cm, papery, both surfaces pubescent, abaxially with raised midvein and lateral veins, reticulate veins prominent, adaxially with slightly impressed midvein and lateral veins, reticulate veins inconspicuous, base attenuate to decurrent petiole, margin revolute, mostly entire, rarely few spinulose on each side, apex mucronate. Inflorescence a raceme, 2–4 cm including peduncle 1–1.5 cm, glabrous; bracts ca. 1 mm. Pedicels 4–6 mm, glabrous. Flowers unknown. Berry oblong, 4–7 × 3–4 mm, not pruinose, style not persistent; seeds 1. Fl. unknown, fr. Aug.

- Mountain slopes. Hubei, Shaanxi.

**157. *Berberis kongboensis*** Ahrendt, J. Bot. 80(Suppl.): 97. 1942.

工布小檗 gong bu xiao bo

*Berberis amoena* Dunn var. *moloensis* Ahrendt.

Shrubs, deciduous, ca. 2 m tall. Branches dark purplish red, shiny, not verruculose; shoots shiny, red, glabrous; spines 3-fid, pale yellow, 1–2.5 cm, adaxially sulcate. Petiole 2–5 mm; leaf blade adaxially deep green, oblanceolate, 1–5 × 0.5–1.5 cm, papery, adaxially with conspicuous midvein and lateral veins, reticulate veins conspicuous, base narrowly cuneate, margin entire, apex acute, mucronate. Inflorescence a raceme, loosely 7–25-flowered, 3–8 cm including peduncle 1–2 cm; bracts 3–5 mm, apex acuminate. Pedicels 1–2 cm, slender, glabrous. Sepals in 2 whorls; outer sepals oblong-ovate, ca. 6.5 × 2.5 mm; inner sepals oblong-elliptic, ca. 8.5 × 4 mm. Petals obovate, ca. 4.5 × 3 mm, base cuneate, with separate lanceolate glands, apex retuse with 2 rounded lobes. Stamens ca. 3 mm; anther connective slightly prolonged, apiculate. Ovules 3, one of these sessile. Berry ?red, oblong, not pruinose, style not persistent. Fl. May, fr. Jun–Aug.

• Forests; 2700–3200 m. Xizang.

**158. *Berberis agricola*** Ahrendt, J. Linn. Soc., Bot. 57: 192. 1961.

暗红小檗 an hong xiao bo

Shrubs, deciduous, 0.8–2 m tall. Branches dark gray, terete; shoots dark red, sparsely black verruculose, glabrous; internodes 1.5–3 cm; spines 3-fid, pale yellow, 1–1.5 cm, adaxially sulcate. Leaves subsessile; leaf blade abaxially pale green, adaxially deep green, obovate, 1.2–2.5 × 0.7–1.5 cm, papery, abaxially not pruinose, midvein and lateral veins markedly raised, adaxially with raised midvein and lateral veins, both surfaces with conspicuous reticulate veins, base cuneate, margin entire or occasionally 1–3-spinose-serrate on each side, apex rounded, obtuse. Inflorescence a raceme, 15–30-flowered, often verticillate, rarely compound below, 4–7.5 cm, sometimes pendulous; peduncle 1–2 cm, slender, glabrous; bracts ca. 1.5 mm. Pedicels 5–7 mm, weak, glabrous; bractlets ovate, ca. 2.2 × 1.2 mm. Flowers ca. 1 cm in diam. Sepals in 2 whorls; outer sepals elliptic, 3–3.2 × 1.5–2 mm; inner sepals elliptic-obovate, ca. 5.5 × 3.2 mm. Petals elliptic, ca. 4.5 × 3 mm, base clawed, with separate glands, apex entire. Stamens ca. 3 mm; anther connective slightly prolonged, rounded, obtuse, or truncate. Ovules 2, shortly funiculate. Fruit unknown. Fl. Jun, fr. unknown.

• Thickets on mountain slopes, roadsides; 3200–3600 m. Xizang.

金江小檗 jin jiang xiao bo

Shrubs, deciduous, 1–2 m tall. Branches pale yellow, angulate, sparsely black verruculose; shoots shiny, red, often ultimately becoming brownish yellow; spines 3-fid, concolorous, 1–2 cm. Petiole 3–8 mm; leaf blade abaxially grayish green, adaxially dark green, oblong-obovate, 2–6 × 1–1.8 cm,

papery, abaxially sometimes slightly pruinose, lateral veins slightly raised, reticulate veins conspicuous, adaxially with flat or slightly raised midvein, lateral veins 3–5 pairs, base cuneate, margin entire or 3- or 4-spinose-serrate on each side, apex rounded. Inflorescence a raceme, 10–20-flowered, 6–12 cm including peduncle 1–4 cm; bracts 2–2.5 mm, apex acuminate. Pedicels 7–20 mm, slender; bractlets red, triangular, ca. 3 × 1 mm. Flowers 8–10 mm in diam. Sepals in 3 whorls; outer sepals lanceolate, 4–4.5 × ca. 1.5 mm; median and inner sepals oblong-obovate, 5–6 × 3–4 mm. Petals obovate-elliptic, 4–5 × 2–3 mm, base cuneate, with approximate but not contiguous glands, apex distinctly emarginate, lobes acute. Stamens 2.5–3 mm; anther connective prolonged, shortly apiculate. Ovules 1 or 2. Berry shiny, red, oblong-ovoid, 9–11 × 7–8 mm, not pruinose, style not persistent. Fl. Jun, fr. Jul–Oct.

• Roadsides, thickets, *Pinus* forests; 2700–3600 m. Yunnan.

庐山小檗 *lu shan xiao bo*

*Berberis chekiangensis* Ahrendt; *B. pingjiangensis* Q. L. Chen & B. M. Yang.

Shrubs, deciduous, 1.5–2 m tall. Branches grayish yellow, angulate, not verruculose; shoots purplish brown; spines simple, occasionally 3-fid, 1–4 cm, adaxially sulcate. Petiole 1–2 cm; leaf blade abaxially grayish white, adaxially dark yellow-green, oblong-rhombic, 3.5–8 × 1.5–3.5(–7) cm, thin papery, abaxially with obviously raised midvein and lateral veins, adaxially with slightly raised midvein, lateral veins conspicuous, base cuneate, attenuate to petiole, margin completely entire, sometimes slightly undulate, apex acute. Inflorescence a raceme, 3–15-flowered, 2–5 cm including peduncle 1–2 cm; bracts lanceolate, 1–1.5 mm, apex acuminate. Pedicels 4–8 mm, slender, glabrous. Sepals in 2 whorls; outer sepals oblong-ovate, 1.5–2 × 1–1.2 mm; inner sepals oblong-obovate, ca. 4 × 1–1.8 mm, apex obtuse. Petals elliptic-obovate, 3–3.5 × 1–1.8(–2.5) mm, base clawed, with separate oblong glands, apex obtuse, entire. Stamens ca. 3 mm; anther connective not prolonged, obtuse. Ovules solitary, sessile. Berry red, oblong-ellipsoid, 8–12 × 3–4.5 mm, not pruinose, style not persistent. Fl. Apr–May, fr. Jun–Oct.

- Montane thickets, forests, riversides, beside houses; 200–1800 m. Anhui, Fujian, Jiangxi, Guangdong, Guangxi, Guizhou, Hubei, Hunan, Shaanxi, Zhejiang.

**163. *Berberis humidoubrosa*** Ahrendt, J. Bot. 80(Suppl.): 115. 1942 [*"humido-umbrosa"*].

阴湿小檗 *yin shi xiao bo*

Shrubs, deciduous, 1.5–2.5 m tall. Branches grayish black; shoots purplish red, angulate, sparsely black verruculose; spines simple or 3-fid, 1–2 cm. Petiole 1–2 mm; leaf blade abaxially pale gray, adaxially dark green, oblong-obovate, 1–2 cm × 4–6 mm, papery, abaxially sparsely papillose, midvein obviously raised, both surfaces with raised reticulate veins, base cuneate, attenuate to decurrent petiole, margin entire, apex rounded. Inflorescence a raceme, 4–8-flowered, 2–3 cm including peduncle 0.3–1.5 cm, glabrous; bracts 1–1.5 mm. Pedicels 4–9 mm, glabrous. Sepals in 2 whorls; outer sepals ovate, ca. 2.8 × 1.8 mm, apex obtuse; inner sepals obovate, ca. 3 × 2.5 mm. Petals obovate, ca. 3.3 × 2.5 mm, base with separate elliptic glands, apex entire. Stamens ca. 2.3 mm; anther connective prolonged, truncate. Ovules 2. Berry red, obovoid, 7–8 × 4.5–5 mm, densely blue or violet pruinose, style persistent and conspicuous. Fl. May–Jul, fr. Aug–Oct.

- Rainforests, thickets in arid valleys, shaded wet places; 2800–4000 m. Xizang.

**164. *Berberis sabulicola*** T. S. Ying in C. Y. Wu, Fl. Xizang. 2: 133. 1985.

砂生小檗 *sha sheng xiao bo*

Shrubs, semi-evergreen, ca. 1 m tall. Shoots pale yellow;

branches gray, slightly sulcate; internodes 0.5–1 cm; spines 3-fid, sometimes simple, pale yellow, 8–14 mm. Leaves subsessile; leaf blade abaxially shiny, green, adaxially dark green, obovate, 8–11 × 3–6 mm, papery, abaxially with raised midvein, lateral veins slightly raised, reticulate veins conspicuous, adaxially with slightly raised midvein and lateral veins, reticulate veins inconspicuous, base cuneate, margin entire, apex rounded. Inflorescence a raceme, 3–5-flowered, 1.5–2 cm including peduncle 3–7 mm. Pedicels 4–6 mm, glabrous. Sepals in 2 whorls; outer sepals elliptic, ca. 3 × 1.5 mm; inner sepals obovate-suborbicular, ca. 3.5 × 3 mm. Petals obovate, ca. 3.2 × 2 mm, base very clawed, with separate glands, apex entire. Stamens ca. 3 mm; anther connective prolonged, apiculate. Ovules 3. Berry pale yellow (immature), oblong, slightly pruinose, style not persistent. Fl. May, fr. Jun–Aug.

- Rock fractures, talus deposits; ca. 3800 m. Xizang.

甘肃小檗 *gan su xiao bo*

Shrubs, deciduous, to 3 m tall. Branches pale brown; shoots reddish, angulate; spines weak, simple or 3-fid, concolorous, 1–2.4 cm, adaxially sulcate. Petiole 1–2 cm; leaf blade abaxially gray, adaxially dark green, suborbicular or broadly elliptic, 2.5–5 × 2–3 cm, papery, abaxially slightly pruinose, midvein obviously raised, adaxially with slightly impressed midvein, both surfaces with raised lateral and reticulate veins, base attenuate to decurrent petiole, margin 15–30-spinose-serrate on each side, apex rounded. Inflorescence a raceme, 10–30-flowered, 2.5–7 cm including peduncle 0.5–3 cm; bracts 1–1.5 mm. Pedicels 4–8 mm, often verticillate; bractlets reddish, ca. 1.4 mm, apex acuminate. Sepals in 2 whorls; outer sepals ovate, ca. 2.5 × 1.5 mm, apex acute; inner sepals oblong-elliptic, ca. 4.5 × 2.5 mm. Petals oblong-elliptic, ca. 4.5 × 2 mm, base shortly clawed, with separate obovate glands, apex emarginate, lobes acute. Stamens ca. 3 mm; anther connective slightly prolonged, rounded or truncate. Ovules 2, funiculate. Berry red, oblong-obovoid, 7–8 × 5–6 mm, not pruinose, style not persistent. Fl. May–Jun, fr. Jul–Aug.

- Thickets, mixed forests; 1400–2800 m. Gansu, Ningxia, Qinghai, Shaanxi, Sichuan.

**175. *Berberis anhweiensis*** Ahrendt, J. Linn. Soc., Bot. 57: 185. 1961.

安徽小檗 *an hui xiao bo*

Shrubs, deciduous, 1–2 m tall. Branches grayish yellow or pale yellow, angulate, sparsely black verruculose; shoots dark purple; internodes 2–4 cm; spines simple or 3-fid, 1–1.5 cm. Petiole 5–15 mm; leaf blade abaxially pale green, adaxially deep green, suborbicular or broadly elliptic, 2–6 × 1.5–3 cm, thinly papery, both surfaces glabrous, abaxially slightly pruinose, midvein and lateral veins obviously raised, adaxially with raised midvein and lateral veins, both surfaces with conspicuous reticulate veins, base contracted to petiole, margin 15–40-spinose-serrate on each side, apex rounded, obtuse. Inflorescence a raceme, 10–27-flowered, 3–7.5 cm including peduncle 1–1.5 cm, glabrous; bracts ca. 1 mm. Pedicels 4–7 mm, glabrous; bractlets ovate, ca. 1 mm. Sepals in 2 whorls; outer

sepals oblong, 2.5–3 × 1.3–1.5 mm; inner sepals obovate, ca. 4.5 × 3 mm. Petals elliptic, 4.8–5 × ca. 2.5 mm, base cuneate, with separate glands, apex entire. Stamens ca. 3 mm; anther connective not prolonged, truncate. Ovules 2. Berry red, ellipsoid or obovoid, ca. 9 × 6 mm, not pruinose, style not persistent. Fl. Apr–Jun, fr. Jul–Oct.  $2n = 28^*$ .

• Thickets, forests, roadsides; 400–1800 m. Anhui, Hubei, Zhejiang.

**176. *Berberis dasystachya*** Maximowicz, Bull. Acad. Imp. Sci. Saint-Petersbourg 23: 308. 1877.

直穗小檗 zhi sui xiao bo

*Berberis dolichobotrys* Fedde; *B. kansuensis* C. K. Schneider var. *procera* Ahrendt.

Shrubs, deciduous, 2–3 m tall. Branches yellow-brown, terete, very sparsely verruculose; shoots purplish red; spines simple, 5–15 mm, sometimes absent or occasionally 3-fid, to 4 cm. Petiole 1–4 cm; leaf blade abaxially yellow-green, adaxially dark yellow-green, oblong-elliptic, broadly elliptic, or sub-orbicular, 3–6 × 2.5–4 cm, papery, abaxially glabrous, not pruinose, midvein obviously raised, adaxially with slightly raised midvein and lateral veins, base cuneate, rounded, or cordate, margin 25–50-spinulose-serrulate on each side, apex rounded, obtuse. Inflorescence a raceme, erect, 15–30-flowered, 4–7 cm including peduncle 1–2 cm, glabrous. Pedicels 4–7 mm; bractlets lanceolate, ca. 2 × 0.5 mm. Sepals in 2 whorls; outer sepals lanceolate, ca. 3.5 × 2 mm; inner sepals obovate, ca. 5 × 3 mm, base slightly clawed. Petals obovate, ca. 4 × 2.5 mm, base clawed, with separate oblong-elliptic glands, apex entire. Stamens ca. 2.5 mm; anther connective not prolonged, truncate. Ovules 1 or 2. Berry red, ellipsoid, 6–7 × 5–5.5 mm, not pruinose, style not persistent. Fl. Apr–Jun, fr. Jun–Sep.

• Thickets, forests, forest margins, streamsides, grasslands; 800–3400 m. Gansu, Hebei, Henan, Hubei, Ningxia, Qinghai, Shaanxi, Shanxi, Sichuan.

**177. *Berberis amurensis*** Ruprecht, Bull. Cl. Phys.-Math. Acad. Imp. Sci. Saint-Petersbourg 15: 260. 1857.

黄芦木 huang lu mu

*Berberis vulgaris* Linnaeus var. *amurensis* (Ruprecht) Regel.

Shrubs, deciduous, 2–3.5 m tall. Branches pale yellow or gray, slightly sulcate, not verruculose; internodes 2.5–7 cm; spines 3-fid, rarely simple, 1–2 cm. Petiole 5–10 mm; leaf blade abaxially pale green, adaxially dark green, obovate-elliptic, elliptic, or ovate, 5–10 × 2.5–5 cm, papery, abaxially with slightly raised midvein and lateral veins, reticulate veins slightly conspicuous, adaxially with impressed midvein and lateral veins, reticulate veins inconspicuous, base cuneate, margin 40–60-spinulose-serrulate on each side, apex acute or rounded. Inflorescence a raceme, 10–25-flowered, 4–10 cm including peduncle 1–3 cm. Pedicels 5–10 mm. Sepals in 2 whorls; outer sepals obovate, ca. 3 × 2 mm; inner sepals obovate, 5.5–6 × 3–3.4 mm. Petals elliptic, 4.5–5 × 2.5–3 mm, base slightly clawed, with separate glands, apex emarginate. Stamens ca. 2.5 mm; anther connective not prolonged, truncate. Ovules 2. Berry red,

oblong, ca. 10 × 6 mm, not or slightly blue pruinose at base, style not persistent. Fl. Apr–May, fr. Aug–Sep.  $2n = 28$ , 42.

Thickets, sparse forests, valleys, forest margins, streamsides, sides of rocks; 1100–2900 m. Gansu, Hebei, Heilongjiang, Henan, Jilin, Liaoning, Nei Mongol, Shaanxi, Shandong, Shanxi [Japan, Korea, Russia (Siberia)].

**178. *Berberis shensiana*** Ahrendt, Gard. Chron., ser. 3, 112: 155. 1942.

陕西小檗 shan xi xiao bo

Shrubs, deciduous, ca. 1.5 m tall. Branches dark gray, angulate, glabrous; shoots stramineous or pale purplish red, sparsely black verruculose; spines 3-fid or simple, pale yellow, 1–2 cm, adaxially slightly sulcate. Petiole ca. 1 cm; leaf blade abaxially pale green, adaxially green, elliptic or obovate, 1.5–4.5 × 0.5–1.7 cm, papery, abaxially glabrous, not pruinose, midvein obviously raised, lateral and reticulate veins conspicuous, adaxially with slightly impressed midvein, lateral and reticulate veins inconspicuous, sometimes conspicuous, base cuneate, margin 10–20-spinulose-serrulate on each side, apex acute or rounded, obtuse. Inflorescence a raceme, 4–8-flowered, 1.5–3.5 cm including peduncle ca. 5 mm, sometimes compound below; bracts ovate, ca. 1.3 mm. Pedicels 5–8 mm, slender, glabrous; bractlets lanceolate, ca. 3 × 1 mm. Sepals in 2 whorls; outer sepals elliptic, 4.5–5 × 2.5–3 mm; inner sepals oblong-elliptic, ca. 6 × 4 mm. Petals obovate-elliptic, 5–5.5 × 3–3.5 mm, base clawed, with separate glands, apex entire. Stamens ca. 3 mm; anther connective slightly prolonged, apiculate. Ovules 5 or 6. Berry red, oblong, 7–8 × 4–5 mm, not pruinose; style persistent and very short, or not persistent. Fl. May–Jun, fr. Jul–Sep.

• Thickets, slopes, woodlands, roadsides; 1200–3000 m. Shaanxi.

**179. *Berberis hersii*** Ahrendt, Gard. Ill. 64: 426. 1944.

南阳小檗 nan yang xiao bo

*Berberis amurensis* Ruprecht var. *licentii* Ahrendt.

Shrubs, deciduous, 1–3 m tall. Branches grayish black, terete; shoots grayish yellow, angulate, sparsely black verruculose; spines absent or simple, occasionally 3-fid, weak, concolorous, 3–6 mm. Petiole 6–15 mm; leaf blade abaxially grayish brown, adaxially green, obovate, obovate-elliptic, or elliptic, 2.5–5 × 1–1.8 cm, thinly papery, abaxially with obviously raised midvein and lateral veins, adaxially with slightly raised midvein and lateral veins, both surfaces with conspicuously raised reticulate veins, base cuneate, margin 15–30-spinulose-subserulate on each side, apex acute. Inflorescence a raceme, 15–30-flowered, 3–5 cm, sometimes compound below; peduncles 5–15 mm; bracts 1–1.5 mm. Pedicels dark red, 2–8 mm, slender; bractlets red, ca. 2 × 1 mm, apex acute. Sepals in 2 whorls; outer sepals ovate, 3–3.5 × 2–2.5 mm, apex obtuse; inner sepals obovate, 4.5–5 × 3–3.5 mm. Petals elliptic, 4–4.5 × 2.5–3 mm, base slightly clawed, with separate oblong glands, apex slightly emarginate. Stamens ca. 2.5 mm; anther connective not prolonged, truncate, or retuse. Ovules 2. Berry red, ellipsoid, ca. 9 × 5.5 mm, not pruinose, style not persistent. Fl. May–Jun, fr. Aug–Oct.

• Thickets, forests, forest margins, roadsides; 700–2100 m. Hebei, Shandong, Shanxi.

**180. *Berberis pseudotibetica*** C. Y. Wu ex S. Y. Bao, *Acta Phytotax. Sin.* 25: 159. 1987.

假藏小檗 *jia zang xiao bo*

Shrubs, deciduous, ca. 1 m tall. Branches grayish black, sparsely black verruculose; spines simple or 3-fid, concolorous, 5–25 mm. Petiole 1–3 mm; leaf blade abaxially pallid, adaxially deep green, narrowly oblong-obovate, 2.5–3 cm × 6–10 mm, thinly leathery, abaxially with conspicuously raised midvein and lateral veins, reticulate veins prominent, adaxially with slightly raised midvein and lateral veins, reticulate veins inconspicuous, base cuneate, margin flat, 2–5-spinose-serrate on each side, apex obtuse, aristate. Flowers unknown. Infructescence with 3–10 berries, 3–4 cm; berry deep red, oblong-ellipsoid, 7–10 × 4–5 mm, not pruinose; style persistent, short; seeds 2. Fl. unknown, fr. Jul.

• Streamsides in thickets, *Pinus* forests; 800–3200 m. Yunnan.

**181. *Berberis dubia*** C. K. Schneider, *Bull. Herb. Boissier, sér.* 2, 5: 663. 1905.

置疑小檗 *zhi yi xiao bo*

Shrubs, deciduous, 1–3 m tall. Branches grayish black, slightly sulcate, sparsely black verruculose; shoots purplish red, shiny, conspicuously sulcate; spines simple or 3-fid, concolorous, 0.7–2 cm. Petiole 1–3 mm; leaf blade abaxially pale yellow, adaxially deep green, narrowly obovate, 1.5–3 × 0.5–1.8 cm, papery, both surfaces glabrous, not pruinose, abaxially with conspicuously raised midvein and lateral veins, adaxially with obviously raised midvein and lateral veins, both surfaces with markedly raised reticulate veins, base attenuate, margin 6–14-spinulose-serrulate on each side, apex subacuminate. Inflorescence a raceme, 5–10-flowered, 1–3 cm; peduncle 5–10 mm. Pedicels weak, 3–6 mm, glabrous; bractlets lanceolate, 1.5 × 1 mm, apex acute. Sepals in 2 whorls; outer sepals ovate, ca. 2.5 × 1.5 mm; inner sepals broadly obovate, ca. 4.5 × 3.5 mm. Petals elliptic, ca. 3.5 × 2.5 mm, base cuneate, with separate glands, apex shortly emarginate. Stamens ca. 2.5 mm; anther connective prolonged, shortly apiculate. Ovules 2. Berry red, obovoid-ellipsoid, ca. 8 × 4 mm, not pruinose, style not persistent. Fl. May–Jun, Aug–Sep.

• Thickets, forests, stony slopes, river beaches; 1400–3900 m. Gansu, Nei Mongol, Ningxia, Qinghai.

**182. *Berberis potaninii*** Maximowicz, *Trudy Imp. S.-Peterburgsk. Bot. Sada* 11: 41. 1891 [*“potanini”*].

少齿小檗 *shao chi xiao bo*

*Berberis leichtensteinii* C. K. Schneider.

Shrubs, evergreen, 1–2 m tall. Branches dark purplish red or dark gray, glabrous; shoots grayish yellow, sometimes, angulate, sparsely black verruculose; spines 3-fid, (1.5–)2–6 cm, stout, adaxially slightly sulcate. Leaves subsessile; leaf blade abaxially pale green, adaxially deep green, shiny, lanceolate, obovate, or narrowly obovate, 2–4 × 0.3–1.8 cm, leathery, abaxially sometimes densely papillose, midvein obviously raised,

lateral and reticulate veins inconspicuous, adaxially veins inconspicuous, base attenuate or cuneate, margin often thickened, 1–4-spinose-serrate on each side, rarely entire, apex acute, mucronate. Inflorescence a raceme, 4–12-flowered, 2–4 cm. Pedicels 5–15 mm, glabrous. Sepals in 2 whorls; outer sepals elliptic to obovate, 4–5 × 3–4 mm, apex obtuse; inner sepals obovate, 5–7 × 4–5 mm. Petals obovate, 4.3–5 × 3–3.5 mm, base truncate, with separate lanceolate glands, apex entire. Stamens 4–5 mm; anther connective obtuse. Ovules 1 or 2, sessile. Berry red, oblong or oblong-globose, 7–8 × 5–6 mm, not pruinose, sometimes slightly so, style persistent and conspicuous. Fl. Apr–May, fr. Aug–Oct.

• Sunny slopes, roadsides, streamsides, valleys; 400–2100 m. Gansu, Shaanxi, Sichuan.

**183. *Berberis centiflora*** Diels, *Notes Roy. Bot. Gard. Edinburgh* 5: 167. 1912.

多花大黄连刺 *duo hua da huang lian ci*

*Berberis pruinosa* Franchet var. *centiflora* (Diels) Handel-Mazzetti.

Shrubs, evergreen, 1–2 m tall. Branches brownish gray or brownish yellow, terete, glabrous, not verruculose; spines 3-fid, concolorous, ca. 1.5 cm, slender. Petiole 1–4 mm; leaf blade abaxially pale green, adaxially shiny, yellow-green, oblong-obovate or oblanceolate, 3–9 × 1–3 cm, leathery, abaxially with obviously raised midvein, lateral veins 8–12 pairs, conspicuous, adaxially with slightly impressed midvein, both surfaces with inconspicuous reticulate veins, base cuneate, margin sometimes slightly revolute, 10–20-spinose-serrate on each side, apex obtuse, apiculate. Inflorescence a fascicle of 15–30 flowers or 2–4-flowered raceme 5–6 cm. Pedicels 1.5–4 cm, glabrous, not pruinose; bractlets ca. 2 × 1.5 mm. Sepals in 2 whorls; outer and inner sepals obovate, equal in size, ca. 5.5 × 4 mm. Petals obovate, ca. 6.5 × 5 mm, base clawed, with separate lanceolate glands, apex slightly retuse. Stamens ca. 5 mm; anther connective prolonged, shortly apiculate. Ovules 4–6. Berry oblong-ellipsoid, ca. 7 × 6 mm, not pruinose; style persistent, short. Fl. Mar–Apr, fr. Jun–Oct.

• Roadsides in valleys; 1800–2700 m. Yunnan.

**184. *Berberis tenuipedicellata*** T. S. Ying, *Acta Phytotax. Sin.* 37: 343. 1999.

细梗小檗 *xi geng xiao bo*

Shrubs, evergreen, 1–2 m tall. Branches dark gray or dark purplish red, terete, sparsely black verruculose, glabrous; shoots dark purplish red, angulate; spines simple or 3-fid, 0.6–1.5 cm. Petiole 2–3 mm, sometimes leaf subsessile; leaf blade abaxially shiny, brown, adaxially green, obovate or obovate-elliptic, 0.8–2(–3.5) × 0.5–1.2 cm, thinly leathery, abaxially not pruinose, midvein and lateral veins obviously raised, adaxially with slightly raised midvein and lateral veins, both surfaces with conspicuously raised reticulate veins, base attenuate, margin 10–25-spinose-serrate on each side, apex rounded, obtuse, or acute. Inflorescence a raceme, 3–10-flowered, 1–3.5 cm, often with 1–3 fascicled flowers at base. Pedicels 5–12 mm, very slender, glabrous. Flowers unknown. Berry red, subglobose, 9–

10 × 8–9 mm, not pruinose, style not persistent, apex cavity-like; seeds 2 or 3. Fl. unknown, fr. May–Jun.

• Thickets, field margins, streamsides, roadsides; 2300–3100 m. Sichuan.

**185. *Berberis mouillacana*** C. K. Schneider in Sargent, Pl. Wilson. 1: 371. 1913.

变刺小檗 *bian ci xiao bo*

*Berberis boschanii* C. K. Schneider.

Shrubs, deciduous, 1.5–3 m tall. Branches dark gray, sulcate; shoots sometimes reddish, not verruculose; spines simple, sometimes 3-fid or absent, pale yellow, terete, 3–18 mm. Petiole 2–5 mm, or leaf subsessile; leaf blade abaxially green, adaxially shiny, green, obovate or oblong-obovate, 1–6 × 0.5–3.5 cm, papery, abaxially not pruinose, not papillose, midvein slightly raised, lateral and reticulate veins conspicuous, adaxially with flat or slightly impressed midvein, lateral and reticulate veins inconspicuous, base cuneate, margin entire, occasionally inconspicuously 1–8-spinulose-serrate on each side, apex rounded, obtuse. Inflorescence usually a raceme with few fascicled flowers at base, or occasionally a subumbellate raceme with 4–12 flowers, 2–5 cm. Pedicels 3–15 mm, glabrous; bractlets lanceolate, ca. 3 × 1 mm, apex acuminate. Sepals in 2 whorls; outer sepals narrowly elliptic, 4–4.5 × 2–2.2 mm; inner sepals elliptic, 6–6.5 × 3–3.5 mm. Petals broadly elliptic, ca. 4.5 × 3 mm, base with separate glands, apex emarginate. Stamens ca. 3 mm; anther connective truncate. Ovules 2–4. Berry ovoid-ellipsoid, 9–10 × 5–6 mm, not pruinose, style persistent. Fl. Apr–May, fr. Jul–Sep.

• Floodlands, forests, forest margins, roadsides on slopes; 2000–3500 m. Qinghai, Sichuan.

**186. *Berberis franchetiana*** C. K. Schneider, Oesterr. Bot. Z. 67: 223. 1918.

滇西北小檗 *dian xi bei xiao bo*

*Berberis franchetiana* var. *glabripes* Ahrendt.

Shrubs, deciduous, 1–2 m tall. Branches brownish gray, obviously sulcate, glabrous, rarely black verruculose; spines 3-fid, weak, 1–1.5 cm, adaxially slightly sulcate. Petiole 2–4 mm; leaf blade abaxially pale gray, adaxially deep green, narrowly obovate, 2–3.5 cm × 6–10 mm, papery, both surfaces not pruinose, abaxially with slightly raised midvein, adaxially with flat midvein, lateral veins 2 or 3 pairs, branched, both surfaces with inconspicuous reticulate veins, margin entire, apex obtuse or acute. Inflorescence a raceme, 3–8-flowered, 2–4 cm, often with few fascicled flowers at base. Pedicels 7–18 mm; bractlets lanceolate, ca. 2.8 mm. Sepals in 3 whorls; outer sepals lanceolate, ca. 4.5 × 1.1 mm; median sepals oblong-obovate, ca. 6 × 3.5 mm; inner sepals obovate, ca. 7 × 5.5 mm. Petals elliptic, ca. 5 × 3.5 mm, base clawed, with separate lanceolate glands, apex acute, emarginate. Stamens ca. 3.8 mm; anther connective not prolonged. Ovules 2. Berry red, oblong-ovoid, 9–10 × 4.5–6 mm, not pruinose, upper part sometimes bent; style persistent, short. Fl. Jun, fr. Aug–Oct.

• Montane thickets, forest margins; 3000–4100 m. Sichuan, Yunnan.

**187. *Berberis lecomtei*** C. K. Schneider in Sargent, Pl. Wilson. 1: 373. 1913.

光叶小檗 *guang ye xiao bo*

道孚小檗 *dao fu xiao bo*

Shrubs, deciduous, 1–2 m tall. Branches brownish gray or

brownish black, sulcate, sparsely black verruculose; shoots pale yellow or purplish red; spines 3-fid, weak, 6–25 mm, adaxially slightly sulcate. Petiole 1–4 mm; leaf blade abaxially ultimately pale green, adaxially deep green, oblong-obovate, 1–3 × 0.7–1.3 cm, papery, both surfaces glabrous, abaxially initially pruinose, ultimately not pruinose, midvein slightly raised, adaxially with flat or slightly impressed midvein, both surfaces with conspicuous reticulate veins, base cuneate, margin 6–10-spinose-serrate on each side, occasionally entire, apex rounded, obtuse. Inflorescence a raceme, 5–10-flowered, 2–4 cm, sometimes with few fascicled flowers at base. Pedicels 7–12 mm, slender, but pedicels of fascicled flowers to 1.8 cm, glabrous. Sepals in 2 whorls; outer sepals obovate, 6–8 × ca. 4.5 mm; inner sepals obovate, 6.5–8.5 × 4–6 mm. Petals broadly elliptic, 5–7 × 3–5 mm, base cuneate, with approximate obovate glands, apex emarginate, lobes acute. Stamens 3–4 mm; anther connective prolonged, obtuse. Ovules 2. Berry red, oblong-ovoid, ca. 10 × 5 mm, slightly pruinose; style persistent, short; seeds 2. Fl. Apr–May, fr. Sep–Oct.

• Thickets, forests, forest margins; 3000–3900 m. Sichuan, Yunnan.

**190. *Berberis heteropoda*** Schrenk in Fischer & C. A. Meyer, Enum. Pl. Nov. 1: 102. 1841.

异果小檗 *yi guo xiao bo*

Shrubs, deciduous, 2–3 m tall. Branches dark red, terete, not verruculose; spines simple or 3-fid, pale purplish red, subterete, 5–30 mm. Petiole 3–10 mm; leaf blade abaxially pale green, slightly shiny, adaxially green, obovate-elliptic, 2–6 × 1–4 cm, thickly papery, both surfaces glabrous, not pruinose, abaxially with slightly raised midvein, lateral veins 2–4 pairs, conspicuous, adaxially with flat or slightly raised midvein, lateral veins raised, both surfaces with raised reticulate veins, base broadly cuneate, margin entire or indistinctly spinose-serrate, apex rounded. Inflorescence a raceme or umbellate raceme, 4–9-flowered, 2–5 cm, with few fascicled flowers at base, glabrous; bracts ovate-lanceolate, 1.5–3 mm. Pedicels 9–17 mm. Sepals in 2 whorls; outer sepals elliptic, ca. 5 × 4 mm, apex rounded; inner sepals obovate, ca. 7 × 5 mm. Petals obovate-spatulate, ca. 6 × 4 mm, base cuneate, with separate glands, apex rounded, entire. Stamens ca. 4.5 mm; anther connective prolonged, apiculate. Ovules 4–6, funiculate. Berry black, subglobose, 10–12 × 9–10 mm, slightly pruinose, style not persistent. Fl. May–Jun, fr. Jul–Oct.

Forests, sparse forests, thickets, floodlands, stony slopes, arid steppe lands; 900–3200 m. Xinjiang [Russia].

**191. *Berberis kaschgarica*** Ruprecht, Sert. Tiansch. 38. 1869.

喀什小檗 *ka shi xiao bo*

Shrubs, deciduous, ca. 1 m tall. Branches purplish red, shiny, terete, glabrous; internodes ca. 1 cm; spines 3-fid, pale yellow, 1–2.5 cm, adaxially slightly sulcate. Leaves subsessile; leaf blade abaxially pale green, adaxially green, oblanceolate, 1–2.5 cm × 2–5 mm, papery, both surfaces not pruinose, abaxially with raised midvein, adaxially with slightly raised midvein, lateral veins 2 or 3 pairs, inconspicuous, both surfaces with inconspicuous reticulate veins, base cuneate, margin en-

tire, occasionally 1- or 2-spinose-serrate on each side, apex acute, aristate. Inflorescence a raceme, 5–9-flowered, 1.5–3 cm, often with 1 or more fascicled flowers at base, glabrous; bracts ovate-triangular, ca. 2 mm. Pedicels 4–10 mm, but pedicels of fascicled flowers to 1.3 cm; bractlets lanceolate, ca. 1.5 mm. Sepals in 2 whorls; outer sepals elliptic, ca. 3 × 1.5 mm; inner sepals obovate, ca. 4.5 × 3 mm. Petals oblong, ca. 4 × 2 mm, base cuneate, with separate glands, apex emarginate. Stamens ca. 2.5 mm; anther connective not prolonged, truncate. Ovules 5. Berry black, ovoid-globose, ca. 8 × 6 mm, not pruinose, style persistent. Fl. May–Jun, fr. Jun–Aug.

• Valley floors, steppe lands, slopes, forest margins, thickets; 1900–2800 m. Xinjiang.

The specific epithet was spelled "*kaschgarica*" in the protologue, although "*kasgarica*" has been commonly used.

**192. *Berberis dielsiana*** Fedde, Bot. Jahrb. Syst. 36(Beibl. 82): 41. 1905.

首阳小檗 *shou yang xiao bo*

Shrubs, deciduous, 1–3 m tall. Branches grayish brown, sulcate, sparsely verruculose; shoots purplish red; spines simple, terete, 3–15 mm, but spines on shoots to 2.5 cm. Petiole ca. 1 cm; leaf blade abaxially initially gray, ultimately green, adaxially dark green, elliptic or elliptic-lanceolate, 4–9 × 1–2 cm, thinly papery, both surfaces glabrous, abaxially initially slightly pruinose, midvein slightly raised, lateral veins visible, adaxially with flat midvein, lateral veins inconspicuous, both surfaces not reticulate, base attenuate, margin 8–20-spinose-serrate on each side, but on shoots margin entire, apex acuminate or acute. Inflorescence a raceme, 6–20-flowered, 5–6 cm including peduncle 0.4–1.5 cm, sometimes compound below, glabrous. Pedicels 3–5 mm, glabrous; bractlets red, lanceolate, 2–2.5 × ca. 0.7 mm. Sepals in 2 whorls; outer sepals oblong-ovate, 2–2.5 × 0.8–1 mm, apex acute; inner sepals obovate, 4–4.5 × ca. 3 mm. Petals elliptic, 5–5.5 × ca. 3 mm, base with separate glands, apex emarginate. Stamens ca. 3 mm; anther connective not prolonged, truncate. Ovules 2. Berry red, oblong, 8–9 × 4–5 mm, not pruinose, style not persistent. Fl. Apr–May, fr. Aug–Sep.

• Slopes, forests, thickets, streamsides; 600–2300 m. Gansu, Hebei, Henan, Hubei, Shaanxi, Shandong, Shanxi.

**193. *Berberis dictyoneura*** C. K. Schneider in Sargent, Pl. Wilson. 1: 374. 1913.

松潘小檗 *song pan xiao bo*

*Berberis brachystachys* T. S. Ying.

Shrubs, deciduous, 1–2 m tall. Branches dark gray, sulcate, sparsely verruculose; shoots pale purplish red; spines 3-fid or simple, concolorous, 1–2 cm, adaxially slightly sulcate. Petiole 2–8 mm; leaf blade abaxially yellow-green, adaxially dark grayish green, elliptic or elliptic-obovate, 1–3.5 × 0.4–1.5 cm, papery, both surfaces glabrous, not pruinose, abaxially with conspicuously raised midvein, adaxially with slightly impressed midvein, both surfaces with dense, obviously raised reticulate veins, base cuneate, margin closely 5–7-spinose-serrate on each side, apex rounded or obtuse. Inflorescence a raceme, 7–14-

flowered, 2–3 cm, sometimes with few fascicled flowers at base; bracts ovate, ca. 1 mm. Pedicels 4–6 mm, glabrous; bractlets ca.  $2.5 \times 1.3$  mm, apex acute. Sepals in 2 whorls; outer sepals oblong,  $4.4\text{--}4.8 \times 2.3\text{--}2.8$  mm; inner sepals obovate,  $5.5\text{--}6.5 \times 3.5\text{--}4$  mm. Petals obovate,  $5\text{--}5.8 \times 3\text{--}3.5$  mm, base clawed, with separate ovate glands, apex entire. Stamens ca. 3.5 mm; anther connective prolonged, apiculate. Ovules 1 or 2. Berry pink or pale red, obovoid-oblong,  $8\text{--}10 \times 5\text{--}6$  mm, not pruinose, style not persistent. Fl. Apr–Jun, fr. Jul–Sep.

• Thickets, forests, weedy slopes, roadsides; 1700–4200 m. Gansu, Qinghai, Shanxi, Sichuan, Xizang.

**194. *Berberis nutanticarpa*** C. Y. Wu ex S. Y. Bao, Bull. Bot. Res., Harbin 5(3): 15. 1985.

垂果小檗 *chui guo xiao bo*

Shrubs, deciduous, ca. 1 m tall. Branches brownish gray, sulcate, sparsely verruculose, glabrous; spines 3-fid or simple, pale yellow, 1–2.5 cm. Petiole 2–3 mm; leaf blade abaxially pale green, sometimes grayish white, adaxially deep green, obovate or elliptic-obovate,  $2.5\text{--}5 \times 1\text{--}2$  cm, papery or thickly so, abaxially with obviously raised midvein and lateral veins, adaxially with flat or slightly raised midvein, lateral veins 5–7 pairs, base cuneate, margin remotely 10–14-spinose-serrate on each side, occasionally entire, apex rounded or acute. Flowers unknown. Inflorescence a raceme with 5–8 berries, 4.5–6 cm including peduncle 1.5–2 cm, nutant; bracts lanceolate, 4–5 mm; fruit stalk 1.5–3.5 cm, glabrous; berry red, ellipsoid,  $9\text{--}12 \times 4\text{--}5$  mm, slightly pruinose, style not persistent; seeds 2. Fl. unknown, fr. Oct.

• Weedy slopes, alpine meadows; 3000–3700 m. Sichuan, Xizang, Yunnan.

**195. *Berberis bracteata*** (Ahrendt) Ahrendt, J. Linn. Soc., Bot. 57: 163. 1961.

长苞小檗 *chang bao xiao bo*

*Berberis dictyoneura* C. K. Schneider var. *bracteata* Ahrendt, J. Bot. 80(Suppl.): 111. 1942.

Shrubs, deciduous, less than 1 m tall. Branches dark gray, obviously sulcate, not verruculose; shoots pale yellow, sometimes dark purplish red; spines weak, 3-fid, concolorous, 1–1.5 cm. Petiole 1–3 mm; leaf blade adaxially shiny, green, obovate or elliptic-obovate,  $1.7\text{--}4 \times 0.7\text{--}1.7$  cm, papery, both surfaces glabrous, not pruinose, adaxially with slightly raised midvein and lateral veins, both surfaces with conspicuously raised reticulate veins, base cuneate, margin coarsely 10–12-aristate-dentate on each side, apex rounded, obtuse. Inflorescence a raceme, 5–8-flowered, compound below, 2–3 cm, glabrous; bracts lanceolate, 4–5 mm, apex acuminate. Pedicels 5–6(–9) mm, glabrous. Flowers ca. 7 mm in diam. Sepals in 2 whorls; outer sepals oblong,  $4\text{--}4.5 \times 2\text{--}2.5$  mm; inner sepals obovate,  $5.5\text{--}6.5 \times 3.5\text{--}4$  mm. Petals obovate,  $5\text{--}5.5 \times 3\text{--}3.5$  mm, base clawed, with separate glands, apex entire. Stamens ca. 3 mm; anther connective prolonged, subapiculate. Ovules 1 or 2. Fruit unknown. Fl. Jul–Aug, fr. unknown.

• Sunny rocky slopes, weedy places within *Abies* forests; 3200–3300 m. Yunnan.

**196. *Berberis batangensis*** T. S. Ying, Acta Phytotax. Sin. 37: 344. 1999.

巴塘小檗 *ba tang xiao bo*

Shrubs, deciduous, 0.5–1.5 m tall. Branches dark gray, terete; shoots dark purplish, sulcate, glabrous; spines 3-fid, concolorous, 1–1.5 cm. Leaves subsessile; leaf blade abaxially gray, adaxially pale green, obovate or narrowly obovate,  $0.4\text{--}2 \text{ cm} \times 2\text{--}7$  mm, papery, abaxially glabrous, not pruinose, midvein obviously raised, adaxially with slightly raised midvein, both surfaces with conspicuously raised reticulate veins, base cuneate, margin thickened, entire, apex rounded or retuse. Inflorescence a raceme, 5–10-flowered, 1–1.5 cm, often with few fascicled flowers at base. Pedicels ca. 3 mm, glabrous, sometimes slightly pruinose; bractlets ovate, ca. 1 mm, apex acuminate. Sepals in 3 whorls; outer sepals ovate,  $1.2\text{--}1.5 \times \text{ca. } 1$  mm; median sepals ovate-orbicular,  $\text{ca. } 3 \times 2$  mm; inner sepals elliptic,  $4\text{--}4.2 \times 3\text{--}3.2$  mm. Petals obovate,  $2.8\text{--}3.1 \times 1.8\text{--}2$  mm, base clawed, with approximate glands, apex emarginate, lobes acute. Stamens ca. 1.2 mm; anther connective not prolonged, truncate. Ovules 4. Fruit unknown. Fl. Jun–Jul, fr. unknown.

• Thickets, field margins; 2600–3000 m. Sichuan.

**197. *Berberis ignorata*** C. K. Schneider, Bull. Herb. Boissier, sér. 2, 5: 661. 1905.

烦果小檗 *fan guo xiao bo*

*Berberis virescens* J. D. Hooker var. *ignorata* (C. K. Schneider) Ahrendt.

Shrubs, deciduous, 1–3 m tall. Branches gray, terete, sparsely verruculose; shoots shiny, purplish black; spines simple, sometimes 3-fid, 5–15 mm. Petiole 2–3 mm, or leaf subsessile; leaf blade abaxially gray, adaxially dark green, narrowly obovate,  $1\text{--}3.5 \times 0.4\text{--}1.5$  cm, papery, abaxially slightly pruinose, midvein slightly raised, adaxially with flat or slightly raised midvein, lateral veins 4 or 5 pairs, reticulate veins inconspicuous, base cuneate, margin entire, sometimes 1–5-spinose-serrate on each side, apex rounded or acute. Inflorescence a raceme or subumbellate raceme, 3–9-flowered, 2–3.5 cm, often with few fascicled flowers at base; bracts ca. 1.5 mm. Pedicels 5–10 mm, slender, glabrous; bractlets broadly lanceolate,  $\text{ca. } 3 \times 1$  mm. Sepals in 3 whorls; outer sepals oblong-ovate,  $4\text{--}4.5 \times 2\text{--}2.5$  mm; median sepals elliptic,  $\text{ca. } 5 \times 2.5$  mm, apex obtuse; inner sepals elliptic-obovate,  $5.2\text{--}6 \times 3.7\text{--}4$  mm. Petals obovate,  $4.5\text{--}5 \times \text{ca. } 3$  mm, base with separate glands, apex emarginate, lobes rounded. Stamens ca. 4 mm; anther connective prolonged, obtuse. Ovules 3 or 4,  $\pm$  not funiculate. Berry red, oblong,  $10\text{--}13 \times 5\text{--}7$  mm, not pruinose, style not persistent. Fl. May, fr. Aug–Sep.

Forests, thickets, mixed forests; 2700–3800 m. Xizang [Bhutan, India (Sikkim)].

**198. *Berberis jiulongensis*** T. S. Ying in S. Y. Jin & Y. L. Chen, Cat. Type Spec. Herb. China (Suppl. II), 54. 2007.

九龙小檗 *jiu long xiao bo*

Shrubs, evergreen, 1–2 m tall. Branches dark gray, angulate; shoots purplish red, sparsely black verruculose. Spines

simple, purplish red, 5–10 mm. Leaves shortly petiolate; leaf blade abaxially pale green, adaxially green, obovate-lanceolate or narrowly obovate, 1.5–3.5 cm × 5–8 mm, thinly leathery, abaxially not pruinose, midvein obviously raised, lateral veins conspicuous, adaxially with inconspicuous midvein and lateral veins, both surfaces with markedly raised reticulate veins, base attenuate, margin entire, apex rounded, obtuse, aristate. Inflorescence a corymbose panicle, 20–30-flowered, 4–10 cm, often with 1–3 racemes fascicled at base, sometimes flowers verticillate at apex of inflorescence; bracts leaflike, ca. 1 cm. Pedicels ca. 2 mm. Sepals in 3 whorls; outer sepals triangular-ovate or ovate, 2–2.5 × 1.6–2 mm; median sepals broadly elliptic or suborbicular, ca. 3.2 × 2.8–3 mm; inner sepals broadly obovate, 4.5–5 × 4.1–4.5 mm. Petals obovate or obovate-elliptic, 4–4.5 × 3–3.5 mm, base clawed, with separate glands, apex emarginate. Stamens 3.5–4 mm; anther connective prolonged, obtuse or truncate. Ovules 3 or 4, shortly funiculate. Fruit unknown. Fl. Jun, fr. unknown.

- Thickets, slopes, floodlands, valleys; 2300–2500 m. Sichuan.

**199. *Berberis contracta*** T. S. Ying, Acta Phytotax. Sin. 37: 322. 1999.

德钦小檗 *de qin xiao bo*

Shrubs, deciduous, to 2 m tall. Branches gray, terete, sparsely black verruculose; spines simple or 3-fid, pale yellow, 1–2 cm. Leaves subsessile; leaf blade abaxially pale green, adaxially green, narrowly elliptic, 1–3.5 cm × 5–10 mm, papery, abaxially not pruinose, glabrous, midvein and lateral veins raised, adaxially with flat midvein, lateral veins 3–5 pairs, both surfaces with obviously raised reticulate veins, base cuneate, margin 1–4-spinose-serrate on each side, occasionally entire, apex acute or obtuse. Inflorescence a corymbose panicle, 15–20-flowered, 1.5–5 cm including peduncle 3–12 mm, sometimes with 1 or 2 racemes fascicled at base; bracts triangular-ovate, ca. 1 mm, apex acuminate. Pedicels 2–5 mm, slender; bractlets lanceolate, ca. 1.3 mm. Sepals in 2 whorls; outer sepals ovate-lanceolate, ca. 2 × 1 mm; inner sepals oblong, 3 × 2 mm, translucent. Petals obovate-elliptic, ca. 2.5 × 1.3 mm, translucent, base clawed, with separate inconspicuous glands, apex entire or emarginate. Stamens ca. 2 mm; anther connective slightly prolonged, rounded, obtuse. Ovules 2, shortly funiculate. Berry oblong, 7–8 × 2.5–3 mm, slightly pruinose, style persistent; seeds 1. Fl. Jul, fr. Jul–Sep.

- Thickets; 2500–3000 m. Yunnan.

**200. *Berberis aggregata*** C. K. Schneider, Bull. Herb. Boissier, sér. 2, 8: 203. 1908.

堆花小檗 *dui hua xiao bo*

*Berberis aggregata* var. *integrifolia* Ahrendt; *B. brevipaniculata* C. K. Schneider.

Shrubs, semi-evergreen or deciduous, 2–3 m tall. Branches dark brown, sulcate, glabrous; shoots pale brown, slightly puberulous, sparsely black verruculose; spines 3-fid, pale yellow, 8–15 mm. Leaves subsessile or shortly petiolate; leaf blade abaxially pale yellow-green or grayish white, adaxially dark

yellow-green, obovate-oblong or obovate, 8–25 × 4–15 mm, subleathery, abaxially with raised midvein, adaxially with slightly impressed midvein, both surfaces with conspicuous reticulate veins, base cuneate, margin 2–8-spinose-serrate on each side, sometimes entire, apex rounded, obtuse, aristate. Inflorescence a congested panicle, 10–30-flowered, 1–2.5 cm, subsessile; bracts slightly longer than pedicels, 1.5–3 mm. Pedicels 1–3 mm; bractlets ovate, ca. 1 mm, apex acute. Sepals in 2 whorls, elliptic; outer sepals ca. 2.5 × 1.8 mm; inner sepals ca. 3.5 × 2.5 mm. Petals obovate, ca. 3.5 × 2 mm, base clawed, with oblong glands, apex emarginate. Stamens 2–2.5 mm; anther connective prolonged, obtuse. Ovules 2, subsessile. Berry red, subglobose or ovoid-globose, 6–7 mm, not pruinose, style persistent. Fl. May–Jun, fr. Jul–Sep.

- Thickets, forests, roadsides, floodlands; 1000–3500 m. Gansu, Hubei, Qinghai, Shanxi, Sichuan.

**201. *Berberis luhuoensis*** T. S. Ying, Acta Phytotax. Sin. 37: 323. 1999.

炉霍小檗 *lu huo xiao bo*

Shrubs, deciduous, ca. 1.2 m tall. Branches dark gray, angulate, sparsely black verruculose; spines simple or 3-fid, yellow-brown, ca. 1 cm, sometimes absent. Petiole 2–6 mm; leaf blade abaxially yellow-green, adaxially deep green, obovate or obovate-elliptic, (1.5–)2–4 × 0.8–2 cm, papery, abaxially not pruinose, midvein and lateral veins obviously raised, adaxially with slightly impressed midvein, lateral veins slightly raised, both surfaces with conspicuous reticulate veins, base attenuate, margin 2–16-spinose-serrate on each side, sometimes entire, apex rounded or obtuse. Inflorescence a panicle, 30–60-flowered, to 13 cm including peduncle ca. 4.5 cm, sometimes with few fascicled flowers at base; rachis and peduncle puberulous. Pedicels 2–3 mm, glabrous; bractlets lanceolate, 2.5–3.2 mm. Sepals in 3 whorls; outer sepals narrowly elliptic, 2.8–3.1 × 1.2–1.5 mm; median sepals elliptic, ca. 4 × 2.3 mm; inner sepals suborbicular, ca. 4 × 3.1 mm. Petals elliptic, base clawed, with separate elliptic glands, apex emarginate, lobes acute. Stamens ca. 2.2 mm; anther connective not prolonged, truncate. Ovules 2, shortly funiculate. Berry oblong, 7–8 × 2–2.1 mm, slightly pruinose, style not persistent. Fl. Jul, fr. Aug.

- Slopes of plateaus, valleys; 2100–3100 m. Sichuan.

**202. *Berberis sherriffii*** Ahrendt, J. Bot. 79(Suppl.): 77. 1941.

短苞小檗 *duan bao xiao bo*

Shrubs, deciduous, ca. 2 m tall. Branches gray, terete, sparsely black verruculose; shoots dark pale red; spines simple, weak, concolorous, 1–1.5 cm. Petiole 1–5 mm; leaf blade abaxially yellow-green, adaxially dark green, obovate, 1–3.5 × 0.7–1.5 cm, papery, abaxially not pruinose, midvein obviously raised, adaxially with flat midvein, lateral veins 3 or 4 pairs, both surfaces with conspicuous reticulate veins, base cuneate, margin entire, occasionally 2- or 3-spinose-serrate on each side, apex obtuse. Inflorescence a panicle, 15–20-flowered, 3–5 cm; rachis flexuose, glabrous; bracts 1–1.5 mm. Pedicels 2–4 mm, glabrous; bractlets oblong, ca. 2 mm, apex acute. Sepals in 3 whorls; outer sepals oblong, ca. 3.5 × 2.5 mm, apex acute;

median sepals oblong-elliptic, ca.  $4.3 \times 3.5$  mm; inner sepals obovate, ca.  $6 \times 5$  mm. Petals obovate, ca.  $5 \times 3.8$  mm, base clawed, with remote glands, apex slightly emarginate, lobes acute. Stamens ca. 3 mm; anther connective slightly prolonged, shortly apiculate. Ovules 1 or 2 (or 3). Berry purplish red, oblong or ovoid-oblong,  $6-9 \times 3-4$  mm, slightly blue pruinose, style not persistent. Fl. Jun–Jul, fr. Aug–Oct.

- Forest margins; 2000–3300 m. Xizang.

**203. *Berberis prattii*** C. K. Schneider in Sargent, Pl. Wilson. 1: 376. 1913.

短锥花小檗 duan zhui hua xiao bo

*Berberis aggregata* C. K. Schneider var. *prattii* (C. K. Schneider) C. K. Schneider; *B. oblanceolata* (C. K. Schneider) Ahrendt; *B. polyantha* Hemsley var. *oblanceolata* C. K. Schneider; *B. prattii* var. *laxipendula* Ahrendt; *B. prattii* var. *recurvata* C. K. Schneider.

Shrubs, deciduous, 2–3 m tall. Branches pale yellow, angulate, sparsely verruculose, sometimes puberulous; shoots purplish red, puberulous; spines simple or 3-fid, weak, brownish yellow, terete, 5–15 mm. Petiole 1–3 mm; leaf blade abaxially grayish green, adaxially yellow-green, sometimes shiny, obovate-elliptic or obovate,  $1-3(-4) \times 0.5-1.5$  cm, papery, abaxially initially pruinose, often ultimately not pruinose, closely papillose, midvein slightly raised, adaxially with slightly raised or flat midvein, both surfaces with obviously raised reticulate veins, base cuneate or attenuate, margin entire, apex rounded or obtuse. Inflorescence a panicle, 15–80-flowered, 5–15 cm, narrow, glabrous or puberulous; bracts 1–2.5 mm. Pedicels 2.5–4 mm, glabrous; bractlets absent. Sepals in 3 whorls; outer sepals lanceolate,  $4-5 \times 1.2-2$  mm, apex acuminate; median sepals ovate-lanceolate,  $4-5 \times 1.5-2$  mm, apex subacuminate; inner sepals obovate, ca.  $5.5 \times 4$  mm. Petals narrowly obovate, ca.  $4.5 \times 2.3$  mm, base clawed, with separate oblong glands, apex emarginate, lobes acute. Stamens ca. 2.5 mm; anther connective prolonged, obtuse. Ovules 2, sessile. Berry shiny, pink, ovoid, ca.  $6.5 \times 4.5$  mm, not pruinose, style not persistent. Fl. Jun–Jul, fr. Sep–Oct.

- Thickets; 2100–3400 m. Sichuan, Xizang.

**204. *Berberis beaniana*** C. K. Schneider in Sargent, Pl. Wilson. 3: 439. 1917.

康松小檗 kang song xiao bo

Shrubs, deciduous, 1.5–2.5 m tall. Branches grayish yellow, sulcate, sparsely verruculose, glabrous; shoots green; spines 3-fid, pale yellow, 1–2.5 cm. Petiole 1–3 mm; leaf blade abaxially gray, adaxially shiny, deep green, narrowly elliptic to ovate-elliptic,  $2-5 \times 0.6-1.3$  cm, papery, abaxially pruinose, finely papillose, midvein obviously raised, adaxially with impressed midvein, reticulate veins conspicuous, base cuneate, margin slightly revolute, 5–10-spinose-serrate on each side, apex acute to acuminate. Inflorescence a panicle, loosely 10–20 flowered, 2–4 cm, broad, glabrous; bracts ca. 1.5 mm. Pedicels 6–15 mm. Sepals in 3 whorls; outer sepals yellow, without discoloration, oblong-ovate,  $2-3 \times 1-1.3$  mm; median sepals

oblong-ovate,  $4-5 \times 2.3-3.3$  mm, apex subobtusate; inner sepals obovate,  $6-6.5 \times 3.5-4.5$  mm. Petals obovate, ca.  $5 \times 3-3.5$  mm, base cuneate with separate oblong glands, apex subentire or slightly emarginate. Stamens 3–3.5 mm; anther connective slightly prolonged, rounded. Ovules 3 or 4, sessile. Berry dark red, ovoid-oblong,  $9-10 \times 5-6$  mm, densely mauve pruinose, style not persistent. Fl. Jun, fr. Oct–Nov.

- W Sichuan.

This species is known only from the type gathering (at A and OXF), a cultivated plant grown at the Royal Botanic Gardens, Kew, from seed (*E. H. Wilson Veitch Exped. no. 1930*) collected in 1904 from an unspecified location in W Sichuan.

**205. *Berberis francisci-ferdinandi*** C. K. Schneider in Sargent, Pl. Wilson. 1: 367. 1913.

大黄檗 da huang bo

Shrubs, deciduous, 1–3 m tall. Branches grayish brown or reddish brown, subterete; shoots reddish brown, scarcely verruculose; spines simple, rarely 3-fid, 0.5–2 cm, adaxially sulcate, sometimes absent. Petiole 5–15 mm; leaf blade abaxially pale yellow-green, adaxially green, shiny, ovate to elliptic,  $2-7 \times 1-3$  cm, papery, both surfaces glabrous, abaxially not pruinose, midvein obviously raised, adaxially with slightly impressed midvein, both surfaces with slightly visible reticulate veins, base contracted to decurrent petiole, margin 15–30-spinulose-serrulate on each side, apex acute or subacute. Inflorescence a panicle, 20–40-flowered, 5–14 cm including peduncle 1–3 cm, glabrous; bracts linear-subulate, 3–3.5 mm. Pedicels 4–10 mm, slender; bractlets reddish, 1.5–2 mm, apex acute. Sepals in 3 whorls; outer sepals ovate, ca.  $2.4 \times 1.5$  mm, apex acute; median sepals ovate, ca.  $3 \times 2$  mm; inner sepals obovate,  $3.3-4.3 \times 2-2.5$  mm. Petals oblong,  $3.5-4.5 \times 2.5-3$  mm, base cuneate, with separate oblong glands, apex acute, slightly incised. Stamens 2.5–3.5 mm; anther connective slightly prolonged, rounded. Ovules 2, sessile. Berry scarlet, obovoid-ellipsoid,  $10-12 \times 4-6$  mm, not pruinose, style  $\pm$  persistent. Fl. May–Jun, fr. Jul–Oct.

- Thickets, forests, weedy slopes; 1400–4000 m. Gansu, Shanxi, Sichuan, Xizang.

**206. *Berberis trichiata*** T. S. Ying in C. Y. Wu, Fl. Xizang. 2: 125. 1985.

毛序小檗 mao xu xiao bo

Shrubs, deciduous, 1–2 m tall. Branches pale brown, sparsely black verruculose, sulcate, puberulous, often ultimately glabrous; spines 3-fid, occasionally simple, pale yellow, 1–2 cm, stout. Leaves subsessile; leaf blade abaxially pale green, adaxially green, obovate or obovate-oblong,  $1.2-3.5 \times 0.7-1.5$  cm, herbaceous, abaxially puberulous on veins initially, ultimately glabrous, midvein obviously raised, lateral veins slightly raised, adaxially with flat midvein, lateral veins 4–6 pairs, both surfaces with conspicuous reticulate veins, base cuneate, margin 2–12-spinose-serrate on each side, but sometimes entire on leaves of upper branches, apex rounded. Inflorescence a panicle, 15–40-flowered, 3–5.5 cm, puberulous; peduncles 1–1.7

cm, sometimes compound at base; bracts triangular-lanceolate, 1–2 mm. Pedicels 2–6 mm, slender, puberulous; bractlets narrowly ovate, ca.  $3 \times 1.5$  mm. Sepals in 2 whorls; outer sepals ovate, ca.  $3.6 \times 3$  mm; inner sepals suborbicular or obovate, ca.  $5 \times 3$  mm. Petals ovate-elliptic, ca.  $4 \times 2.2$  mm, base clawed, with separate glands, apex emarginate. Stamens ca. 2.1 mm; anther connective prolonged, subapiculate. Ovules 2, subsessile. Berry unknown. Fl. Jun, fr. unknown.

- Forest margins; ca. 3500 m. Xizang.

**207. *Berberis gyalai*** Ahrendt, Gard. Chron., ser. 3, 109: 101. 1941.

波密小檗 *bo mi xiao bo*

*Berberis gyalai* var. *maximiflora* Ahrendt; *B. gyalai* var. *minuata* Ahrendt; *B. taylorii* Ahrendt.

Shrubs, deciduous, 1.2–3 m tall. Branches deep gray or purplish brown, puberulous, ultimately glabrous; spines simple, occasionally 3-fid, pale yellow, 6–12 mm. Leaves subsessile or very shortly petiolate; leaf blade abaxially grayish green, adaxially dark green, obovate-elliptic,  $1.2\text{--}3.2 \times 0.7\text{--}1.7$  cm, papery, abaxially with obviously raised midvein and lateral veins, adaxially with raised midvein, lateral veins much branched, both surfaces with conspicuous reticulate veins, base cuneate, margin entire, occasionally 2–4-spinose-serrate on each side, apex acute or rounded. Inflorescence a panicle, 10–45-flowered, 4–11 cm including peduncle 1–3 cm, rachises and peduncles puberulous; bracts 1.5–4 mm, usually longer than pedicels. Pedicels 1.5–3 mm, glabrous; bractlets ovate,  $3\text{--}3.2 \times \text{ca. } 2$  mm, apex acuminate. Sepals in 2 whorls; outer sepals ovate, ca.  $3.5 \times 3$  mm, apex acute; inner sepals obovate, ca.  $5.5 \times 4$  mm. Petals obovate, ca.  $4.6 \times 3.5$  mm, base clawed, with separate glands, apex incised, rounded, lobes obtuse. Stamens ca. 3 mm; anther connective not prolonged, truncate. Ovules (1–)3 or 4(or 5). Berry purplish black, oblong-ovoid,  $9\text{--}10 \times 4\text{--}5$  mm, slightly pruinose, style not persistent. Fl. Jun–Jul, fr. Oct.

- Thickets, forest understories, roadsides; 2000–3200 m. Xizang.

**208. *Berberis kerriana*** Ahrendt, J. Linn. Soc., Bot. 57: 91. 1961.

南方小檗 *nan fang xiao bo*

Shrubs, evergreen, ca. 2 m tall. Stems pale yellow, terete, glabrous; branches deep red, becoming red-brown, and soon yellow-brown; shoots reddish; internodes 1–2 cm; spines discolorous, pale yellow, 2–3.5 cm, slender. Leaves adaxially slightly shiny, oblanceolate,  $2.5\text{--}4.5 \times 0.7\text{--}1.3$  cm, slightly stiffly leathery, abaxially white pruinose, with veins more distinct, adaxially veins branched, scarcely subreticulate, base attenuate, margin entire, sometimes toward apex 3–5-spinose-serrate on each side, apex acute. Inflorescence a panicle, 6–12-flowered, 3–5 cm; bracts ca. 1 mm. Pedicels 7–14 mm. Ovules 2 or 3. Berry black, oblong,  $9\text{--}10 \times 5\text{--}6$  mm, excluding a very short but distinct style, gray pruinose. Fl. May, fr. Oct.

- China (without precise locality).

This species is known only from the type (at BM), a cultivated plant that once grew at the Royal Horticultural Society's garden in Wisley, Surrey, United Kingdom, reputedly from *Kerr* 39, collected in some unspecified part of China in 1935.

**209. *Berberis polyantha*** Hemsley, J. Linn. Soc., Bot. 29: 302. 1892.

刺黄花 *ci huang hua*

Shrubs, semi-evergreen, 1.5–2(–4.5) m tall. Branches grayish brown, sulcate, sparsely verruculose; spines simple, occasionally 3-fid, 1–3 cm. Leaves subsessile; leaf blade abaxially pale green, adaxially shiny, dark green, oblong-obovate or obovate,  $0.8\text{--}4.5 \times 0.5\text{--}1.7$  cm, leathery, abaxially not pruinose, midvein raised, adaxially with flat or impressed midvein, both surfaces with obviously raised close reticulate veins, base cuneate, margin 3–10-spinose-serrate on each side, sometimes entire, apex rounded. Inflorescence a panicle, broad and much branched, 30–100-flowered, 5–15 cm including peduncle 0.3–2 cm, glabrous; bracts 1.5–2.5 mm. Pedicels 2–4 mm, glabrous; bractlets triangular, 1–1.5 mm. Sepals in 2 whorls; outer sepals ovate, ca.  $3.5 \times 2$  mm, apex acute; inner sepals obovate,  $4.5\text{--}6.5 \times 2.5\text{--}3$  mm. Petals obovate,  $3.5\text{--}4 \times \text{ca. } 2$  mm, base clawed, with separate oblong glands, apex incised, lobes acute. Stamens ca. 3 mm; anther connective prolonged, obtuse. Ovules 2, subsessile. Berry dark red or dark reddish brown, narrowly ovoid,  $7\text{--}8 \times 3\text{--}4$  mm, pruinose, style conspicuous, to 1.5 mm; seeds purple. Fl. May–Jul, fr. Aug–Oct.

- Sunny slopes, thickets, forests, forest margins, roadsides, grassy slopes; 2000–3600 m. Sichuan, Xizang.

**210. *Berberis sikkimensis*** (C. K. Schneider) Ahrendt, J. Bot. 80(Suppl.): 85. 1942.

锡金小檗 *xi jin xiao bo*

*Berberis chitria* Buchanan-Hamilton ex Ker Gawler var. *sikkimensis* C. K. Schneider, Bull. Herb. Boissier, sér. 2, 5: 453. 1905; *B. sikkimensis* var. *baileyi* Ahrendt; *B. sikkimensis* var. *glabramea* Ahrendt.

Shrubs, semi-evergreen, 1.5–2.5 m tall. Branches dark gray, glabrous or scarcely verruculose; shoots pale yellow, glabrous, sulcate; spines 3-fid, pale yellow, 0.5–2 cm, adaxially slightly sulcate. Leaves shortly petiolate; leaf blade abaxially yellow-green, adaxially deep green, obovate or obovate-elliptic,  $1.5\text{--}2.7 \text{ cm} \times 5\text{--}10 \text{ mm}$ , leathery, abaxially pruinose, becoming glabrous, scarcely papillose, midvein slightly raised, lateral veins 2–4 pairs, adaxially slightly shiny, midvein flat, both surfaces with conspicuous reticulate veins, base cuneate, margin entire, sometimes 1–5-spinose-serrate on each side, apex acute or rounded, mucronate. Inflorescence a panicle or raceme, 3–20-flowered, 3–5 cm including peduncle 0.5–2 cm. Pedicels 4–8 mm, glabrous; bractlets yellow, sepeloid, ca.  $2 \times 1.6$  mm, apex acute. Sepals in 2 whorls; outer sepals ovate,  $3.5\text{--}4 \times 2.5\text{--}3$  mm, apex acute; inner sepals broadly elliptic,  $7\text{--}8 \times \text{ca. } 5$  mm. Petals obovate, ca.  $6 \times 4$  mm, base clawed, with separate glands, apex entire or slightly crenulate. Stamens ca. 6 mm; anther connective prolonged, subapiculate. Ovules 4. Berry

dark red, narrowly ovoid, ca.  $15 \times 4.5$  mm, not pruinose, often slightly curved, style ca. 1.5 mm. Fl. May–Jun, fr. Jul–Aug.

Mixed forests, forest margins, thickets; 2000–3000 m. Xizang, Yunnan [Bhutan, India (Sikkim), Nepal].

**211. *Berberis coryi*** Veitch, Gard. Chron., ser. 3, 52: 321. 1912.

贡山小檗 gong shan xiao bo

Shrubs, semi-evergreen. Leaves spatulate,  $10\text{--}25 \times 8\text{--}12$  mm, abaxially glaucous, base cuneate, margin entire, apex retuse. Inflorescence a panicle, 7–20-flowered, 3–5 cm, sometimes reduced to a short raceme or subfascicle; bracts shorter than pedicels. Pedicels 4–5 mm. Berry pinkish red, oblong-globose,  $5\text{--}6 \times 4.5\text{--}6$  mm, style ca. 0.5 mm. Fl. Jul, fr. Dec.

• Rocks, cliffs, dry rocky slopes on mountains; 3000–3300 m. Yunnan.

**212. *Berberis metapolyantha*** Ahrendt, J. Bot. 79(Suppl.): 75. 1941.

万源小檗 wan yuan xiao bo

Shrubs, semi-evergreen, 1–2 m tall. Branches puberulous, sulcate; spines 3-fid or simple, 1–1.5 cm. Leaves subsessile; leaf blade abaxially pallid, becoming grayish brown when dry, adaxially dark green, obovate or obovate-oblong,  $1.5\text{--}2.7 \times 0.7\text{--}1.2$  cm, subleathery, both surfaces with conspicuous reticulate veins, base cuneate, margin entire, rarely 1–3-spinose-serrate on each side, apex rounded. Inflorescence a panicle, 10–14-flowered, 3–5 cm, sometimes compound below, apex rounded; bracts 2–3 mm, apex acuminate. Pedicels 3–5 mm, puberulous; flowers ca. 6 mm in diam.; bractlets lanceolate, ca. 1.5 mm, apex acuminate. Sepals in 2 whorls; outer sepals ovate, ca.  $2.5 \times 1.5$  mm, apex acute; inner sepals elliptic, ca.  $4 \times 2$  mm. Petals obovate, ca.  $3.5 \times 2.8$  mm, base with separate glands, apex emarginate, rounded. Stamens ca. 2.5 mm; anther connective slightly prolonged, shortly apiculate. Ovules 3 or 4. Berry red, oblong-globose, ca.  $6.5 \times 6$  mm, not pruinose, style persistent. Fl. Jun, fr. Oct.

• Mountain slopes, roadsides; 1500–2700 m. Sichuan, Yunnan.

**213. *Berberis xanthophlaea*** Ahrendt, J. Bot. 79(Suppl.): 73. 1941.

黄皮小檗 huang pi xiao bo

Shrubs, deciduous, 1–2(–3) m tall. Branches dark gray, terete, not verruculose; shoots pale yellow, slightly shiny; spines simple, sometimes 3-fid, concolorous, terete, 0.5–1.5 cm. Leaves subsessile; leaf blade abaxially initially gray, ultimately shiny, pale green, adaxially green, obovate or oblanceolate,  $1.5\text{--}6.5 \times 0.8\text{--}2$  cm, papery, abaxially slightly pruinose, ultimately not pruinose, both surfaces with midvein and lateral veins conspicuous, reticulate veins inconspicuous, base cuneate, margin entire, apex obtuse or rounded. Inflorescence a panicle, 10–45-flowered, 6–9(–12) cm including peduncle  $1.5\text{--}4(–7)$  cm, glabrous, sometimes rachis with leaflike bracts. Pedicels 5–12 mm; bractlets ovate,  $1.3\text{--}3 \times 1\text{--}2$  mm, apex acute. Sepals in 2 whorls; outer sepals elliptic,  $3\text{--}5 \times 2\text{--}4$  mm; inner sepals ellip-

tic-obovate,  $5\text{--}5.6 \times 3\text{--}3.5$  mm. Petals obovate,  $3.5\text{--}5 \times 2.5\text{--}4$  mm, base obviously clawed, with slightly separate glands, apex emarginate. Stamens ca. 3 mm; anther connective not prolonged, truncate. Ovules 2, shortly funiculate. Berry red, oblong-obovoid,  $7\text{--}9 \times 5\text{--}6$  mm, blue pruinose, style persistent. Fl. Jun–Jul, fr. Aug–Oct.

• Thickets, forests, streamsides, valleys; 2800–4000 m. Xizang.

**214. *Berberis concolor*** W. W. Smith, Notes Roy. Bot. Gard. Edinburgh 11: 199. 1919.

同色小檗 tong se xiao bo

Shrubs, deciduous, 1.5–2 m tall. Branches pale yellow or dark gray, subterete, sometimes very sparsely verruculose; shoots brownish yellow or dark red, slightly sulcate; spines 3-fid, concolorous, 1.5–2.5 cm. Leaves subsessile; leaf blade abaxially pale green, adaxially green, narrowly obovate or obovate,  $1\text{--}2.7 \text{ cm} \times 3\text{--}9$  mm, thickly papery, abaxially not pruinose, midvein obviously raised, adaxially with flat midvein, lateral veins 3–5 pairs, both surfaces with distinctly raised, much-branched lateral veins, reticulate veins conspicuous, base cuneate, margin entire, occasionally 1–3-spinose-serrate on each side, apex obtuse. Inflorescence a panicle, 10–20-flowered, 3–7 cm; bracts lanceolate, 1–2.5 mm. Pedicels 6–7 mm, glabrous. Sepals in 2 whorls; outer sepals broadly ovate,  $2.5\text{--}3 \times 2\text{--}2.5$  mm; inner sepals obovate,  $4\text{--}4.5 \times 3\text{--}3.5$  mm. Petals obovate, ca.  $3.5 \times 2.5$  mm, base shortly clawed, with separate glands, apex slightly incised. Stamens ca. 3 mm; anther connective slightly prolonged, truncate. Ovules 1 or 2. Berry dark red to red-purple, ellipsoid,  $7\text{--}8 \times 5\text{--}6$  mm, slightly blue pruinose, with short style. Fl. May–Jun, fr. Jul–Aug.

• Thickets; 2300–3600 m. Yunnan.

**215. *Berberis beijingsensis*** T. S. Ying, Acta Phytotax. Sin. 37: 324. 1999.

北京小檗 bei jing xiao bo

Shrubs, deciduous, ca. 1 m tall. Branches stramineous or pale brownish stramineous, sulcate, glabrous, sparsely black verruculose; spines simple, occasionally 3-fid, concolorous, 5–8 mm, adaxially slightly sulcate. Leaves subsessile; leaf blade abaxially pale green, adaxially green, narrowly oblanceolate,  $1\text{--}4 \text{ cm} \times 3\text{--}6$  mm, thinly papery, abaxially glabrous, not pruinose, midvein distinctly raised, adaxially with slightly raised midvein, both surfaces with conspicuously raised lateral and reticulate veins, base attenuate, margin entire, apex acute. Inflorescence a panicle, 15–30-flowered, 3–7 cm including peduncle 1–1.5 cm, glabrous; bracts lanceolate, 2–3.5 mm. Pedicels 2–5 mm, glabrous; bractlets lanceolate, ca. 2 mm. Sepals in 2 whorls; outer sepals elliptic,  $2\text{--}2.5 \times 1\text{--}1.3$  mm; inner sepals obovate,  $3\text{--}3.5 \times 1.5\text{--}1.8$  mm. Petals elliptic,  $3\text{--}3.2 \times 1.2\text{--}1.5$  mm, base cuneate, with separate glands, apex emarginate or entire. Stamens ca. 2.1 mm; anther connective not prolonged, truncate. Ovules solitary, funiculate. Fruit unknown. Fl. May–Jun, fr. unknown.

• Thickets on slopes; ca. 100 m. Hebei, Shandong.

## Additional names based on Chinese material

Editors' note. The following names, all based on Chinese material, have not been accounted for in the above treatment by Ying Junsheng (see the comments at the beginning of the genus). This appendix is provided for information only, and no taxonomic opinions are expressed.

- Berberis acuminata* Franchet, Bull. Soc. Bot. France 33: 387. 1887. Described from Yunnan.
- Berberis ambigua* Ahrendt, J. Bot. 79(Suppl.): 60. 1941. Described from cultivated material reputedly grown from seed collected in Yunnan.
- Berberis angulosa* Wallich ex J. D. Hooker & Thomson var. *fasciculata* Ahrendt, J. Bot. 79(Suppl.): 42. 1941. Described from Xizang.
- Berberis approximata* Sprague var. *campylogyna* Ahrendt, J. Bot. 79(Suppl.): 53. 1941 (*B. dictyophylla* Franchet var. *campylogyna* (Ahrendt) Ahrendt, J. Linn. Soc., Bot. 57: 128. 1961). Described from Yunnan.
- Berberis aridocalida* Ahrendt, Bull. Misc. Inform. Kew 1939: 273. 1939 [*"arido-calida"*]. Described from cultivated material reputedly grown from seed collected in Gansu.
- Berberis atropasina* Ahrendt, Gard. Chron., ser. 3, 112: 155. 1942. Described from cultivated material reputedly grown from seed collected in Yunnan.
- Berberis bodinieri* H. Léveillé, Repert. Spec. Nov. Regni Veg. 9: 454. 1911, not (Gagnepain) Laferrière (1997). Described from Yunnan.
- Berberis buchananii* C. K. Schneider var. *tawangensis* Ahrendt, J. Bot. 79(Suppl.): 37. 1941. Described from Xizang.
- Berberis calliantha* Mulligan, Gard. Chron., ser. 3, 97: 394. 1935. Described from Xizang.
- Berberis caroli* C. K. Schneider, Bull. Herb. Boissier, sér. 2, 5: 459. 1905. Described from Nei Mongol.
- Berberis chinensis* Poirét, Encycl. 8: 617. 1808. Described from cultivated material in Paris and said to be native to China.
- Berberis consimilis* C. K. Schneider, Oesterr. Bot. Z. 66: 324. 1916. Described from cultivated material reputedly grown from seed collected in Sichuan.
- Berberis dasystachya* Maximowicz var. *pluriflora* P. Y. Li, Acta Phytotax. Sin. 10: 213. 1965. Described from Gansu and Qinghai.
- Berberis faberi* C. K. Schneider, Oesterr. Bot. Z. 67: 215. 1918. Described from Sichuan.
- Berberis faxoniana* C. K. Schneider, Oesterr. Bot. Z. 66: 325. 1916. Described from cultivated material reputedly grown from seed collected in Sichuan or Yunnan.
- Berberis franchetiana* C. K. Schneider var. *gombalana* C. Y. Wu & S. Y. Bao, Bull. Bot. Res., Harbin 5(3): 15. 1985. Described from Yunnan.
- Berberis gagnepainii* C. K. Schneider var. *subovata* C. K. Schneider, Repert. Spec. Nov. Regni Veg. 46: 264. 1939. Described from Sichuan.
- Berberis heteropsis* Ahrendt, J. Linn. Soc., Bot. 57: 213. 1961. Described from Guizhou and Sichuan.
- Berberis hookeri* Lemaire subsp. *longipes* D. F. Chamberlain & C. M. Hu, Notes Roy. Bot. Gard. Edinburgh 42: 533. 1985. Described from Xizang.
- Berberis humidoumbrosa* Ahrendt var. *dispersa* Ahrendt, J. Linn. Soc., Bot. 57: 160. 1961. Described from Xizang.
- Berberis insignis* J. D. Hooker & Thomson var. *zelaica* Ahrendt, J. Bot. 79(Suppl.): 9. 1941. Described from Xizang.
- Berberis integerrima* Bunge var. *stenophylla* Maximowicz, Fl. Tangut. 29. 1889. Described from Gansu.
- Berberis jaeschkeana* C. K. Schneider var. *bimbilaica* Ahrendt, J. Bot. 79(Suppl.): 65. 1941. Described from Xizang.
- Berberis jingguensis* G. S. Fan & X. W. Li, J. Trop. Subtrop. Bot. 5(3): 1. 1997. Described from Yunnan.
- Berberis kartanica* Ahrendt, J. Bot. 79(Suppl.): 68. 1941. Described from Xizang.
- Berberis mairei* Ahrendt, J. Linn. Soc., Bot. 57: 76. 1961. Described from Yunnan.
- Berberis oblanceifolia* C. M. Hu, Bull. Bot. Res., Harbin 6(2): 12. 1986. Described from Hunan.
- Berberis oritrepha* C. K. Schneider, Oesterr. Bot. Z. 67: 293. 1918. Described from Shaanxi.
- Berberis orthobotrys* Bienert ex Aitchison var. *rupestris* Ahrendt, J. Linn. Soc., Bot. 57: 143. 1961. Described from Xizang.
- Berberis petrogena* C. K. Schneider, Repert. Spec. Nov. Regni Veg. 46: 253. 1939. Described from Yunnan.
- Berberis pingbaensis* M. T. An, Bull. Bot. Res., Harbin 28: 641. 2008. Described from Guizhou.
- Berberis poiretii* C. K. Schneider f. *weichangensis* C. K. Schneider in Sargent, Pl. Wilson. 1: 372. 1913. Described from Hebei.
- Berberis praecipua* C. K. Schneider, Repert. Spec. Nov. Regni Veg. 46: 248. 1939. Described from Hunan and Yunnan.
- Berberis pseudothunbergii* P. Y. Li, Acta Phytotax. Sin. 10: 211. 1965. Described from Gansu and Shaanxi.
- Berberis rockii* Ahrendt, J. Bot. 79(Suppl.): 72. 1941. Described from Yunnan.
- Berberis sanei* T. Husain, Datt, Arti Garg & R. R. Rao, Bull. Mus. Natl. Hist. Nat., B. Adansonia 17: 69. 1995. Described from Xizang.
- Berberis sinensis* Desfontaines var. *angustifolia* Regel, Trudy Imp. S.-Peterburgsk. Bot. Sada 2: 416. 1873 (*B. poiretii* C. K. Schneider var. *angustifolia* (Regel) Nakai, Fl. Sylv. Kor. 21: 66. 1936). Described from N and NE China.
- Berberis sphalera* Fedde, Bot. Jahrb. Syst. 36(Beibl. 82): 44. 1905. Described from Shaanxi.
- Berberis spraguei* Ahrendt, Gard. Chron., ser. 3, 109: 101. 1941. Described from cultivated material apparently originally collected in Yunnan.
- Berberis stearnii* Ahrendt, Gard. Chron., ser. 3, 109: 101. 1941. Described from cultivated material apparently originally collected in Yunnan.
- Berberis subsessiliflora* Pampanini, Nuovo Giorn. Bot. Ital., n.s., 22: 293. 1915. Described from Hubei.
- Berberis tarokoensis* S. Y. Lu & Yuen P. Yang, Fl. Taiwan, ed. 2, 2: 581. 1996. Described from Taiwan.
- Berberis thibetica* C. K. Schneider, Repert. Spec. Nov. Regni Veg. 6: 268. 1909. Described from cultivated material reputedly grown from seed collected in Sichuan or Yunnan.
- Berberis trichohaematoides* Ahrendt, J. Bot. 79(Suppl.): 62. 1941. Described from Xizang.
- Berberis tsangpoensis* Ahrendt, Gard. Chron., ser. 3, 109: 101. 1941. Described from Xizang.
- Berberis uniflora* F. N. Wei & Y. G. Wei, Guihaia 15: 218. 1995. Described from Guangxi.
- Berberis wanhuashanensis* Yue Jin Zhang, Acta Bot. Boreal.-Occid. Sin. 11: 258. 1991. Described from Shaanxi.
- Berberis xinganensis* G. H. Liu & S. Q. Zhou, Fl. Intramongol., ed. 2, 2: 712. 1991. Described from Nei Mongol.
- Berberis zayulana* Ahrendt, J. Bot. 79(Suppl.): 64. 1941. Described from Xizang.

### 3. MAHONIA Nuttall, Gen. N. Amer. Pl. 1: 211. 1818, nom. cons.

十大功劳属 shi da gong lao shu

Ying Junsheng (应俊生 Ying Tsun-shen); David E. Boufford, Anthony R. Brach

*Odostemon* Rafinesque.

Shrubs or small trees, evergreen, 0.3–8 m tall. Spines absent. Leaves imparipinnate, alternate, sessile or petiolate; petiole to 14 cm; leaflets 3–41; lateral leaflets usually sessile; terminal leaflet sessile or petiolulate; margins of leaflets entire, variously toothed, or with coarse or fine serrations. Inflorescence terminal, of (1–)3–18-fascicled simple or branched racemes or panicles, 3–35 cm, subtended by leafletlike bracts. Pedicel 1.5–24 mm, subtending bract shorter or longer than pedicel. Flowers yellow, with 3 whorls of sepals and 1 whorl of petals, with or without glands at base of petals. Anther connective not prolonged, apiculate or conspicuously prolonged. Ovary ellipsoid; ovules 1–7; styles absent or to 3 mm, persistent on mature fruit. Fruit berries, bluish or black, often glaucous. Seeds 1–7.

About 60 species: mainly in E and SE Asia, also in W North America, Central America, and W South America; 31 species (27 endemic) in China; six additional species (five endemic) are insufficiently known.

Most of the Chinese wild populations of *Mahonia* have been extirpated, probably as a result of over-collecting for medicinal use, and the plants now being described are probably individuals that vary only in minor ways from the relatively few specimens that exist in herbaria.

Ahrendt (J. Linn. Soc., Bot. 57: 1–410. 1961) recognized two “groups” in *Mahonia*: “Orientales” and “Occidentales.” All of the Asian species of *Mahonia*, plus a single North American species from the Pacific Northwest, *M. nervosa* (Pursh) Nuttall, are in the “Orientales.”

See the paper by J. Y. Wu, H. N. Qin, D. Y. Xue, and K. X. Zhou, “Study on seed morphology of *Mahonia* (Berberidaceae)” (Guihaia 30: 155–160. 2010).

#### 1a. Inflorescences panicles.

2a. Petals retuse; pedicels 6–11 mm, bracts 2–3 mm; teeth per upper leaflet 4–11; ovules 5 or 6 ..... 1. *M. bracteolata*

2b. Petals emarginate or incised; pedicels 2.5–3 mm or 13–24 mm, bracts 1–2 mm or 4.5–7 mm; teeth per upper leaflet 1–5; ovules 1–4.

3a. Petals emarginate; inflorescences 25–35 cm; leaflets 2 or 3 pairs, abaxially pruinose; pedicels 13–24 mm ..... 2. *M. gracilipes*

3b. Petals incised; inflorescences 11–18 cm; leaflets 5–9 pairs, abaxially not pruinose; pedicels 2.5–3 mm ..... 3. *M. monyulensis*

#### 1b. Inflorescences racemes.

##### 4a. Inflorescence of branched racemes.

5a. Petals incised; leaflets 12–20 pairs; ovules 2 or 3 ..... 4. *M. oiwakensis*

5b. Petals emarginate; leaflets 4–9 pairs; ovules 4–7.

6a. Bracts longer than pedicels; fruit obovoid, style less than 0.5 mm; leaf blade basally cuneate ..... 5. *M. calamicaulis*

6b. Bracts shorter than to slightly longer than pedicels; fruit globose, style 2–3 mm; leaf blade basally oblique, rounded ..... 6. *M. duclouxiana*

##### 4b. Inflorescence of unbranched racemes.

##### 7a. Petals entire.

8a. Petioles 3.5–14 cm; leaflets entire or with 1–3 inconspicuous teeth near apex ..... 9. *M. shenii*

8b. Petioles 0.5–2.5 cm; leaflets with teeth.

9a. Leaflets remote, not contiguous, apex acuminate or caudate-acuminate, margin with 9–23 teeth on each side; anther connective not prolonged; fruit globose ..... 7. *M. taronensis*

9b. Leaflets contiguous, apex acute, margin with 2–7 teeth on each side; anther connective prolonged; fruit obovoid ..... 8. *M. subimbricata*

##### 7b. Petals emarginate or incised.

##### 10a. Leaves petiolate, petiole 2.5–9 cm.

11a. Inner sepals lanceolate or obovate; anther connective prolonged.

12a. Leaflets subrhombic or elliptic, margin with 2–4 teeth on each side; inner sepals obovate ..... 10. *M. breviracema*

12b. Leaflets lanceolate, margin 8–20-spinose-serrate on each side; inner sepals lanceolate ..... 11. *M. setosa*

11b. Inner sepals oblong or elliptic; anther connective not prolonged.

13a. Inflorescence 1- or 2-fascicled racemes; leaflets ovate or ovate-elliptic, basally truncate ..... 12. *M. decipiens*

13b. Inflorescence 4–10-fascicled racemes; leaflets basally cuneate.

14a. Leaflets 2 or 3 pairs, oblong-ovate or elliptic, shortly petiolate ..... 13. *M. paucijuga*

14b. Leaflets 2–9 pairs, lanceolate to elliptic-lanceolate or elliptic, sessile.

15a. Leaflets 2–5 pairs; pedicels ca. as long as bracts; glands of petals distinct ..... 14. *M. fortunei*

15b. Leaflets 6–9 pairs; pedicels much longer than bracts; glands of petals distinct or sometimes indistinct ..... 15. *M. eurybracteata*

10b. Leaves subsessile or petiole less than 2 cm.

- 16a. Leaflets entire ..... 16. *M. microphylla*  
 16b. Leaflets spinose-serrate.  
 17a. Leaflets lanceolate, elliptic-lanceolate, or ovate-oblong.  
 18a. Leaflets 6–9 pairs, margin 3–9-spinose-serrate on each side; base of petals with glands ..... 15. *M. eurybracteata*  
 18b. Leaflets 8–12 pairs, margin 35–65-spinulose-serrulate on each side; base of petals without glands ..... 17. *M. leptodonta*  
 17b. Leaflets oblong, ovate, broadly elliptic, or rhombic.  
 19a. Veins on adaxial surface of leaflets reticulate, obviously raised, margin of leaflets 2–11-spinose-serrate on each side ..... 18. *M. retinervis*  
 19b. Veins on adaxial surface of leaflets reticulate, flat or inconspicuous, margin of leaflets 2–16-dentate on each side.  
 20a. Abaxial surface of leaflets pruinose; fruit 10–12 mm in diam. .... 19. *M. bealei*  
 20b. Abaxial surface of leaflets yellowish green, not pruinose; fruit less than 10 mm in diam.  
 21a. Floral bracts longer than pedicels.  
 22a. Racemes 3–9 per fascicle, 5–9 cm; apex of petals slightly emarginate.  
 23a. Racemes 5–9 per fascicle; fruit not pruinose; leaflets serrate, with 4–7(–11) teeth on each side ..... 20. *M. longibracteata*  
 23b. Racemes 3–5 per fascicle; fruit pruinose; leaflets spinose-serrate, with 10–16 teeth on each side ..... 21. *M. polyodonta*  
 22b. Racemes 8–15 per fascicle, 7–19 cm; apex of petals incised.  
 24a. Anther connective prolonged; ovules 2–6; leaf blade adaxially dark green and shiny ..... 22. *M. napaulensis*  
 24b. Anther connective not prolonged; ovules 2; leaf blade adaxially green ..... 23. *M. cardiophylla*  
 21b. Floral bracts shorter than to ca. as long as pedicels.  
 25a. Margin of leaflets 1–3(–6)-dentate on each side ..... 24. *M. nitens*  
 25b. Margin of leaflets 4–10-dentate on each side.  
 26a. Leaflets markedly overlapping.  
 27a. Inflorescence 3–6 racemes; anther connective prolonged; leaflets 8–18 pairs ..... 25. *M. conferta*  
 27b. Inflorescence 9 or 10 racemes; anther connective not prolonged; leaflets 5–7 pairs ..... 26. *M. imbricata*  
 26b. Leaflets separate or sometimes contiguous.  
 28a. Pedicels shorter than floral bracts; anther connective prolonged, rounded; petals 1.8–2 mm wide ..... 31. *M. hancockiana*  
 28b. Pedicels longer than or ca. as long as floral bracts; anther connective not prolonged, truncate; petals 2–2.8 mm wide.  
 29a. Fruit globose or pyriform, style not persistent; petiolar glands indistinct; leaflets 8–13 pairs ..... 27. *M. bodinieri*  
 29b. Fruit ovoid, obovoid, or ellipsoid, persistent style short; petiolar glands conspicuous; leaflets 4–9 pairs.  
 30a. Pedicels ca. as long as or slightly longer than floral bracts; leaf blade shiny, apically acute, cuspidate ..... 28. *M. sheridaniana*  
 30b. Pedicels markedly longer than floral bracts; leaf blade apically acute or acuminate, sometimes aristate.  
 31a. Leaflets 4–6 pairs, margin 2–4-dentate on each side; pedicels 6–7 mm; ovules 4–7 ..... 29. *M. japonica*  
 31b. Leaflets 5–9 pairs, margin 2–9-spinose-serrate on each side; pedicels 2.5–4 mm; ovules 2 ..... 30. *M. fordii*

**1. *Mahonia bracteolata*** Takeda, Notes Roy. Bot. Gard. Edinburgh 6: 228. 1917.

鹤庆十大功劳 *he qing shi da gong lao*

*Berberis bracteolata* (Takeda) Laferrière; *B. bracteolata* var. *zhongdianensis* (S. Y. Bao) Laferrière; *B. caesia* (C. K. Schneider) Laferrière; *Mahonia bracteolata* var. *zhongdianensis* S. Y. Bao; *M. caesia* C. K. Schneider.

Shrubs, 1.5–2 m tall. Leaves abaxially pale grayish green, adaxially dull grayish green, ovate, 14–25 × 8–14 cm; leaflets 3–8 pairs, contiguous, lowest pair 0.7–1.5 cm above base of petiole, oblong-lanceolate, 2.5–12 × 1.5–3 cm, thick, rigid, abaxially slightly pruinose, veins ± obscure, adaxially indis-

tinctly veined, base broadly cuneate, margins of lower leaflets with 2 or 3 teeth, those of upper leaflets with 4–11 teeth, apex acuminate; rachis stout, ca. 2 mm in diam.; internodes 2–3 cm, decreasing apically. Inflorescence 4–9-fascicled panicles, 7–19 cm; bracts of inflorescence ovate to ovate-lanceolate, 10–15 × 7–10 mm. Pedicel 6–11 mm; floral bracts ovate, 2–3 mm, apically acute. Sepals yellow; outer sepals ovate, 2–3 × 1.5–2 mm; median sepals ovate, 4–6 × 3–4 mm, apically obtuse; inner sepals elliptic, 7–8 × 3.5–4 mm. Petals yellow, oblong-elliptic, 6–7.5 × 2.5–3 mm, base with distinct glands, apex slightly retuse. Stamens 3.5–4.5 mm; anther connective prolonged, ca. 1.5 mm, rounded to truncate. Ovary ca. 5 mm; ovules 5 or 6. Berry slightly pruinose, subglobose, 5–7 mm in diam.; style persistent, ca. 1.5 mm. Fl. Aug–Nov, fr. Sep–Jan.

- Thickets, open hillsides; 1900–2500 m. Sichuan, Yunnan.

**2. *Mahonia gracilipes*** (Oliver) Fedde, Bot. Jahrb. Syst. 31: 128. 1901.

Shrubs, ca. 1 m tall. Leaves abaxially pale green, adaxially green, ovate or ovate-elliptic, 14–16 × 6–8 cm; leaflets 3 or 4 pairs, lowest pair ca. 4 cm above base of petiole; rachis 1–2 mm in diam.; internodes 2.5–3 cm, ca. equidistant, abaxial veins raised, adaxial veins impressed; leaflets elliptic to subrhombic, 3–6.6 × 1.2–3 cm, slightly decreasing in size from base to apex, leathery, base cuneate, margin with 2–4 teeth on each side, apex acute to acuminate; terminal leaflet larger than others, 5.5–6.5 × 2.5–3 cm, sessile. Inflorescence 5–8-fascicled racemes, 3–8 cm; bracts of inflorescence lanceolate, 1–1.5 cm × 3–6 mm. Pedicel 2–2.5 mm; floral bracts ovate, 1–1.2 × 0.6–0.8 mm. Outer sepals ovate, 1.6–1.8 × 1–1.1 mm; median sepals obovate-oblong, 3.7–3.8 × 1.7–1.8 mm; inner sepals obovate, ca. 4 × 2.1 mm. Petals elliptic, 3.5–3.6 × 1.3–1.4 mm, base with distinct glands, apex emarginate. Stamens ca. 2.1 mm; anther connective prolonged, rounded. Ovary ca. 1.7 mm; ovules 2; style 0.3–0.5 mm. Berry unknown. Fl. Oct–Nov, fr. unknown.

- Open rocky slopes in thickets; ca. 600 m. Guangxi (Lingui, ?Tiandeng), ?Guizhou (Guiyang).

*Mahonia breviracema* is cultivated in Yan Shan Botanical Garden, Guangxi Institute of Botany, Guilin, from where the type specimen (S. K. Lee 200582, IBK) was collected. *Mahonia monodens*, described from Guangxi (Tiandeng) and Guizhou, is tentatively included in synonymy, but we have not been able to compare the limited number of specimens available to determine the appropriateness of this placement.

**11. *Mahonia setosa* Gagnepain, Bull. Soc. Bot. France 55: 86. 1908.**

刺齿十大功劳 ci chi shi da gong lao

*Berberis setosa* (Gagnepain) Laferrière.

Shrubs, ca. 1.5 m tall. Leaves abaxially pale yellowish green, becoming golden yellow when dry, adaxially dull, ca. 25 × 14 cm; leaflets 4–8 pairs, lowest pair 2.5–3.5 cm above base of petiole, abaxial veins 3, both surfaces with raised reticulate veins; rachis slender, 1–2 mm in diam.; internodes 1–2 cm; leaflets lanceolate to linear-lanceolate, 1.8–8 × 0.8–1.2 cm, thickly papery, base cuneate, margin 8–20-spinose-serrulate or setose-serrate, apex acuminate. Inflorescence 3–5-fascicled racemes, 3–5 cm; bracts of inflorescence narrowly triangular, apically acute. Pedicel slender; floral bracts lanceolate. Sepals yellow; outer sepals narrowly triangular, apex acute; median and inner sepals lanceolate, subequal. Petals yellow, scarcely shorter than inner sepals, base clawed, with distinct glands, apex slightly retuse. Stamens long; anther connective prolonged, subconical, obtuse. Ovary conical; ovules 2, stipitate. Berry unknown. Fl. Oct, fr. unknown.

- Sichuan, Yunnan.

The cuneate base and the spinose-serrulate or setose margins of the leaflets of *Mahonia setosa* are distinct in the genus.

**12. *Mahonia decipiens* C. K. Schneider in Sargent, Pl. Wilson. 1: 379. 1913.**

鄂西十大功劳 e xi shi da gong lao

*Berberis decipiens* (C. K. Schneider) Laferrière.

Shrubs, 1–2 m tall. Leaves abaxially pale, adaxially dull green, elliptic, 15–20 × 7–11 cm; leaflets 2–7 pairs, lowest pair 4–6 cm above base of petiole, abaxial veins slightly branched, veins slightly raised on both surfaces; rachis ca. 2 mm in diam.; internodes 2.5–3.5 cm; leaflets separate or sometimes contiguous, ovate to ovate-elliptic, lowest similar to others, ovate, 3–5.5 × 1.5–3 cm, those above ovate to ovate-elliptic, 4.5–7 × 2.5–3.5 cm, base subtruncate, margin with 3–6 teeth on each side, apex acute; terminal leaflet much larger, 7.5–9.5 × 3.5–5 cm, petiolule 1.5–2 cm. Inflorescence 1 or 2 racemes, 4–6 cm; bracts of inflorescence ovate to narrowly ovate, 1–1.5 cm × 4–7 mm. Pedicel 2.5–3 mm; floral bracts ovate, 2–2.5 × ca. 1.5 mm. Sepals yellow; outer sepals ovate, 2.3–2.5 × 1.5–2 mm; median sepals broadly ovate, 3–3.5 × 2–2.5 mm; inner sepals elliptic, 5–6 × 3–4 mm. Petals yellow, obovate, 5–5.5 × 3–3.2 mm, base with distinct glands, apex emarginate, acute. Stamens ca. 3 mm; anther connective not prolonged, truncate. Ovary ca. 2.5 mm; ovules 2; style ca. 0.3 mm. Berry unknown. Fl. Apr–Aug, fr. unknown.

- Forests, thickets; 800–1500 m. W Hubei.

Shrubs or small trees, 1–7 m tall. Leaves abaxially yellowish green,  $\pm$  shiny, adaxially dark green,  $\pm$  shiny, elliptic to ovate,  $17\text{--}61 \times 7\text{--}19$  cm, with 5–12 pairs of leaflets, lowest 0.5–2(–4) cm above base of petiole, abaxially venation reticulate, raised, adaxially main veins impressed, others impressed or slightly raised; rachis 2–4 mm in diam.; internodes (1–)2–5(–8.3) cm, decreasing in length upward; leaflets oblong, oblong-ovate, or ovate to ovate-lanceolate, lowest  $1.3\text{--}3.7 \times 1.2\text{--}2.4$  cm, those above  $2\text{--}9.5 \times 1.5\text{--}5$  cm, base broadly cuneate, rounded, or sometimes subcordate, oblique, margin with 3–10 teeth on each side, apex acute, acuminate, or cuspidate; terminal leaflet larger,  $6\text{--}10 \times 2\text{--}3$  cm, sessile or petiolule to ca. 2.5 cm. Inflorescence 3–18-fascicled racemes, 7–23 cm; bracts of inflorescence oblong to ovate or ovate-lanceolate,  $1\text{--}3.5 \times 0.5\text{--}1.5$  cm. Pedicel 3–9 mm; floral bracts lanceolate, ovate, or oblong,  $2\text{--}6 \times 1\text{--}3$  mm. Flowers yellow to deep yellow, mildly fragrant. Outer sepals triangular-ovate or ovate to suborbicular,  $2\text{--}3.2 \times 1\text{--}2.4$  mm; median sepals ovate to oblong,  $3.5\text{--}5.2 \times 2\text{--}3.3$  mm; inner sepals elliptic to oblong-elliptic,  $5\text{--}7 \times 2.6\text{--}3.5$  mm. Petals elliptic to oblong-elliptic,  $3.6\text{--}7 \times 1.6\text{--}3.2$  mm, base with glands distinct or sometimes indistinct, apex emarginate to narrowly clawed. Stamens 3.5–7 mm; anther connective prolonged, apiculate to rounded. Ovary 3.2–4 mm; ovules 2–6; style 0.7–1.5 mm. Berry bluish black, pruinose, oblong, 5–7 mm in diam. Fl. Jun–Jan, fr. Jan–Jul.  $2n = 28$ .

Forests, forest margins, thickets; 1200–3000 m. S Sichuan, SE Xizang, Yunnan [Bhutan, India, Myanmar, Nepal; cultivated in Australia, S Europe, Indonesia, Sri Lanka, and other parts of the world].

### Insufficiently known species

***Mahonia annamica*** Gagnepain, Bull. Soc. Bot. France 55: 84. 1908.

*Berberis annamica* (Gagnepain) Laferrière.

This species was described from Vietnam and reported for Guangxi. We have not seen specimens from Guangxi and are unsure of its placement.

***Mahonia bijuga*** Handel-Mazzetti, Symb. Sin. 7: 331. 1931.

This species was described from Sichuan ("Lose-schan s von S of Ningyüen," 3300 m), based on *H. v. Handel-Mazzetti 1430* (?W), but we have not seen the type.

***Mahonia dulongensis*** H. Li, Ann. Bot. Fenn. 46: 469. 2009.

This species was recently described from Yunnan (Gongshan, Dulong Jiang, 1620 m, 5 Nov 2005), based on *Gaoligongshan Biodiversity Survey 21834* (holotype, KUN; isotypes, CAS, E).

***Mahonia hypoleuca*** Takeda, Notes Roy. Bot. Gard. Edinburgh 6: 238. 1917.

*Berberis nivea* (C. K. Schneider) Laferrière; *Mahonia nivea* C. K. Schneider.

Both *Mahonia hypoleuca* and *M. nivea* are based on *A. Henry 9863*, from Mengtze, Yunnan, which is without flowers and fruit and the only collection known.

***Mahonia jingxiensis*** J. Y. Wu, M. Ogisu, H. N. Qin & S. N. Lu, Bot. Stud. (Taipei) 50: 487. 2009.

This species was recently described from Guangxi (Jingxi Xian, Sanhe Xiang, Niansi Tun, ca. 500 m, 23 Oct 2007), based on *J. Y. Wu & M. Ogisu 1023* (holotype, PE; isotype, IBK).

***Mahonia lushuiensis*** T. S. Ying & H. Li, Ann. Bot. Fenn. 46: 472. 2009.

This species was recently described from Yunnan (Lushui County, Luzhang Township, 325 m, 19 May 2005), based on *Gaoligongshan Biodiversity Survey 24522* (holotype, KUN; isotypes, CAS, E).

桃儿七属 tao er qi shu

Ying Junsheng (应俊生 Ying Tsun-shen); David E. Boufford, Anthony R. Brach

Herbs, perennial. Rhizomes stout, shortly nodose; aerial stems erect, with large brown scales at base. Leaves 2, simple, petiolulate; base cordate, apex 3–5-dissected, usually to ca. midway or more, sometimes partitions 2- or 3-lobed. Inflorescence terminal. Flowers appearing before leaves, bisexual, solitary, pink, large. Sepals 6, caducous. Petals 6, open. Anthers basifixed, dehiscing longitudinally. Pistils 1; ovary ellipsoid, 1-loculed, with numerous ovules. Fruit a berry. Seeds numerous, without fleshy arils. Pollen grains in tetrads.  $2n = 12^*$ ,  $14^*$ .

One species: E Afghanistan, Bhutan, China, N India, Kashmir, Nepal, and Pakistan.

*Sinopodophyllum* was included within *Podophyllum* by Shaw (in Stearn, Gen. *Epimedium*, 258. 2002).

**1. Sinopodophyllum hexandrum** (Royle) T. S. Ying in C. Y. Wu, Fl. Xizang. 2: 119. 1985.

桃儿七 tao er qi

*Podophyllum hexandrum* Royle, Ill. Bot. Himal. Mts. 1: 64. 1834; *P. emodi* Falconer ex Royle; *P. emodi* var. *chinense* Sprague; *Sinopodophyllum emodi* (Falconer ex Royle) T. S. Ying.

Plants 20–50 cm tall. Stems solitary, angulate, glabrous. Leaf petiole 10–25 cm; leaf blade orbicular, not peltate, 11–20 × 18–30 cm, thinly papery, abaxially pubescent, adaxially glabrous, base cordate, 3–5-dissected to ca. midway or more, often

partitions 2- or 3-lobed, apex of lobes acute or acuminate, margin entire or coarsely dentate, teeth apiculate. Petals obovate or obovate-oblong,  $2.5\text{--}3.5 \times 1.5\text{--}1.8$  cm, apex slightly sinuate. Stamens ca. 1.5 cm; filaments slightly shorter than anthers, 4–6 mm; anthers linear,  $5\text{--}7 \times 1.2\text{--}1.9$  mm, apex rounded, obtuse; anther connective not prolonged. Pistils ca. 1.2 cm; ovary with parietal placentation; style short, 1–3 mm. Berry red, ovoid-globose,  $4\text{--}7 \times 2.5\text{--}4$  cm, fleshy. Seeds maroon, ovoid-triangular. Fl. May–Jun, fr. Jul–Sep.

Forests, thickets, wet forest margins, weedy places, meadows; 2200–4300 m. Gansu, Qinghai, Shaanxi, Sichuan, Xizang, Yunnan [E Afghanistan, Bhutan, N India, Kashmir, Nepal, Pakistan].

#### 5. PLAGIORHEGMA Maximowicz, Mém. Acad. Imp. Sci. St.-Petersbourg Divers Savans 9 [Prim. Fl. Amur.]: 34. 1859.

鲜黄连属 xian huang lian shu

Ying Junsheng (应俊生 Ying Tsun-shen); David E. Boufford, Anthony R. Brach

Herbs, perennial. Rhizome slender, with dense fibrous roots branched; aerial stems absent. Leaves basal, simple, long petiolate; leaf blade suborbicular in gross outline, not lobed, glabrous, base deeply cordate, venation palmate. Inflorescence terminal; flowers solitary, pale purple. Sepals 6, caducous, petal-form. Petals 6. Stamens opposite petals; filaments flat. Pistils 1; stigma disciform; ovules numerous, placentation marginal. Capsules leathery, obliquely dehiscing longitudinally. Seeds numerous, black.  $2n = 12$ .

One species: China, Korea, and Russia.

*Plagiorhegma* was included within *Jeffersonia* by Stearn (Gen. *Epimedium*, 222. 2002).

**1. Plagiorhegma dubium** Maximowicz, Mém. Acad. Imp. Sci. St.-Petersbourg Divers Savans 9 [Prim. Fl. Amur.]: 34. 1859.

鲜黄连 xian huang lian

*Jeffersonia dubia* (Maximowicz) Benth. & J. D. Hooker ex Baker & S. Moore; *J. manchuriensis* Hance.

Plants 10–30 cm tall, glabrous. Rhizome with cross section bright yellow, producing 4–6 foliage leaves or flowering shoots per year; aerial stems absent. Leaf petiole 10–30 cm, glabrous; leaf blade abaxially grayish green, suborbicular, 6–8 × 9–10 cm, membranous, base deeply cordate, margin entire or

repand, apex obtusely emarginate, apiculate. Scapes 15–20 cm. Sepals caducous, purplish red, oblong-lanceolate, ca. 6 mm, striate, glabrous. Petals 6, obovate, ca.  $1 \times 0.6$  cm, base attenuate. Stamens ca. 6 mm; filaments flat, ca. 2 mm; anthers ca. 4 mm. Pistil ca. 4 mm, glabrous; ovules numerous; style ca. 2 mm; stigma rugosely undulate on margin. Capsules yellowish brown, fusiform, ca. 1.5 cm, obliquely dehiscing from top toward base; style ca. 3 mm. Fl. May–Jun, fr. Sep–Oct.

Needle-leaved forests, mixed forests, thickets, shaded and wet places on slopes; 500–1100 m. Jilin, Liaoning [Korea, Russia (along Amur River)].

#### 6. DYSOSMA Woodson, Ann. Missouri Bot. Gard. 15: 338, t. 46. 1928.

鬼臼属 gui jiu shu

Ying Junsheng (应俊生 Ying Tsun-shen); David E. Boufford, Anthony R. Brach

Herbs, perennial. Rhizomes creeping, short, stout, with numerous fibrous roots; aerial stems erect, simple, glabrous, with large

scales at base. Leaves peltate, large, 3–9-parted or lobed. Inflorescence of few fascicled flowers or a subumbel. Flowers perfect, nutant. Sepals 6, membranous, caducous. Petals 6, dark purplish red. Filaments decumbent, flat; anthers introrsely dehiscent; anther connective wide and usually prolonged; pollen grains 3-colpate, subspheroidal or suboblate, sexine thicker than nexine, foveolate. Pistils solitary; ovary 1-loculed; ovules numerous; stigma globose. Berry red or purplish red. Seeds numerous, without arils.  $2n = 12$ .

Between seven and ten species: China and N Vietnam; seven species (six endemic) in China; three additional species (all endemic, described under *Podophyllum*) are insufficiently known.

*Dysosma* was included within *Podophyllum* by Shaw (in Stearn, Gen. *Epimedium*, 269. 2002).

- 1a. Leaves opposite, flowers attached at base of petiole.
  - 2a. Lobes of leaf apically 3-fid; petals oblong, to 6 cm ..... 7. *D. delavayi*
  - 2b. Lobes of leaf apically not divided; petals obovate-elliptic, ca. 3 cm.
    - 3a. Leaf blade glabrous, palmately lobed, lobes triangular-ovate ..... 5. *D. pleiantha*
    - 3b. Leaf blade pubescent on both surfaces, palmately parted, lobes cuneate-oblong ..... 6. *D. tsayuenensis*
- 1b. Leaves alternate, flowers attached near or far from base of blade.
  - 4a. Flowers attached far from base of blade; petals obovate, 1.4–1.6 cm ..... 4. *D. aurantiocaulis*
  - 4b. Flowers attached near base of blade; petals oblong, lanceolate, or obovate, 2.4–10 cm.
    - 5a. Leaf lobes apically 3-fid; petals elliptic-lanceolate ..... 1. *D. majoensis*
    - 5b. Leaf lobes apically not divided; petals spatulate-obovate or oblong-loriform.
      - 6a. Leaves 4–9-lobed or deeply divided; petals spatulate-obovate; berry ca. 4 cm, ellipsoid or ovoid ..... 2. *D. versipellis*
      - 6b. Leaves mostly undivided; petals oblong-loriform; berry 1.7–2.7 cm, globose ..... 3. *D. difformis*

**1. *Dysosma majoensis*** (Gagnepain) M. Hiroe, Pl. Basho's & Buson's Hokku Lit. 8(3): 328. 1973 [*"majoense"*].

贵州八角莲 *gui zhou ba jiao lian*

*Podophyllum majoense* Gagnepain, Bull. Soc. Bot. France 85: 167. 1938; *Dysosma guangxiensis* Y. S. Wang; *D. lichuanensis* Z. Zheng & Y. J. Su; *D. majoensis* var. *emeiensis* J. L. Wu & P. Zhuang; *P. guangxiense* (Y. S. Wang) J. M. H. Shaw.

Plants ca. 50 cm tall. Rhizomes brown, stout, nodose, fibrous roots numerous. Stems erect, angulate, puberulent. Leaves alternate; petiole 4–20 cm; leaf blade abaxially grayish purple, adaxially dark green, reniform-orbicular, 10–20 × ca. 20 cm, thinly papery, abaxially puberulent, deeply 4–6-divided, lobes 3-fid at apex, margin remotely serrulate. Inflorescence a fascicle or sometimes an umbel. Pedicel grayish white, 1–3 cm, long puberulent. Flowers 2–5, attached near base of blade, purple. Sepals pale green, elliptic, unequal in size, 7–15 mm, glabrous. Petals elliptic-lanceolate, ca. 9 × 1.5 cm. Stamens ca. 1.8 cm; filaments nearly as long as or sometimes shorter than anthers; anther connective conspicuously prolonged. Ovary oblong; stigmas shield-shaped, ca. 1.5 mm in diam. Berry red when mature, oblong. Fl. Apr–Jun, fr. Jun–Sep.

• Forests, bamboo forests; 1300–1800 m. Guangxi, Guizhou, Hubei, Sichuan, Yunnan.

The specific epithet is often misspelled "*majorensis*" in Chinese publications.

**2. *Dysosma versipellis*** (Hance) M. Cheng ex T. S. Ying, Acta Phytotax. Sin. 17(1): 18. 1979.

八角莲 *ba jiao lian*

*Podophyllum versipelle* Hance, J. Bot. 21: 362. 1883; *P. esquirolii* H. Léveillé.

Plants 40–150 cm tall. Rhizomes stout, with numerous fibrous roots; aerial stems erect, pale green, unbranched, glabrous. Leaves alternate; petiole of lower leaves 12–25 cm, peti-

ole of upper leaves 1–3 cm; leaf blade suborbicular, to 30 cm in diam., thinly papery, abaxially pubescent, venation obviously raised, adaxially glabrous, palmately 4–9-lobed; lobes broadly triangular, ovate, or ovate-oblong, 2.5–4 cm, base 5–7 cm wide, margin remotely serrate, apex acute, not lobed. Inflorescence 5–8-fascicled flowers. Pedicel pendulous, slender, pubescent. Flowers attached near base of blade, red. Sepals oblong-elliptic, 0.6–1.8 cm × 3–8 mm, outside puberulent, inside glabrous, apex acute. Petals spatulate-obovate, ca. 2.5 × 0.8 cm, glabrous. Stamens ca. 1.8 cm; filaments shorter than anthers; anther connective slightly prolonged, glabrous, acute. Ovary ellipsoid, glabrous; style short; stigma shield-shaped. Berry ellipsoid or ovoid, ca. 4 × 3.5 cm. Seeds numerous. Fl. Mar–Jun, fr. May–Sep.  $2n = 12^*$ .

• Forests, thickets, shaded and wet places by streams, bamboo forests; 300–2400 m. Anhui, Guangdong, Guangxi, Guizhou, Henan, Hubei, Hunan, Jiangxi, Shanxi, Yunnan, Zhejiang.

*Podophyllum versipelle* was treated by Shaw (in Stearn, Gen. *Epimedium*, 276–282. 2002) as comprising two subspecies: subsp. *versipelle* ("Leaf lobes elobulate, upper leaf with 4–7 lobes on one side, lobes shallow 1/5–1/3 of radius; inflorescence 4–9 flowered; pedicels with hairs") and subsp. *boreale* J. M. H. Shaw ("Leaf lobes often with lobules, upper leaf with 4 or 5 lobes on one side, lobes deep, 1/2–2/3 of radius; inflorescence 4–10(–19) flowered; pedicels glabrous or rarely hairy").

Within *Podophyllum versipelle* subsp. *boreale*, Shaw (loc. cit.) recognized two varieties: *P. versipelle* var. *boreale* (lobes of leaves with convex margins, lobes entire or trilobulate; pedicels and leaves abaxially glabrous) and *P. versipelle* var. *sichuanense* J. M. H. Shaw (lobes of leaves with concave margins, lobes usually trilobulate; pedicels and leaves abaxially hairy).

**3. *Dysosma difformis*** (Hemsley & E. H. Wilson) T. H. Wang ex T. S. Ying, Acta Phytotax. Sin. 17(1): 19. 1979.

小八角莲 *xiao ba jiao lian*

*Podophyllum difforme* Hemsley & E. H. Wilson, Bull. Misc. Inform. Kew 1906: 152. 1906; *Dysosma tonkinensis*

(Gagnepain) Hiroe; *P. tonkinense* Gagnepain; *P. triangulum* Handel-Mazzetti.

Plants 15–30 cm tall. Rhizomes usually terete, slender, with numerous fibrous roots. Stems erect, sometimes purplish red, glabrous. Leaves alternate, obliquely peltate, unequal in size, sharply diversiform; petioles unequal in length, 3–11 cm, glabrous; leaf blade adaxially sometimes purplish red, 5–11 × 7–15 cm, thinly papery, both surfaces glabrous, base often rounded, entire or lobed, margin sparsely inconspicuously serrate. Inflorescence 2–5-fascicled flowers. Pedicel 1–2 cm, nodding, sparsely white pubescent. Flowers attached near base of blade. Sepals oblong-lanceolate, 2–2.5 cm × 2–5 mm, outside pubescent, inside glabrous, apically acuminate. Petals pale brownish red, oblong-lanceolate, 4–5 × 0.8–1 cm, glabrous, apex rounded. Stamens ca. 2 cm; filaments ca. 0.8 cm; anthers ca. 1.2 cm; anther connective conspicuously prolonged. Pistil ca. 0.9 cm; ovary urceolate; style ca. 2 mm; stigma shield-shaped. Berry globose, 1.7–2.7 cm. Fl. Apr–Jun, fr. Jun–Sep.

Dense forests; 700–1800 m. Guangxi, Guizhou, Hubei, Hunan, Sichuan [Vietnam].

Shaw (in Stearn, Gen. *Epimedium*, 280. 2002) treated *Podophyllum tonkinense* as a synonym of *P. versipelle* subsp. *versipelle*.

**4. *Dysosma aurantiocaulis*** (Handel-Mazzetti) Hu, Bull. Fan Mem. Inst. Biol., Bot. 8: 37. 1937.

云南八角莲 yun nan ba jiao lian

*Podophyllum aurantiocaulis* Handel-Mazzetti, Anz. Akad. Wiss. Wien, Math.-Naturwiss. Kl. 61: 163. 1924; *Dysosma furfuracea* S. Y. Bao; *D. mairei* (Gagnepain) Hiroe; *P. aurantiocaulis* subsp. *furfuraceum* (S. Y. Bao) J. M. H. Shaw; *P. mairei* Gagnepain; *P. sikkimense* R. Chatterjee & Mukerjee; *P. sikkimense* var. *majus* R. Chatterjee & Mukerjee.

Plants 30–50 cm tall. Rhizomes brown, short, stout, with numerous fibrous roots. Stems erect, pale stramineous, 3–5 mm in diam., angulate, glabrous. Leaves alternate; petiole of lower leaves 12–22 cm, petiole of upper leaves 3–7 cm, all petioles angulate; leaf blade abaxially pale green, adaxially deep green, suborbicular or reniform in gross outline, sharply diversiform, 7–8 × 13–15 cm, thinly papery, abaxially on veins scurfy squamulate, sometimes mixed pubescent, adaxially glabrous, 5–8-lobed, lobe margin scarcely inconspicuously serrulate. Inflorescence 2–5-fascicled flowers. Pedicel nutant, 3–6 cm, glabrous. Flowers attached far from base of blade, purple or pink. Sepals narrowly oblong, 10–12 × 4–5 mm, glabrous. Petals obovate or suborbicular, 1.4–1.6 × 1–1.2 cm, apex rounded. Stamens ca. 8 mm; filaments flat, shorter than anthers; apex of anther connective not prolonged. Pistil ca. 8 mm; ovary subglobose; style ca. 1 mm; stigma disciform, margin rugosely undulate. Berry pale green (immature), subglobose, ca. 8 mm in diam. Seeds numerous. Fl. May–Jun, fr. Jun–Aug.

• Deciduous broad-leaved forests; 2800–3000 m. Yunnan [Myanmar].

Shaw (in Stearn, Gen. *Epimedium*, 299–306. 2002) recognized two subspecies of *Podophyllum aurantiocaulis*, which he separated into subsp. *aurantiocalis* (“Leaf lobes long, obovate to lanceolate; sinuses deep, penetrating 1/2–2/3 of radius; flowers usually in petiole fork; an-

thers 5–7.5(–9) mm long”) and subsp. *furfuraceum* (“Leaf lobes short, triangular, sinuses shallow penetrating 1/4–1/3 of radius; flowers borne on petiole; anthers 3.5–4.5 mm”).

**5. *Dysosma pleiantha*** (Hance) Woodson, Ann. Missouri Bot. Gard. 15: 339. 1928.

六角莲 liu jiao lian

*Podophyllum pleianthum* Hance, J. Bot. 21: 175. 1883; *Dysosma chengii* (S. S. Chien) Hiroe; *D. hispida* (K. S. Hao) Hiroe; *P. chengii* S. S. Chien; *P. hispidum* K. S. Hao; *P. onzoi* Hayata; *P. pleianthum* var. *album* Masamune.

Plants 20–60(–80) cm tall. Rhizomes creeping, stout, nodose, with numerous fibrous roots; aerial stems erect, solitary, glabrous. Leaves opposite; petiole 10–28 cm, angulate, glabrous; leaf blade abaxially pale yellowish green, adaxially dark green, usually shiny, suborbicular in gross outline, 16–33 cm in diam., papery, both surfaces glabrous, 5–9-lobed; lobes broadly triangular-ovate, margin spinose-serrulate, apex acute. Inflorescence 5–8-fascicled flowers. Pedicel 2–4 cm, often nodding, glabrous. Flowers attached at base of petiole, purplish red. Sepals caducous, elliptic-oblong or ovate-oblong, 1–2 × ca. 0.8 cm. Petals 6–9, purplish red, obovate-oblong, 3–4 × 1–1.3 cm. Stamens falcate-inflexed, ca. 2.3 cm; filaments flat, 7–8 mm; anthers ca. 1.5 cm; anther connective prolonged. Ovary oblong, ca. 1.3 cm; ovules numerous; style ca. 3 mm. Berry purplish black, obovoid-oblong or ellipsoid, ca. 3 × 2 cm. Fl. Mar–Jun, fr. Jul–Sep.  $2n = 12^*$ .

• Forests, streamsides, grassy slopes in valleys; 400–1600 m. Anhui, Fujian, Guangdong, Guangxi, Henan, Hubei, Hunan, Jiangxi, Sichuan, Taiwan, Zhejiang.

Shaw (in Stearn, Gen. *Epimedium*, 279. 2002) treated *Podophyllum hispidum* as a synonym of *P. versipelle* subsp. *versipelle*, and, based on flower color, recognized two varieties of *P. pleianthum*: var. *pleianthum* (“petals dark maroon red”) and var. *album* (“petals white”).

**6. *Dysosma tsayuensis*** T. S. Ying, Acta Phytotax. Sin. 17(1): 20. 1979.

西藏八角莲 xi zang ba jiao lian

Plants 50–90 cm tall. Rhizomes creeping, stout, with numerous fibrous roots; aerial stems 35–55 cm high, unbranched, glabrous, angulate, scaly brown at base. Leaves opposite; petiole centrally attached, 11–25 cm; leaf blade abaxially pale yellowish green, adaxially deep green, orbicular or suborbicular in gross outline, papery, both surfaces strigose, palmately 5–7-parted to ca. midway; lobes cuneate-oblong, 8–12 × 4–7 cm, margin spinose-serrulate, ciliolate, apex acute. Inflorescence 2–6-fascicled flowers. Pedicel 2–4 cm, glabrous. Flowers attached at base of petiole, large, 4–5 cm in diam. Sepals 6, caducous, elliptic, 1.3–1.5 cm × 5–6 mm. Petals 6, white, obovate-elliptic, 2.7–2.8 × 1–1.1 cm. Stamens ca. 1 cm; filaments flat, ca. 2 mm; anthers introrse; anther connective wide, not prolonged. Pistils nearly as long as stamens; ovary stipitate; ovules numerous; style ca. 2 mm; stigma inflated, rugosely undulate. Berry red, ovoid or ovoid-ellipsoid, ca. 3 cm; style ± persistent. Seeds numerous. Fl. May, fr. Jul.

• *Picea*, *Abies*, and *Pinus* forests and openings in forests; 2500–3500 m. Xizang.

Shaw (in Stearn, Gen. *Epimedium*, 304. 2002) treated *Dysosma*

*tsayuensis* as a synonym of *Podophyllum aurantiocaulis* subsp. *aurantiocalis*.

**7. *Dysosma delavayi*** (Franchet) Hu, Bull. Fan Mem. Inst. Biol., Bot. 8: 37. 1937.

川八角莲 chuan ba jiao lian

*Podophyllum delavayi* Franchet, Bull. Mus. Hist. Nat. (Paris) 1: 63. 1895; *Dysosma veitchii* (Hemsley & E. H. Wilson) L. K. Fu ex T. S. Ying; *D. veitchii* var. *longipetala* J. L. Wu & P. Zhuang; *P. delavayi* var. *longipetalum* J. M. H. Shaw; *P. veitchii* Hemsley & E. H. Wilson.

Plants 20–50 cm tall. Rhizomes creeping, short, stout, fibrous roots slightly stout. Leaves opposite; petiole white, 7–10 cm, pubescent; leaf blade abaxially pale yellowish green or dark purplish red, adaxially dark green, sometimes purplish green, suborbicular in gross outline, to 22 cm in diam., papery, abaxially venation pubescent, often ultimately glabrous, adaxially glabrous, 4- or 5-parted to ca. midway; lobes cuneate-

oblong, apex 3-lobed, lobules subtriangular, margin scarcely spinulose-suberrulate, apex acuminate. Inflorescence 2–6-fascicled flowers, rarely umbellate. Pedicel nutant, 1.5–2.5 cm, densely white pubescent. Flowers large, attached at base of petiole, dark purplish red. Sepals caducous, oblong-obovate, ca. 2 cm, outside pubescent. Petals purplish red, oblong, 4–6 cm, apex rounded, obtuse. Stamens ca. 3 cm; filaments flat, shorter than anthers; anther connective conspicuously prolonged, to 9 mm. Pistils short, only ca. 1/2 as long as stamens; ovary ellipsoid; stigma large, rugosely undulate. Berry scarlet when mature, obovoid-ellipsoid, 3–5 × 3–3.5 cm. Seeds numerous, white. Fl. Apr–May, fr. Jun–Sep.  $2n = 12^*$ .

• Forests, streamsides, shaded wet places; 1200–2500 m. Guizhou, Sichuan, Yunnan.

Shaw (in Stearn, Gen. *Epimedium*, 294–295. 2002) reported *Podophyllum delavayi* from S Shaanxi and recognized two varieties of the species: var. *delavayi* (“petals 3.5–7 cm long, 3–5 mm wide”) and var. *longipetalum* (“petals 8–10 cm long, ca. 9 mm wide”).

### Insufficiently known species

Shaw (in Stearn, Gen. *Epimedium*, 283, 285, 297. 2002) recognized three species of *Podophyllum*, below, that we have not seen, or for which we have seen inadequate material. The descriptions and key characters (in quotes) provided here are taken from Shaw’s treatment.

***Podophyllum glaucescens*** J. M. H. Shaw, New Plantsman 6(3): 162. 1999.

Plants to 40 cm tall. Mature leaves 2, glabrous, membranous, abaxially glaucescent, adaxially dark green, shiny; lower leaf trapezoid, 4-lobed, sinuses shallowly undulate, margin minutely toothed, apex of lobes shortly acuminate; upper leaf roughly pentagonal, with 4 obvious and 2 obscure lobes, ca. 20 cm across. Inflorescence inserted on petiole of upper leaf ca. 2 cm below blade, 7-flowered. Pedicel thin, 4–6 cm, swollen near apex, densely hairy. Sepals narrowly ovate, ca. 14 × 6 mm, margins membranous. Petals 6, reddish purple, ovate-lanceolate, 10–12 × 5–6 mm, apex acute or slightly toothed. Stamens 6, ca. 1 cm; filaments flattened, 2–3 mm; anthers 6–7 mm, apical mucro 1.5–2 mm. Ovary ovoid, ca. 5 × 3 mm; style 2–3 mm; stigma peltate, corrugated, ca. 3 mm in diam. Mature fruit and seeds unknown.

• Moist woodlands; ca. 1200 m. Guangxi.

On the basis of petal size and leaf blade color, Shaw (in Stearn, Gen. *Epimedium*, 285–286. 2002) distinguished *Podophyllum glaucescens* (“petals less than 1.2 cm; leaves abaxially glaucous”) from *P. difforme* and *P. versipelle* (“petals more than 1.5 cm; leaves abaxially pale green”). Shaw (loc. cit.) also speculated that *P. glaucescens* may be of hybrid origin from a cross between those two species, which he distinguished from each other by their leaf lobes and flower number (*P. difforme* with “upper leaf irregularly and indistinctly lobed; inflorescence 1–3-flowered” vs. *P. versipelle* with “upper leaf 4–7-lobed; inflorescence 4–9-flowered”).

***Podophyllum hemsleyi*** J. M. H. Shaw & Stearn, New Plantsman 6(3): 161. 1999.

Plants to 40 cm. Stems grooved. Leaves 2, abaxially glaucous green, adaxially dark green, to 35 cm in diam., lobed to 4/5 of radius, sinuses rounded, lobes spatulate-oblong, abaxially with prominent main veins, margin with fine teeth, apex of lobes rounded, tip acute to acuminate. Inflorescence inserted on petiole ca. 2 cm below blade, 4-flowered. Pedicel glabrous, 3–4

cm, dilated to 2 mm wide below receptacle. Sepals ovate-lanceolate, 14–16 mm, outer sepals 6–8 mm wide, inner sepals 3–4 mm wide, glabrous, entire, apex rounded. Petals dark red, 3–3.5 cm, oblong-spatulate, widest below apex, entire, apex rounded. Stamens 6; filaments flattened, 7–8 mm; anthers 9–10 mm. Ovary globose to pyriform, 6–7 × ca. 4 mm; style 2–3 × ca. 1 mm; stigma globose, corrugated, 3–5 mm across. Berry and seeds unknown.

• Forests; 1500–1800 m. W Hubei.

This is apparently known from only three collections made by E. H. Wilson between 1901 and 1909. It was reported by Shaw to be most similar to *Podophyllum versipelle* subsp. *boreale*. Shaw separated *P. hemsleyi* by its “lobes of leaves spatulate-oblong, to 4/5 of leaf radius; inflorescence 4-flowered, on petiole 2 cm below lamina” and *P. versipelle* by its “lobes of leaves obovate to oblong, 1/2–2/3 of leaf radius; inflorescence 4–19-flowered, on petiole just below upper leaf.”

***Podophyllum trilobulum*** J. M. H. Shaw, New Plantsman 7: 158. 2000 [“*trilobulus*”].

Plants 20–25(–40) cm tall. Stem and petioles with fine short linear hairs. Leaves 2, lobed, lobes trilobulate, margin finely toothed; lower leaf 18–28 cm wide, lobes 7, sinuses to 2/3 of radius, rounded, keyhole-shaped; upper leaf ca. 15 cm wide, lobes 5, strongly retarded on adaxial margin, reduced to few large teeth. Inflorescence inserted at or above midpoint on petiole of upper leaf, 2–5-flowered. Pedicel 2.2–2.5 cm, apically dilated, brown pilose, hairs linear. Petals purplish red, ovate-lanceolate, tapering gradually to acute apex, 4–5 × 8–10 mm. Anthers ca. 6 mm. Fruit unknown.

• Forests; ca. 1600 m. Sichuan (Emei Shan).

*Podophyllum trilobulum* is most similar to *Dysosma delavayi*. Shaw separated *P. delavayi* by its “inflorescence in fork of petioles” and *P. trilobulum* by its “inflorescence along petiole just below leaf, at or above midpoint of upper leaf or held above leaves on elongated peduncle.”

## 7. *DIPHYLLEIA* Michaux, Fl. Bor.-Amer. 1: 203, t. 19–20. 1803.

山荷叶属 shan he ye shu

Ying Junsheng (应俊生 Ying Tsun-shen); David E. Boufford, Anthony R. Brach

Herbs, perennial, with thickened creeping rhizomes and coarse fibrous roots; rhizomes formed of distinct annual increments, producing stout 2(or 3)-leaved stem separating at base in autumn along marked articulation, leaving broad bowl-like excavation on rhizome. Leaves alternate; blade petiolate and peltate [except in *Diphylleia grayi* F. Schmidt, in which upper leaf sessile or subsessile and attached at sinus], transversely oblong to reniform-orbicular, pubescent or sparsely pubescent with unicellular hairs, palmately veined with main veins connected by secondary reticulate veins, 2-cleft with divisions shallowly to coarsely lobed and prominently dentate. Inflorescence terminal, pedunculate, usually a many-flowered cyme or umbel; branches glabrous or pubescent. Flowers pedicellate, actinomorphic, 3-merous. Sepals 6 in 2(or 3) whorls, white or pale green. Petals 6 in 2 whorls, white. Stamens opposite petals; anthers basifixed, longitudinally dehiscent; thecae separating from connective and ultimately attached only at apex; pollen conspicuously spiny. Ovary ellipsoid, 1-loculed; placentation parietal near base of ovary; ovules 2–11, anatropous; style absent or short and thickened; stigma peltate, cristate. Fruit berries, dark blue or purplish black, glaucous, globose or broadly ellipsoid. Seeds reddish brown, oblong to ovoid.  $n = 6$ .

Three species: discontinuous distribution in E Asia and SE North America; one species (endemic) in China.

### 1. *Diphylleia sinensis* H. L. Li, J. Arnold Arbor. 28: 443. 1947.

南方山荷叶 nan fang shan he ye

*Diphylleia cymosa* Michaux subsp. *sinensis* (H. L. Li) T. Shimizu.

Plants 40–80 cm tall. Petiole of lower leaf 7–20 cm, of upper leaf (2.5–)6–13 cm; blade peltate, reniform or reniform-orbicular to transversely oblong, 19–40 × 20–46 cm in lower leaf and 6.5–31 × 19–42 cm in upper leaf, abaxially whitish pubescent, sparsely so or subglabrous adaxially, 2-cleft with divisions undulate or shallowly 3–6-lobed, margin irregularly dentate with teeth apiculate. Inflorescence 4.2–35 cm including peduncle, 3.5–10 cm in diam.; branches pubescent or glabrescent

in fruit; peduncle 3.5–28 cm, solitary, occasionally bifurcate. Pedicel 0.4–3.7 cm. Flowers (8–)15–51. Outer sepals lanceolate to linear-lanceolate, 2.3–3.5 × 0.7–1.2 mm; inner sepals broadly elliptic to subcircular, 4–4.5 × 3.8–4 mm. Outer petals narrowly to broadly obovate, 5–8 × 2.5–5 mm; inner petals narrowly elliptic to narrowly obovate, 5.5–8 × 2.5–3.5 mm. Stamens ca. 4 mm; laminar filaments 1.7–2 mm; anthers ca. 2 × 0.6 mm. Ovary ellipsoid, 3–4 × 1.8–2 mm; ovules 5–11; style absent or represented by slight constriction at summit of ovary; stigma ca. 0.3 × 1 mm. Berry dark blue or purplish black, slightly pruinose, globose to broadly ellipsoid, 1–1.5 cm × 6–10 mm. Seeds 2–4, ovoid. Fl. May–Jun, fr. Jul–Aug.  $2n = 12^*$ .

• Moist deciduous and coniferous forests, thickets, bamboo thickets; 1900–3700 m. Gansu, Hubei, Shaanxi, Sichuan, Yunnan.

## 8. *EPIMEDIUM* Linnaeus, Sp. Pl. 1: 117. 1753.

淫羊藿属 yin yang huo shu

Ying Junsheng (应俊生 Ying Tsun-shen); David E. Boufford, Anthony R. Brach

*Aceranthus* C. Morren & Decaisne; *Vindicta* Rafinesque.

Herbs, perennial, deciduous or evergreen. Rhizome sympodial, short or horizontally creeping, stout. Stems solitary or caespitose, glabrous, squamate at base. Leaves basal or cauline, simple or compound; petioles of basal leaves longer than those of cauline; leaflets ovate, ovate-lanceolate, or suborbicular, basally cordate, lateral lobes asymmetric, with outer basal lobe longer than inner, usually spiny on margin, apex acute or acuminate. Flowering stem leafless or with 1–4 leaves, opposite or rarely alternate. Inflorescence simple or compound, with terminal raceme or panicle, few or many flowered, glabrous or glandular. Flowers dimerous. Sepals 8 in 2 whorls; inner sepals petaloid. Petals 4, flat, or saccate and prolonged outward into nectariferous pouches or spurs shorter or longer than sepals. Stamens 4, opposite petals; filaments glabrous; anthers dehiscing by 2 oblong valves, curling upward; pollen grains elliptic, smooth, with 3 longitudinal furrows. Ovary with parietal placentation; ovules 6–15; style slender; stigma slightly dilated. Capsule loculicidal. Seeds with conspicuous fleshy aril.  $2n = 12$ .

About 50 species: China, India (W Himalaya), Japan, Korea, Russia (Far East), S Europe, and N Africa; 41 species (40 endemic) in China; eight additional species (seven endemic) are insufficiently known.

See Stearn, The Genus *Epimedium* and Other Herbaceous Berberidaceae [hereafter Gen. *Epimedium*]. 2002.

*Epimedium cavaleriei* H. Léveillé (Cat. Pl. Yun-Nan, 18. 1916) is a synonym of *Stauntonia cavaleriana* Gagnepain (Bull. Soc. Bot. France 55: 47. 1908) in the Lardizabalaceae (see Fl. China 6: 452. 2001).

- 32a. Leaflets abaxially glabrous.
- 33a. Leaflet margin remotely spinose-serrate; spur of petals much shorter than inner sepals, curved, blunt ..... 29. *E. dolichostemon*
- 33b. Leaflet margin closely spinose-serrulate; spur of petals longer than inner sepals, slightly curved, subulate ..... 30. *E. mikinorii*
- 32b. Leaflets abaxially hairy.
- 34a. Leaflets abaxially strigose, margin undulate; inner sepals ovate, pale green ..... 31. *E. chlorandrum*
- 34b. Leaflets abaxially lanate or glabrous, margin flat; inner sepals broadly elliptic, pale yellow .... 32. *E. wushanense*
- 31b. Rachis and pedicels, or only pedicels, glandular pubescent.
- 35a. Spur of petals shorter than inner sepals.
- 36a. Leaflets abaxially conspicuously puberulent; inner sepals lanceolate, ca. 12 mm; spur of petals brown ..... 33. *E. stellulatum*
- 36b. Leaflets glabrous or pilose along veins; inner sepals elliptic, ca. 6 mm; spur of petals yellow ..... 34. *E. reticulatum*
- 35b. Spur of petals longer than inner sepals.
- 37a. Leaflets lanceolate, margins undulate-sinuate and sparsely spinose-serrate; outer sepals apically emarginate ..... 35. *E. ilicifolium*
- 37b. Leaflets ovate to lanceolate, margins flat; outer sepals apically entire.
- 38a. Leaflets ovate to lanceolate, abaxially densely strigose ..... 36. *E. acuminatum*
- 38b. Leaflets ovate, abaxially sparsely pubescent or nearly glabrous.
- 39a. Leaflets abaxially glaucescent, terminal leaflet oblong; spurs straight ..... 37. *E. hunanense*
- 39b. Leaflets abaxially glaucous, terminal leaflet ovate; spurs curved.
- 40a. Inner sepals narrowly ovate, ca. 6 mm; spurs 20–35 mm, pale yellow; inflorescence a panicle; blade length:width ratio 2 ..... 38. *E. rhizomatosum*
- 40b. Inner sepals narrowly lanceolate, 15–17 mm; spurs 15–20 mm, pale purplish red; inflorescence a raceme; blade length:width ratio 2.5 ..... 39. *E. sutchuenense*

**1. *Epimedium simplicifolium*** T. S. Ying, Acta Phytotax. Sin. 13(2): 51. 1975.

单叶淫羊藿 dan ye yin yang huo

Herbs, 30–55 cm tall. Rhizomes brown, stout, squamate at upper part. Leaves simple, basal and cauline; petiole of stem leaf 5–7 cm, glabrous; leaf blade adaxially green, ovate or broadly elliptic-ovate, 7–19 × 8–10 cm, papery, abaxially densely sericeous, veins conspicuously raised, adaxially glabrous, reticulate veins conspicuous, base deeply or shallowly cordate with lobes rounded, subequal, margin closely spinulose-subserulate, apex acute. Flowering stem with 2 opposite leaves. Inflorescence a terminal panicle, 12–22 × 8–10 cm, usually 15–32-flowered; rachis glabrous. Pedicel 1–2.5 cm, puberulent. Flowers yellow. Sepals 8 in 2 whorls; outer sepals obovate, ca. 4 × 2 mm, apex obtuse; inner sepals ovate, ca. 6 × 4 mm, membranous, apex acute. Petals curved upward, reddish purple, horn-shaped, much longer than inner sepals, ca. 2 cm. Stamens 4, pale yellow, ca. 3 mm; filaments shorter than anthers; anthers valved. Pistil obliquely terete; style ca. 1 mm. Capsules obliquely terete; style rostriform. Fl. Apr–May, fr. May–Jun.

• Slopes in valleys; ca. 1100 m. Guizhou.

小叶淫羊藿 xiao ye yin yang huo

*Epimedium elachyphyllum* Stearn, nom. illeg. superfl.

Herbs, 15–25 cm tall, glabrous. Rhizome apparently creeping, longer than 15 cm, 1.5–3 mm in diam. Leaves simple, basal and cauline; leaf blade adaxially dark green, broadly ovate, 2.5–3.5 × 3–4 cm, abaxially sparsely puberulent, often pruinose, reticulate veins conspicuous, adaxially glabrous, base deeply cordate with rounded lobes subequal, margin remotely spinose-serrate, apex acuminate. Flowering stem with 1 simple leaf at base of rachis. Raceme 8–10 cm, 8–12-flowered; rachis glabrous. Pedicel 1–2 cm, glabrous; bracts ovate, ca. 1.5 mm. Flowers purple. Sepals in 2 whorls; outer sepals 4, purple, 2 of them lanceolate, ca. 3 × 1.2 mm, others ovate, ca. 3.5 × 2.5 mm; inner sepals 4, yellow, lanceolate, ca. 3 × 1.2 mm. Petals 4, purple, suboblong, ca. 1.2 mm, without spur. Stamens 4, ca. 2.5 mm; filaments flat; anthers ca. 1.8 mm, apex obtuse. Pistil ca. 2 mm; style ca. 1 mm. Capsules ca. 1 cm; style ca. 3 mm. Seeds 1 or 2, brown, reniform, ca. 3.5 mm, glabrous. Fl. Apr–May, fr. May–Jun.

• Forests, thickets; 1300–1400 m. Guizhou (Songtao).

竹山淫羊藿 zhu shan yin yang huo

Herbs, 40–60 cm tall. Rhizome short, stout. Flowering stem brown, terete, squamate at base, with 2 opposite leaves. Leaves simple, basal and cauline; petiole 5.5–6 cm, tomentose at base and apex; leaf blade adaxially deep green, oblong to suborbicular, 10–14 × 7–11 cm, abaxially densely sericeous-tomentose, adaxially glabrous, base deeply cordate, with rounded lobes subequal, margin slightly repand or irregularly denticulate, apex obtuse. Racemes usually many loosely flowered, ca. 30 cm, glandular. Pedicel 1.5–5 cm, slender; bracts ovate, ca. 2 mm. Flowers purple. Sepals 4 in 1 whorl, petaloid, ovate-lanceolate, 9–11 × ca. 3.5 mm, apex obtuse. Petals 4, purple, saccate, ca. 1.7 cm, base cucullate, apex long attenuate. Stamens 4, ca. 4 mm; filaments flat, shorter than anthers; anthers valved, valves revolute, apex of anther connective apiculate. Style 2.5–3 mm; stigma slightly quadrilobate or inconspicuous. Fruit unknown. Fl. Jun–Jul, fr. unknown.

• Forests, roadsides; ca. 1200 m. NW Hubei.

**4. *Epimedium glandulosopilosum*** H. R. Liang, Acta Phytotax. Sin. 28: 323. 1990.

腺毛淫羊藿 xian mao yin yang huo

Herbs, 20–50 cm tall. Rhizome short, stout, usually irregularly nodose. Flowering stem glandular pubescent and pilose. Leaves simple, basal and cauline; basal leaves broadly ovate, ca. 9 × 6.5 cm, petiole ca. 24 cm; cauline leaves opposite, petiole 3–6.5 cm, glandular pubescent and puberulent, leaf blade adaxially deep green, ovate to ovate-elliptic, 5–8.5 × 2.5–5.5 cm, abaxially densely golden yellow villous, adaxially glabrous, base deeply cordate with acute lobes nearly equal, margin spinose-serrate, apex acuminate. Racemes 8–24-flowered, 6–23 × 3–6 cm; rachis and pedicels glandular pubescent. Pedicel 1–3 cm; bracts ovate, 1–2 mm. Flowers yellow. Sepals 8 in 2 whorls; outer sepals narrowly ovate, 8–9 × 4–5 mm; inner sepals similar to outer sepals in size and shape. Petals spurred, yellow, horn-shaped, ca. 1.3 cm. Stamens ca. 4 mm; filaments flat, ca. 1 mm; anthers valved, valves revolute, apex of anther connective apiculate. Ovary terete; style ca. 2 mm; stigma quadrilobate or inconspicuous. Capsules 5–10 mm; style 3–4 mm. Fl. Apr–May, fr. May–Jun.

• 800–900 m. Sichuan.

裂叶淫羊藿 *lie ye yin yang huo*

Herbs, 30–70 cm tall. Rhizome compact, rigid. Leaves basal and cauline, trifoliolate; petiole 6–9.5 cm; basal leaves smaller than cauline leaves; lateral leaflets narrowly ovate, entire, base shallowly cordate, sinus widely open, lobes unequal, inner lobe rounded, outer lobe acute, margin spinulose-serulate, apex acuminate; petiolule of terminal leaflet 5–7 cm; terminal leaflet obovate to ovate or obovate-elliptic, 9–14 × 4–6.4 cm, base shallowly cordate, sinus open, lobes rounded, margin spinulose-serulate, apex (2 or)3(–5)-lobed, lobes acuminate, abaxially glaucous, glabrous except main veins pilose. Inflorescence terminal, paniculate, (8–)25–34 cm, glabrous, many flowered; peduncles 7–17 mm, mostly 5-flowered. Flowers white or yellowish, 3–4.5 mm in diam. Outer sepals 4, ovate to elliptic, 2–3.5 mm, apex 2-lobed; inner sepals 4, obovate or ovate-lanceolate, 2–3.5 × ca. 1.5 mm. Petals suborbicular, 1.5–3 × ca. 1.3 mm, slightly saccate. Stamens 3–4 mm; anthers ca. 1.5 mm. Ovary narrowly ovoid, 3–3.5 mm; ovules 2–6. Capsules 1.3–1.7 cm, beak 4–5 mm. Seeds 2–6, ca. 3.5 mm. Fl. Apr–Jul, fr. Jul–Sep.

- Forests; 700–1500 m. Hunan.

**10. *Epimedium ecalcaratum*** G. Y. Zhong, Acta Phytotax. Sin. 29: 89. 1991.

无距淫羊藿 *wu ju yin yang huo*

Herbs, 30–65 cm tall. Rhizome creeping, nodose, with numerous fibrous roots. Leaves basal and cauline, 3(or 5 or 7)-foliolate; petiole of basal leaf 3–15 cm; cauline leaf opposite or alternate, petiole 2–4 cm, sparsely brownish villous, but densely so at base and apex; leaflets adaxially deep green, ovate or narrowly ovate, 2.5–4.5 × 1.4–2.6 cm, leathery, abaxially sparsely white strigose on veins, adaxially glabrous, base deeply cordate, apex acute, terminal leaflet with equal rounded lobes, lateral leaflets oblique with outer lobe large and rounded, inner lobe smaller and rounded, margin remotely spinose-serrate. Inflorescence a raceme or sometimes subpaniculate, erect, 7–33 cm, slender; rachis, peduncle, and pedicels brownish red glandular pubescent. Pedicel 8–21 mm, slender. Flowers yellow, 8–10 mm in diam. Outer sepals caducous, pale purple, elliptic to broadly ovate, ca. 3 × 2 mm, membranous; inner sepals purple, lanceolate, 2.5–3.5 × ca. 1.5 mm. Petals yellow, sometimes purple spotted, obovate-orbicular, 6–8 × 4–5 mm, base cucullate, apex rounded, obtuse. Stamens ca. 4.5 mm; anthers ca. 1.5 mm, valved, valves revolute. Pistil longer than stamens. Capsule terete, short, 6–8 mm; style ca. 3 mm. Seeds reddish brown, shiny, reniform. Fl. and fr. May–Aug.

- Forests, thickets, rocky slopes; 1100–2100 m. Sichuan.

黔北淫羊藿 qian bei yin yang huo

Herbs, 40–60 cm tall. Rhizome nodose, short, with numerous fibrous roots. Leaves basal and cauline, trifoliate; leaflets lanceolate to narrowly lanceolate, 13–18 × 2.5–4 cm, thickly leathery, abaxially sparsely lanose, adaxially glabrous, base cordate, apex acuminate or long acuminate, terminal leaflet with subequal rounded lobes, lateral leaflets oblique with outer lobe large, cuneate and acuminate, inner lobe much smaller and rounded, margin spinose-serrate. Flowering stem with 2 opposite trifoliate leaves, occasionally 3 leaves whorled. Panicle without conspicuous peduncle, many (up to 150) flowered, 30–35 cm, usually glabrous. Pedicel 1–2 cm, glabrous. Flowers ca. 6 mm in diam. Outer sepals caducous, purple, elliptic, ca. 3.5 × 1.5–3 mm; inner sepals white, ovate, ca. 2.5 × 1 mm. Petals yellow, obovate, ca. 2 mm, apex involute, without spur. Stamens ca. 4 mm; filaments ca. 1.5 mm; anthers ca. 2.5 mm. Pistil ca. 4 mm; ovules 3 or 4; style ca. 2.5 mm. Capsule ca. 1 cm; style ca. 4 mm. Fl. Mar–Apr, fr. Apr–May.

• Streamsides in valleys; 300–500 m. Guizhou (Yanhe).

**12. *Epimedium myrianthum*** Stearn, Kew Bull. 53: 218. 1998.

天平山淫羊藿 tian ping shan yin yang huo

*Epimedium sagittatum* (Siebold & Zuccarini) Maximowicz subsp. *pyramidale* (Franchet) Stearn; *E. sagittatum* var. *pyramidale* (Franchet) Stearn; *E. sinense* Siebold ex Miquel var. *pyramidale* Franchet.

Herbs, 30–60 cm tall. Rhizome short, stout, with numerous fibrous roots. Leaves basal and cauline, leathery, trifoliate; leaflets of basal leaves mostly ovate, 5–6 × 3–4 cm, apex acute; leaflets of cauline leaves adaxially shiny, mostly narrowly ovate, sometimes elliptic or lanceolate, 6–11 × 2–6 cm, abaxially glaucous, with extremely minute appressed hairs, adaxially glabrous, base moderately cordate, apex long acuminate, lobes of terminal leaflet rounded, those of lateral leaflets unequal with lobes rounded or acute, margin flat, closely spinulose-serrate. Flowering stem with 2 opposite, or sometimes 3 or 4 whorled, long petiolate leaves. Inflorescence paniculate, loosely 70–210-flowered, 18–34 × 7–9 cm, glabrous. Pedicel 5–15 mm. Flowers minute. Outer sepals black, obtuse, unequal in length, one pair ca. 2 mm, other pair ca. 3.5 mm; inner sepals white, narrowly ovate, ca. 4 × 1.5–2 mm, apically acute. Petals orange-yellow and red, slipper-shaped, shorter than inner sepals, 2–2.5 mm, apically obtuse. Stamens exposed, pale yellow, ca. 4 mm; filaments ca. 2 mm; anthers ca. as long as filaments. Pistil ca. 5.2 mm; style ca. 2.8 mm. Fruit unknown. Fl. Apr–Jul, fr. unknown.

• Dense forests, thickets, roadsides, streamsides; 700–1500 m. Guangxi, Hubei, Hunan.

多花淫羊藿 duo hua yin yang huo

Herbs, ca. 80 cm tall. Rhizome short, stout. Leaves basal and cauline, trifoliate; leaflets abaxially pale green, adaxially green, elliptic or oblong, sometimes narrowly ovate, 12–14 × 5–6 cm, membranous, abaxially sparsely white strigose or glabrous, adaxially glabrous, base cordate, apex acuminate or long acuminate, terminal leaflet with equal rounded lobes, lateral leaflets quite oblique with outer lobes large, acute and deltoid, inner lobes smaller and rounded, margin spinose-serrate. Flowering stem with 2 opposite, or 3 or 4 whorled, trifoliate leaves. Inflorescence compound, many (300–400) flowered, ca. 25 × 15 cm, base of rachis with 1–5 peduncles 20–30-flowered, usually glabrous. Pedicel 5–10 mm, glabrous; bracts lanceolate, ca. 1 mm. Flowers minute, ca. 3 mm in diam. Outer sepals purplish red, oblong, ca. 3.5 × 1.5 mm; inner sepals white, lanceolate, ca. 3 × 1 mm. Petals pale yellow, oblong, saccate, 1.2–2 × 0.6–1 mm, without spur. Stamens ca. 3 mm; filaments ca. 1 mm; anthers valved. Pistil 5–7 mm; style 3–4 mm. Fruit unknown. Fl. Apr–May, fr. unknown.

• Slopes in valleys, roadsides, streamsides; 500–800 m. Guizhou (Wangmo, Yinjiang, Yuping).

**14. *Epimedium koreanum*** Nakai, Fl. Sylv. Kor. 21: 63. 1936.

朝鲜淫羊藿 chao xian yin yang huo

*Epimedium cremeum* Nakai & Maekawa ex Honda; *E. grandiflorum* C. Morren subsp. *koreanum* (Nakai) Kitamura; *E. grandiflorum* var. *koreanum* (Nakai) K. Suzuki; *E. sulphurellum* Nakai (1944), not C. Morren (1849).

Herbs, 15–40 cm tall. Rhizome creeping, 3–5 mm in diam. Leaves basal and cauline, biternate, usually 9-foliate; leaflets abaxially pallid, adaxially dark green, ovate, 3–13 × 2–8 cm, papery, abaxially glabrous or sparsely puberulent, adaxially glabrous, base deeply cordate with usually rounded lobes, base of lateral leaflets conspicuously oblique with outer lobe large, deltoid, and acute, inner lobe smaller and rounded, margin minutely serrate, apex acute or acuminate. Flowering stem with 1 biternate leaf. Inflorescence a simple raceme, 4–16-flowered, 10–15 cm, glabrous or pilose. Pedicel 1–2 cm. Flowers white, pale yellow, deep rose, or violet, 2–4.5 cm in diam. Outer sepals reddish, oblong, 4–5 mm; inner sepals narrowly ovate to lanceolate, flat, 8–18 × 3–6 mm, apically acute. Petals usually much longer than inner sepals, rounded; spurs slender, elongate, tapering-subulate, 1–2 cm. Stamens ca. 6 mm; anthers ca. 4.5 mm; filaments ca. 1.5 mm. Pistil ca. 8 mm; ovary ca. 4.5 mm; style ca. 3.5 mm. Capsules narrowly fusiform, ca. 6 mm; style ca. 2 mm. Seeds 6–8. Fl. Apr–May, fr. May.  $2n = 12$ .

Forests, thickets; 400–1500 m. Anhui, Jilin, Liaoning, Zhejiang [Japan, N Korea].

**15. *Epimedium flavum*** Stearn, Bot. Mag., n.s., 12: 21. 1995.

天全淫羊藿 tian quan yin yang huo

Herbs, 15–30 cm tall. Leaves basal and cauline, nearly leathery when mature, basal leaves mostly with 5 leaflets, sometimes 3, cauline leaves with 3 or 5 leaflets; leaflets ovate, to 4 × 3 cm, both surfaces glabrous, base cordate with lobes rounded and slightly diverging or separated by a narrow sinus,

those of lateral leaflets moderately unequal, margin remotely spinose-serrate, apex acuminate. Flowering stem with 1 leaf or 2 leaves at same height or at different heights. Inflorescence simple, racemose, loosely few flowered (3–10-flowered), ca. 6 cm. Pedicel to 2 cm, with short glandular hairs. Flowers large, ca. 3 cm in diam. Outer sepals caducous; inner sepals spreading horizontally, pale sulfur-yellow, lanceolate, ca.  $11 \times 4$  mm, apex obtuse. Petals pale sulfur-yellow, slightly longer than inner sepals; spur elongated, subulate, slightly curved, ca. 1.3 cm, expanded at base into a lamina ca. 8 mm high. Stamens included, ca. 3 mm; filaments pale sulfur-yellow, ca. 0.5 mm; anthers pale sulfur-yellow, ca. 2.5 mm. Fruit unknown. Fl. Apr, fr. unknown.

- About 2000 m. Sichuan (Erlang Shan, Tianquan).

**16. *Epimedium brachyrrhizum*** Stearn, Kew Bull. 52: 659. 1997.

短茎淫羊藿 duan jing yin yang huo

Herbs, ca. 23 cm tall. Rhizome short, compact, clump-forming. Leaves basal and cauline, trifoliolate; leaflets adaxially deep green, ovate or narrowly ovate,  $6\text{--}10 \times 3.5$  cm, leathery, abaxially glabrous except for hairy thickened insertion of secondary petiole, adaxially glabrous, base deeply cordate, base of terminal leaflet with equal rounded lobes, those of lateral leaflets unequal with outer lobe large, deltoid, and acute, inner lobe smaller and rounded, margin closely spinulose subserrulate, apex acuminate. Flowering stem with 1 leaf. Inflorescence simple, racemose, loosely few flowered (6–12-flowered), ca. 14 cm. Pedicel ca. 2 cm, sparsely glandular pubescent. Flowers large, ca. 4 cm in diam. Outer sepals obovate,  $3.5\text{--}4$  mm, apically obtuse; inner sepals pale rose, lanceolate,  $20\text{--}22 \times$  ca. 6 mm. Petals basally rose, elsewhere white, slightly longer than inner sepals; spur strongly curved, elongate,  $2.2\text{--}2.6$  cm, nearly lamina-less. Stamens prolonged, ca. 4 mm; filaments whitish, ca. 1 mm, slender; anthers yellow, valved. Pistil ca. 6 mm; style ca. 2.5 mm; stigma ruminant. Fl. Apr–May, fr. unknown.

- Forests on slopes; 600–1200 m. Guizhou (Fanjing Shan).

**17. *Epimedium leptorrhizum*** Stearn, J. Bot. 71: 343. 1933.

黔岭淫羊藿 qian ling yin yang huo

*Epimedium macranthum* H. Léveillé, Fl. Kouy-Tchéou, 48. 1914–1915, not Morren & Decaisne (1834).

Herbs, 12–30 cm tall. Rhizome long creeping, 1–2 mm in diam.; internodes sometimes to 20 cm. Leaves basal and cauline, trifoliolate; petiole reddish pubescent; leaflets adaxially dark green, narrowly ovate or ovate,  $3\text{--}10 \times 2\text{--}5$  cm, leathery, abaxially often glaucous, papillose and reddish pubescent on midvein and lateral veins, especially dense at insertion of petiolules, adaxially glabrous, base deeply cordate with usually rounded lobes nearly touching, those of lateral leaflets unequal, margin closely spinose-serrate, apex long acuminate. Flowering stem with 1 trifoliolate leaf, or occasionally 2 opposite leaves. Inflorescence simple, racemose, 4–12-flowered, 12–25 cm, glandular. Pedicel 1–2.5 cm, glandular. Flowers white, tinged with rose or deep rose, large,  $3.5\text{--}4$  cm in diam. Outer sepals

ovate-oblong, 3–4 mm, apex obtuse; inner sepals white, narrowly elliptic,  $11\text{--}20 \times 4\text{--}7$  mm, apex acute. Petals longer than inner sepals, horn-shaped, to 2 cm, tapering from swollen but lamina-less base. Stamens ca. 4 mm; anthers ca. 3 mm, valved, revolute. Capsules oblong, 1.5–2 cm; style rostriform. Fl. Mar–Apr, fr. Apr–May.

- Forests, thickets; 400–1500 m. Guangxi, Guizhou, Hubei, Hunan, Sichuan.

**18. *Epimedium pauciflorum*** K. C. Yen, Guihaia 14: 124. 1994.

少花淫羊藿 shao hua yin yang huo

Herbs, 6–20 cm tall. Rhizome long creeping, 1–3 mm in diam.; internodes sometimes to 20 cm. Leaves basal and cauline, trifoliolate; leaflets ovate or suborbicular,  $1.3\text{--}2.5 \times 1.2\text{--}2.5$  cm, abaxially sparsely puberulent, adaxially glabrous, base deeply cordate with rounded lobes nearly touching, those of lateral leaflets conspicuously unequal, margin coarsely serrate, apex acute or shortly acuminate. Flowering stem with 1 trifoliolate leaf. Inflorescence simple, racemose, few flowered (ca. 3-flowered), 4–7 cm; rachis and pedicels glandular, pubescent. Pedicel 1–2.3 cm; bracts ovate, 0.8–1.4 mm. Outer sepals caducous, narrowly obovate, ca.  $4 \times 3$  mm; inner sepals white, broadly lanceolate, ca.  $12 \times 5$  mm, apex obtuse. Petals declined, white, horn-shaped, longer than inner sepals, blunt spurs ca. 1.7 cm. Stamens 4; anthers ca. 2.5 mm, valved. Pistil ca. 6 mm; style 2–2.8 mm. Fruit unknown. Fl. Mar–Apr, fr. unknown.

- Weedy slopes; ca. 1700 m. Sichuan.

紫距淫羊藿 zi ju yin yang huo

Herbs, ca. 15 cm tall. Rhizome long creeping, slender, 2–3 mm in diam. Leaves basal and cauline, trifoliolate; leaflets adaxially deep green, ovate,  $4\text{--}5 \times 2\text{--}3$  cm, abaxially glaucous,

with sparse minute prostrate hairs, adaxially glabrous, base shallowly cordate with lobes separated by a moderately broad sinus, those of terminal leaflet rounded, lateral leaflets with smaller lobe rounded and larger lobe acute, margin closely spinulose-suberrulate, apex acuminate. Flowering stem with 2 opposite leaves or only 1 leaf. Inflorescence simple, racemose, 6–15-flowered, ca. 6 cm or longer; bracts entire. Pedicel ca. 3 cm, glabrous. Flowers large, ca. 3 cm in diam. Outer sepals caducous, greenish, suborbicular, 2.5–3.5 mm; inner sepals white, ovate, ca. 13 × 9 mm, apex acute. Petals pale purple, slightly longer than inner sepals; spur basally deeper purple, slightly curved, subulate, elongated, 1.5–1.6 cm, basally expanded to 5 mm high. Stamens enclosed, ca. 4 mm; filaments ca. 0.5 mm. Pistil ca. 4.2 mm; style ca. 3 mm. Fruit unknown. Fl. Apr, fr. unknown.

• Forest margins, shaded places by streamsides; 400–1000 m. Hunan (Tianping Shan).

**21. *Epimedium fangii* Stearn, Bot. Mag., n.s., 12: 18. 1995.**

方氏淫羊藿 fang shi yin yang huo

Herbs, ca. 25 cm tall. Rhizome long creeping, slender, 1.5–2 mm in diam. Leaves basal and cauline, trifoliolate; leaflets adaxially pale green, narrowly ovate, 4–8 × 2.5–5.5 cm, leathery, abaxially glaucous, nearly glabrous except for scattered appressed minute hairs, adaxially glabrous, base moderately cordate with lobes rounded and separated by a narrow sinus, those of lateral leaflets moderately unequal, margin spinulose-serrulate, apex obtuse or nearly acute. Inflorescence simple, racemose, loosely 6–10-flowered, to 13 cm. Pedicel ca. 2 cm, glabrous. Flowers pale yellow, large, ca. 4.5 cm in diam. Outer sepals caducous, 2.5–3.5 mm; inner sepals spreading horizontally, reddish, cymbiform, ca. 6 × 2.5 mm, obtuse. Petals pale yellow, much longer than inner sepals; spur nearly straight and horizontally spreading, subulate, elongated, ca. 2.2 cm, expanded at base into a lamina ca. 1 cm high. Stamens included, ca. 3.5 mm; filaments ca. 1 mm; anthers pale yellow, ca. 2.5 mm, valved. Capsules unknown. Fl. Apr, fr. unknown.

• Forests; 1800–1900 m. Sichuan (Emei Shan).

A natural hybrid swarm (*Epimedium × omeiense* Stearn, Bot. Mag., n.s., 12: 22. 1995) reportedly results when *Epimedium fangii* and *E. acuminatum* occur together (see also Stearn, Gen. *Epimedium*, 183. 2002).

**22. *Epimedium latisepalum* Stearn, Bot. Mag. (Kew Mag.) 10: 180. 1993.**

宽萼淫羊藿 kuan e yin yang huo

Herbs, ca. 30 cm tall. Rhizome creeping, slender. Leaves basal and cauline, trifoliolate; petiole to 10 cm; leaflets adaxially deep green, narrowly ovate, 6–9 × 2.5–4 cm, leathery, abaxially glaucous, with short erect scattered hairs, adaxially glabrous, base deeply cordate with lobes acute or rounded and touching or slightly overlapping, those of lateral leaflets unequal, margin spinulose-suberrulate, apex shortly acuminate or acute. Flowering stem with 2 trifoliolate opposite leaves. Inflorescence simple, racemose, loose, few flowered (ca. 8-flowered), ca. 20 cm. Pedicel 2.5–5 cm, glabrous. Flowers pendulous, large, 4–5 cm in diam. Outer sepals caducous, green, ob-

long, 3–5 mm, margin emarginate or repand; inner sepals spreading horizontally, white, elliptic, ca. 16 × 8–9 mm, apically shortly acuminate. Petals white but slightly yellowish or purplish tinged at base, much longer than inner sepals; spur slightly curved, horn-shaped, elongated, ca. 2.5 cm, basally expanded into lamina ca. 7 mm. Stamens included, ca. 4 mm; anthers yellow, ca. 2.5 mm, valved, apex blunt. Pistil ca. 7 mm; style ca. 3.5 mm. Fl. and fr. unknown.

• About 900 m. Sichuan (Baoping).

*Epimedium latisepalum* was described from plants cultivated in the Royal Botanic Gardens, Kew, but originally from Sichuan.

*Epimedium membranaceum* K. Meyer subsp. *orientale* Stearn.

Herbs, 30–40 cm tall. Rhizome long creeping, slender, 2–3 mm in diam. Leaves basal and cauline, trifoliate; leaflets adaxially dark green, narrowly ovate, 5–11 × 3.5–5 cm, leathery, abaxially glaucous, with long multicellular hairs or subglabrous, base cordate with a narrow or open sinus, lobes of terminal leaflet equal and obtuse, those of lateral leaflets unequal, with inner one smaller and rounded or obtuse, outer one longer and acute, margin closely spinulose-suberrulate, apex acuminate or sometimes acute. Flowering stem with 2 opposite leaves. Inflorescence simple, 5–11-flowered, 7–12 cm. Pedicel 1–2 cm, glandular hairy. Flowers yellow, large. Outer sepals caducous, 4–5 mm, with white margins; inner sepals appressed to petals, yellowish, ovate or narrowly oblong, 10–11 × 6–7 mm, apically acute. Petals pale sulfur-yellow, much longer than inner sepals, lamina-less; spur strongly curved, subulate, elongated, 2–2.5 cm. Stamens exposed, pale yellow, ca. 5 mm; filaments ca. 1 mm; anthers ca. 3.5 mm. Pistil ca. 7 mm. Fruit unknown. Fl. Apr–May, fr. unknown.

• Forests on slopes. Jiangxi (Lu Shan).

**28. *Epimedium davidii*** Franchet, Nouv. Arch. Mus. Hist. Nat., sér. 2, 8: 195. 1885 [“*davidi*”].

宝兴淫羊藿 bao xing yin yang huo

*Epimedium membranaceum* K. Meyer.

Herbs, 30–50 cm tall. Rhizome shortly creeping, stout. Leaves basal and cauline, (3 or) 5-foliate, basal leaf usually much shorter than flowering stem leaf, 12–25 cm; leaflets abaxially glaucescent, adaxially deep green, shiny, ovate or broadly ovate, 6–12 × 2–5 cm, leathery or papery, abaxially papillose and sparsely pubescent with short appressed hairs, both surfaces with distinct reticulate veins, base deeply or shallowly cordate with subequal rounded lobes, margin spinose-serrate, apex obtuse or acute. Flowering stem with 2 trifoliate opposite leaves, rarely alternate or 3 leaves. Panicle loosely 6–24-flowered, 15–25 cm. Pedicel 1.5–2 cm, slender, glandular. Flowers pale yellow, 2–3 cm in diam. Outer sepals ovate, 2–4 mm, blunt; inner sepals pale reddish, narrowly ovate, 6–7 × 3–4 mm, apex acute. Petals much longer than inner sepals, lamina distinct, petaloid, rounded, forming a cup 7–13 mm deep; spur slender, curved, subulate, 1–1.5 cm. Stamens included, 3–4 mm; filaments flat, ca. 7 mm; anthers ca. 4 mm, valved. Ovary ca. 5 mm. Capsule 1.5–2 cm; style ca. 5 mm, rostrate. Fl. Apr–May, fr. May–Aug.

• Forests, thickets, mixed forests by streams, rock crevices; 1400–3000 m. Sichuan, Yunnan.

**29. *Epimedium dolichostemon*** Stearn, Kew Bull. 45: 685. 1990.

长蕊淫羊藿 chang rui yin yang huo

Herbs, ca. 30 cm tall. Rhizome shortly creeping. Leaves basal and cauline, trifoliate; leaflets adaxially deep green, ovate-lanceolate or lanceolate, to 8 × 3 cm, leathery, abaxially glabrous, base deeply cordate with subequal acute lobes, those of lateral leaflets unequal, acuminate, margin remotely spinose-serrate, apex acuminate. Flowering stem with 2 trifoliate op-

posite leaves. Panicle loosely many flowered (to 38-flowered), ca. 15 cm, with lower peduncles 1–2 cm, each 2- or 3-flowered at base of rachis. Pedicel 1–1.5 cm, glabrous. Outer sepals caducous, 2.5–3 mm; inner sepals white, narrowly elliptic, 8–9 × ca. 2.5 mm. Petals reddish purple, cucullate, much shorter than inner sepals, ca. 3 mm, with slight lamina and blunt incurved spur. Stamens conspicuously prolonged, ca. 8 mm; filaments yellowish, 4.5–5 mm; anthers ca. 2.5 mm, valved, revolute. Fruit unknown. Fl. Apr; fr. unknown.

• Habitat unknown, described from plants in cultivation in England; ca. 1400 m. Sichuan (Shizhu).

**30. *Epimedium mikinorii*** Stearn, Kew Bull. 53: 214. 1998.

直距淫羊藿 *zhi ju yin yang huo*

Herbs, 30–40 cm tall. Rhizome shortly repent, compact. Leaves basal and cauline, trifoliolate; leaflets adaxially dark green, lanceolate, 8–11 × 3–4 cm, leathery, abaxially glaucous, glabrous, base cordate with equal lobes rounded, those of lateral leaflets oblique with outer lobe large and acute, inner lobe smaller and rounded, margin closely spinose-serrulate, apex long acuminate. Flowering stem with 2 trifoliolate opposite leaves. Panicle ca. 30-flowered, ca. 18 cm, glabrous, with lower peduncles 3–5-flowered. Pedicel ca. 1 cm. Flowers large. Outer sepals caducous, oblong, ca. 3.5 mm; inner sepals rose-tinged, elliptic, 11–12 × 4–5.5 mm. Petals much longer and narrower than inner sepals, with yellow-edged lamina ca. 3.5 mm high; spur slightly curved, nearly straight, purple, subulate, elongated, 1.7–2 cm. Stamens enclosed, whitish, ca. 3 mm; filaments ca. 1 mm; anthers ca. 2 mm, valved. Pistil ca. 5.8 mm; style slightly curved. Fruit unknown. Fl. Apr; fr. unknown.

• Forests on slopes; ca. 700 m. Hubei (Enshi).

**31. *Epimedium chlorandrum*** Stearn, Kew Bull. 52: 660. 1997.

绿药淫羊藿 *lü yao yin yang huo*

Herbs, 35–65 cm tall. Rhizome compact. Leaves basal and cauline, trifoliolate; leaflets adaxially green, mottled with brown when young, narrowly ovate or sublanceolate, 5–11 × 2–4.5 cm, leathery, abaxially glaucous, with numerous minutely appressed hairs, base moderately cordate, terminal leaflet with equal rounded lobes, lateral leaflets oblique with outer lobe large and obtuse or rounded, inner lobe smaller and rounded, margin slightly undulate, sparsely or closely spinulose-subserulate, apex shortly acuminate. Panicle 12–30-flowered, 25–36 cm, lower peduncles 3–5-flowered. Pedicel ca. 2.5 cm, glabrous. Flowers large, ca. 4 cm in diam. Outer sepals caducous, green, 2–3 mm; inner sepals not appressed to petals, greenish, narrowly ovate, unequal, outer pair ca. 8 × 4.5 mm, inner pair ca. 10 × 4.5 mm. Petals pale yellow, much longer than inner sepals; spur strongly curved, subulate, elongated, lamina-less. Stamens prolonged, ca. 4.5 mm; filaments white, with slightly pink tinge; anthers green, ca. 3 mm; pollen green. Fruit unknown. Fl. Apr; fr. unknown.

• Forests on slopes; ca. 900 m. Sichuan (Baoping).

**32. *Epimedium wushanense*** T. S. Ying, Acta Phytotax. Sin. 13(2): 55. 1975.

巫山淫羊藿 *wu shan yin yang huo*

Herbs, evergreen, 50–80 cm tall. Rhizome short, stout, nodose. Leaves basal and cauline, trifoliolate; leaflets lanceolate to narrowly lanceolate, 9–23 × 1.8–4.5 cm, leathery, abaxially lanate or becoming glabrous, adaxially glabrous, base cordate, terminal leaflet with equal rounded lobes, lateral leaflets oblique with outer lobe large, deltoid, and acute, inner lobe smaller and rounded, margin coarsely aristate-dentate, apex acuminate or long acuminate. Flowering stem with 2 trifoliolate opposite leaves. Panicle many flowered (25–70-flowered), 15–30(–50) cm; rachis glabrous. Pedicel 1–2 cm, sparsely glandular pubescent or glabrous. Flowers pale yellow, to 3.5 cm in diam. Outer sepals suborbicular, 2–5 × 1.5–3 mm; inner sepals pale yellow, broadly elliptic, 3–15 × 1.5–8 mm, apex obtuse. Petals slightly curved, pale yellow or sometimes purplish at base, horn-shaped, longer than inner sepals, 0.6–2 cm. Stamens ca. 5 mm; filaments 1–1.5 mm; anthers ca. 4 mm, valved, revolute. Pistil ca. 5 mm; ovary obliquely terete; ovules 10–12. Capsule ca. 1.5 cm; style ca. 4.5 mm, rostrate. Fl. Apr–May, fr. May–Jun.

• Forests, thickets, weedy places, crevices; 300–1700 m. Chongqing, Guangxi, Guizhou, Hubei, Sichuan.

**33. *Epimedium stellulatum*** Stearn, Kew Bull. 48: 810. 1993.

星花淫羊藿 *xing hua yin yang huo*

Herbs, 20–35 cm tall. Rhizome shortly creeping. Leaves basal and cauline, trifoliolate; leaflets adaxially dark green, shiny, ovate, 8–9 × 4–7 cm, leathery, abaxially conspicuously puberulent, base deeply cordate, terminal leaflet with equal rounded lobes, lateral leaflets moderately oblique with outer lobe and inner lobe smaller, acute, margin spinose-serrate, apex acute or shortly acuminate. Flowering stem with 2 trifoliolate opposite leaves, rarely with 1 leaf. Panicle loosely 20–40-flowered, 15–20 cm, with lower peduncles to 3 cm, each 3-flowered. Pedicel 5–15 mm, with numerous glandular hairs; bracteole ca. 2.2 mm, apex shortly acuminate. Outer sepals 4, caducous, unequal, 2.5–3 mm; inner sepals white, lanceolate, ca. 12 × 3 mm, apically acuminate. Petals nearly straight, brown suffuse but orange toward base, much shorter than inner sepals, ca. 2.5 mm, with slight lamina and blunt spur. Stamens conspicuously prolonged, ca. 3.5 mm; filaments yellowish, ca. 1.5 mm; anthers yellow, ca. 2 mm, valved. Pistil ca. 4.5 mm; style ca. 2.5 mm. Fruit unknown. Fl. Apr; fr. unknown.

• Slopes; ca. 900 m. Hubei, Sichuan.

**34. *Epimedium reticulatum*** C. Y. Wu ex S. Y. Bao, Acta Phytotax. Sin. 25: 156. 1987.

革叶淫羊藿 *ge ye yin yang huo*

Herbs, 30–40 cm tall. Rhizome purplish red, shortly creeping. Leaves basal and cauline, trifoliolate; petiole of basal leaves ca. 20 cm, petiole of cauline leaves 5–6 cm; leaflets adaxially dark green, ovate, 5–7 × 3.5–5 cm, thickly leathery, glabrous, abaxially pilose in axils of veins, adaxially with 5 slightly impressed veins, both surfaces with conspicuous reticulate veins, base deeply cordate with usually rounded lobes, those of lateral leaflets conspicuously unequal, margin spinose-

serrate, apex acute or acuminate. Flowering stem with 2 opposite trifoliate leaves, sometimes 3 or 4 leaves whorled. Panicle 40–45-flowered, 30–35 cm, with lower peduncles 2–20-flowered; rachis glandular pubescent. Pedicel ca. 1.5 cm, slender, glandular pubescent. Flowers yellow. Outer sepals oblong, ca. 5 mm; inner sepals elliptic, ca. 6 mm, apex rounded. Petal spur yellow, horn-shaped, shorter than inner sepals, ca. 4.5 mm. Stamens ca. 3 mm; filaments flat, short. Capsule 1.2–1.5 cm; style rostrate. Seeds 3–5, reniform. Fl. Apr–May, fr. Jun–Jul.

- Forests; ca. 1100 m. Sichuan.

**35. *Epimedium ilicifolium* Stearn, Kew Bull. 53: 213. 1998.**

镇坪淫羊藿 *zhen ping yin yang huo*

Herbs, 28–42 cm tall. Rhizome compact. Leaves basal and cauline, trifoliate; leaflets adaxially glossy, lanceolate, 8–11 × 3–4 cm, leathery, abaxially puberulent, adaxially glabrous, base cordate with an open sinus and acute lobes, terminal leaflet with equal rounded lobes, lateral leaflets oblique with outer lobe large and inner lobe smaller, margin undulate-sinuate and sparsely spinose-serrate, apex long acuminate. Flowering stem with 2 opposite trifoliate leaves. Panicle loosely 25–32-flowered, 18–23 cm. Pedicel ca. 2 cm, glandular. Flowers yellow, large. Outer sepals caducous, black, white-margined, obovate, ca. 4.2 × 4 mm, apex emarginate; inner sepals pale yellow, elliptic or narrowly ovate, 10–12 × 5–6 mm, apex acute. Petals pale yellow, much longer than inner sepals, ca. 2 mm; spur strongly curved, subulate, elongated, basal lamina ca. 7 mm high. Stamens enclosed, yellow, ca. 4 mm; filaments ca. 1 mm; anthers ca. 3 mm, valved. Pistil ca. 5.5 mm; style ca. 3 mm. Fruit unknown. Fl. Apr, fr. unknown.

- 1600–1700 m. Shaanxi (Zhenping).

**36. *Epimedium acuminatum* Franchet, Bull. Soc. Bot. France 33: 109. 1886.**

粗毛淫羊藿 *cu mao yin yang huo*

*Epimedium komarovii* H. Léveillé.

Herbs, 30–70 cm tall. Rhizome stout, short, sometimes long creeping, 0.5–2.5 cm in diam. Leaves basal and cauline, trifoliate; leaflets adaxially deep green, narrowly ovate or lanceolate, 3–18 × 1.5–7 cm, thinly leathery, abaxially glaucous, with dense or sparse shortly appressed fairly stout bristles, sometimes nearly glabrous, adaxially glabrous, base cordate, terminal leaflet with equal rounded lobes, lateral leaflets oblique with outer lobes large and rounded, inner lobes smaller and rounded, margin closely spinose-serrate, apex long acuminate. Flowering stem with 2 trifoliate opposite leaves, sometimes 3-whorled. Panicle 10–50-flowered, 12–25 cm, with lower peduncles loosely 3–5-flowered, glabrous or glandular pubescent. Pedicel 1–4 cm. Flowers yellow, white, rose-purple, or pale violet, large, 3–4 cm in diam. Outer sepals 4, outer pair ovate-oblong, ca. 3 × 2 mm, inner pair broadly obovate, ca. 4.5 × 4 mm; inner sepals ovate-elliptic, 8–12 × 3–7 mm, apically acute. Petals curving outward, horn-shaped, much longer than inner sepals, 1.5–2.5 cm, tapering from swollen but lamina-less base. Stamens 3–4 mm; anthers ca. 2.5 mm, valved, revolute. Capsule ca. 2 cm; style long rostrate. Seeds numerous. Fl. Apr–May, fr. May–Jul.  $2n = 12^*$ .

- Forests, thickets, bamboo forests, weedy slopes; 300–2400 m. Guangxi, Guizhou, Sichuan, Yunnan.

**37. *Epimedium hunanense* (Handel-Mazzetti) Handel-Mazzetti, Symb. Sin. 7: 324. 1931.**

湖南淫羊藿 *hu nan yin yang huo*

*Epimedium davidii* Franchet var. *hunanense* Handel-Mazzetti, Anz. Akad. Wiss. Wien, Math.-Naturwiss. Kl. 62: 131. 1925; *E. kunawarense* S. Clay.

Herbs, ca. 40 cm tall. Rhizome shortly creeping, 3–5 mm in diam. Leaves basal and cauline, trifoliate; leaflets abaxially glaucescent, adaxially deep green, oblong-elliptic or narrowly ovate, 10–13 × ca. 6 cm, leathery, abaxially papillose and sparsely pubescent or nearly glabrous, adaxially glabrous, base deeply cordate, terminal leaflet with equal rounded lobes, lateral leaflets conspicuously oblique with outer lobe large, deltoid, and acute or rounded, inner lobe smaller and rounded, margin closely spinulose-subserulate, apex acuminate. Flowering stem with 2 trifoliate opposite leaves. Panicle loosely 10–20-flowered, nearly glabrous, with lower peduncles 2- or 3-flowered. Pedicel 1–2 cm, sparsely glandular pubescent. Flowers yellow, ca. 3.5 cm in diam. Outer sepals oblong-elliptic, ca. 4 × 2 mm, apex obtuse; inner sepals broadly elliptic, 5–6 × 3–4 mm, apically obtuse. Petals nearly cylindric and horizontally spreading, much longer than inner sepals, with distinct petaloid rounded lamina forming a cup ca. 8 mm deep and fairly stout; spurs straight, 1.5–1.8 cm, blunt. Stamens ca. 4 mm; filaments ca. 1 mm; anther ca. 3 mm, valved, revolute. Capsules narrowly ellipsoid, ca. 1.3 cm; style 2–3 mm, rostrate. Fl. Mar–Apr, fr. Apr–Jun.

- Forests, thickets, slopes, roadsides; 400–1400 m. Guangxi, Hubei, Hunan.

**38. *Epimedium rhizomatosum* Stearn, Kew Bull. 53: 220. 1998.**

强茎淫羊藿 *qiang jing yin yang huo*

Herbs, 38–42 cm tall. Rhizome creeping, elongated, ca. 8 cm or longer, slender, 1.5–2 mm in diam. Leaves basal and cauline, trifoliate; leaflets adaxially green, narrowly ovate, 4–6 × 2–3 cm, leathery, abaxially glaucous, with scattered minute erect hairs, adaxially glabrous, base shallowly cordate, with narrow sinus and basal lobes rounded or acute, lateral leaflets conspicuously oblique with outer lobe large, inner lobe smaller, margin closely spinulose-subserulate, apex acuminate. Flowering stem with 2 opposite or alternate leaves. Panicle 5–30-flowered, 9–30 cm, with lower peduncles 2–5-flowered. Pedicel 1.5–2 cm, glandular hairy. Flowers large, 4–6 cm in diam. Outer sepals caducous, white with purple tinge, ca. 4 mm; inner sepals appressed, white or reddish, narrowly ovate, ca. 6 × 2.5 mm, apically acute. Petals pale yellow, much longer than inner sepals; spur curved, subulate, elongated, 2–3.5 cm, lamina-less. Stamens nearly enclosed, pale yellow, ca. 3.5 mm; filaments ca. 1.5 mm; anthers ca. 2 mm, valved. Pistil ca. 4.3 mm. Capsules ca. 2.5 cm; style ca. 7 mm. Fl. Apr, fr. Jul.

- Forests, thickets; 2000–2200 m. Sichuan.

**39. *Epimedium sutchuenense*** Franchet, J. Bot. (Morot) 8: 282. 1894.

四川淫羊藿 *si chuan yin yang huo*

Herbs, 15–60 cm tall. Rhizome long creeping, 1–4 mm in diam., with internodes to 14 cm. Leaves basal and cauline, trifoliate; leaflets adaxially green, ovate or narrowly ovate, 5–13 × 2–5 cm, thinly leathery, abaxially glaucous, papillose, sparsely gray pubescent, reticulate veins conspicuous, adaxially glabrous, base deeply cordate, terminal leaflet with equal rounded lobes, lateral leaflets conspicuously oblique with outer lobe large and acute, inner lobe smaller and rounded, apex long acuminate. Flowering stem with 2 trifoliate opposite leaves. Inflorescence simple, racemose, 4–10-flowered, 8–15 cm, glandular. Pedicel 1.5–2.5 cm, glandular. Flowers rose or mauve-purple, 3–4 cm in diam. Outer sepals 4, outer pair ovate, ca. 3 mm, apex rounded, inner pair broadly obovate, ca. 4 mm; inner sepals reflexed, narrowly lanceolate, 1.5–1.7 cm × ca. 3 mm, apex long acuminate. Petals reflexed, pale purplish red, spur horn-shaped, ca. as long as inner sepals or slightly longer, 1.5–2 cm, lamina-less. Stamens prolonged, 4–5 mm; filaments 1–2 mm; anthers 3–4 mm, valved. Capsules 1.5–2 cm; style rostrate. Fl. Mar–Apr, fr. May–Jun.

• Forests, thickets, grasslands, streamsides; 400–1900 m. Guizhou, Hubei, Sichuan.

**40. *Epimedium brevicornu*** Maximowicz, Trudy Imp. S.-Peterburgsk. Bot. Sada 11: 42. 1889.

淫羊藿 *yin yang huo*

*Epimedium rotundatum* K. S. Hao.

Herbs, 20–60 cm tall. Rhizome short, clumped, 3–5 mm in diam. Leaves basal and cauline, usually biternate, 9-foliate, rarely 5-foliate; leaflets abaxially glaucous, adaxially usually shiny, ovate or broadly ovate, 1.5–7.5 × 1–6 cm, papery or thickly so, abaxially glabrous or scarcely pubescent, adaxially with conspicuous reticulate veins, base deeply cordate, terminal leaflet with equal rounded lobes, lateral leaflets slightly oblique with outer lobes large and acute or rounded, inner lobe smaller

and rounded, margin spinose-serrate, apex rounded or acute to acuminate. Flowering stem with 2 opposite usually biternate leaves. Panicle 10–35 cm, loosely 20–50-flowered; rachis and pedicel glandular. Pedicel 5–20 mm. Flowers white or pale yellow, ca. 1.5 cm in diam. Outer sepals dark green, ovate-triangular, 1–3 mm; inner sepals white or pale yellow, lanceolate, ca. 10 × 4 mm. Petals much shorter than inner sepals, with slight lamina and blunt spurs; spur narrow, conical, 2–3 mm. Stamens exserted, 3–4 mm; anthers ca. 2 mm, valved. Capsules ca. 1 cm; style 2–3 mm, rostrate. Fl. May–Jun, fr. Jun–Aug.

• Forests, thickets, slopes; 600–3500 m. Gansu, Henan, Hubei, Qinghai, Shaanxi, Shanxi, Sichuan.

**41. *Epimedium elongatum*** Komarov, Trudy Imp. S.-Peterburgsk. Bot. Sada 29: 139. 1908.

川西淫羊藿 *chuan xi yin yang huo*

Herbs, 25–60 cm tall. Rhizome moderately long creeping, 2–5 mm in diam. Leaves basal and cauline, bi- or triternate, 9-foliate or occasionally 5-foliate; leaflets adaxially green, ovate or suborbicular, 1.5–7.5 × 1–6 cm, papery, abaxially sparsely pubescent or glabrous, adaxially glabrous, both surfaces with conspicuous reticulate veins, base deeply cordate, terminal leaflet with equal rounded lobes, lateral leaflets slightly oblique with outer lobe large and rounded or acute, inner lobe smaller and rounded, margin spinose-serrate, apex rounded or acute. Flowering stem with 3 alternate or rarely opposite leaves, upper biternate or trifoliate, lower biternate or triternate. Panicle 17–30-flowered, 15–30 cm, sparsely glandular, with lower peduncles 3–5-flowered. Pedicel 1–2 cm, sparsely glandular. Flowers yellow, large, 2.5–3 cm in diam. Outer sepals whitish, ovate, 3–4 × ca. 2 mm, blunt; inner sepals purple, lanceolate, ca. 4 × 1.5 mm, apically acute. Petals yellow, longer than inner sepals; spur horizontally spreading or upwardly curved, ca. 1.5 cm, slender, lamina-less. Stamens slightly prolonged, ca. 3 mm; anthers ca. 2 mm, valved, revolute. Pistil ca. 4 mm. Capsules elongated, 2–2.5 cm, slender; style ca. 8 mm. Fl. May–Jun, fr. Jun–Jul.

• Forests, forest margins, thickets; 2600–3700 m. Sichuan.

#### Insufficiently known species

***Epimedium baojingense*** Q. L. Chen & B. M. Yang, Acta Phytotax. Sin. 20: 482. 1982 [*"baojingensis"*].

*Epimedium baojingense* is known only from the type gathering (Hunan: Baojing County, Lüdong Shan, 23 Apr 1956, B. M. Yang 34, holotype, HNU). As mentioned by Stearn (Gen. *Epimedium*, 113. 2002), *E. baojingense* has stem leaves with only a single leaflet, as in *E. simplicifolium*. It is reported to differ from *E. simplicifolium* by having a simple inflorescence with dark yellow hairs.

***Epimedium campanulatum*** Ogisu, Kew Bull. 51: 401. 1996.

According to the author, *Epimedium campanulatum* is morphologically similar to *E. ecalcaratum* G. Y. Zhong and *E. platypetalum* K. I. Meyer. *Epimedium campanulatum* is reported to differ from *E. ecalcaratum* in having 1 or 2 leaves per flowering stem, and basal and cauline leaves with only 3, never 5 or 7, leaflets. *Epimedium campanulatum* differs from *E. platypetalum* in having compact or shortly creeping rhizomes and compound, rarely simple, inflorescences. It flowers in mid

to late May and occurs at ca. 2000 m in Sichuan (Duijiangyan).

***Epimedium grandiflorum*** C. Morren, Belgique Hort. 2: 141. 1852.

*Epimedium grandiflorum* was described from cultivated plants brought to Belgium (Ghent) from Japan by Philipp Franz von Siebold in 1830. Stearn includes in the range of *E. grandiflorum* "southern Manchuria," but we have seen no specimens from China. The reports of *E. grandiflorum* in the Flora of Anhui (see X. H. Qian, Fl. Anhui 2: 346. 1986) and Flora of Zhejiang (see C. S. Ding, Fl. Zhejiang 2: 307–320. 1992) are probably based on plants here treated as *E. koreanum*.

***Epimedium jingzhouense*** G. H. Xia & G. Y. Li, Nordic J. Bot. 27: 472. 2009.

*Epimedium jingzhouense* is known only from the type gathering (Hunan: Jingzhou County, Pukou village, 300 m, 8 Apr 2008, Xia *et al.* s.n., holotype, ZJFC).

**Epimedium pseudowushanense** B. L. Guo, Acta Phytotax. Sin. 45: 814. 2007.

According to the authors, *Epimedium pseudowushanense* is morphologically similar to *E. wushanense* but differs in flower structure. It differs from *E. mikinorii* in having leaves abaxially villous and glaucous, more slender spurs, 10–15 mm, inner sepals broadly ovate or ovate, and purplish or yellow petals with purple lamina. Its flowering time is from Mar–Apr, fruiting is in May, and it occurs at 900–1400 m in Guangxi and Guizhou.

**Epimedium pudingense** S. Z. He, Y. Y. Wang & B. L. Guo, Ann. Bot. Fenn. 47: 226. 2010.

*Epimedium pudingense* is known only from the type gathering (Guizhou: Puding County, 1300 m, 13 Apr 1995, S. Z. He 95413, holotype, HGCM).

**Epimedium qingchengshanense** G. Y. Zhong & B. L. Guo, Acta Phytotax. Sin. 45: 817. 2007.

*Epimedium qingchengshanense* is reported to differ from *E. fargesii* in having smaller flowers but larger rounded petal lamina and purple filaments. Its flowering time is from May–Jun and it occurs at 900–1500 m in Sichuan (Qingcheng Shan).

**Epimedium shennongjiaense** Yan J. Zhang & J. Q. Li, Novon 19: 567. 2009 [*“shennongjiaensis”*].

*Epimedium shennongjiaense* is known only from the type gathering (Hubei: cultivated at Wuhan Botanical Garden from material collected at Muyuping, Shennongjia National Nature Reserve, 30 Mar 2007, Y. J. Zhang 148, holotype, HIB; isotype, HIB).

## 9. GYMNOSPERMIUM Spach, Hist. Nat. Vég. Phan. 8: 66. 1839.

牡丹草属 mu dan cao shu

Ying Junsheng (应俊生 Ying Tsun-shen); David E. Boufford, Anthony R. Brach

Herbs, perennial, glabrous. Tuber subglobose or irregular; stem erect, herbaceous, branchless. Stem with 1 terminal leaf, bi- or triternate, rarely trifoliolate; leaflets thinly herbaceous, slightly pruinose. Inflorescence simple, racemose, terminal. Pedicel with bract at base. Flowers yellow. Sepals 6, petaloid. Petals 6, nectary-like, much shorter than sepals. Stamens distinct, opposite petals and equal in number; anthers dehiscent by 2 apical flaps. Pistil simple; ovary 1-loculed; ovules 2–4; placentation basal; style short or slender; stigma truncate. Capsule less than 8 mm in diam., valved. Seeds 2–4; aril whitish.  $x = 8$ .

Six to eight species: north temperate zone; three species (one endemic) in China.

1a. Leaves bipinnate or tripinnate; inflorescence 13–16-flowered; pedicel 3–4 cm; sepals 7–10 mm ..... 1. *G. kiangnanense*

1b. Leaves trifoliolate; inflorescence 5–10-flowered; pedicel 1–2.5 cm; sepals 5–8 mm.

2a. Leaflets 3-divided; ovules 2 or 3; pedicel 2–2.5 cm ..... 2. *G. microrrhynchum*

2b. Leaflets palmately 5-divided; ovules 4; pedicel ca. 1 cm ..... 3. *G. altaicum*

江南牡丹草 jiang nan mu dan cao

*Leontice kiangnanensis* P. L. Chiu, Acta Phytotax. Sin. 18: 96. 1980.

Herbs, 20–40 cm tall. Tuber subglobose, 3–5 cm in diam., sometimes to 8 cm; section of tuber yellow. Stem erect or decumbent, usually black-purple, glabrous, but slightly pruinose. Leaf terminal, 2–3 × ternately compound, 6–10 × 9–18 cm; pinnules adaxially pale green, obovate or ovate-oblong, 2.5–3.5 × 1.5–2.5 cm, abaxially slightly glaucous, 2- or 3-parted, margin entire. Raceme terminal, 13–16-flowered, 13–25 cm; bracts triangular-ovate or reniform, apex acute. Pedicel 3–4 cm. Flowers yellow, 1.1–1.8 cm in diam. Sepals narrowly elliptic or oblong-obovate, 7–10 × 5–6 mm, apically obtuse. Petals ca. 2 mm. Stamens 4–7 mm. Pistil shortly stipitate; ovary rhomboid-ovoid; ovules 2 or 3; style short; stigma truncate. Capsule subglobose, 5-valved. Seeds greenish brown, obovoid. Fl. Mar–Apr, fr. Apr–May.

• Forest margins; 700–800 m. Anhui, Zhejiang.

**2. Gymnospermium microrrhynchum** (S. Moore) Takhtajan, Bot. Zhurn. (Moscow & Leningrad) 55: 1192. 1970.

牡丹草 mu dan cao

*Leontice microrrhyncha* S. Moore, J. Linn. Soc., Bot. 17: 377. 1879; *L. microrrhyncha* f. *venosa* (S. Moore) Kitagawa; *L.*

*microrrhyncha* var. *venosa* S. Moore.

Herbs, ca. 30 cm tall. Tuber ca. 2 cm in diam. Stem erect, stramineous, herbaceous, succulent, with 1 leaf. Stipules 2, large, apex shallowly 2- or 3-lobed; leaf trifoliolate or biternate compound, herbaceous; petiole ca. 2 cm; leaf blade abaxially pale green, adaxially green, 3-divided, lobes oblong to oblong-lanceolate, 3–4 cm, entire, apex blunt. Raceme terminal, simple, 5–10-flowered; peduncle ca. 8 cm. Pedicel 2–2.5 cm, slender; bracts broadly ovate, ca. 5 × 6 mm. Flowers pale yellow. Sepals 5 or 6, obovate, ca. 5 × 3 mm, apex blunt. Petals ca. 3 mm, apex truncate. Stamens ca. 4 mm. Pistil shortly stipitate or subsessile; ovary ovoid; ovules 2 or 3; style short; stigma truncate. Capsule globose, ca. 6 mm in diam., 5-valved. Seeds usually 2. Fl. Apr–May, fr. May–Jun.

Forests, forest margins; ca. 100 m. Jilin, Liaoning [Korea].

**3. Gymnospermium altaicum** (Pallas) Spach, Hist. Nat. Vég. Phan. 8: 67. 1839.

阿尔泰牡丹草 a er tai mu dan cao

*Leontice altaica* Pallas, Acta Acad. Sci. Imp. Petrop. 2: 255. 1779.

Herbs, ca. 15 cm tall. Tuber subglobose, ca. 1.5 cm in diam. Stem erect, herbaceous, green. Stipules 2, ca. 7 × 4 mm, entire; cauline leaf 1, terminal, trifoliolate, thin in texture; leaflets abaxially pale green, adaxially green, 4- or 5-palmatisect, segments oblong or oblong-lanceolate, 2–2.5 cm × 7–10 mm,

margin entire, apex blunt. Raceme terminal, simple, 7–9-flowered, 4–5 cm; peduncle ca. 1.5 cm; bracts broadly elliptic or ovate, 7–9 × 6–7 mm. Pedicel ca. 1 cm, slender. Flowers yellow. Sepals 6, elliptic, ca. 8 × 3 mm. Petals 6, opposite sepals, yellowish brown, longitudinally half-tubular, ca. 2 mm, apex aristate. Stamens opposite petals, ca. 4 mm; filaments thin, ca.

2.2 mm; anthers valved. Pistil ca. 4.5 mm; ovules 4, obovoid, basal; style ca. 2.5 mm. Capsule unknown. Fl. Mar–Apr, fr. unknown.

Foot of mountains, along trails; ca. 200 m. Xinjiang [Russia (Siberia)].

## 10. LEONTICE Linnaeus, Sp. Pl. 1: 312. 1753.

囊果草属 nang guo cao shu

Ying Junsheng (应俊生 Ying Tsun-shen); David E. Boufford, Anthony R. Brach

*Leontopetalon* Miller.

Herbs, perennial, with tubers, glabrous. Stem erect, herbaceous, unbranched. Cauline leaves usually 2(–5), alternate, 2–3 × pinnately compound, stipulate. Raceme simple, terminal, bracteate. Flowers yellow. Sepals 6, petaloid. Petals 6, yellow, nectary-like, much shorter than sepals. Stamens distinct. Pistil simple; carpels 1; ovary inflated, not stipitate or shortly so; ovules 2–4; placentation basal. Achene globose, utricle-like, indehiscent or irregularly lacerate on top of fruit. Seeds in fruit, usually 2; aril absent.

About three or four species: north temperate zone; one species in China.

1. *Leontice incerta* Pallas, Reise Russ. Reich. 3: 726. 1776.

囊果草 nang guo cao

*Leontice vesicaria* Willdenow.

Herbs, 5–20 cm tall. Tuber ovoid, globose, or irregular, 2–5 cm in diam. Stem pale brown, terete, shiny at base, with few lanceolate scales at base. Cauline leaves 2; petiole 3–5 cm, sheathed at base; leaf blade 2 or 3 × pinnately compound, pinnales abaxially yellowish green, adaxially deep green, elliptic or obovate, entire, abaxially inconspicuously veined, adaxially 3–

5-basinerved, both surfaces glabrous, entire. Raceme terminal, 4–6 cm; peduncle 2–2.4 cm; bracts suborbicular or broadly ovate, apex blunt, fleshy. Pedicel to 1.2 cm, stout, glabrous. Sepals yellow, bluish purple spotted on outside, elliptic or ovate, longer than petals. Petals obovate, base clawed. Stamens distinct; anthers valved. Carpel 1; ovules 2–4. Achene pale purple in upper part, subglobose, large, to 2.5–4.5 cm in diam., bladderlike inflated, indehiscent, with conspicuous reticulate veins. Seeds 2, black-brown. Fl. Apr, fr. May.

Slopes of hills in desert regions, *Haloxylon* forests; ca. 600 m. Xinjiang [Kazakhstan].

## 11. CAULOPHYLLUM Michaux, Fl. Bor.-Amer. 1: 204, t. 21. 1803.

红毛七属 hong mao qi shu

Ying Junsheng (应俊生 Ying Tsun-shen); David E. Boufford, Anthony R. Brach

*Phtheirotheca* Maximowicz ex Regel.

Herbs, perennial, deciduous, glabrous. Rhizome creeping, stout, nodose, with numerous fibrous roots. Aerial stem erect. Leaves alternate, 2 or 3 × ternately compound, broadly ovate in overall outline; petiole short or leaves sessile; pinnales petiolulate or sessile, ovate, obovate, or broadly lanceolate, undivided or lobed, venation pinnate or palmate, margin entire. Inflorescences terminal, compound cymes. Flowers 3-merous; bracteoles 3 or 4, sepald, caducous. Sepals 6, petaloid, yellow, red, purple, or green. Petals 6, fan-shaped or obovate, nectary-like. Stamens distinct; anthers dehiscing by 2 apically hinged flaps; pollen prolate, 3-colporate, exine reticulate. Ovary bladderlike; placentation basal; styles eccentric. Fruit not developing, ovary wall soon rupturing and seed coat becoming fleshy and fruitlike. Seeds 2, raised on elongating stalk, naked at maturity, globose; seed coat tunic-blue, fleshy, glaucous.  $x = 8$ .

Three species: North America and E Asia; one species in China.

1. *Caulophyllum robustum* Maximowicz, Mém. Acad. Imp. Sci. St.-Petersbourg Divers Savans 9 [Prim. Fl. Amur.]: 33. 1859.

红毛七 hong mao qi

*Leontice robusta* (Maximowicz) Diels.

Herbs, to 80 cm tall. Rhizomes short, stout, nodose. Stem leaves 2; terminal leaflet usually petiolulate, lateral leaflets subsessile; leaflets abaxially pale green or grayish white, adaxially green, ovate, oblong, or broadly lanceolate, 4–8 × 1.5–5 cm, both surfaces glabrous, base broadly cuneate, margin entire,

sometimes 2- or 3-lobed, apex acuminate. Flowers pale yellow, 7–8 mm in diam.; bracteoles usually 3. Sepals obovate, 5–6 × 2.5–3 mm, apex rounded. Petals much smaller than sepals, base clawed. Stamens opposite petals, ca. 2 mm; filaments longer than anthers. Pistils shorter than stamens; ovules 2, stipitate; funiculus thickened, 7–8 mm. Seeds naked at maturity, 6–8 mm in diam.; seed coat blue, fleshy, glaucous; aril absent. Fl. May–Jun, fr. Jul–Sep.  $2n = 16$ .

Forests, bamboo thickets, *Cathaya* forests, moist places in valleys; 900–3500 m. Anhui, Gansu, Guizhou, Hebei, Heilongjiang, Henan, Hubei, Jilin, Liaoning, Shaanxi, Shanxi, Sichuan, Xizang, Yunnan, Zhejiang [Japan, Korea, Russia].

## Index to Scientific Names

Names in *italic* are synonyms, those in Roman are accepted names, and page numbers in **boldface** indicate where the taxon is described. Accepted names of the families and genera described in this volume are given in boldface.

- Abelia**, 642, **644**  
 sect. *Zabelia*, 642  
*adenotricha*, 643  
*angustifolia*, 643  
*anhweiensis*, 643  
*aschersoniana*, 644  
*biflora*, 643  
 f. *minor*, 643  
 var. *coreana*, 643  
 var. *minor*, 643  
*brachystemon*, 643  
*buddleioides*, 643  
 var. *divergens*, 643  
 var. *intercedens*, 643  
 var. *stenantha*, 643  
*cavaleriei*, 644  
*chinensis*, **644**, 645  
 var. *ionandra*, 644  
*coreana*, 643  
*davidii*, 643  
*deutziifolia*, 645  
*dielsii*, 643  
*engleriana*, 645  
*forrestii*, **644**  
*gracilentia*, 644  
 var. *microphylla*, 644  
*graebneriana*, 645  
 var. *deutziifolia*, 645  
 ×*grandiflora*, 644, **645**  
*hanceana*, 644  
*hersii*, 643  
*ionandra*, 644  
*lipoensis*, 644  
*longituba*, 645  
*macrotera*, 381, **645**  
*mairei*, 645  
*microphylla*, 644  
*myrtilloides*, 645  
*onkocarpa*, 643  
*parvifolia*, 645  
*rupestris*, 644  
 f. *grandiflora*, 645  
*schischkinii*, 645  
*schumannii*, 645  
*serrata*, 646  
*spathulata*, 646  
*tereticaelyx*, 645  
*triflora*, 643  
 var. *parvifolia*, 643  
*umbellata*, 643  
*uniflora*, 381, 644, **645**  
*verticillata*, 645  
*zanderi*, 643
- Abies**, 578, 582, 591, 605, 725, 727, 730, 731, 736, 750, 754, 766, 785
- Acanthaceae**, 369  
**Acanthocalyx**, **649**  
*alba*, 649, **650**  
*delavayi*, 650  
*nepalensis*, **649**  
 subsp. *delavayi*, 649, **650**  
 subsp. *nepalensis*, **649**
- Acanthodus*, 379  
*Acanthopale*  
*dalzielii*, 401  
*debilis*, 392  
*japonica*, 393  
*labordei*, 392  
*oligantha*, 393  
*radicans*, 392  
*tetrasperma*, 392
- Acanthus**, 369, **379**  
*ebracteatus*, **379**  
 var. *xiamenensis*, 379  
*ilicifolius*, **379**  
 var. *ebracteatus*, 379  
 var. *xiamenensis*, 379  
*leucostachyus*, 379, **380**  
*maderaspatensis*, 380  
*mollis*, 379  
*xiamenensis*, 379
- Aceranthus*, 787  
*macrophyllus*, 791  
*sagittatus*, 791  
*triphyllus*, 791
- Achlys*, 714
- Acranthera**, 58, 59, 62, **68**, 93  
 subg. *Acranthera*, 68  
 subg. *Androtropis*, 68  
 subg. *Sinacranthera*, 68  
*sinensis*, **69**
- Actinostemma**, **1**, **18**  
*biglandulosum*, 17  
*japonicum*, 18  
*lobatum*, 18  
 f. *longilobum*, 18  
 f. *subintegrum*, 18  
 var. *japonicum*, 18  
 var. *palmatum*, 18  
*multilobum*, 17  
*palmatum*, 18
